Woodland belts, for protection against winds, are found of much utility and value, both in the Eastern States and on the vast plains of the West. Where the face of the country has become denuded, and wintry winds and summer storms sweep farms with more fury than formerly, belts of this character are found to protect young crops and to increase the product of the land. Young plants of grass and winter grain, after heaving by frost, are beaten about and sometimes torn out by the action of the winds on the bare surface. Grain-crops and meadows are prostrated by tempests. We are informed by landowners who have planted screens of evergreens that in some instances the increase of crops raised within the range of their protection, and out of their immediate shade, has amounted to fifty per cent. greater than with entire exposure. Belts of timber a few rods in width, traversing farms fully exposed to winds, are therefore profitable in two ways: First, by the increased amount of the crops; and secondly, by the timber perpetually furnished by these belts. They should be placed at intervals of from sixty to eighty rods. Where rising land faces prevailing winds they should be nearer; but where it falls, they may be more remote. If the belts are evergreen, a rod wide will be sufficient; if deciduous, they should be three or four rods, or more. When cut, one half in breadth may be taken at a time. Or the belts may be planted thirty or forty rods apart, and alternate ones removed for timber. By selecting thrifty growers, such as the Norway spruce (evergreen) and the Scotch larch (deciduous), a growth of from twenty-five to thirty feet may be reached in about ten years, if the young trees are well cultivated at first, and fifty feet in twenty-five years. If planted closely, they will spread less and will shoot up higher than if thin and scattered. *The profits* of timber plantations must become greater each year as the forests of the country are consumed. For ordinary fuel alone, the two cords per acre which may be yearly obtained would be a constant revenue of ten dollars in many portions of the country; and when good timber trees are raised, which may be employed in the innumerable manufactures of tools and machinery, for cooperage, ships, buildings, carriages, and cabinet-work, the annual revenue would be several times greater.

If the planting of the timber-belts already described were generally adopted throughout the country, they would occupy about one twenty-fifth part of the two hundred million improved acres of the Union; would possess a money value when grown of at least $800,000,000, afford a yearly revenue in wood and timber of more than $80,000,000, and render the land they shelter more valuable than before.

But it is not merely the pecuniary profit that should induce our people generally to raise trees. The improved and polished appearance which ornamental trees would give the country at large, if planted along roadsides and on the lawns of farm-residents, would increase the attractions of country life and make their homes more desirable to young people. The moral influences of tree-planting would in this way become an important agency for improving the character of the people. (For means of accelerating the growth of young ornamental trees, see G. P. MARSH's "Man and Nature," p. 320, note.) JOHN J. THOMAS.

Ar'bor Vi'tæ (literally the "tree of life"), a term applied to the thick mass of white substance in either hemisphere of the cerebellum. This mass, when cut parallel to the median line, presents a tree-like appearance.

Arbor Vitæ [see preceding article], (*Thuʹya*), a genus of plants of the natural order Coniferæ, consisting of evergreen trees or shrubs, with compressed or flattened branchlets, and small, scale-like, and imbricated leaves. The *Thuya occidentalis* is a native of the U. S., and is often planted as an ornamental tree in the parks and pleasure-grounds of America and Europe. It is one of the trees known as white cedar. The Chinese arbor vitæ (*Thuya orientalis*), a native of China, has larger strobiles and more upright branches than the preceding. It is cultivated in Europe and the U. S. as an ornamental tree, and produces a resin which has been supposed to possess medicinal virtues. The genus comprises several other species.

Ar'broath, Ab'erbroth'wick, or Ab'erbroth'ock, a seaport town of Scotland, in Forfarshire, at the mouth of a small stream called the Brothock, 18 miles N. E. of Dundee, with which it is connected by railway. It has a public library, and manufactures of coarse linens, canvas, leather, etc. About 100 vessels, tonnage 14,800, belong to this port. Here are picturesque ruins of a richly endowed

abbey, founded by William the Lion in 1178. Robert Bruce and the Scottish nobles met in this abbey in 1320 to organize a resistance to Edward II. Pop. of the municipal burgh in 1861, 8500; of the parliamentary burgh, 17,591; of the parliamentary burgh in 1871, 19,974.

Ar'buckle, a post-township of Mason co., West Va. Pop. 1301.

Arbuckle (MATTHEW), an American general, born in Greenbrier co., Va., in 1775. He served many years on the frontier among the Indians; also in the Mexican war (1846–47). Died June 11, 1851.

Arbuth'not (ALEXANDER), a Scottish theologian and poet, born about 1538. He became principal of the University of Aberdeen in 1569. Among his works are a poem called "The Praises of Women" and a "History of Scotland." Died in 1583.

Arbuthnot (JOHN), M. D., F. R. S., an eminent physician, born at Arbuthnot, near Montrose, in Scotland, in 1660. He studied at Aberdeen, where he graduated, and settled in London. His first work was an "Examination of Dr. Woodward's Account of the Deluge" (1697). His reputation was increased by his "Tables of the Greek, Roman, and Jewish Measures, Weights, and Coins" (1705). He was appointed physician to the queen in 1709, and obtained an extensive practice. He was an intimate associate of Pope, Swift, and Lord Bolingbroke. In 1712 he published a humorous political allegory entitled a "History of John Bull," in which the great powers then involved in war were personated by John Bull the clothier, Nick Frog the linen-draper, and Louis Baboon (Louis XIV.). This work displays a great talent for satire. He produced another humorous and ironical work, called "The First Book of the Memoirs of Martinus Scriblerus." This was part of an unfinished work which Pope, Swift, and Arbuthnot projected in partnership, and which was designed to be a satire against pedantry and the abuse of learning. In 1723 he was chosen second censor of the Royal College of Physicians, and in 1727 was made an elect of the college. Died Feb. 27, 1735. He was a man of amiable character. "He has more wit than we all have," said Swift, "and his humanity is equal to his wit." Comparing him with contemporary British authors, Dr. Johnson said, "I think Dr. Arbuthnot the first man among them. He was the most universal genius, being an excellent physician, a man of deep learning, and a man of much humor."

Ar'butine, a principle found in the leaves of the red bearberry (*Arctostaphylos uva ursi*).

Ar'butus, a genus of plants of the order Ericaceæ, mostly natives of America and Southern Europe. They are evergreen shrubs, bearing a fleshy fruit which has five cells and many seeds. The arbutus mentioned by Virgil was the *Arbutus unedo* or strawberry tree,* which bears bright red and yellow berries, with beautiful foliage, and is cultivated as an ornamental evergreen. The fruit has narcotic properties, and is used for making wine in Corsica. Another species, the *Arbutus Andrachne*, a native of the Levant, is admired as an ornamental plant, and bears an esculent fruit. The *Madroña* of California is a species of this genus; but the *Manzanita*, and also the bearberry (or *Uva ursi*, a trailing shrub of the northern hemisphere, the leaves used as an astringent tonic in medicine), belong to the related genus *Arctostaphylos*, although formerly included in *Arbutus*. "Trailing arbutus" is EPIGÆA REPENS (which see).

Arc [from the Lat. *ar'cus*, a "bow"], in geometry, any part of a curved line. An arc of a circle is any portion of the circumference. The straight line joining the extremities of an arc is its *chord*, which is always shorter than the arc itself. Arcs of circles are similar when they subtend equal angles at the centres of their respective circles. To rectify an arc is to find the length of a straight line to which it would be equal if it had the same length in a right direction as it has in a curved. The area included between an arc and its chord is a segment of a circle.

Ar'ca, or **Arc Shell,** a genus of bivalve mollusks which are lamellibranchiate, and are the type of a family called Arcadæ. The hinge is straight, and is coextensive with the whole breadth of the shell, the breadth being greater than the length. Numerous species of *Arca* occur in tropical and other seas. Many others are fossil. One living species occurs in fresh water in India.

Arca'da, a township of Gratiot co., Mich. Pop. 1202.

Arcada, a township of Lapeer co., Mich. Pop. 418.

Arcade [from the Lat. *ar'cus*, a "bow," an "arch"], a row of arches supported by columns or square pillars. This term is sometimes applied to a long arched building or gallery lined on each side with shops; also to a row of piers or columns and arches by which the aisles are divided from the nave of a church. The arcade in Gothic corresponds to the colonnade of classical architecture. Arcades were employed by the ancient Romans in theatres, aqueducts, amphitheatres, and temples.

Arcade, a post-village and township of Wyoming co., N. Y., on the Buffalo New York and Philadelphia R. R., 35 miles S. E. of Buffalo, has extensive woollen mills, mowing-machine works, furniture manufactory, academy and union school, three churches, and one weekly newspaper. Pop. of village, 573; of township, 1742.

S. W. WADE, ED. OF "TIMES."

Arca'dia [Gr. Ἀρκαδία], a celebrated state of ancient Greece, was the most central part of the Peloponnesus (now called the Morea). It was bounded on the N. by Achaia, on the E. by Argolis, on the S. by Laconia and Messenia, and on the W. by Elis. The area was about 1600 square miles. It was enclosed on nearly all sides by mountains, and a large part of it was occupied by fertile valleys and verdant mountain-ridges. The principal river was the Alpheus. The Arcadians were a simple, pastoral people, inferior to most of the other Greeks in genius and culture. This inferiority may be ascribed to their isolated position, which deprived them of the influence of the sea and of the advantages of commerce. The chief towns of Arcadia were Mantinea, Tegea, Orchomenos, and Megalopolis. The Arcadians resembled the Swiss in their love of freedom and money, and in their tendency to enlist as mercenaries in foreign armies. Among the Ten Thousand whose famous retreat Xenophon described, more than two thousand were Arcadians. This country was a favorite of ancient pastoral poets, who praise the peaceful and happy life of the Arcadian shepherds. At present, Arcadia is one of the thirteen nomarchies of the kingdom of Greece. Area, 2028 square miles. Pop. in 1870, 131,740.

Arcadia, a post-township of Morgan co., Ill. P. 1251.

Arcadia, a township of Manistee co., Mich. Pop. 175.

Arcadia, a post-village and township of Iron co., Mo., about 4 miles S. of Pilot Knob. Pop. of township, 3058.

Arcadia, a post-village and township of Wayne co., N. Y. Pop. of township, which contains the village of Newark, 5271.

Arcadia, a post-township of Davidson co., N. C. Pop. 720.

Arcadia, a township of Halifax co., N. C. Pop. 2898.

Arcadia, a post-village of Washington township, Hancock co., O. Pop. 288.

Arcadia, a post-township of Trempealeau co., Wis. Pop. 1651.

Arca'dius [Gr. Ἀρκάδιος], emperor of the East, the eldest son of Theodosius the Great, was born in Spain in 383 A. D. In 395 Theodosius died, after he had divided his empire between Arcadius and Honorius, the latter of whom received the western part. The eastern empire, of which Byzantium was the capital, included Thrace, Asia Minor, and Syria, and extended from the Adriatic to the Tigris. During the minority of Arcadius, Rufinus and Eutopius successively acted as regents of the empire. The empress Eudoxia acquired the control over Arcadius, who was a feeble and indolent prince. He died in 408 A. D., and was succeeded by his son, Theodosius II.

Arca'ni Discipli'na (*i. e.* the "Discipline of Secrecy"), a term for the first time used by the Protestant theologian Dallæus in 1666 for the secrecy observed in the early Church with respect to certain doctrines; as, for example, those of baptism, the Eucharist, and some others. These were withheld from candidates until after they had been received into full communion with the Church. Soon after the introduction of the term, the subject gave rise to a very animated controversy between Catholic and Protestant theologians, which has continued ever since. The former used it to account for the silence of the early Church writers as to certain doctrines and practices of their Church. Protestant writers generally regard it either as a natural outgrowth of the oppressed condition in which the Church found itself at that time, or a degeneration of the simple forms of primitive Christianity in the interest of the hierarchy. The best Catholic treatises on the subject are those by Döllinger (1826), Toklot (1836), Hefele (1846), and Mayer (1868); the best Protestant, those by Richard Rothe (in Herzog's "Real-Encyklopädie"), Zezschwitz ("Katechetik," 1863), Niedner ("Kirchengeschichte," 1846). Harnack ("Der christliche Gemeindegottesdienst," 1854), and, in particular, Bonwetsch (in "Zeitschrift für historische Theologie," 1873), who gives a complete history of the controversy.

Arca'num (plu. **Arca'na**), a secret, a mystery; some-

*In the U. S. the name of strawberry tree has been applied to the *Euonymus Americanus*, a plant of a different order.

times applied to a medicine the composition of which is kept a secret. This term was much used by the alchemists, whose object was to discover the grand arcanum, the philosopher's stone.

Arcanum, a post-village of Twin township, Darke co., O. Pop. 450.

Arca'ta, a post-village and township of Humboldt co., Cal., situated at the head of Humboldt Bay. It is a place of considerable trade. Pop. 924.

Ar'ce (MANUEL JOSÉ), a general who in 1824 was chosen president of the republic of Central America for four years. He favored the clerical party, at whose instigation he arrested Barrundia, governor of Guatemala, in Sept., 1826. This act provoked a popular revolt and a civil war, in which Arce was defeated in 1827. He was expelled in 1829.

Arcesila'us [Ἀρκεσίλαος], a Greek philosopher, born at Pitane, in Æolis, in 316 B. C., was the founder of the New (or, as it is sometimes called, the Middle) Academy. He was a pupil of Theophrastus, and was an admirer of Plato, but taught a modified form of Platonic philosophy. He was eloquent, witty, and ingenious in argument, revived the Socratic method of teaching, and recommended an abstinence from dogmatism. It appears that he left no written statement of his doctrines, which are known to us only through the medium of his adversaries, the Stoics. Among the sayings ascribed to him is, that "he knew nothing, not even his own ignorance." Died in 241 B. C. (See RITTER, "History of Philosophy;" G. H. LEWES, "Biographical History of Philosophy.")

Arch [Lat. *ar'cus*, "a bow," "an arch"], a curved structure of stone or brick supported by the mutual pressure of its component parts, intended to cover the space between two piers or two columns, and to support at the same time a superincumbent weight. The wedge-shaped pieces of which the arch is composed are called *voussoirs*. The middle stone of the arch is called the *key-stone*, and the lowest stone on either side is the *springer*. The highest part is the *crown*, the sides are termed *haunches*, the inner curve is the *intrados*, and the exterior or upper curve is the *extrados;* while the base which supports the lowest *voussoir* or *springer* on each side is the *impost*. Arches are of various shapes, but the principal distinction is into *round* and *pointed*. All other shapes are merely described in one of these, and the principle of construction is the same for all. The arch was known to the Egyptians, the Ethiopians, the Assyrians, the Greeks, and the Etruscans, though no one of these peoples made any extensive use of it, since the post-and-lintel system met all their wants. Its first considerable use was by the Romans, who employed exclusively the round form. They used it in doors and windows, in their aqueducts, bridges, and triumphal arches, and they early developed from it a complete system of vaulting. (See VAULT.) Among the oldest arches known is the Cloaca Maxima, a great sewer built in Rome in the time of the Tarquins, and still in good condition. The pointed arch came into use later. It was at first sparingly employed, but lending itself more easily than the round arch to the increasing desire for height in building, it gradually superseded the round arch, and became so inherent a feature of the Gothic style that the name of Pointed Architecture is often applied to the works of the mediæval builders.

CLARENCE COOK.

Arch, Triumphal [Lat. *ar'cus triumpha'lis;* Fr. *arc de triomphe* or *arc triomphal*], a monumental structure erected in honor of a victorious general or in commemoration of some important event or victory. It was usually placed at the entrance of a city or over a grand avenue. The ancient Romans built numerous triumphal arches at Rome and elsewhere. Scipio Africanus erected one on the Capitoline Hill, about 190 B. C. Magnificent structures of this class were raised by Augustus at Rimini and Ancona. Three triumphal arches at Rome are still extant—namely, the Arch of Titus, which commemorates the conquest of Judea; the Arch of Septimius Severus; and the Arch of Constantine, a beautiful and imposing structure adorned with bas-reliefs. The most magnificent of modern triumphal arches are those of Paris, and the finest among these is the Arc de l'Étoile, erected by Napoleon I. at the Barrière de Neuilly. It has three arches, the central one of which is 95 feet high. The whole structure, which is equal in grandeur and splendor to the ancient Roman arches, is about 160 feet high and 150 feet in length.

Arch (JOSEPH), president of the English National Agricultural Laborers' Union, was born in Barford, Warwickshire, England, in 1828. He was the child of laboring people, and was brought up as a laborer, with no education but what he has picked up by himself. He has learned from the newspapers all he knows about the important questions of the day, and has taught himself to read and write. Being a total-abstinence man and a Methodist, he added to his daily labor the duties of "a local preacher;" that is, a layman who preaches in the chapel or in the open air within a certain district, and without pay. He says of himself that in his twenty-seven years as a preacher he walked over 7000 miles to expound the gospel to his fellows. When a young man, Arch felt that he and his kind were badly treated, and he rebelled against it. In a speech at Leamington in 1872 he said: "Men, I'll tell you what I had to do. I had a wife and two children, and one and-sixpence a day (thirty-six cents) was all I was getting, working hard, morning and night. I asked my master for more; he said, 'One-and-sixpence a day is all I shall give you.' I had sworn at the altar to love and cherish my wife, and I knew that would not keep her and the children; so I struck. I went away to work where I could get higher wages. Sometimes I could not get anything but straw to sleep on, and once I slept for nights and nights on corded wood; but I thought if any one was to suffer, it was not my wife and children, but myself." He roamed over England, working at job or piece work, sending all he earned to his wife, and preaching on Sundays on the village-greens. After a long time, and with much labor and sacrifice, Arch saved money enough to buy the freehold of his little cottage at Barford. When the Warwickshire farm-laborers struck they appealed to Arch to be their leader. The strike began in Feb., 1872, at Wellesbourne, 7 miles from Warwick. The laborers there and in the neighboring hamlets struck for an advance of four shillings ($1) per week. Their leader was one John Lewis, who proposed that they should form a union, but it was necessary to have for leader a better-taught man; so Joseph Arch, the local preacher, was sent for. After much foolish opposition from high-placed people, both lay and clergy, the union was fairly started by the active assistance of rich Radicals in Birmingham, with Mr. Auberon Herbert, Mr. Edward Jenkins (the author of "Ginx's Baby"), Dr. Langford, and other reformers. Arch travelled through all parts of England, organising branches of the union wherever he went. In two months such progress was made that on the 29th and 30th of May a meeting was held at Leamington of delegates from all parts of the country, presided over by Mr. G. Dixon, M. P. for Birmingham. At this meeting Arch was unanimously elected president of the union. The movement, which at first was only a demand for a few more shillings a week, has now become one of political importance, and the laborers demand a vote in the counties, as the artisans have already done in the cities. Arch at first avoided all political references, but when the queen, through her steward, discharged the laborers on her private estate for demanding a few more shillings a week, he spoke strong words, and even as the movement has advanced there is no doubt his ideas have advanced also. The union did not at first encourage emigration. Arch said, "I wish to assist a man to get a living in England, not to run away from it." Emigration had been tried, and many laborers had been persuaded to go to Brazil, where they had suffered terribly from the insufficient food and from the yellow fever. Their fate was learned from some of their number, who were sent to New York by the Brazilian authorities. (See on this subject, "Reports respecting the Condition of British Emigrants in Brazil, presented to Parliament by Her Majesty's Command," 1873, and a heartrending letter from one of the emigrants, Thomas Sheasby, published by order of the earl of Kimberley in the *Times* of Aug. 29, 1873. See also, for a thorough exposure of the whole nefarious business, a little book, "Brazilian Civilization, from an European Point of View," by Jacaré Assu (a *nom-de-plume*), London, 1873.) As the men sent by the Brazilian authorities to New York immediately got good places, and as the superintendent declared that they were just the sort of men needed here, and that he could obtain places for all such who should arrive, Arch determined to visit America and look into the matter for himself. He accordingly came over in the summer of 1873, and made a careful study of Canada, returning to England in the late autumn of the same year, and promising to return to America in the following spring and make an equally careful study of the U. S. as a field for emigration. His report will be looked for with great interest, and if it shall prove favorable the results cannot fail to be of importance to both countries. (We are indebted for the facts in this notice mainly to an article in the New York "Tribune" for Aug. 16, 1873. A brief review of Jacaré Assu's book will be found in the "Athenæum" for Oct. 18, 1873.) (CLARENCE) COOK.

Archæol'ogy [from the Gr. ἀρχαῖος, "ancient," and λόγος, a "discourse," a "science"], literally, "the science of antiquities." The term in its widest sense includes the knowledge of the origin, language, religion, laws, institutions, literature, science, arts, manners, customs—everything, in fact, that can be learned of the ancient life and

being of mankind. Archæology may thus be made to comprehend a part, in greater or less degree, of many branches of knowledge which are recognized as distinct or independent pursuits; but in its narrower, and perhaps more popular signification, it is understood to have reference to the *materials* from which a knowledge of the ancient condition of a country is to be attained. These materials may be divided into three groups—written, monumental, and traditional. The first, or written archæology, includes both the science of ancient writings and the knowledge of printed books. The second, monumental archæology, admits of almost endless subdivisions, according to the character of the remains to be studied, which may be works of art, such as buildings, sculptures, paintings, inscriptions, coins, armorial bearings, furniture, enamels, glass, porcelain, etc.; works of engineering, such as roads, canals, aqueducts, mines, etc.; articles of dress, armor, or personal ornament; tools, weapons, utensils, etc.; forms of sepulture; vestiges of man and animals, such as bones, etc. The third, or traditional archæology, may be said to include the oral literature of a people, their dialects, legends, proverbs, ballads, as well as their sports, customs, and superstitions.

In regard to the application of the words Archæology and Antiquities, it may be remarked that the latter has reference properly to the objects studied, the former to the study itself. And though archæology in its more limited signification refers to the materials studied, those materials are considered not as individuals, but in their totality. Thus, while we might say a "collection of antiquities" (*i. e.* of antique objects), we could not so properly say "a collection of archæology," though we might say "an archæological collection." The study of archæology was long almost exclusively confined to the antiquities of the Greeks and Romans, but about the middle of the sixteenth century attention was turned to the antiquities of other ancient nations and of the Middle Ages. Since the discovery of the Rosetta Stone, which gave a key to its hieroglyphics, the archæology of Egypt has made considerable progress; while the discoveries of Layard, Rawlinson, and others have already far advanced that of Assyria. Within the last few years the archæology of India and that of China have been successfully prosecuted. The rude and scanty remains of the aboriginal inhabitants of North America have occupied the attention of men of letters in this country; while the more stately and instructive monuments of Central and South America have fully rewarded the investigations of antiquaries. Pre-historic archæology, or the study of the relics of man as he existed before the dawn of history, is of late attracting much attention, the Royal Society of Antiquaries at Copenhagen having given this branch of the subject especial attention, Northern Europe being peculiarly rich in remains of the pre-historic ages.

In Great Britain, too, pre-historic remains of the most ancient origin have been abundantly found, and there can be but little doubt that many ancient relics which have been regarded as Druidical are in reality ante-Celtic. But in France and Belgium, especially, have the labors of Boucher de Perthes, Lartet, De Vibraye, and others been rewarded by the discovery of very ancient human relics. In Switzerland (see LAKE DWELLINGS), in Italy, Turkey, Germany, India, America, and in many other lands, the study of these profoundly interesting pre-historic remains has aroused much enthusiasm. But the work is as yet in its early infancy. The Cyclopean walls of the southern peninsulas of Europe are now generally assigned to the pre-historic ages. The fruits of the discoveries near the supposed site of ancient Troy are by many referred to pre-historic times. Still, the presence of inscriptions with what seem like Semitic characters must link these supposed "treasures of Priam" with historic peoples. The later heroic age of Greece has left but few undoubted relics. The discovery of Phrygian ruins bearing the name of King Midas is interesting in this connection, though it does not appear that these ruins can with confidence be referred to the age of Midas. The deeply interesting discoveries in Cyprus (see CYPRUS and CESNOLA, DI) have shown us unquestionably the works of historic times. The recent (1873) discovery of the key to the reading of the strange inscriptions in the syllabic alphabet of Cyprus have thus far given no evidence of their being of very remote origin, and the inscriptions themselves are in Greek of a very marked dialect.

While pre-historic archæology opens to us a world of mystery and wonder, the archæology of later times serves to dispel mysteries; the resulting effect of the two being to remove the mysterious age farther backward into the past. Much that has hitherto been unexplained is receiving light from the labors of archæologists in the valley of the Euphrates-Tigris, as well as in that of the Nile. Biblical archæology is greatly forwarded by the labors of the English and Americans in the Holy Land. The Asiatic societies find abundant material for examination in Southeastern India, a new and almost untrodden field. Osiander, Fresnel, and other Semitic scholars would appear to have solved the riddle of the Himyaritic inscriptions in Arabia; and the wonders of the semi-civilizations of America before the time of Columbus have been much diminished by the simple and yet admirable generalizations which have been of late brought forward with regard to them. (See the article ARCHITECTURE OF THE AMERICAN ABORIGINES in the present work, by LEWIS H. MORGAN, LL.D.) But an interest hardly less intense than attaches to the above-mentioned works is, and long has been, felt in the antiquities of the Middle Ages, both ecclesiastical and social. The civilizations of ancient Rome and Greece are quite clearly marked off from ours, while the Christian civilization that sprang up on the ruins of the old is our own civilization, and must possess for ever a deep interest to the student of the science of humanity. The French and Italians have given special attention to this department.

Among other archæological works going on at present or quite recently, may be mentioned the interesting and quite important excavations at Ephesus and other points in Asia Minor; those at Cyrene and Carthage; and the labors of Mariette Bey in Egypt, so pregnant with important consequences, extended, by the direction of the khedive of Egypt, to Nubia and the Soudan. The British war in Abyssinia has led to discoveries of much interest in regard to the literary archæology of that remarkable region. The monumental archæology of Brazil, Ecuador, Peru, and the rest of South America has been studied with important results.

The quite modern science of "folk-lore," which examines and compares the traditions, legends, superstitions, and immemorial customs of existing peoples, links itself inseparably with some departments of archæology; and it is from the study of long-overlooked traces of the old Ayran and Sanscrit traditions, legends, superstitions, and customs that they receive much of the light which has lately been shed upon them—a light which shows very plainly that a common, if very remote, kinship unites all the Indo-European peoples. Such considerations show that the true archæologist is no mere antiquarian curiosity-hunter, but a student of matters which have a very wide and deep interest to nearly every thoughtful mind.

The science of archæology has been greatly promoted by the publication of chronicles, records, catalogues, etc., by the formation of clubs and societies, and by the establishment of museums for the collection and classification of antiquities. Among the societies formed for this purpose may be mentioned the Society of Antiquaries of London, which was founded in 1572, but was not incorporated by royal charter until 1751; the Society of Antiquaries of Scotland, chartered in 1780; and the Royal Irish Academy, for promoting "the study of science, polite literature, and antiquities," which was chartered in 1786. The last two have good museums of national antiquities. Among the most celebrated antiquarian collections are those of the British Museum in London, which contains, besides a great collection of early manuscripts, galleries of Assyrian, Egyptian, Etruscan, Greek, Roman, British, and mediæval antiquities; the museums of the Louvre and the Hôtel de Cluny in Paris, which contain an unrivalled collection of mediæval in addition to more ancient antiquities; and the Royal Museum at Naples, which contains most of the objects recovered during the last one hundred years from the ruins of Herculaneum and Pompeii. Among the best works on classic antiquity are those of MONTFAUCON, particularly his "Antiquité Expliquée" (10 vols., 1719), and WINCKELMANN'S "Geschichte der Kunst des Alterthums" (1766), and his "Monumenti antichi inediti" (1766). On Egyptian archæology, see the works of Champollion and Bunsen. Among the recent works on archæology those by WESTROPP, "Handbook of Archæology" (1867), JAHN, "Aus der Alterthumswissenchaft" (1869), and J. H. PARKER'S "Archæology of Rome" (vol. i. 1874), deserve to be here mentioned. On pre-historic archæology see LUBBOCK, "Pre-historic Times" (2d ed. 1869); BALDWIN, "Pre-historic Nations" (1869), and "Ancient America" (1872); C. C. JONES, "Antiquities of the Southern Indians" (1873); FOSTER, "Pre-historic Races of the U. S." (1873). Among the writers upon Scandinavian pre-historic remains we may mention N. M. PETERSEN, FINN MAGNUSEN, and WORSAAE. (See also the articles HIEROGLYPHICS; CUNEIFORM INSCRIPTIONS, by W. HAYES WARD; BIBLICAL ARCHÆOLOGY; and PRE-HISTORIC RACES.)

REVISED BY C. W. GREENE.

Archæop'teryx [from the Gr. ἀρχαῖος, "old," and πτερύξ, "wing"], a remarkable fossil bird found in the lithographic limestones (Jurassic) of Solenhofen, Bavaria, and named by Prof. Owen. This bird exhibits some peculiarities of anatomical structure which have led zoologists to consider it as a kind of connecting link between birds

and reptiles. The head is not distinctly shown in the fossil. The wings are short, but provided with long plumes spread somewhat like a fan. The tail is long, and composed of a large number of vertebræ, from which feathers diverge on either side. The feet are similar to those of birds.

Archaig' (or **Arkeg**), **Loch,** a beautiful lake of Scotland, in the county of Inverness, 1 mile W. of Loch Lochy (or Lochie). It is about 17 miles long and 1 mile wide. The adjacent scenery is picturesque.

Archan'gel [Gr. ἀρχάγγελος, from ἄρχω, to "be first," and ἄγγελος, a "messenger" or "angel"], an angel of the highest order; a ruling angel. (See ANGEL.) This term is used in the New Testament—Jude 9 and 1 Thess. iv. 16.

Archan'gel, or **Archangelsk',** a government or province of European Russia, is bounded on the N. by the Arctic Ocean, on the E. by the Ural Mountains, on the S. by Wologda and Olonets, and on the W. by Finland. It comprises Russian Lapland, and is divided into two parts by the White Sea. The surface is flat, and the soil mostly barren, but produces valuable timber. The climate is very severe. Area, 286,739 square miles. Pop. in 1867, 275,779.

Archangel, a seaport-town of Russia, the capital of the province of that name, is on the Dwina, about 20 miles from its entrance into the Bay of Archangel (or the White Sea); lat. 64° 32′ N., lon. 40° 33′ E. The houses are mostly of wood. It has about twelve churches and an ecclesiastical college. The harbor is closed by ice except about three months, from July to September, during which period it is visited by many foreign vessels. The chief articles of export are fish, furs, lumber, tallow, flax, linseed, tar, iron, and bristles. This place, which was founded in 1584, was for a long time the only seaport of Russia. Pop. in 1867, 19,936.

Archbish'op [Lat. *archiepis'copus;* Gr. ἀρχιεπίσκοπος, from ἄρχω, to "be first," and ἐπίσκοπος, an "overseer," a "bishop"], the term applied to the head-bishop of an ecclesiastical province containing several dioceses, who has also a diocese of his own. The title came into use during the fourth century, and is said to have been first employed by Athanasius.

Arch'bold, a post-village of German township, Fulton co., O. Pop. 373.

Arch'dale (JOHN), an Englishman and member of the Society of Friends, became governor of Carolina in 1695. He introduced the cultivation of rice, and in several respects promoted the prosperity of the colony. In 1707 he published a "Description of the Province of Carolina."

Archdea'con [Lat. *archidiac'onus*], an ecclesiastic whose jurisdiction is immediately subordinate to that of a bishop. An archdeacon was originally an assistant of the bishop, and an overseer of the deacons and younger clergy. The authority of the archdeacons gradually increased, and became distinct from that of the bishops, so that in the twelfth century they were recognized as influential prelates. Since that time their power and influence have been much reduced. The Church of England has seventy-one archdeacons, who have a limited vice-episcopal territorial jurisdiction. (See DEACON.)

Archduke' and **Archduch'ess,** titles assumed by all the sons and daughters of the emperor of Austria, and inherited by their descendants through the male line. The title of archduke was first taken by the dukes of Austria in the fourteenth century, or earlier, but their claim to that mark of precedence over the other dukes of the German empire was not recognized by the emperor and the electors until 1453.

Archegosau'rus [from the Gr. ἀρχηγός, a "leader" or "beginner," and σαῦρος, a "lizard" or "saurian"], a fossil animal, so named because it was supposed to have been the beginning of reptilian life. It is found in the Bavarian coal-measures. Goldfuss in 1847 described three species discovered in the coal-field of Saarbrück, and gave them the generic name of *Archegosaurus.* Professor Owen considers this animal as a remarkable connecting link between reptiles and fishes. Agassiz and Dana regard it as a ganoid fish, while others class it with salamandroid batrachians.

Archela'us, a Greek philosopher, surnamed PHYSICUS, because he applied himself chiefly to physical science, was a native of Miletus, or, as some say, of Athens. He was a pupil of Anaxagoras, and flourished about 450 B. C. Socrates was one of his pupils. Archelaus taught that there were two principles of generation—heat, which moves, and cold, which remains at rest. His works, if he wrote any, are not extant.

Archelaus [Gr. Ἀρχέλαος], king of Macedonia, was a son of Perdiccas II., whom he succeeded in 413 B. C. He patronized Euripides and Zeuxis and other Greek poets and artists. Socrates was invited to his court, but did not go. This king promoted the prosperity of Macedonia by roads and other internal improvements. Died in 399 B. C.

Archelaus, an able general of Mithridates the Great, was a native of Cappadocia. He commanded a large army which that king sent to oppose the Romans in Greece in 87 B. C. He captured a number of islands and occupied Athens, where he was attacked and besieged by Sulla. Having been forced to evacuate Athens, he retired to Thessaly in 86 B. C., and was defeated by Sulla at Chærone'a and Orchomenus. He signed a treaty of peace with Sulla in the year 85, and deserted to the Romans in 81 B. C.

Archelaus, a son of the preceding, became high priest of Comana about 63 B. C. He pretended to be a son of King Mithridates, and by that imposture induced Berenice, queen of Egypt, to marry him. After he had reigned about six months in Egypt, he was defeated and killed by the Romans in 55 B. C. He left a son, Archelaus, who was high priest of Comana until he was deprived of that office by Cæsar in 47 B. C.

Archelaus, a son of Herod the Great by Malthace, a Samaritan woman. On the death of his father (4 B. C.) he became ethnarch of Judea, Samaria, and Idumea; his full brother Antipas and his half brother Philip receiving the rest of the kingdom. Fear of him sent the parents of Jesus into Galilee. In 6 A. D. he was deposed by Augustus, and banished to Vienne, Gaul, where probably he died.

Archelaus, a Greek sculptor, a native of Priene, is supposed to have lived about 30–60 A. D. He produced an admirable marble bas-relief representing the apotheosis of Homer, which is now in the British Museum.

Archenceph'ala [from the Gr. ἀρχή, the "first or highest place," and ἐγκέφαλος, the "brain"], a term applied to the highest division of the class Mammalia, to which the order Bimana, composed of the solitary genus *Homo,* belongs.

Ar'chenholz', von (JOHANN WILHELM), BARON, a German historian, born at Dantzic Sept. 3, 1745. He served in the Prussian army in the Seven Years' war, after which he travelled in England and other countries. He wrote, besides other works, "England and Italy" (2 vols., 1785), and a popular "History of the Seven Years' War" (2 vols., 1793), which was translated into many languages. Died Feb. 28, 1812.

Ar'cher [from the Lat. *ar'cus,* a "bow; Fr. *archer*] and **Archery.** An archer is one who shoots with a bow. In ancient times archers formed an important portion of the armies of most Oriental and of all barbarous or semi-barbarous nations. Among the ancients, the Cretans, Parthians, and Thracians, and in the Middle Ages the English, were especially distinguished for the skill and efficiency of their archers. The English archers decided the fate of the day in the important battles of Crécy, Poitiers, and Agincourt. Among the Asiatic Turks, the Persians, the Tartars, and other nations of the East, as well as certain native African tribes and some American Indians, the bow and arrow are still used as weapons of war. In England archery is now no more than a pastime; it is promoted by archery clubs or societies. During the reign of Charles II. of England archery was much patronized by the court. After his reign archery fell into disuse for about a century. Towards the latter part of the last century it was revived as a fashionable pastime; even ladies often taking part in the trials of skill. The exercise, especially in the form of target-shooting, is still popular. (See BOW and ARROW.)

Ar'cher, a county in the N. of Texas. Area, 900 square miles. It is drained by the Little Wichita River and its North and South Forks. It has only a small settled population. It is well adapted to pasturage. Bismuth, copper, and other metals are found. The county was returned as having no population in 1870.

Archer, a post-township of Harrison co., O. Pop. 726.

Archer (BRANCH T.), M. D., born in 1790 in Virginia, studied medicine in Philadelphia, and was long a prominent physician and politician in Virginia. He went to Texas, in 1831 took part in the revolution, was in 1835 president of the "Consultation," and was sent as a commissioner to the U. S. He was a member of the first Texan Congress, and speaker of the house of representatives and secretary of war 1839–42. Died Sept. 22, 1856, in Brazoria co., Tex.

Archer (JOHN), M. D., born in Harford co., Md., in 1741, graduated at Princeton in 1760, was the first person who received the degree of M. D. in America. This degree he received from the Philadelphia Medical College in 1768. He served for a time as an officer in the Revolutionary

war, and was a member of Congress from Maryland (1801–07). Died in 1810.

Archer (Stevenson), LL.D., a son of Dr. John Archer, born in Harford co., Md., and graduated at Princeton in 1805. He was a member of Congress from Maryland (1811–17 and 1819–21), and was a judge in the State court of appeals, and for a time U. S. judge in Mississippi Territory. Died June 5, 1848.

Archer (Stevenson), Jr., a son of the preceding, born in Harford co., Md., in 1827, graduated at Princeton College in 1846, became a lawyer, and in 1866 was elected to Congress, of which he is still (1873) a member.

Archer (William S.), a Senator, born in Amelia co., Va., Mar. 5, 1789. He was educated at William and Mary College, was a member of Congress from 1820 to 1835, and was elected to the U. S. Senate by the Whigs of Virginia in 1841. He was chairman of the Senate's committee on foreign relations. Died Mar. 28, 1855.

Archer Fish, the name of certain small East Indian fishes of the acanthopterygious family of Bramidæ. They

Archer Fish.

project drops of water at insects, which they thus cause to fall from the air into the water, and then devour them. The *Toxo'tes jacula'tor*, one of these archer fishes, is a native of Java, and about six inches long. The only remarkable peculiarity in the form of this fish is its greatly elongated lower jaw, which perhaps may aid it in directing the liquid missile upon which its subsistence partially depends, as does that of the hunter on the accuracy of his rifle. "So powerful," says Wood, "is the projectile force, and so marvellously accurate is the aim [of the *Toxotes jaculator*], that it will strike a fly with certainty at a distance of three or even four feet."

Ar'ches, Court of, a court of ecclesiastical law in England, is the chief court of appeal in the province of Canterbury, which includes nearly all England. The dean of arches is usually the deputy of the archbishop of Canterbury. This court is so called because it was once held in the church of St. Mary le Bow (*de Arcubus*).

Ar'chetype [from the Gr. ἀρχή, a "beginning," "origin," and τύπος, "a type"], the original pattern or model of a work; the original type on which others are formed. Among Platonic philosophers the term archetype was applied to the original patterns or ideas existing in the Divine mind before the creation.

Archiac, d' (Etienne Jules Adolphe Desmier de Saint-Simon), Vicomte, a French geologist and author, born at Rheims in 1802. He published, besides other works in French, a romance entitled "Zizim, or the Chivalry of Rhodes" (3 vols., 1828), and a "History of the Progress of Geology from 1834 to 1863" (8 vols., 1847–62). The latter was published at the expense of the state.

Ar'chias (Aulus Licinius), a Greek poet, born at Antioch, became a resident of Rome in 102 B. C., and obtained the right of citizenship. He was intimate with Cicero and Lucullus, and was courted or patronized by several eminent men on account of his genius or learning. Having been accused of being an alien, he was defended by Cicero in an able oration ("Pro Archia") about 60 B. C. Among the works of Archias which are lost was a poem on the Mithridatic war. (See Wallenius, "Dissertatio de Aulo Licinio Archia," 1806.)

Archia'ter, or **Archiator** [Gr. ἀρχίατρος, a "chief physician," from ἄρχω, to "be first," and ἰατρος, "physician"], a title given by the Roman emperors to some of their medical attendants; also to certain officials who were paid by the state or city, and were expected to give gratuitous medical treatment to the poor.

Arch'ibald, a post-borough of Luzerne co., Pa., on the Delaware and Hudson R. R., about 12 miles N. E. of Scranton. Here are rich coal-mines. Pop. 2571.

Archibald (Adams G.), born in Truro, Nova Scotia, May 18, 1814, became a lawyer in 1839, solicitor-general of Nova Scotia in 1856, and was a prominent legislator in that province. In 1867 he was president of the Canadian council and one of the secretaries of state, and in 1871–72 lieutenant-governor of Manitoba and the North-west Provinces.

Archida'mus II., of Sparta, became king about 470 B. C. He waged war against the Messenians, and commanded the army which invaded Attica in 431 B. C., but the Athenians declined a battle. This was one of the earliest campaigns of the Peloponnesian war. He was the father of the famous Agesilaus. Died in 427 B. C.

Archidamus III., king of Sparta, was a grandson of the preceding and son of Agesilaus II. He defeated the Arcadians and Argives in 367 B. C., in a battle which was called the "scarless" or "tearless," because no Spartan was killed in it. In 362 he defended Sparta with success against Epaminondas. He began to reign on the death of his father, 361 B. C., and was an ally of the Phocians in the Sacred war. Having led an army to Italy to aid the Tarentines, he was killed in battle in 338 B. C.

Archidamus V. was the last king of the Proclid line. He was a brother of Agis IV., whom he succeeded in 240 B. C. He was soon killed by the parties that murdered Agis.

Archido'na, a village of Spain, in the province of Malaga, 9 miles E. N. E. of Antequera. It is on the railway from Granada to Antequera. It has large quarries of marble, and many Roman antiquities. Pop. 7410.

Ar'chil, Or'chil, or **Orseille** [perhaps a corruption of *roccel'la*, a "little rock," so named because the plant grows on rocks], a reddish-purple dye obtained from various species of lichens, among which are the *Lichen roccella* or *Roccella tinctoria*, *Roccella fuciformis*, and *Lecanora tartarea*. These are gathered from rocks near the shores of the Canaries, the Azores, the Cape de Verde Isles, Sardinia, Corsica, Ceylon, Madeira, Lower California, Auvergne, the Pyrenees, Sweden, and many other countries. The lichens do not contain the coloring-matter ready formed, but they contain colorless acids, *erythric*, *lecanoric*, *orsellinic*, *evernic*, etc., which readily change to Orcin (which see). By the action of air and ammonia the colorless orcin changes to purple *orcein*, which is the coloring-principle of archil. To produce the archil, the weeds are reduced to pulp, a little putrid urine or ammonic carbonate is added, and the whole is allowed to putrefy or ferment. In a week or ten days the color is fully developed. By adding potassic or sodic carbonate, instead of ammonia, a blue color, Litmus (which see), is obtained instead of archil. *Cudbear* is a variety of archil made at Glasgow. Archil produces beautiful shades of purple, violet, mauve, red, etc., but, unfortunately, they are not, as generally employed, permanent. Dr. Stenhouse suggested some improvements in the manufacture of archil, which were in 1856 put in practice by M. Marnas of the firm of Guinon, Marnas & Bonnet of Lyons. He treated lichens with milk of lime, filtered, precipitated the color-producing principles by hydrochloric acid, washed them on a filter, dissolved them in ammonia, and subjected the solution to a temperature of from 153° to 160° for twenty or twenty-five days. The color being at this time fully developed, he precipitated it by adding calcic chloride. The purple lake thus obtained was sold as *French purple*. To dye with this lake it is mixed with oxalic acid and water, boiled, and filtered. The color all goes into solution, a little ammonia is added, and on introducing the silk, wool, or mordanted cotton (mordanted with albumen, or as for Turkey-red), they become dyed with magnificent fast shades of purple. Unfortunately for M. Marnas, in the same year that he developed his *French purple* (1856) Mr. Perkin discovered his *mauve*, which was the starting-point in the great aniline-color industry. Archil has therefore a comparatively limited application. C. F. Chandler.

Archil'ochus [Gr. Ἀρχίλοχος], a Greek poet, was born

in the island of Paros. He flourished about 710–670 B. C. At an early age he emigrated to Thasos and became a soldier, but he lost or threw away his shield in a battle between the Thasians and Thracians. He afterwards went to Sparta, from which he was banished, probably for the licentiousness of his verses. He wrote odes, elegies, and satires, which were extremely severe and personal, was regarded as the inventor of iambic verse, and was ranked by ancient critics as second to Homer. His versatile and brilliant genius is highly praised by Quintilian. According to tradition, he was killed in a battle between the Parians and the people of Naxos. The extant fragments of his poetry have been edited by Bergk in his "Poetæ Lyrici Græcorum" (1854). (See MÜLLER, "Literature of Ancient Greece.")

Archima'gus, the chief of the ancient Persian magi. This title and office belonged to the reigning king of Persia after the time of Darius I., who, having ordered a general massacre of the magi, directed that it should be recorded on his monument that he was the master of the magi. It is also the name of a powerful and wicked magician in Spenser's "Faerie Queene."

Archiman'drite [Lat. *archimandri'ta*, from the Gr. ἀρχή, the "first place or power," and μάνδρα, a "retreat" or "resting-place"], an ecclesiastic who presides over monasteries of the Greek Church. The Russian bishops are chosen from the archimandrites. The title is retained in the Greek rite of the Roman Catholic Church.

Archime'des [Gr. Ἀρχιμήδης], the greatest of ancient geometers, was born at Syracuse about 287 B. C., and was of Greek extraction. He is said to have been a pupil of Conon and a kinsman of Hiero II., king of Syracuse, by whom he was patronized. He enriched geometry, mathematics, and mechanics with important discoveries, and invented several useful and powerful machines. King Hiero suspecting that a goldsmith had mixed alloy with a golden crown which he had made for him, applied to Archimedes to detect the fraud. The solution of this problem suggested itself to him as he entered a full bathing-tub, and perceived that his body must displace a volume of water equal to its own bulk. Greatly delighted with the discovery, he ran out of the bath, without having dressed (as the story goes), exclaiming "Eurēka!"—"I have found it!" He discovered the proportion which a sphere bears to a cylinder by which it is enclosed. He was the author of a celebrated saying, "Δὸς ποῦ στῶ καὶ τὴν γῆν κινήσω"—"Give me where I may stand and I will move the world" (or "universe"). When Syracuse was besieged by the Roman general Marcellus, Archimedes exerted his ingenuity in the invention and construction of powerful machines or engines for the defence of that city. The tradition that he burned the Roman ships by mirrors is not confirmed by Polybius and Plutarch, and is discredited by many writers. He was killed, it is said, at the capture of Syracuse, in 212 B. C., by a Roman soldier, who would have spared his life if Archimedes had not been so absorbed in a problem that he would not comply with the soldier's summons to surrender or to follow him. He wrote numerous works, of which eight are extant, namely: "On the Sphere and Cylinder;" "The Measurement of a Circle;" "On the Equilibrium and Centre of Gravity of Planes;" "On Conoids and Spheroids;" "On Spirals;" "The Quadrature of the Parabola;" "The Arenarius;" and "On Floating Bodies." According to his direction, a cylinder enclosing a sphere was engraved on his tombstone, to commemorate his discovery of their relation. His extant works were edited by Torelli, Oxford, 1792. "He possessed," says Professor Donkin of Oxford, "in a degree never exceeded, unless by Newton, the inventive genius which discovers new provinces of inquiry, and finds new points of view for old and familiar objects, and the power and habit of intense and persevering thought, without which other intellectual gifts are comparatively fruitless." (See HENNERT, "Dissertation sur la Vie d'Archimède," 1766; DOMENICO SCINÀ, "Discorso intorno ad Archimede," 1823.)

WILLIAM JACOBS.

Archimedes, a genus of fossil Bryozoans found in the lower carboniferous limestone of the Mississippi Valley, of which the calcareous portion consists of a central axis, around which is spirally wound a reticulated, poriferous, divergent, ribbon-like band, forming a screw. Several species have been described, and they are so abundant in the rock which contains them that this has been sometimes called the *archimedes limestone*.

Archimedes, the Principle of, an important principle in the science of hydrostatics, the discovery of which is ascribed to Archimedes, is this: "A body immersed in a fluid loses exactly as much of its weight as is equal to the weight of the fluid which it displaces."

Archimedes' Screw, a machine for raising water, supposed to have been invented by Archimedes. The most simple form of it is a flexible tube bent spirally around a solid cylinder, the ends of which turn on pivots. The machine is placed in an inclined position, the lower mouth of the tube being under the surface of the water, which can be raised to a limited height by turning the crank at the upper end. It is often formed of a centre shaft, on which metal plates are fixed like the thread of a screw, and enclosed in a cylindrical trough, the lower end of which is inserted in the water. It is used in Holland for draining low grounds.

Archine, a measure of length in Russia exactly equal to twenty-eight British or American inches.

Archipel'ago [from the Gr. ἀρχι-, "first," "chief," and πέλαγος, "sea"], a name originally applied to a part of the Mediterranean called the Ægean Sea, which lies between Greece and Asia Minor and encloses numerous islands. These are mostly arranged in two groups, the Cyclades and Sporades. The principal islands of the former group are Melos or Milo, Naxos, Paros, Andros, Teuos, Delos, Scripho, Syra, Cythnos, and Thera. These islands, with Negropont, which is the largest island in the Archipelago, belong to Greece. Some writers include Crete in the Archipelago. Among the Sporades, which belong to Turkey, are Rhodes, Samos, Scio (Chios), Lemnos, Metelin or Mitylene, Imbro, Samothraki, and Thasos. The islands of this sea are generally of calcareous formation, and have a fertile soil, beautiful scenery, and a pleasant climate. Many of them have produced famous philosophers, artists, and poets, and have been the scenes of interesting events of ancient history. (See ÆGEAN SEA.) In modern times the term is applied to any sea or expanse of water which contains many islands, or to a group of islands, as the Malay or Eastern Archipelago.

Archipelago (EASTERN). See EASTERN ARCHIPELAGO.

Arch'itecture [Gr. ἀρχιτεκτονική, "chief art;" Lat. *architectu'ra;* It. *architettu'ra;* Fr. *architecture;* Ger. *Baukunst,* the "building art"]. The art of architecture, like all the fine arts, except, perhaps, the art of music, has its roots in pure utility. It begins everywhere with the construction of a shelter against the elements. The rudest peoples, and even those who live in the mildest climates, feel the need of a roof. The Otahcitan has his hut, the American Indian his tent, the Esquimaux his dome of ice, the Indian his cave. Every race shows that there is inherent in man the instinct of building. He shares it with the beaver, the ant, and the bird. It exists in him as the power of language exists in him, and, like that, as like any one of his native powers, it may be developed or may remain undeveloped. So long as it continues in this merely rudimentary condition, serving man's necessary physical needs, and them alone, it is not a fine art, and it is sometimes questioned whether, even when it is at its highest, it deserves that distinction. But without entering upon too subtle an argument, it may at least be asserted that building only becomes architecture and enters the region of art when man begins to decorate his shelter in order to gratify a craving for beauty, a love of proportion. Still, it is necessary in studying the history of architecture to observe and to record its rudimentary condition in the several countries where it has been developed to a high point. For man's social experience is written in his buildings; their grandeur and beauty are a measure of his civilization. They are the material mould of his politics, his religion, and his laws.

Egyptian Architecture.—Any sketch of the history of architecture, however slight, must necessarily begin with Egypt, because there the oldest civilization of the human race is recorded in the oldest buildings of which we have any knowledge. Scholars are now generally agreed that the date of the Pyramids of Ghizeh is not less that 3000 years B. C. It is suspected that the Sphinx and the small temple of granite and alabaster near it may be very much older than this. But, whatever may be the result of the researches that are now being pushed by scholars and explorers in the domain of Egyptian history written all over these stupendous monuments, that Time has only partly overthrown and partly buried, it is not possible their age can be reckoned at much less than is at present believed,* and the oldest buildings of other peoples are but young in comparison with these.

The architecture of Egypt consists of temples, palaces, and tombs. The Pyramids are now believed to be tombs. They have been thoroughly explored and patiently studied by many able people, and there seems no explanation of their purpose more simple and intelligible than this. They were built by the different kings whose names they bear as receptacles for their bodies, which were concealed in them with the most ingenious art; the object in piling up these

* According to Poole, Sir Gardiner Wilkinson, and others, the three great Pyramids of Ghizeh were built B. C. 2450; Bunsen puts the date at B. C. 3209; and Mariette at B. C. 4235.

mountains of stone being to make an indestructible resting-place for the body during the ages that must elapse before the soul should return and take again her accustomed seat. The entrances to the Pyramids are carefully concealed, and have been discovered only by stripping off the outer coating of stone. The passages that lead to the chambers where the royal mummies once reposed (for every pyramid has been entered and rifled) were purposely made difficult, and even dangerous, to traverse, and the entrances to the burial-chamber, when reached, were so artfully and securely closed as to be passable only to force. Even when entered, the sarcophagus of polished granite in which the mummy lay could only be opened by breaking the solid stone that formed the lid, for this had been closed by a device at once so simple and effectual that no wit of man could better it. All these devices for concealment can have but one reasonable interpretation; and it may be said, we think, without fear of contradiction, that the many theories by which a mystic or scientific origin has been proposed for the Pyramids are none of them held at present by any Egyptologists of eminence, who are all agreed that the Pyramids were intended simply as tombs. They stand in the midst of a vast necropolis, and are in all about a hundred in number. The three largest, named after their builders, Cheops or Soofoo, Chepheren or Shafra, and Mycerinus, Menkeres, are the best known. The pyramid of Cheops originally covered a little over thirteen acres of ground, and was 480 feet 9 inches in perpendicular height. Owing to the removal of the coating of polished granite with which this pyramid, like both the others, was originally covered, and the heaping of the ruins about the base, both these dimensions are somewhat reduced. Col. Vyse makes the present area slightly in excess of twelve acres, and the present height 450 feet 9 inches. But in the case of the Pyramids, as with all great buildings, the measurements of no two persons agree, and these must be taken as merely approximative. Beside the Pyramids, the necropolis of Memphis contains many smaller tombs, the greater part of which are structural, others being hewed out of the solid rock where there was a good opportunity, as was the case at Ghizeh. At Beni-Hassan, farther up the Nile, there are tombs, all of which are excavated from the rocky hillside, and are of singular interest from an architectural point of view. Both the exterior and the interior of these tombs are carved in imitation of a post-and-lintel system. The entrance consists of a portico of two columns supporting a pretended architrave; the stone above is cut into an imitation of projecting eaves, with rafters showing underneath. The whole of this portico, end-piers, columns, architrave, and eaves, is carved out of the solid face of the rock, which behind it is smoothed down to the appearance of a wall, in which is the door that gives entrance to the chamber. The roof of this chamber is carved into the semblance of architraves, between which it is hollowed out in the form of shallow barrel-vaulting. These make-believe architraves are supported by rock-cut columns. In several of these grotto-tombs the pillars within and without have so strong a resemblance to the Doric column that they have been called *proto-Doric*, and many modern writers on the subject are persuaded that the Greeks borrowed the Doric column from the Egyptians. We cannot enter on the subject here, but we may express a doubt whether at present this belief ought to be considered as having any better foundation than conjecture and a striking resemblance.

The buildings next in antiquity to the Pyramids are the palaces of Thebes. The principal ruins of this once magnificent city lie on both sides of the Nile, covering an area that extends about two and a quarter miles N. and S. and three and a half miles E. and W. The principal group is at Karnac, on the eastern bank, and consists of a palace-temple 1200 feet long, with five or six smaller buildings grouped about it with that lack of symmetry which was a characteristic of the builders of that age and of the later times, as distinguished from the period of the Pyramids. Farther S., about two miles, but once united with it by an avenue of sphinxes now in ruins, was the temple of Luxor, 820 feet long, and with no other buildings connected with it. The rest of this astonishing Theban group is found on the opposite side of the river, and consists of the temple of Medinet Habou, the Rhamsession, the temple of Gournou, and the temple of Thotmes and Amenophis, but of the last two little remains above ground. The river on whose bank they were directly built has played a double part in their destruction. The inundations have undermined and swept them away, and their neighborhood to the water has enabled boats to come and carry away their stone for building purposes. Our narrow limits utterly forbid any minute description of these buildings. Everything about them was huge. Their ground-plans were not only really extensive, but they were so subdivided as to make them seem much larger than they were. Court succeeded to court, room to room, until the sense of size and the sense of distance were wearied. The long avenues of sphinxes, the mighty columns supporting roofs of solid stone, the tower-like pylons that guarded the entrance, were all calculated to overawe the human spirit by the notions of vastness and the sense of power in the monarchs that could command the erection of such structures. Nor must we forget that the enormous size and extent of these palace-temples (for they contained within themselves the abodes of the kings as well as the shrines of the gods) were tempered by a noble sense of proportion, by sculpture of a grandeur of which we never weary, by the most delicate carving, and by a system of ornamentation alike perfect in form and color. Any notice of the Egyptian buildings of this period that should fail to hint at their beauty would leave an incomplete impression, but we too often find this praise forgotten in the wonder excited by their stupendous feats of building.

Still farther S., in passing from Thebes to the Second Cataract, we find the ruins of temples which, once reckoned coeval with the Pyramids, or even more ancient, are now known to be the most modern of the Egyptian buildings. Of these the best known are the temples at Edfou, Denderah, Philæ, and Kalabsche, but the shore on either side is scattered with ruins, and they differ from those of Thebes in being exclusively temples. Some of these buildings are of a grandeur of design and size that would have done credit to the time of the Pharaohs, and, as a rule, the inferiority of these temples, built under the dominion of the Ptolemies, is more apparent in the sculpture and painting that decorate them than in their architecture. In style and general arrangement the later buildings differ surprisingly little from the more ancient, but many of the buildings are better preserved; they make, for this reason, a clearer impression on the visitor, and while it would seem as if this fact should have militated against the idea of their greater antiquity, it was perhaps counteracted in its effect by their greater remoteness, by the difficulty of access to them, and the loneliness that invests them.

"A spirit of simplicity, grandeur, and solidity reigns throughout all the Egyptian temples, and every precaution seems to have been taken to make them eternal." Doubtless the ease with which large masses of stone were procured, and the fact that labor cost but little—for the laborer was a slave and the land was inexhaustibly fertile—had much to do with the peculiar massiveness of the style. Every original style of architecture, and even those derived styles, such as the Greek, which modified their model by the laws of a higher ideal in art and a purer taste, until it became almost an independent style,—all these genuine workers have been controlled in great measure by their material, or rather, let us say, have known how to take advantage of it. The Egyptian architecture is in thorough harmony with the physical characteristics of the country. The monotony of this flat valley is varied, and at the same time accented, if we may so express it, by these gigantic piles of masonry that suggest mountain forms. At the same time, in piling them up, their builders obeyed the laws of structure; they played no tricks with gravitation, as the Gothic and Renaissance builders did; and if man could have been restrained from violating the pyramids and the tombs, and from making quarries of the temples, time would have preserved them unharmed until to-day and for centuries to come. Acquainted with the arch, they rarely used it, as knowing doubtless that "an arch never sleeps," and they would employ no feature that would jeopard the durability of their work. Perfect sculptors, they knew how to subordinate their carving perfectly to the architecture it was to adorn, and as all their sculpture had an important meaning, they studied that reserve in its treatment that would best enable it to resist all accidents of time and human violence. Their buildings have been reproached with monotony, but it may be questioned whether any architecture has ever made so wide spread, so profound an impression, or has given such enduring pleasure. They would seem to have early discovered the best way of piling up enormous masses of stone, the best way of supporting their architraves and roofs, and the best way of ornamenting their work; and having found what they wanted, they rested in a sublime content, continuing to build for ages without the wish to change, and with no motive to attempt improvement in what seemed to them doubtless, as it seems to us, incapable of being improved.

Grecian Architecture.—What we shall have to say about Greek architecture will begin, properly, with the introduction into the peninsula of the Doric order. This, supposing the temple at Corinth to be the oldest example existing, does not carry us back very far, since its date is supposed to be only about 650 B. C. The Ionic order was no doubt introduced from Asia as early as this, or, it may be, earlier, but all the oldest examples have perished, and the few buildings in which it is now found in Greece itself

are of a date far much more recent than the oldest Doric temples. There are a few buildings in Greece much older than the temple at Corinth, but they are in a ruinous condition, and with the exception of the tomb of Atreus (the so-called "treasury" of Atreus) at Mycenæ, and the Gate of Lions in the wall of the same city, they have little interest for any one but the antiquary; nor do they belong to the history of the development of Grecian architecture, properly so called. We shall not therefore stop to describe the tumuli of Mycenæ and Orchemenos, but shall pass at once to the consideration of the later buildings.

In Greece itself the most famous temples were all Doric. The temple at Corinth, that at Ægina, the temple of Theseus at Athens, with those of Jupiter at Olympia, of Minerva at Sunium, and finally the Parthenon at Athens, with many others, were all in this style, for which the Greeks had a peculiar liking, and which they treated with the most perfect skill and taste.

The Parthenon, indeed, stands in men's minds as the type of the perfection of Greek architecture. Even if we felt it necessary to admit—as we certainly do not—that the Greeks borrowed the Doric columns and every architectural idea and feature from the Egyptians and the Assyrians, we may assert that in the Parthenon they so perfected their model, and invested it with such poetic beauty, that they deserve to be called creators rather than copyists. We cannot understand the Doric order until we have studied it in the Parthenon. It united in itself all the beauties and refinements of which the style was capable, and it is perhaps the highest praise that can be given it if it be admitted that it gained little essentially by the addition of the sculptures of Pheidias. They were a glorious ornament, but the Parthenon was perfect as a building without them.

The Parthenon was the only temple in Greece that had eight columns in its end porticoes. It was a small building, being only 228 feet long by 101 feet wide, and it was built of the finest white marble. Like all the Doric temples, it was painted over its whole surface, internally as well as externally. The sculpture was relieved by a colored background, the coverings of the roof were certainly painted, and all the mouldings. This seems to be the general opinion of scholars and artists on this much-vexed question, but it is still disputed by some persons of authority. Fergusson in England, Viollet-le-Duc in France, and Semper in Germany maintain the affirmative, however, and their authority, singly or combined, is very great. The fact that color was used cannot be disputed, seeing that there are plenty of traces of it still existing. The question seems to be, How extensively was it used, and was it applied to the buildings when they were first erected or at a later date?

The Parthenon was built by Pericles about 440 B. C. The architects Ictinus and Callicrates were charged with the construction, and Pheidias was entrusted with the commission to fill the two pediments and the metopes with sculpture. Whatever may have been the origin of the Doric order, by the time the Parthenon came to be built Greek delicacy and perception had so ripened as to give the order that final grace which has made this celebrated temple a standard of architectural perfection to the whole civilized world. So delicate are the refining processes by which this final perfection was reached that it was long before they were discovered, and people wondered why the most careful and conscientious attempts made by skilful architects to reproduce the Parthenon always failed to please like the original. The truth is, that these refinements are too delicate to be detected except by the most accurate measurement; they were never intended to be discovered by the eye, since their only object was the correction in each instance of an optical illusion, and the error in which the refinement consisted was only meant to be sufficient to just counterbalance this delusion. The first of these refinements was the *entasis* or swelling of the columns, a peculiarity noticed by Vitruvius, and in our own time first verified by Mr. Allanson, though it is to Mr. Penrose's measurements and analyses that we owe our present knowledge on this subject, and indeed on all the minute points connected with the Athenian architecture. That the columns diminished from the bottom to the top was always known, and is evident enough to the eye, but it was long before it was proved that this diminishing was not regular, and that, owing to their swelling slightly out, they were bounded not by straight lines, but by a very delicate hyperbolic curve, only discoverable by the nicest measurement. When this was found out it explained why the modern columns made with such good faith and cleverness in close imitation of the Greek looked so stiff and lifeless. And yet we have never known how to profit by our knowledge. Modern Doric columns either have not enough entasis, and look as if the sides sank in, or they have too much, and look like bolsters set on end. The entasis of the columns of the Parthenon is $\frac{1}{130}$ of the whole height. By another refinement, the end architraves in all the temples were curved upward, the middle of the line being higher than the ends. This curving of the end architraves was common to all the temples, but in the Parthenon the stylobate and the architrave of the sides were also curved upward. The commonly accepted explanation of these refinements is, that they were designed to correct the error to which the eye is liable in looking at a long straight line. The same nicety of perception led to the curving upward of the roof-ridge, to the giving all the columns a slight inward inclination, and to the making the columns at the angles thicker than the others—in the case of the Parthenon by $\frac{1}{74}$ of the diameter, and in the case of the Theseum by $\frac{1}{47}$. All the curves are hyperbolas or parabolas, and in the adjustment of the parts one to another a system of proportions was adopted and elaborately carried out so recondite that by most persons it was long regarded as more fanciful than real. Now, however, the discoveries of Mr. Penrose are universally admitted, and it is seen that they explain the charm the Greek architecture has even for persons who have no scientific acquaintance with the subject. We must not overlook in passing the theory that the Doric temple was an imitation in all its parts of a wooden original, the *columns* being the trunks of trees; the *architrave* the beam that was laid from post to post; the *triglyphs* the ends of the joists; and the *metopes* the spaces between them filled up with slabs of marble; that the *mutules* were the ends of the roof-rafters, and the *gutte* the drops of rain that collect on the under side of horizontal beams. This theory might by this time, we think, be allowed to rest with the myths of Romulus and Remus or the story of William Tell and the apple. It has no foundation in fact, and deserves no consideration. It is all one with the story that the Doric column was designed to suggest the male figure, and the Ionic the female. The Doric temple was essentially a stone construction, the cella and the portico being covered with a wooden roof, and no part of the masonry was imitative of anything.

It seems to be admitted by those who have the most right to be heard on the subject that the Ionic order was in use as early in Greece as the Doric; that in Asia Minor it was in use even earlier; and that it was employed in many of the finest temples in that region, which were destroyed during the Persian war. The fact that the few existing buildings in Greece in which this Ionic order is found are of a much later date than the oldest Doric buildings led earlier writers on the subject to consider it as of much later introduction, but it is now admitted that the Ionic order was in use as early in Greece as the Doric order, and that in Asia Minor it was perhaps of greater antiquity. The famous temple of Diana at Ephesus, that of Apollo at Miletus, and others at Sardis, Priené, and Teos, all of which have perished, were built in this style. On the other hand, the temple of Juno at Samos was originally of the Doric order, but was perhaps destroyed and rebuilt, since the ruins now found there are Ionic. Architectural forms often indicate changes in fashion or the prevalence of certain influences, as well as deeper-seated modifications of ideas. Thus, at Pompeii, immediately after the first great eruption of Vesuvius (63 B. C.), the Roman officials caused all the temples and public buildings to be either rebuilt or restored in the Corinthian order, which was as much a favorite at Rome as the Doric was in Greece, and the traces of this fashionable remodelling are evident enough to the most careless observers. In the so-called temple of Venus near the Forum the Doric capitals were changed into Corinthian by means of stucco, which to-day is falling off and shows the Doric marble underneath. This is only one instance of what has been going on in the practice of building since the earliest times. The Egyptians seem to have been the only Western people who never were influenced in their architecture by their conquerors or their allies. Their architecture does not show a single trace of foreign influence, but in Western Europe the history of architecture is only the history of modifications, many of them vital, it is true, like those produced by the use of the arch, of iron, and of painted glass, but many of them, also, due to fashion, to the influence of conquest, to the exigencies of climate, and to changes in political and social life. It is not easy to understand why the Ionic buildings should have suffered so much more than the Doric, but it is true that even in Greece there is but little left by which to judge of the progressive history of the Ionic order. We can trace the Doric from its clumsy beginnings in the temple of Corinth to the perfect beauty of the Parthenon, but when we first meet the Ionic in the Erechtheum and the temple of the Wingless Victory, it is in full development; the stages by which it arrived at this point, in Greece at least, are all destroyed. The loss of these intermediate buildings is much to be regretted. Without them it is almost impossible to acknowledge the relationship between

the stilted and awkward capitals of the Hall of Xerxes at Persepolis and the elegant capitals of the Erectheium at Athens.

The Corinthian order was not introduced into Greece until the age of Alexander the Great (B. C. 356–323), unless we are to accept what Pausanias says about the temple in Tegea, in Arcadia. According to this doubtful authority, that temple was rebuilt by Scopas, the celebrated architect of Paros, after its destruction by fire about 400 B. C. It was surrounded by an Ionic peristyle externally, but the internal peristyle was Doric, with a gallery above, with Corinthian columns supporting the roof. Supposing this to be trustworthy, this temple would mark a very important era in the history of Greek architecture, as showing the influx of new ideas and a definite departure from the older style. Nothing, however, remains in the presumed locality of the temple but shapeless ruins, and we must await regular explorations before we can know anything with certainty about the building. So far as we know, the oldest example of the Corinthian order in Greece is found in the Choragic Monument of Lysicrates (one remaining of many small structures erected as trophies of victory in the musical contests). This was built B. C. 335, and has long been considered a model of elegance. Much later in date, and by no means so beautiful, was the Tower of the Winds, a small octagonal building erected to contain a clepsydra or water-clock, and having a dial on one side and a vane at the top. This was built in the second century B. C. The only traces of the Corinthian order are found in the fragments discovered near it, out of which the archæologists have constructed two small porches, and it is most likely that they did originally belong to the building. The most important example in Athens of the Corinthian order was the temple of Jupiter Olympus, but this was not a Greek work, having been begun by Cosentius, a Roman architect, in the second century B. C., and finished by Hadrian in the second century of our era. The Greeks were not fortunate in their attempt with the Corinthian style. Strangely enough, it was left for the Romans to bring this order to perfection, though perhaps the Greek failure was due rather to the fact that the style was introduced at a time when the arts were in decay than to an inherent inability to deal with it. Judging from the earliest remains we have of the Corinthian as used in Asia Minor, the ancient examples may have been in purer taste than those that remain to us at Athens. In one of these older examples the capital has the acanthus leaf at the base, and the honeysuckle ornament above. Later, the volutes of the Ionic order were added, but in the Greek examples the union was never successfully accomplished. In the Monument of Lysicrates we have the best that Greek hands could do in this doubtful mingling of two styles. In the Tower of the Winds this was not attempted, nor is the spreading Asiatic base of the pillars in the Choragic Monument retained. The pillars of the Tower of the Winds, on the contrary, are without any base whatever. There is something not easily understood in this return to an older severity and purity.

Roman Architecture.—The Greeks were not great builders, but they were supreme architects. With the exception of a few small monuments of no great importance, they have left us nothing besides temples, but in these the system of the post-and-lintel architecture was made to show all the grace, elegance, and dignity of which it was capable, just as in the Egyptian temples and palaces it had reached the highest point of sublimity. The Romans were in general only middling architects, but the Egyptians alone could compare with them as builders. It is asserted of them that everything in their architecture was borrowed, but even if this were admitted, it must be admitted, on the other hand, that they were not slavish copyists: in many instances they made what they borrowed their own. If they inherited the round arch from the Etruscans, they made such an individual use of it that it has its name from them, and not from their neighbors and ancestors. To all intents and purposes they were the inventors of it. They borrowed, we believe, all the orders from the Greeks, and though they spoiled, or at least materially changed, the Doric and the Ionic, they made of the Corinthian a new creation far more beautiful and elegant than it had been in Greek hands. If they borrowed the amphitheatre from the Etruscans, its employment became so important in their society that it soon left its rock-excavated original far behind, and took on a characteristic and essentially new form. The Romans derived in their blood a love for the arch and the circular forms that spring from it and harmonize with it; but it is not perhaps necessary to look elsewhere for an explanation of the development of the arch and dome in Roman hands than to the differences in the climate of Greece and Italy, and in the social needs of the Greeks and Romans. As has been remarked, the only public buildings the Greeks have left us are their temples. They lived in the open air, and had no need of the roofs by which the Romans protected themselves from the excessive heats of their summers and the rigors of their damp and cold winters. Whether it were a simple climatic reason, or a something in the disposition of the people difficult to trace and analyze, as such things are and must be, we cannot tell. Only, here are the facts. The Greeks have left us only temples; the Romans have left us temples, baths, amphitheatres, bridges, aqueducts, triumphal arches, triumphal columns, market-places (*fora*), palaces, houses, and tombs. They took from the Greeks the plans of their rectangular temples, but the Greek temple was merely a wall admirably built and decorated, with a portico running about it; often this wall enclosed an uncovered court, or if the court were roofed it was generally roofed with wood, the wall and its portico being sufficient for the vertical pressure, which was all it had to sustain. Whatever led the Romans to desire plans in which a number of small rooms, or one large room, were to be covered with a roof, as we have said, does not appear, but they showed a marked determination to this sort of building, and of necessity were obliged to invent some stable and at the same time simple means of roofing these rooms. We confess we find something childish in the supposed necessity of finding out whence the Romans borrowed the great principle of the arch, and how they learned to make vaults. Is not man endowed with every faculty that is necessary to his well-being, and did not the Roman derive his skill in arch-building from the same source from which the Esquimaux derives his? Who played Etruscan to the Esquimaux? Nay, for that matter, who played Etruscan to the Etruscans themselves? The Romans, then, wanted roofs, and roofs that were to cover spaces much larger than could be covered by any wooden roofing without the aid of columns. The circular vault was the simplest, most natural device, and we are ready to believe that they came upon it in their own minds without the need of any ancestor from whom to borrow it.

The Roman buildings are imposing and magnificent from their mass, but in their details there is too often a lack of delicacy and proportion, while the ornamentation is almost always coarse in execution, though not unfrequently spirited in design. The Romans employed Greek workmen and artists to decorate their buildings—the structures themselves were of their own designing—and of necessity much fine sculpture and sculptured ornament was executed, not only in Rome, but in other cities in Italy and in the provinces. But, as always happens in cases where the employer has no knowledge of the work he is paying for, and little feeling for it or interest in it beyond a desire to get the most show he can for his money, the skill and taste of the Greek workman deteriorated under Roman employment, just as, if we may be allowed the comparison, the skill and taste of the French artist and workman deteriorate when they work for English and American employers.

If in this slight sketch we do not attempt to give an account of the more celebrated Roman buildings, it is because in point of architecture they have little originality; in nearly every case a Roman building was a skilful pile of masonry, with an external mask made up of details borrowed from Greece. Besides, few of their buildings proper are sufficiently well preserved to be described with accuracy. The Pantheon is the only temple in Rome that still retains its walls, its roof, and its portico; the Flavian Amphitheatre (the Colosseum) is in ruins, though it still keeps the greater part of the mask of arches, columns, and entablatures that covered its masonry and concealed its true structure; the stupendous baths of Titus, of Diocletian, of Caracalla are heaps of nearly indistinguishable ruin; of the Forum nothing remains but a puzzle for the antiquaries, and the palace of the Cæsars is a vast desolation. But though these buildings were constructed with great solidity, and in many cases with admirable science, they showed in almost every instance a lamentable ignorance of the true principles of architectural design, coupled with a singular lack of invention. The Romans piled up mountains of stone, and thought they had showed themselves architects when they had concealed their masonry behind screens consisting of monotonous rows of columns and pilasters, arches, niches, architraves, and entablatures. Still, if we fix our eyes upon what the Romans did, rather than upon what they failed to do, we shall find we owe them a considerable debt. Their delight in building gave a stimulus to the art all over Western Europe, and if they were not architects themselves in the true sense of the term, they were at least the cause why others were architects, since they laid the broad and deep foundations on which the men of the Middle Ages built so well.

We know very little of the architecture of Rome during

the republic: it was with the empire that the long line of Roman achievement in the art of building began. The Pantheon, the temples of the Forum, the Colosseum, the great aqueducts, the bridges, the baths, were all of late construction, and when the empire fell to pieces every place on the earth's surface that had been subject to it contained the proofs of that subjection in buildings that still remain, and that would still be in their original condition, so solidly were they built, if man had not destroyed them from wantonness or cupidity.

One class of buildings, however, owed a longer life than was granted to the rest to the fact that they easily fitted themselves to the new order of things that came in with the toleration of Christianity by the state, under Constantine. These were the basilicas or halls of justice. They were of several kinds—those that were roofed with stone vaults, and those that were roofed with wood—and they were either rectangular or circular in form. They were built wherever the Romans founded or took possession of cities and towns. The larger and more splendid basilicas of Trajan and Maxentius, of which the ruins still exist in Rome, were vaulted with stone, and splendidly if also somewhat barbarously coated with a false decoration of pillars and entablatures in costly marbles; but in the provinces, and later in Rome itself, these buildings were often small and roofed with wood, and when the Christians first began to look around them for places in which to worship, they either took possession of basilicas already erected or put up new ones modelled on the old, but smaller and less expensive. However, their inexpensiveness was not always the measure of their decoration, for they were in most cases built of the materials of older edifices, and adorned, and that often splendidly, with columns and slabs of rare and beautiful marble from the despoiled palaces and temples of imperial Rome. The arrangement of every Christian church that has a ritual is borrowed directly from the original arrangement of the basilicas, though this was considerably modified at an early period in the history of the Church as it changed from a democratic to an aristocratic organization. This will be easily seen by examining the plan of a Roman basilica, where will be found the quæstor's seat in the apse (which was afterwards occupied by the bishop), the altar in front of the apse where sacrifice was performed before commencing any important public business, and the rostrá or pulpits at the sides where the clerks were placed. These last became the reading-desks and pulpits of the new occupants. Originally, the whole space in front of the apse was open to the public, who came and went as in a modern court-room; but with the change of ideas in the rulers of the Church, a separation was established between the clergy and the laity; the apse was railed off, and access forbidden; then a rectangular space was railed off in front of the apse for the inferior clergy, and little by little the present disposition of ritualistic churches was established. In passing, we may refer the reader to the highly interesting church of San Clemente at Rome, where abundant proofs of these early conditions may still be studied, and where the arrangement of the basilica as built by the Christians under the full influence of these aristocratic notions of church government are yet to be seen in perfect preservation. Historically and artistically, the church of San Clemente is much more interesting than St. Peter's, but it is only lately that it is getting to be known to the ordinary traveller.

As the world began to revive after the blasting influences of the downfall of the Roman empire were somewhat spent, the rapid growth of the new religion called for new churches everywhere, and not only churches, but monasteries and convents to house the thousands of men and women who thronged to fill the ranks of the monastic orders, then forming on all sides.

The Eastern Roman empire, having its seat at Byzantium, continued to erect buildings which, until the rise of the Mohammedan powers, showed the influence of the traditions of Rome, with features borrowed from the countries with which the Eastern empire came into more intimate relations. It is to this modification in the Eastern empire of the classic Roman by barbarian influences that the term *Byzantine* is strictly applicable. The similar modification that took place in the classic style in the Western empire, principally in the countries N. of the Alps, under the influence of the so-called Gothic races, is rightly distinguished as *Romanesque*. The period of greatest activity in the Byzantine style was that which is included between the removal of the empire to Byzantium and the death of Justinian (A. D. 328–565). Yet, though the styles of the East and the West became later so different, during this period the line of demarcation can hardly be perceived. Constantinople, Rome, and Ravenna were the chief cities of one great empire, and throughout the whole region whatever building was done was building for the same new uses out of the materials that had once done service for the old religion and the old society. But, as when a family is separated by one of its members leaving the old home and going to dwell in a distant region, while both he who goes and they who stay long continue to keep up the old traditions and to maintain the former ways of living, yet each is sure in time to be subjected to new influences, and so to become widely different from the other,—so each division of the Roman empire, subjected during this long period of nearly three hundred years to severe experiences, developed a new society, and of course a new phase of architecture. Before the age of Constantine one style pervaded the whole empire. Then came the period of transition, "during which the Western empire was in a state of decay, ending in a débâcle from which the Gothic style did not emerge until some four centuries later, while the Eastern empire, on the contrary, was during that time progressively forming itself, and did form a style of its own of singular beauty and perfection." This style culminated in the erection of the great church of Santa Sophia at Constantinople (A. D. 532–563), which the Turks afterwards converted to their own worship. After this glorious achievement the art gradually declined, but many buildings of great skill and beauty were erected all over the East, not only in Constantinople, but in Syria, Russia, Armenia, Asia Minor, and Greece.

Meanwhile, in Western Europe the story of architectural progress runs on almost without interruption from the grand days of the Roman empire down to the time of the great revival of learning which we call "the Renaissance" or "the Reformation." Christian architecture began in pagan Rome, and every Christian church edifice—parish church or cathedral—traces its ancestry back to the Roman basilica. While the countries N. of the Alps were yet struggling to create their new civilization on the ruins of the Roman empire, in Italy the state of society was undergoing a less violent transformation, and the old Roman forms were modified, but not overthrown nor outgrown. The one reason for this we have already noticed in the fact that the buildings erected in this period were either restored on the ruins of older structures, or were made of old materials, and adorned with the marble columns, capitals, friezes, and slabs that were found in such abundance in the Roman cities. The same thing was done in cities in France and Spain and England—principally in France, of course, though even there to a much less extent than in Italy; but in the North there were new exigencies of climate to be met, and there were the wants and tastes of a new society demanding new forms in which to enshrine themselves. But there was wanted the shock of a new crisis, the stir and emotion of a great conflict—not of bodies merely in battle, but of ideas; and the conquests of the Turks, which led to the final absorption and disappearance of the Byzantine style in Eastern Europe, had much to do with developing the Romanesque and the full splendor of the Gothic, by introducing into the society of Western Europe a new and powerful disturbing force, stimulating the old faith into new ardor, and bringing the whole population, directly or indirectly, into contact and conflict with the civilization of the East, through those enterprises in which religion and the trading spirit were so curiously yet so inextricably mingled, and which we call the Crusades. Gothic architecture was not derived from the East; no single feature of it can be traced to that source; it was the fruit of religious enthusiasm roused to fever-heat by the menace of a new persecution; of thought stimulated by adventure, discovery, and contact with new societies; of the wealth that poured into Europe with the rapidly increasing trade with the East.

While the new religion was getting itself established in Western Europe, it contented itself with working in the channel of Roman ideas, and wherever it could find them employing Roman materials. But not only did these materials give out before long, but, as the nations progressed more and more in their own development and got farther away from the Roman influence, and as the Northern ideas and sentiments ever grew stronger, it was inevitable that there should come a change over the style of building. For a very slight study of the subject will convince any one that of the history of the human race a large chapter at least is written in its buildings, and no great change ever came over the spirit of man without a corresponding change coming over the more important of the works of his hand; and none of his works have a more essential importance than the buildings in which he lives and worships and makes his laws.

It would, however, be a serious mistake if we should think that any new principle was discovered by which the architecture we call Christian was separated from the pagan Roman. It was only development, nothing more.

When the Romans neglected the architrave system—or, as it is better called, the post-and-lintel system—of the Greeks and Egyptians, and took up and developed the arch (known long before their time, but never used to any extent), they left nothing useful to be discovered in the field of architecture, and these two principles, used separately or in combination, are all that since their day men have found it necessary to employ. The pointed arch was developed as naturally, in obedience to man's needs, as the round arch had been; it was even, as it would appear, a local discovery, and was used in Provence in France while the rest of Western Europe was still building round arches under Roman influence. Mr. Fergusson shows that its use was very ancient, it having been employed by the Assyrians in the eighth century B. C., and by the Ethiopians in the seventh century B. C.; while the Ethiopians and early settlers in Greece (Pelasgi) used the form, though constructed with horizontal courses, twelve centuries B. C., and while, to come nearer to our own time, the Saracens adopted it in Cairo in the first century of the Hejira, and never apparently used a round arch after the erection of the mosque of Ebn Touloun (A. D. 885); yet, although he shows very clearly that its use by the builders of Provence in the time of Charlemagne was dictated by necessity, he finds it difficult to believe that they could have reinvented it for the purposes to which it was applied. But we are so far from being surprised at any such fact as this, and so unwilling to insist that an ancestor must be found for every achievement of man, that we see no reason to doubt that the people of Provence invented the form, nor should we be surprised to come upon it or the round arch in any land, if such remain to be discovered, as impossible to connect with any ancestry as Palenque or Japan.

The pointed arch was, then, merely a new and fortunate step in the march of architectural progress, but its introduction was gradual, and at first it was combined with the still lingering traces of Roman architecture, appearing like a new element in the buildings so well called Romanesque from the preponderance in them of Roman features. It would be impossible in our small space to so much as glance over the immense field covered by the buildings of the Gothic period. The Gothic architecture reached its culmination in the thirteenth century, when the most beautiful buildings were erected that the world has ever seen. "Not even the great Pharaonic era in Egypt, the age of Pericles in Greece, nor the great period of the Roman empire, will bear comparison," says Fergusson, "with the thirteenth century in France, whether we look to the extent of the buildings executed, their wonderful variety and constructive elegance, the daring imagination that conceived them, or the power of poetry and of lofty religious feeling that is expressed in every feature and in every part of them." The Gothic style is seen in its purity in France and in England, but even in Venice and some other cities of Northern Italy, where it is mingled with Byzantine and Roman features, there is a beauty about it, a poetic charm, which has of late years especially excited a high degree of admiration.

We have said that no new principle was introduced in the pointed architecture, but it is important to remember that the exigencies of the Northern climate, the less amount of sunlight, and the double necessity of admitting as much light as possible while excluding rain and snow, inevitably led to the development of the manufacture of glass and its employment in windows. The Greeks, Egyptians, and Romans were all well acquainted with glass, and manufactured and used it as freely in proportion to their population as we of to-day. They employed glass to close small window-openings, as well as mica, of both which materials large quantities have been found in Pompeii and Herculaneum; but in a southern climate the need of such protection from the weather must have been less frequent and for shorter periods than in the North. The builders of the Pantheon left an opening of twenty-six feet in diameter, making an area of thirty-two square feet, in the centre of the dome, through which the rain and snow are free to fall; but in the Roman climate no practical inconvenience is ever felt from this exposure. North of the Alps such freedom as this would be impossible, and man's old possession of glass was soon made to serve a new use. As it lent itself easily to staining with lovely color, the Gothic builders found a natural delight in using it, and they enlarged and multiplied the windows of their churches merely for the pleasure of filling them with painted glass. These windows are the glory and chief beauty of their buildings. Some of them—the Sainte Chapelle at Paris, for instance—are nothing but lovely tents or tabernacles of glass, incomparable in design and color. And so strong a hold did this new element of decoration take upon the minds of the people of that age that "after the middle of the twelfth century the principal and guiding motive in all the changes introduced into the architecture of the age was to obtain the greatest possible space and the best-arranged situations for its display."

The Gothic architecture, after crowding Europe with the beautiful or grand performances of its prime, and leaving to the world a heritage of wonder that is inexhaustible, was struck by decay, and died at last in the fifteenth century. Then, after a pause in which much interesting, much picturesque, and much very ugly building went on, there came slowly on with the dwindling of the old faith, with the vital change in society, with all the elements that made the sixteenth century a period of revolution, another great change in architecture, which is called the Classic Revival, the Renaissance. And just as in the growth of the Gothic style we saw the old Roman forms slowly displaced by new, so now we see the new forms as slowly displaced by the old elements that had once given place to them. The pointed arch was gradually dropped, the stained-glass windows faded out of sight, and the old architecture of Rome was revived in principle, though shorn of much of its grandeur, in these buildings crowned by domes and with their surfaces masked by the old screens of columns and entablatures.

Still, in the beginning, much that was magnificent in public buildings, in churches, town-halls, châteaux, and palaces, was accomplished by the architects of the Renaissance, and much that was picturesque and charming—if not always defensible—in domestic buildings. In Italy and France the architecture of the Renaissance produced its most splendid fruit, but there is much that is interesting in Germany, in Spain, and in England.

What the chapel of Henry VII. is to the Gothic architecture, the sign of its approaching death, the church of St. Peter at Rome was to the Renaissance; nor did it long survive that colossal blunder. The work of many years and many hands, one of the costliest buildings ever erected in modern times, and the product of the skill of the greatest architects and artists of the age, it is a building every way unsatisfactory, and one which the world has long ceased to regard with enthusiasm. But, in truth, the world had become wearied with building, and since that unfortunate experiment has only trifled with brick and stone. For times are changed, and the zeal that once burned to build churches for the glory of God, the love of art that delighted to adorn them, are grown cold, and stir men not any more. For nearly three hundred years not a single building has been erected in Europe or anywhere that has an original claim to admiration, or that would occasion the least regret by its loss except on grounds of convenience or utility. This could not have been said of any three centuries, nor of any one century, that elapsed between the building of the Pyramids and the close of the sixteenth century of our era. During all that unrolling of centuries architecture was a living art, employing man's highest skill and covering the earth with beautiful and stately buildings. It is often brought as a reproach that man has long ceased to take delight in architecture. But, while we may regret the fact, it is useless to mourn over it, and infidelity to man to argue from it that he is on the road to hopeless degradation. We are living in an era of revolution as striking and as momentous as the race has ever seen, and man's faculties are everywhere busy with the pressing needs of the time. It may be well to remember that the triumphs of architecture have been won in building churches for a worship that was suited to the infancy of our civilization; in building palaces for rulers who subjected their people's bodies as the Church subjected their minds; and in other structures suited to social and political conditions that have passed away, apparently for ever. The race is everywhere in fermentation, and when it has settled down into the new order which will surely come out of chaos, the building instinct and the delight in building which are a part of the nature of man will once more take up the task, and Architecture be born again. (For the styles of architecture contemporary with the European development of the art, but independent of it, see the various articles ASSYRIA, INDIA, and CHINESE ARCHITECTURE. Also for later modifications, see RENAISSANCE ARCHITECTURE.) The historical study of architecture is made easy in our day by a multitude of excellent books upon the subject, some dealing with it in the general, others in detail. For the English reader no book is more valuable than Fergusson's "History of Architecture, Ancient and Modern," beginning with the earliest times and coming down (in a volume published in 1873) to our own day. This latest volume contains also an account of the principal buildings in America, with criticisms upon them. Kügler's "Handbuch der Baukunst" is a complete and valuable dictionary for consultation, too dry to read. The invaluable "Dictionnaire de l'Architecture" of Viollet le Duc covers the architecture of France from the twelfth century to the Renaissance. CLARENCE COOK.

Architecture of the American Aborigines. When America was first discovered in its several regions, the aborigines were found in two dissimilar conditions. First were the Village Indians, who depended almost exclusively upon horticulture for subsistence; such were the nations of New Mexico, Mexico, and Central America, and upon the plateau of the Andes. Second were the Non-horticultural Indians, who depended upon fish, bread-roots, and game; such were the Indians of the Valley of the Columbia, of the Hudson's Bay Territory, of parts of Canada, and of all other sections of North America where cultivation was unknown. Between these, and connecting the extremes by insensible gradations, were the partially Village and partially Horticultural Indians; such were the Iroquois, the New England and Virginia Indians, the Creeks, Cherokees, Mandans, Minnitarees, Shawnees, and Chichemecs of Mexico. The weapons, arts, usages, inventions, dances, architecture, and form of government of all alike bear the impress of a common mind, and reveal, through their wide range, the successive stages of development of the same original conceptions. Our first mistake consisted in overrating the comparative advancement of the Village Indians; and our second in underrating that of the Non-horticultural, and also that of the partially Village Indians; whence resulted a third, that of separating one from the other, and regarding them as different stocks. The evidence of their unity of origin has now accumulated to such a degree as to leave no reasonable ground for doubt upon the question, although this conclusion is not universally accepted. The latter classes always held the preponderating power, at least in North America, and furnished the migrating bands which replenished the continent with inhabitants.

It is a singular fact that the Village Indians, who first became possessed of corn, the great American cereal, and of the art of cultivation, did not rise to supremacy over the continent. With their increased and more stable means of subsistence it might reasonably have been expected that they would have extended their power, and spread their migrating populations over the most valuable areas, to the gradual displacement of the ruder nations. In this they signally failed. Their civilization, such as it was, did not enable them to advance, either in their weapons or in the art of war, beyond the more barbarous nations, except as a superior house-architecture rendered their habitations impregnable to Indian assault.

Besides this, their governmental institutions had not advanced beyond the *societas*, founded upon the gentes, and which created personal relations, into the *civitas*, founded upon territory and upon property. This argument, when extended, demonstrates the impossibility of potentates or privileged classes under their institutions, with power to enforce the labor of the people for the erection of houses or palaces for their individual use.

It should be further observed, with respect to their relative advancement, that the Non-horticultural Indians were, in general, without the art of pottery, and therefore in a state of savagery; that the partially Village Indians, who practised the ceramic art, were in the First Period of Barbarism; whilst the Village Indians, who, in addition, cultivated by irrigation, constructed houses of adobe bricks and stone, and a portion of whom, the Peruvians, had domesticated the llama as well as invented bronze, were in the Middle Period of Barbarism. It remained for them to invent the process of smelting iron ore to attain to the Closing Period of Barbarism: and beyond that, to invent a phonetic alphabet to reach the First Stage of Civilization.

The indigenous architecture of the Village Indians has given to them, more than aught else, their position in the estimation of mankind. The facts of their social condition, which unfortunately are obscure, have done much less in fixing their status than existing architectural remains. The Indian edifices of the period of the Conquest, from the materials used in their construction, from their palatial extent, and from the character of their ornamentation, may well excite surprise and even admiration; but, as we think it can be shown, a false interpretation has, from the first, been put upon this architecture, and inferences constantly drawn from it, with respect to the social condition and advancement of the people, both fallacious and deceptive, where the plain truth would have been more creditable to the aborigines themselves.

There is a common principle running through this architecture, from the "long house" of the Iroquois to the pueblo houses of New Mexico, and to the so-called "Palace" at Palenque and the "Governor's House" at Uxmal. It is the principle of *communism in living*, restricted, in the first instance, to groups of persons mutually related, and extended, finally, to all the inhabitants of a village or encampment by the *law of hospitality*. Hunger and destitution were not known at one end of an Indian village whilst abundance prevailed at the other. Communism in living and the general law of hospitality seem to have accompanied all the phases of Indian life. These great facts of their social condition embodied themselves in their architecture, and will contribute to its elucidation.

It will be the object of this article to present, briefly, some of the facts tending to show the practice of communism in living amongst the Non-horticultural and also the partially Village Indians, and after that to show its expression in their architecture; and, in the second place, to bring into notice the principal features of the architecture of the Village Indians of New and Old Mexico and Central America, from which the inference will be drawn that communism in living entered into and determined its character. Concerning the social condition of the latter our information is limited and defective.

Communism in living has its origin in a union of effort to procure subsistence, and to a great extent it was a necessary result of the mode of life of the aborigines. A few examples will illustrate the proposition. The Blackfeet, during the buffalo-hunt, follow the herds on horseback in large parties, composed of men, women, and children. When the pursuit of the herd is commenced the hunters leave the dead animals in the track of the chase, to be appropriated by the first persons who come up behind. This method of distribution is continued until all are supplied. All the nations who hunt upon the Plains observe the same custom, making a common stock of the capture. During the fishing-season in the Valley of the Columbia, where the fish are more abundant than in any other river on the earth, all the members of a band encamp together and make a common stock of the fish obtained. They are divided each day according to the number of women, giving to each an equal share. This makes a general distribution at the outset. When cured and packed they are removed to their homes. Among the Iroquois—and the same was substantially true of the principal Indian nations—each party made a common stock of the fish and game obtained on their hunting and fishing expeditions. This usage led to an equal participation in the means of subsistence, as well as an equal division of the surplus, which was cured and reserved for winter use. Those forming a common household who cultivated a garden-bed enjoyed the product in common. After gathering the harvest it was stored as a common stock in their dwelling. Each house, as will presently be shown, was constructed large enough to accommodate several families, among whom the communal principle was carried out, but it was limited to the household. The village did not make a common stock of their provisions, and thus offer a bounty to improvidence, but the principle of hospitality came in to relieve the consequences of destitution.

It should be observed that the family, consisting of a married pair and their children, was a weak organization in barbarous life, and still weaker in savagery, unable alone to cope with the hardships of their condition. It was made by pairing, with divorce at the option of either party. But the gens, in which the family practically was merged, was sufficiently powerful as an organism to face the difficulties of daily life. Accordingly, it will be found that the household, which formed a communal group, was mostly composed of members of the same gens.

The law of hospitality may be illustrated by Iroquois usages. If a man enters an Indian house in any village, it is the duty of the women therein to set food before him. An omission to do this would be a discourtesy amounting to an affront. If hungry, he ate; if not, courtesy required that he should taste the food and thank the giver. This would be repeated at every house he entered and at whatever hour in the day. As a custom it was upheld by a rigorous public sentiment, and seems to have been universal amongst the American aborigines. Lewis and Clarke refer to the same practice among the nations of the Missouri. "It is the custom," they remark, "of all the nations of the Missouri to offer every white man food and refreshment when he first enters their tents." (*Travels*, Longman's ed., 1814, p. 649.) This was simply applying their rules of hospitality among themselves to their white visitors. It tended, obviously, to equalize subsistence, and prevent destitution in any portion of an Indian community whilst any household possessed a surplus. Notwithstanding this generous custom, it is well known that the Northern Indians were fearfully pressed for the means of subsistence during a large portion of the year. From the intensity of the struggle to maintain existence it is not surprising that immense areas were entirely uninhabited, that other large areas were thinly peopled, and that dense populations were impossible.

Lands were universally held in common, but after tillage commenced a possessory right to cultivated tracts or gardens

was recognized so long as used. When occupation ceased they reverted.

I. *Communal Houses of the Non-horticultural Indians.*—We are first to show that communism in living entered into and determined the character of the architecture of the Non-horticultural and also the partially Village Indians. If it can be shown that their houses were constructed on this principle, then, wherever houses obviously communal are found, although in ruins, and although the people who erected them have disappeared, a presumption will arise that this principle prevailed among them, and led to the construction of their houses in this form. The architecture of the ruder Indians is of but little importance, in itself considered, but as an outcome of their usages, and in its relations to the architecture of the Village Indians, it is highly significant.

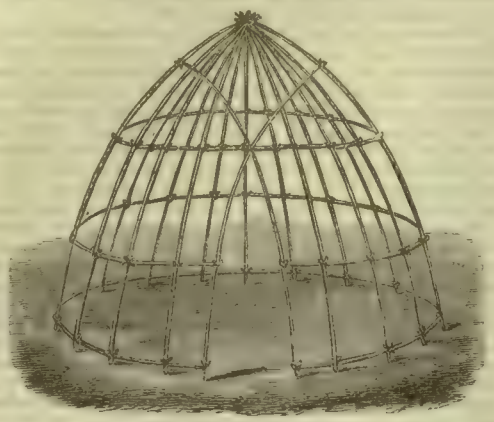

FIG. 1. Ojibwa Wig-e-wam.

The Non-horticultural Indians differed among themselves in the plan of the lodge. The figure, which is copied from Schoolcraft's work, shows the form of an Ojibwa cabin of the best class, as it is still seen on the S. shore of Lake Superior. Its mechanism is sufficiently explained by the figure. Over it is placed a covering of bark, usually the canoe birch, taken off in large pieces and attached with splints. Its size on the ground varied from ten to sixteen feet in diameter and from seven to ten in height. Twigs of spruce or hemlock were strewn around the inner border of the ground-floor, upon which blankets or skins were spread for beds. The fire-pit was in the centre of the floor, over which in the roof was an opening for the exit of the smoke. Such a lodge would accommodate two or three pairs, with their children. Several such lodges are usually found in a cluster, and the several households were made up of related persons, the principal portion being of the same gens. Carver, who visited a village of this nation on the Chippewa River in Wisconsin in 1767, observes: "This town contains about forty houses, and can send out upwards of 100 warriors, many of whom are fine stout young men." (*Travels*, Philadelphia ed., 1796, p. 65.) It would give a total of 500 persons, and an average of twelve persons to a lodge.

FIG. 2. Dakota Wä-ka'ya, or Skin Tent.

When first discovered the Dakotas lived in houses constructed of poles and covered with bark, each of which was large enough for several families. Forced upon the Plains, after obtaining the horse they invented a skin tent superior to any other in use among the aborigines, from its roominess, its portable character, and the facility with which it can be erected and struck. The frame consists of some twelve poles, from fifteen to eighteen feet in length, which, after being tied together at the small ends, are raised upright with a twist, so as to cross the poles above the fastening. They are then drawn apart at the large ends, and adjusted upon the ground in the rim of a circle which is usually ten feet in diameter. A number of unhaired, tanned buffalo skins, stitched together in a form adjustable to the frame, are drawn around it and lashed together as shown in the figure. The lower edges are secured to the ground with tent-pins. At the top there is an extra skin adjusted as a collar, so as to be open on the windward side to facilitate the exit of the smoke. A low opening is left for a door, which is covered with an extra skin, used as a drop. The fire-pit and arrangement for beds are the same as in the Ojibwa lodge. When their tents are struck the poles are attached to a horse, half on each side, like thills; the covering and scanty camp-furniture are packed upon other horses, and even upon their dogs, and are thus transported over the Plains. This tent is so well adapted to their mode of life that it has spread far and wide among the Indian tribes. We have seen it in use among seven or eight Dakota tribes, among the Iowas, Otoes, and Pawnees, and among the Blackfeet, Crows, Asiniboines, and Crees. A collection of fifty of these tents, which would accommodate 500 persons, makes a picturesque appearance.

The aborigines of the Valley of the Columbia were more or less Village Indians, but without horticulture. They found an abundant subsistence upon shell- and scale-fish, upon fruits and game, and upon the kamash and other bread-roots, which they cooked in ground ovens. When Lewis and Clarke visited this valley (1805–06) they found the Indians living in houses of a higher communal type than those previously described, and approaching the pueblo houses in New Mexico. They speak of a village of the Chopunish (Nez Perces) as follows: "The village of Tumachemootool is in fact only a single house, 150 feet long, built after the Chopunish fashion, with sticks, straw, and dried grass. It contains twenty-four fires, about double that number of families, and might perhaps muster 100 fighting men." (*Travels, loc. cit.*, p. 548.) This would give 500 people in a single house; and the fires probably indicate the number of groups, practising communism among themselves, into which they were subdivided, though it may have been general to the entire household.

FIG. 3. Ground-Plan of Neerechokioo.

Another great house, Neerechokioo, is thus described: "This large building is 226 feet in front, entirely above ground, and may be considered a single house, because the whole is under one roof; otherwise it would seem more like a range of buildings, as it is divided into seven distinct apartments, each thirty feet square, by means of broad boards set up on end from the floor to the roof. The apartments are separated from each other by a passage or alley four feet wide, extending through the whole depth of the house, and the only entrance is from this alley through a small hole about twenty inches wide and not more than three feet high. The roof is formed of rafters and round poles laid on horizontally. The whole is covered with a double roof of bark of white cedar." (*Ib.*, p. 503.) The apartments indicate the number of groups. Elsewhere (p. 515), speaking of the houses of the Clahclellah, they remark: "These houses are uncommonly large; one of them measured 160 by 40 feet. . . . Most of the houses are built of boards and covered with bark, though some of the more inferior kind are constructed wholly of cedar bark."

These first explorers found the houses of the natives large enough to accommodate several families, with from twenty to thirty persons in each. They name the following villages together (*Ib.*, p. 428): "The Clamoitomish, of twelve houses and 260 souls; the Potoashees, of ten houses and 200 souls; the Pailsk, of ten houses and 200 souls; the Quinults, of sixty houses and 1000 souls; the Chillates, of eight houses and 140 souls," etc. The formation of large groups in single houses or in apartments of a house is thus fully shown. Our explorers do not speak of the practice of communism in these groups. When the usages of other nations, which are known, are presented, the inference of communism in living in these aboriginal houses in the Valley of the Columbia will be plain. The tendency to aggregation in groups, which is clearly shown in the numbers occupying each house, reveals the weakness as well as inability of the single family to cope with the hardships of savage, and even of barbarous, life. Com-

munism in living, as elsewhere stated, was the law of their condition.

II. *Communal Houses of the Partially Village Indians.*—

FIG. 4. Pomeiok.

The houses of this class are equally communal in character. Wythe, in his "Sketches of Virginia," first published in 1690, furnishes an engraving of the village of the Powhattan Indians, called Pomeiok, consisting of seventeen long houses, besides a council-house, arranged around an open central space and surrounded with a palisade. Here the Algonkin lodge gives place to round-roofed long houses, framed with poles, and covered with movable matting instead of bark, and large enough for several families. The suggestion of Wythe that "the buildings were mostly those of chiefs and men of rank" (*Sketches*, etc., Langley ed., 1841, pl. 21) embodies the precise error which has repeated itself, from the first, with respect to the architecture of the American aborigines. Because the house is large, as the Governor's House at Uxmal, therefore it must have been the exclusive residence of an Indian potentate—a conclusion opposed to the whole theory of Indian life and institutions. Indian chiefs were housed with the people, and no better than the poorest of them.

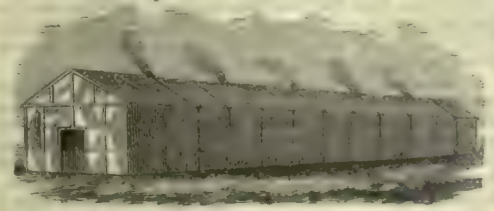

FIG. 5. Ho-de'no-sote of the Iroquois.

During the greater part of the year the Iroquois resided in villages. The size of the village was estimated by the number of houses, and the size of the house by the number of fires it contained. One of the largest villages of the Seneca-Iroquois, situated near Mendon in the county of Monroe, N. Y., is thus described by Mr. Greenhalgh, who visited it in 1677: "Tiotohatton is on the brink or edge of a hill, has not much cleared ground, is near the river Tiotohatton, which signifies *bending*. It lies to the westward of Canngora about thirty miles, contains about 120 houses, being the largest of all the houses we saw, the ordinary being fifty to sixty feet long, with twelve and thirteen fires in one house. They have a good store of corn growing to the northward of the town." (*Doc. Hist. N. Y.*, i. 13.)

The "long house" of the Iroquois, from which they called themselves, as one confederated people, *Ho-de'no-san-nee* ("People of the Long House"), was from fifty to eighty, and sometimes more than 100 feet long. It consisted of a strong frame of upright poles set in the ground, strengthened with horizontal poles attached with withes, and covered with a triangular roof. It was covered over with large shingles of elm bark tied to the frame with strings or splints. An external frame of poles and rafters was then adjusted to hold the shingles between them, the two being tied together.

FIG. 6. Ground-Plan of Iroquois House.

The interior was comparted at intervals of six or eight feet, leaving each chamber entirely open, like a stall, upon the hall which passed through the centre from end to end, where were the only doors. Between each four apartments, two on a side, was a fire-pit in the centre of the hall, used in common by their occupants. Thus a house with five fires would contain twenty apartments and accommodate twenty families, unless some were reserved for storage. An elderly Seneca woman, now deceased, informed the writer that she remembered living in one of these houses of the ancient model when a child, which contained eight families and two fires. Raised bunks were constructed around the walls of each apartment for beds. From the roof-poles were suspended their strings of corn in the ear, braided by the husks, also their strings of dried squashes and melons. Spaces were left between the partitions here and there for storage. Each house was usually occupied by related families, the women and children belonging to the same gens. Whatever was taken in the hunt or raised by cultivation by any member of the household was for the common benefit. Provisions were made a common stock within the house.

It should be observed, further, that among the Iroquois there was but one regular meal each day, and that in the morning. At this time the cooking for the day was done, and the food was served to all within the household from wooden bowls, ladles, or platters, and without the use of tables. What remained was reserved for use during the day, each one partaking whenever hunger prompted. Hommony, which formed their usual lunch, was cooked at the close of the day. The separate fires were for convenience alone, all the stores within the house being common.

Here we find communism in living carried out in practical life, and an expression of the principle in the plan of the house itself. Having found it in one stock so well developed as the Iroquois, a presumption of its universality in the Ganowanian family at once arises, requiring proof of the negative in other cases for its rebuttal.

In 1790, Mr. Caleb Swan, under the direction of Gen. Knox, secretary of war, visited the Creek villages in Georgia and Alabama. Without describing their houses specially, he remarks in his report that "the smallest of their towns have from twenty to forty houses, and some of the largest contain from 150 to 200 that are tolerably compact. These houses stand in clusters of four, five, six, seven, and eight together, irregularly distributed up and down the banks of the rivers and small streams. Each cluster of houses contains a clan or family, who eat and live in common." (Schoolcraft, *History, etc. of Indian Tribes*, v., 262.) The cluster of houses among the Creeks was equivalent to one of the long houses of the Iroquois; and the clustered household of the former, who *ate and lived in common*, was made up of related families, as the large Iroquois household within a single house, the relationship being partly gentile and partly marital.

Carver, in describing the "great town of the Sawkees" on the Wisconsin River, remarks (*Travels*, *loc. cit.*, p. 29) that "it contains about ninety houses, each large enough for several families. They are built of hewn plank, neatly jointed, and covered with bark so completely as to keep out the most penetrating rain."

The Mandans and Minnitarees of the Upper Missouri constructed a timber-framed house superior in design and

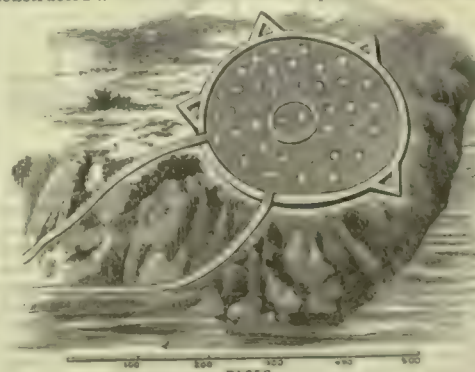

FIG. 7. Mandan Village Plot.

workmanship to those of any Indians N. of New Mexico. In 1862 the writer saw the remains of the old Mandan village shortly after its abandonment by the Arickarees, its last occupants. The houses, nearly all of which were of the same model, were falling into decay, but some of them were still perfect, and the plan of their structure easily made out. The annexed ground-plan of the village is taken from the work of Prince Maximilian, and the remaining illustrations from sketches and measurements of the author. The village was situated upon a bluff on the W. side of the Missouri, and at a bend in the river which formed an obtuse angle, and covered about five acres of land. It was surrounded with a stockade made of timbers set vertically in the ground, but then in a dilapidated state.

The houses were circular in external form, the walls being about five feet high and sloping upward from the ground, with an inclined roof, both exterior wall and roof being plastered over with earth a foot and a half thick.

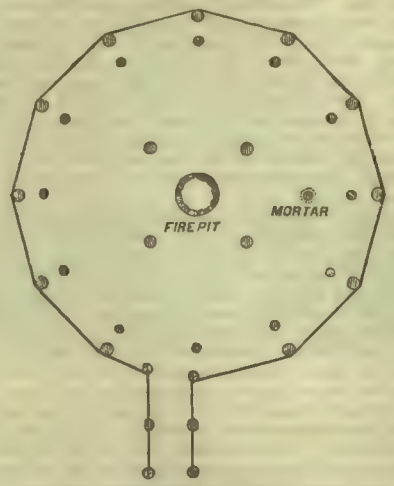

FIG. 8. Ground-Plan of Mandan House.

These houses are about forty feet in diameter, with the floor sunk a foot or more below the surface, six feet high on the inside at the line of the wall, and from twelve to fifteen feet high at the centre. Twelve posts, six or eight inches in diameter, are set in the ground at equal distances in the circumference of a circle, and rising about six feet above the level of the floor. String-pieces, resting on forks upon the top of each post, connect them with each other, thus forming a polygon at the base of the roof and also upon the ground floor. Against these, and opposite to each post, an equal number of braces are sunk in the ground about four feet distant, which, slanting upward, are adjusted by means of forks or depressions cut in the ends, so as to hold both the posts and the stringers firmly in their places. Slabs of wood or round timbers are then placed in the spaces between the braces, at the same inclination from the ground, and resting against the stringers, which when completed surrounded the lodge with a wooden wall. Four posts, each six or eight inches in diameter, are set at the four angles of a square in the centre, ten feet apart, and rising from twelve to fourteen feet above the floor. These are again connected by stringers resting in forks on their tops, upon which, and the external walls, the rafters rest.

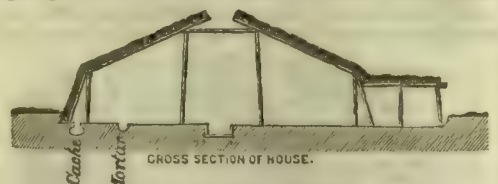

FIG. 9. Cross-section of Same.

The cross-section exhibits the framework as described. Poles three or four inches in diameter are placed as rafters from the external walls to the string-pieces upon the central posts, and near enough together to give the requisite strength to support the earth covering which formed the roof. These poles are first covered over with willow matting, upon which prairie grass was spread, and over this a deep covering of earth. An opening was left in the centre, about four feet in diameter, for the exit of the smoke and for the admission of light. The interior is spacious and tolerably well lighted, although the opening in the roof was the only one through which light could penetrate. There is but one entrance, and that protected by an Eskimo doorway; that is, by a passage five feet wide, ten or twelve feet long, and about six feet high, constructed with split timbers, roofed with poles and covered on the top with earth. Buffalo robes suspended both at the outer and inner entrances supply the place of doors. Each house, when occupied, was comparted by screens of willow matting or unhaired skins suspended from the rafters, with spaces between for storage. These slightly constructed apartments extended back to the wall and opened towards the centre, like stalls, thus defining an open central area which formed the gathering-place of the inmates of the lodge. The fire-pit was in the centre, about five feet in diameter and a foot deep, and encircled with flat stones set up edgeways. A hard smooth earthen floor completed the interior. Such a lodge would accommodate five or six families of related persons. In fact, it was a communal house, in accordance with the usage and institutions of the American aborigines, and growing naturally out of their customs and mode of life. We counted forty-eight of these houses which would average forty feet in diameter, besides several rectangular houses constructed of hewn logs at a more recent day.

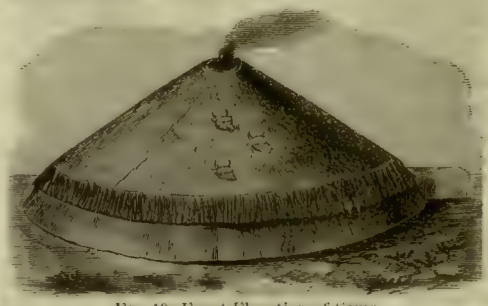

FIG. 10. Front Elevation of Same.

Not the least interesting fact connected with these creditable homes was the quantity of material required in their construction, and the amount of labor necessary for its transportation long distances down the river, and to fashion it with the aid of fire and stone implements into such a comfortable dwelling. To cut the timber without metallic inplements, and to transport it without animal power, indicate a degree of persevering industry highly creditable to a people who are generally regarded as averse to labor.

These houses were thickly studded together to economize the space within the stockade, so that in walking through the village you passed along semicircular footpaths. There is not only no street, but it was impossible to see in any direction except for short distances.

It is plain, from the facts thus far presented, that the Indian household was a group of related families united for subsistence upon the communal principle, which in turn found expression in their house-architecture.

A reference should be made to the Maricopas and Mohaves of the Colorado, who, although Village Indians, still live in ordinary communal houses of the northern type, which are thus described by Gen. Emory: "They [the Maricopas] occupy thatched cottages thirty or forty feet in diameter, made of twigs of cottonwood trees, interwoven with the straw of wheat, corn-stalks, and cane." (*Notes, etc. in N. M.*, p. 132; cf. Bartlett's *Pers. Nar.*, 230.) Those occupied by the Mohaves, as described by Capt. Sitgreaves, are similar in character. (*Expedition, etc. Zuñi and Colorado Rivers*, p. 19.) Although their antecedent history is not well known, they seem to be in the transitional stage, having passed into the horticultural and village condition, without being far enough advanced to imitate their near neighbors in the use of adobe brick and stone. They seem to be existing examples of that recurring advancement of ruder tribes in past ages, through which the Village Indians were constantly replenished from the more barbarous nations.

III. *Communal Houses of the New Mexicans.*—We are next to consider the architecture of the Village Indians, among whom it exhibits a higher development, with the use of durable materials, and with the defensive principle superadded. It will not be difficult, however, to discover and to follow the communal principle as the chief characteristic of this architecture—first, in the pueblo houses in New Mexico, and after that in those of Central America. The necessary limits of this article will prevent a full exposition of the subject, but it will be possible to present the controlling facts.

The Indians N. of New Mexico never constructed a house more than one story high, or of more durable materials than a wooden frame covered with matting or bark or coated over with earth. Chimneys were unknown,

and also stairs, except in the form of ladders. In New Mexico, going southward, are met, for the first time, houses constructed of adobe brick and of stone, and four, five, even six stories high. Sun-dried brick must have come into use earlier than stone. The practice of the ceramic art would suggest the brick sooner or later. At all events, what are supposed to be the oldest remains of architecture in New Mexico, such as the *casas grandes* of the Gila and Salinas rivers, are of adobe brick. They also used rubble stone with mud mortar, and finally thin pieces of tabular sandstone, prepared by fracture, and giving a solid and durable stone wall. Some of the existing pueblo houses in New Mexico are as old as the expedition of Coronado (1540–42), as those at Acoma and Taos, and probably Zuñi, and those of the Moquis, whilst others, constructed since that event, and now occupied, are upon the aboriginal model. There are at present about twenty of these pueblos in New Mexico, inhabited by 7000 Indians, the descendants of those found there by Coronado. They are still living substantially under their ancient organization and usages. Besides, there are the seven Moqui pueblos near the Little Colorado, occupied by 4000 Indians, who have remained pure and undisturbed to the present time, and among whom the entire theory of Indian village life might be obtained if some adventurous ethnologist would seek their secluded homes and study the subject on the spot. These Village Indians represent, at the present moment, the type of village life found from Zuñi to Cuzco at the epoch of the Discovery, and, whilst they are not the highest, they are no unfit representatives of the entire class.

The Central Americans were, in their architecture, in advance of the remaining aborigines of North America. Next to them, probably, were the Aztecs and some few nations southward; and holding the third position, though not far behind, were the New Mexicans. All alike they depended upon horticulture for subsistence and cultivated by irrigation. Their houses, with those previously described, represent together an original, indigenous architecture, which, with its diversities, sprang out of their necessities. Its fundamental communal type, we repeat, is found not less plainly in the comparted long house of the Iroquois than in the so-called palace at Palenque. An examination of the plan of the structures in New Mexico and Central America will tend to establish this proposition.

New Mexico is a poor country for civilized man, but quite well adapted to Village Indians. It possesses a number of narrow fertile valleys, which were occupied in 1540 by thirty or forty pueblo villages, containing possibly 50,000 or 60,000 Indians, and it is occupied now by their descendants in manner and form as it was then. Each pueblo consisted then, as now, either of a single great house or of three or four such houses grouped together; and, what is more significant, the New Mexican pueblo is a fair type of those found in ruins in Central America in general plan, in the mode of life it indicates, and in situation. All the people lived together in these great houses on terms of equality and also for security. Common tenements for common Indians around these structures were not found there by Coronado in 1541; neither have any been found there since. There is not the slightest ground for supposing that any such tenements ever existed around the ruined structures in Central America. This suggestion should be kept in mind.

This pueblo or village is composed of three or four

Fig. 11. Pueblo of Santo Domingo.

structures of adobe brick grouped together, one of which is shown in the engraving. It is about 200 feet long, with two parallel rows of apartments on the ground, of which the front row is carried up one story and the back two, the flat roof of the first story forming a terrace in front of the second. The first story is closed up solid for defensive reasons, with the exception of small window-openings. The first terrace is reached by means of ladders from the ground; the rooms in the first story are entered through trap-doors in the terrace, and in the second through doors opening upon the terrace. This structure is typical of all the aboriginal houses in New Mexico. It shows two principal features: first, the terraced form of architecture, with the housetops as the ordinary gathering-places of the inmates; and second, a closed ground-story for safety. Every house, therefore, is a fortress. Lieut. Abert, from whose report the engraving is taken, remarks that "the upper story is narrower than the one below, so that there is a platform or landing along the whole length of the building. To enter, you ascend to this platform by means of ladders that could be easily removed; and, as there is a parapet wall extending along the platform, these houses could be converted into formidable forts." (*Ex. Doc.* No. 41, 1st Sess. 30th Congress, 1848, p. 462.) The number of apartments is not stated, but, judging from the window-openings, there may be thirty-eight on the first floor, of which half are dark, and nineteen in the second story. The different houses at that time were inhabited by 800 Indians. Chimneys now appear rising above the roof, the fire-place being at the angle of the chamber in front.

The defensive element, so prominent in this architecture, was not so much to protect the Village Indians from each other as from the attacks of the migrating bands flowing down upon them from the Valley of the Columbia. The pueblos now in ruins throughout the original area of New Mexico testify to the perpetual struggle of the former to maintain their ground, as well as prove the general insecurity in which they lived. It could be shown that the second and additional stories were suggested by the defensive principle.

Zuñi is the largest occupied pueblo in New Mexico at the present time. It once contained 5000 or 6000 inhabitants, but in 1851 they were reduced to 1500. The village consists of several structures, most of them accessible to each other from their terraced roofs. They are constructed of adobe brick, and of stone embedded in mud mortar, and plastered over. In the engraving, which is copied from Sitgreaves' report, a section of one of the principal structures is given, the left end being cut off by another building in front of it, and the right showing a series of angles. It shows three stories in the terraced form, with two square buildings standing apart on the summit, and forming a fourth, giving it the appearance somewhat of a temple, and perhaps suggesting an explanation of the application of this term by the Spanish invaders to so many of the buildings seen in and around the pueblos of Mexico.

The living-rooms, as shown by engravings in the same report, are about ten by fifteen feet, and ten feet high, with plastered walls, a hard earthen floor, and usually a single window-opening. To form a durable ceiling, round timbers about six inches in diameter are placed three or four feet apart from the outer to the inner wall. Upon these small poles are placed transversely in juxtaposition, over which is a deep covering of mud mortar, which forms the terrace roof in front and the floor of the rooms within. Water-jars of fine workmanship, and of capacity for several gallons, closely-woven osier baskets, blankets of cotton and wool woven by their own hand-looms are among the objects

seen in these apartments. They are neatly kept, roomy and comfortable, and differ in no respect from those in use at the period of the Conquest.

It should be noticed that this architecture, and the necessities that gave it birth, led to a change in the mode of life from the open ground to the terraces or flat roofs of these communal houses. When not engaged in tillage, and during the morning and evening hours, the terraces were the gathering and living places of the people. They lived, practically, in the open air, to which the climate was adapted, and upon their house-tops, first for safety, and afterwards from habit.

FIG. 12. Section of Pueblo House at Zuñi.

Elevations of the principal New Mexican pueblos have been published. They agree in general plan, but show considerable diversity in details. Rude but massive structures, they accommodated all the people of the village within their walls. Since most of them are of adobe brick, or of rubble stone embedded in mud mortar, our remaining illustrations will be taken from the pueblos in ruins in the valley of the Rio Chaco, which are constructed entirely of stone, are unquestionably as old as the epoch of the conquest of Mexico, and superior architecturally to those now occupied, showing that a decadence in the art commenced with European intrusion.

About 110 miles N. W. from Santo Domingo on the Rio Grande, there are seven great edifices, now in ruins, situated within an extent of ten miles in the valley of the Rio Chaco, an affluent of the Colorado. They were visited and described in 1849 by Lieutenant (now General) Simpson, with ground-plans and measurements. (*Report of James H. Simpson of an Expedition in the Navajo Country in* 1849, Ex. Doc. No. 64, 1st Sess. 31st Cong., pp. 55–139.) In an architectural point of view they are the most interesting and remarkable structures in New Mexico. The ground-plans, elevations, and the detailed particulars are taken from this report. They are probably the remains of the Seven Cities of Cibola, against which the expedition of Coronado was directed in 1540–42.

These great edifices were all constructed of the same materials, and upon the same general plan, but they differ in size upon the ground, in the number of rows of apartments, and consequently in the number of stories. They contained from 100 to 600 apartments each, and would severally accommodate from 1000 to 3000 or 4000 persons. Some of them are also the largest structures in ground dimensions and in the extent of their accommodations ever found in any part of North America. It may be remarked here that it is doubtful whether any single pueblo in New Mexico at its most prosperous period contained more than 5000 or 6000 inhabitants, and in such a case it would be made up of more than one of these structures, grouped together, as at Zuñi. This would probably hold true with the great majority of the ancient pueblos in Mexico and in Central America.

Ground-plans are furnished of five of the seven edifices. They all, save one, agree in being constructed on three sides of an open court, the fourth being protected by a low stone wall. The outer faces of the walls are constructed of thin pieces of tabular sandstone, prepared by fracture, and laid in courses without mortar, the inner faces being composed of rubble masonry with mud mortar. The walls are about three feet thick. There were no doors or openings to enter the buildings from the ground, but in the stories above the first are window-openings through the walls. General Simpson remarks that they are "built of tabular pieces of hard, fine-grained, compact, gray sandstone, to which the atmosphere has imparted a reddish tinge;" that "in the outer faces of the building there are no signs of mortar, the intervals between the beds being chinked with stones of minutest thinness;" and that the "filling and backing are done in rubble masonry, the mortar presenting no indications of the presence of lime." "So beautifully diminutive are the details of the structure as to cause it, at a little distance, to have all the appearance of a magnificent piece of mosaic work." (*Report*, p. 76.) The layers are not usually thicker than three inches, and sometimes as thin as one-fourth of an inch. Their ancient names are of course unknown. General Simpson adopted those given to him by his Spanish guide.

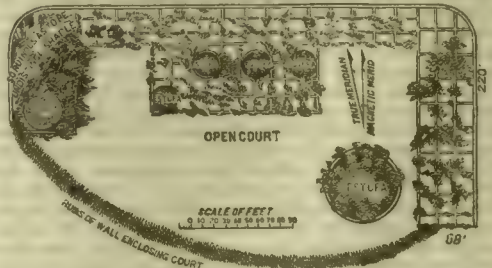

FIG. 13. Ground-Plan of Pueblo of Chettro Kettle.

The general plan of all the edifices on the Chaco will be made intelligible by the annexed ground-plan. The main building and the wings face the court, from which alone they are entered, and from which the several stories recede outward. Including the court, this great house has an exterior development of 1300 feet. The exterior wall of the main building measures 454 feet in length, and the longest of the wings 220 feet. At the centre, where four additional rows of apartments have been added on the inside, the structure is 110 feet deep, and for the remainder 44 feet. One of the wings is 50 and the other 58 feet deep, showing three rows of apartments in each, and consequently they were three stories high; the first row on the court side being carried up one story, the second two, and the third

three, in the usual terrace form as before shown. If carried up in the same manner at the centre, it would be seven stories high on the back row.

From the measurement some impression may be formed of the extent of the accommodations such an edifice would afford, especially in Indian life, where more than one pair with their children are usually found in one lodge, and, it may be supposed here, in one apartment. The plan shows 124 rooms on the ground-floor, exclusive of the left wing, which was too ruinous to identify the number. Excluding one row of apartments for the terrace in front of the second story, and counting one row less for each successive story, there would be an aggregate in this single house of some 300 apartments, capable of accommodating 1500 or 2000 Indians.

The circular estufas, of which there are six, and five of which are incorporated in the body of the structure, were their council-houses. They were sunk below the surface, and carried up, in some cases, two and three stories. Similar estufas are still in use in New Mexican pueblos as places for holding councils. The number indicates a sub-organization analogous to the gens. It may be supposed, therefore, that each estufa was the council-house of a gens, or, if the gentes were numerous, then of a phratry composed of two or more gentes derived by subdivision from an original gens.

In the N. W. corner, Gen. Simpson remarks, "we found a room in an almost perfect state of preservation. This room is fourteen by seven and a half feet in plan, and ten feet in elevation. It has an outside doorway three and a half feet high by two and a quarter wide; and one at the W. end leading into an adjoining room. . . . The stone walls still have their plaster upon them in a tolerable state of preservation. . . . The ceiling showed two main beams, laid transversely; on these, longitudinally, were a number of smaller ones in juxtaposition, the ends being tied together by a species of wooden fibre, and the interstices chinked in with small stones; on these, again transversely, in close contact, was a kind of lathing of the odor and appearance of cedar, all in a good state of preservation. Depending from the ceiling were several pieces of short rope." (*Report*, p. 79.) This ceiling agrees in form with that at Zuñi, previously described. Elsewhere he says that these floor-beams are six inches in diameter, and were hacked off by means of some imperfect instrument, there being no evidence of the use of the metallic axe.

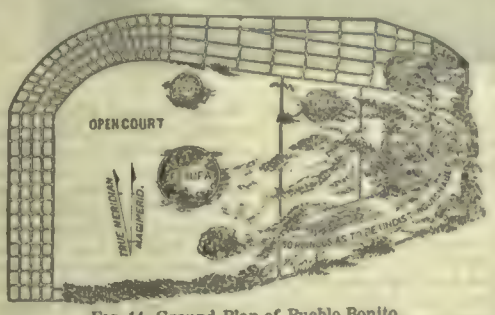

FIG. 14. Ground-Plan of Pueblo Bonito.

This edifice is the most interesting, in some respects, of the seven, as well as the best preserved in certain portions. In exterior development, including the court, it is 1300 feet. Its corners are rounded, and the E. wing, now the most ruinous part of the structure, appears to have had row upon row of apartments added until nearly one-third of the area of the court was covered. "Its present elevation," Simpson observes, "shows that it has had at least four stories of apartments. The number of rooms on the ground-floor is 139. In this enumeration, however, are not included the apartments which are not distinguishable in the E. portion of the pueblo, and which would swell the number to about 200. There, then, having been at least four stories of rooms, . . . there must be a reduction . . . of one range of rooms for every story after the first," which would increase "the number to 641." (*Ib.*, p. 81.) No single edifice of equal accommodations, it may here be repeated, has ever been found in any other part of North America. It would house 3000 Indians.

This room will compare, not unfavorably, with any of equal size to be found at Palenque or Uxmal, although, from the want of a vaulted ceiling, not equal in artistic design. The nice mechanical adjustment of the masonry and the finish of the ceiling are highly creditable to the taste and skill of the builders. "It is walled up," says Simpson, "with alternate beds of large and small stones, the regularity of the combination producing a very pleasing effect. The ceiling of this room is also more tasteful than any we have seen, the transverse beams being smaller and more numerous, and the longitudinal pieces which rest

FIG. 15. Room in Same.

upon them only about an inch in diameter, and beautifully regular. These latter have somewhat the appearance of barked willow. The room has a doorway at each end, and one at the side, each of them leading into adjacent apartments. The light is let in by a window two feet by eight inches, on the N. side." (*Ib.*, p. 81.)

The largest of the seven pueblos is Peñasca Blanca, which has an exterior development of 1700 feet. "This," he further remarks, "differs from the others in the arrangement of the stones comprising its walls. The walls of the other pueblos are of one uniform character in the several beds composing them, but in this there is a regular alternation of large and small stones, the effect of which is both unique and beautiful. The largest stones, which are about a foot in length and half a foot in thickness,* form but a single bed, and then, alternating with these, are three or four beds of small stones, each about an inch in thickness. The ground-plan of the structure also differs from the others in approaching the form of a circle." (*Ib.*, p. 82.)

One of these remaining, Una Vida, seems to have been in process of construction, and designed, when completed, to have been the largest of the seven. The main building is 300 feet in length along the exterior wall, and 95 feet deep, showing four rows of apartments; and the wing is 290 feet long and but 16 feet deep, showing but a single row. It appears, however, from a projection near one end of the width of two apartments, that two more rows were to be constructed outside of the existing row, which were necessary to complete the wing according to its original design. Moreover, it seems to prove that these great houses were of slow construction by the process of addition from year to year with the increase of the people in numbers, and that the enlargement is by adding row to row and story to story until the edifice is several rooms deep and several stories high. Upon this theory of construction, the first row of the main building on the court side would first be completed one story high, and covered with a flat roof; after which, by adding one parallel wall, with partition walls at intervals, as many more apartments would be obtained; and by a third and fourth parallel wall, with partitions, as many more. The second row was carried up two stories, the third three, and the fourth four; the successive stories receding from the court side in the form of great steps or terraces, one rising above the other. The wings would be commenced and completed in the same manner. Further than this, it seems to be evident, from the present condition of this structure, that the main building was to be extended at least 200 feet, with a second wing like the first, to fill out the original design and produce a symmetrical edifice. If these inferences are warranted, the interesting fact is reached that these Indian architects commenced their great houses upon a definite plan, which was to be realized after years, and perhaps generations, had passed away.

The highest portion of the walls still standing are stated at fifteen feet in height at Una Vida, twenty-five feet in Wegegi, and thirty feet in Hungo Pavie. The rooms back of the front row in the first story, and the middle rooms in the second, were dark, except as they were dimly lighted from contiguous apartments.

---

* Norman, speaking of the size of the stones used in the edifices in Yucatan, says: "The stones are usually each of about twelve inches in length and six in breadth."—*Rambles in Yucatan*, p. 127.

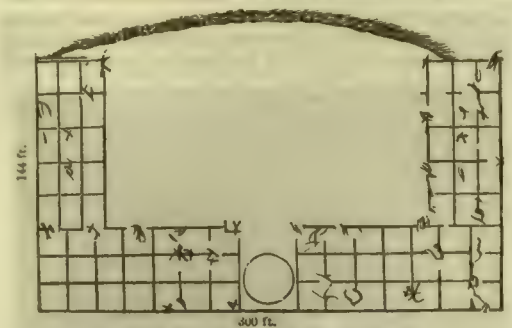

FIG. 16. Ground-Plan of Hungo Pavie.

This pueblo has been reserved to the last for the purpose of giving both a ground-plan and a front elevation. In exterior development, including the court, it is 872 feet, of which the back wall measures 300 and the side walls 144 feet each. It is of medium size, but symmetrical, and larger than any single structure in Central America in ground dimensions. There are seventy-two apartments in the first story, some of which are unusually large, being about thirteen by eighteen feet; and, with forty-eight in the second and twenty-four in the third, contained an aggregate of 146 apartments. It would accommodate from 1200 to 1500 Indians.

To complete the representation of the architectural design of these "great houses of stone" the annexed elevation is given. It is a restoration of the pueblo of Hungo Pavie, made by Mr. Kern, who accompanied Gen. Simpson as draughtsman, and copied from his engraving. We may recognize in this edifice, as it seems to the writer, a very satisfactory reproduction of the so-called palaces of Montezuma, which, like this, were constructed on three sides of a court which opened on a street or causeway, and in the terraced form. From the light which this architecture throws on that of the Aztecs, it appears extremely probable that these famous palaces, considered as exclusive residences of an Indian potentate, are purely fictitious, and that, on the contrary, they were neither more nor less than great communal houses of the aboriginal American model, and with common Indians crowding all their apartments. From what is known of the necessary constitution of society among the Village Indians, it scarcely admits

FIG. 17. Elevation of Hungo Pavie.

of a doubt that the great house in which he lived was occupied on equal terms by a hundred other families in common with his own, all the individuals of which were joint proprietors of the establishment which their own hands had raised.

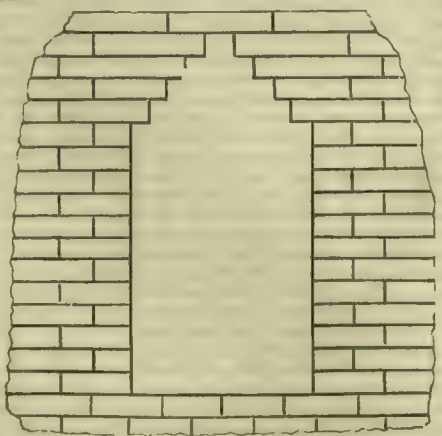

FIG. 18. Triangular Arch.

One of the remarkable features of the architecture of Central America is the triangular arch, which has been regarded as evidence of mechanical advancement. The same arch, of which the above is a representation, was found by Gen. Simpson in the structures on the Chaco, used as a doorway. It is copied from his report. In the edifices at Uxmal, Palenque, and elsewhere the rooms are vaulted with this arch, the angles being bevelled to a uniform surface. The principle of construction is the same in both.

After the capture of the "Seven Cities of Cibola," Coronado made a report to Mendozo, viceroy of Mexico, in which he expresses his disappointment in the following language: "And to be brief, I can assure your honor he [Friar Marcos de Niza] said the truth in nothing that he reported, but all was quite contrary, saving only the names of the cities and great houses of stone; for although they be not wrought with turqueses, nor with lime, nor bricks, yet they are very excellent good houses, of three or four or five lofts high, wherein are good lodgings and fair chambers, with ladders instead of stairs, and certain cellars [estufas] under ground, very good and paved. . . . The seven cities are seven small towns, all made with these kind of houses that I speak of; and they all stand within four leagues together, and they are all called the kingdom of Cibola, and every one of these have their particular name. . . . The people of this town seem unto me of a reasonable stature, and witty, yet they seem not to be such as they should be, of that judgment and wit, to build these houses in such sort as they are." Coronado further states that on the fourth day after the capture "they set in order all their goods and substance, their women and children, and fled to the hills, leaving their town as it were abandoned, wherein remained very few of them." (Hakluyt, *Coll. of Voyages*, London ed., 1600, iii., p. 377.)

No evidence has been adduced of the practice of communism by the present Pueblo Indians of New Mexico.* Information upon this and other questions concerning their organization and mode of life has not been sought by those who have visited this isolated country. The Moqui and Laguna Indians are organized in gentes, which raises a presumption of its universality among the Village Indians. Their arts, weapons, usages, implements and utensils,

* Since writing this article, Mr. David J. Miller of Santa Fé, N. M., has informed me by letter that the Pueblo Indians still hold their lands in common, with a possessory right in each to cultivated lands so long as the individual chooses to occupy it, but that he had not observed any evidence of the practice of communism in living among them.

dances, and general characteristics, so far as they are known, are either precisely the same as those of the partially Village Indians of the North, or more advanced forms of the same original conceptions. The practice of communism must be deduced, for the present, from the structure of the houses themselves. Both in New Mexico and Central America they are strikingly adapted to communistic life. So much is this the case that their peculiar internal arrangement cannot be explained on any other hypothesis. In all the houses in Central America the rooms are usually in pairs, which have no connection with the remainder of the building. In some cases four, and in one six, apartments are found connected with each other by doorways. They are thus divided into sections adapted to groups, which are separated from each other by solid walls. The presumption arises that the houses in New Mexico are similarly constructed, although the fact has not been as yet ascertained.* The published engravings, however, show less than one-fourth as many chimneys as the inhabited houses contain apartments.

IV. *Communal Houses of the Aztecs.*—The writers on the conquest of Mexico have alike failed to describe the Aztec house or the mode of life within it. All that can safely be said is, that the houses were large; that they were constructed of adobe brick and of stone embedded in mud mortar, in both cases plastered over with gypsum, which made them a brilliant white; and that some were constructed of a red porous stone. For working this stone, according to Clavigero, flint implements were used. (*Hist. Conq. Mex.*, Cullen's trans., 1817, ii., 238.) Some of these edifices were constructed on three sides of an open court, like those on the Chaco, but the court opening upon a street or causeway. In most cases they appear to have been two or more stories high, and built in the terraced form. All the roofs were flat. The situation of the pueblo of Mexico, partly on solid ground and partly in the waters of a shallow artificial pond, led to some diversities in its architecture; but the essential type of the latter was the same as that of New Mexico wherever its features distinctly appear. We are able to give one illustration in point. Cortez made his first entry into the pueblo, according to the statement of Bernal Diaz, with 450 Spaniards, accompanied by 1000 Tlascalan allies. (*Conq. of Mexico*, Keating's trans., London ed., 1803, i., 181 and 189.) They were lodged, Diaz naïvely tells us, in a vacant palace of the late father of Montezuma, remarking that "the whole of this palace was very light, airy, clean, and pleasant, the entry being through a great court." (*Ib.*, i., 191.) Suffice it to say, that one of the great houses of the Aztecs was sufficiently large to accommodate Cortez and his total number of 1450 men. One of the great houses then standing on the Rio Chaco would have accommodated twice that number.

It will be noticed that this Mexican house was entered from the court into the first story, in which respect it differed from the present and ancient houses in New Mexico. The reason is obvious. The pueblo could only be entered along its three causeways, which indicate the true places for its defence. The causeways had sluices through them, traversed by bridges that could be taken up.

It is quite plain, we think, that the house occupied by Cortez was constructed on three sides of a court, which opened on a causeway or street, the type of which is still found in New Mexico. When we are gravely told that Cortez and his followers are invited by Montezuma to occupy a vacant palace of his late royal father, we are much impressed with the surroundings of the Indian potentate thus introduced. But a glance at the contemporary edifices on the Chaco tends to unravel the marvel, and to show how it was that Cortez and his men could find ample accommodations in a single house constructed on the aboriginal American model: and when it is found to be wholly unnecessary to call it a *royal palace* in order to account for its size, an ungracious suspicion at once arises in the mind that one of the great communal houses of the Aztecs was emptied of its inhabitants to make room for the unwelcome intruders.

V. *Communal Houses in Central America.*—At the epoch of its discovery Central America was probably more thickly peopled than any other portion of North America of equal area, and its inhabitants more advanced than the remaining aborigines. Their pueblos were planted along the rivers and streams, often quite near each other, and presented the same picture of occupation and of village life found about the same time on the Rio Chaco and upon the Rio Grande and its tributaries. They consisted of a single great house, or of a cluster of houses forming one pueblo. In some cases four or more structures are grouped together upon the same elevated platform. But there is no reason for supposing, from any ruins yet found or from what is known of the people at the time, that any one pueblo contained, at most, more than 10,000 inhabitants. No one nation had risen to supremacy within this area by the consolidation of surrounding nations. They were, on the contrary, found in that state of subdivision and independence which invariably accompanies the gentile organization. Confederacies in all probability existed among such contiguous pueblos as spoke the same dialect or closely related dialects, as the Cibolans were probably confederated, as the Aztecs, the Tlascalan, and Michuacan tribes are known severally to have been. Such confederacies never reached beyond the language of the people confederated. Even the Aztec confederacy was surrounded on all sides except the S. by independent and hostile nations, living within 100 miles of the border of the Valley of Mexico; as witness the Tlascalans on the E., the Michuacans on the W., the Otomies on the N. W., and the Mextitlans and Huextecas on the N. E.

The tropical region of Central America, then as now, was undoubtedly covered with forest, except the limited clearings around the pueblos, and substantially uninhabited. Field agriculture was of course unknown, but the Indians cultivated corn, beans, squashes, pepper, cotton, and tobacco in garden-beds, which tended to localize them in villages. Herrera remarks of the Village Indians of Honduras that "they sow thrice a year, and they were wont to grub up great woods with hatchets made of flint." (*Hist. of America*, London ed., 1725, Stern's trans., iv., 133.) Without metallic implements to subdue the forest, or even with copper axes such as were found among the Aztecs, a very small portion of the country only would be brought under cultivation, and that would be confined mainly to the margins of the streams.

Las Casas, bishop of Chiapa, who was in Central America about 1539, after remarking of the people of Yucatan that they were "better civilized in morals and in what belongs to the good order of societies than the rest of the Indians," proceeds as follows: "The pretence of subjecting the Indians to the government of Spain is only made to carry on the design of subjecting them to the dominion of private men, who make them all their slaves." (*An Account of the First Voyages, etc. in America*, London ed., 1699, trans., p. 52.) And again he quotes from the letter of the bishop of St. Martha to the king, as follows: "To redress the grievances of this province, it ought to be delivered from the tyranny of those who ravage it, and committed to the care of persons of integrity, who will treat the inhabitants with more kindness and humanity; for if it be left to the mercy of the governors, who commit all sorts of outrages with impunity, the province will be destroyed in a very short time." (*Ib.*, p. 61.)

Two material questions which have been raised remain to be considered: First, whether the houses now in ruins in Central America were occupied at the time of the Spanish conquest; and second, whether the present Indians of the country are the descendants of the people who constructed them. There is no basis whatever for the negative of either proposition; but it is assumed by those who regard the palace at Palenque and the Governor's House at Uxmal as the ancient residences of Indian potentates, that great cities which once surrounded them have perished, and further, that these ruins have an antiquity reaching far back of the Spanish conquest.

Mr. Stephens commits himself to the conclusion "that at the time of the Conquest, and afterwards, the Indians were actually living in and occupied these very cities." (*Incidents of Travel in Yucatan*, ii., 348, and to the same effect, ii., 375.) He also regarded the present Indians of the country as the descendants of those in possession at the period of the Conquest. (*Ib.*, ii., 299.) He might have added that as the Maya was the language of the aborigines of Yucatan at the epoch of the Discovery, and is now the language of the greater part of the natives who have not lost their original speech, there was no ground for either supposition. Herrera remarks of the inhabitants of Yucatan that the "people were then found living together very politely in towns, kept very clean; . . . and the reason of their living so close together was because of the wars which exposed them to the danger of being taken, sold, and sacrificed; but the wars of the Spaniards made them disperse." (*Ib., loc. cit.*, iv., 168.) Mr. Stephens, whose works and whose observations are in the main so valuable, is responsible to no small extent for the delusive inferences which have been drawn from the architecture of Central America. If he had repressed his imagination, and confined himself to what he found—namely, certain Indian pueblo villages built of dressed stone and in good architecture, which are sufficiently remarkable just as they are—and had omitted altogether such words as "palaces" and "great cities," his readers would have escaped the deceptive conclusions with respect to the actual condition of society which his mode of treatment and his terminology were certain to suggest.

* Mr. Miller also informs me that the rooms generally are not connected with each other in the New Mexican pueblo house.

It is sufficiently ascertained that within a few years after the conquest of Mexico, Central America was overrun by military adventurers, whose rapacity and violence drove the harmless and timid Village Indians from their pueblos into the forests, thus destroying in a few years a higher culture than the Spaniards, then or since, substituted in its place. Nothing can be plainer, we think, than this additional fact: that all there ever was of Palenque, Uxmal, Copan, and other Indian pueblos in Central America, building for building and stone for stone, is now there in ruins.

One of the most extensive groups of ruins in Central America is that at Uxmal. The several structures are known as "The Governor's House;" the "House of the Nuns," which consists of four disconnected buildings, facing the four sides of a court; the "House of the Pigeons;" the "House of the Dwarf;" and the "House of the Old Woman"—in all eight, with some traces of smaller buildings of inconsiderable size. The dimensions of the largest will be given for comparison with those in New Mexico. They are situated in a cluster quite near each other, and evidently formed one Indian pueblo. They are constructed of stone laid in courses and dressed to a uniform surface, with the upper half of the exterior walls decorated with grotesque ornaments cut on the faces of the stones. Foster states that "these structures are composed of a soft coralline limestone of comparatively recent geological formation, probably of the tertiary period." (*Pre-historic Races of the United States*, p. 398.) Norman had previously described the material used as a "fine concrete limestone." (*Rambles, etc.*, p. 126.) Elsewhere, with respect to the nature of the tools for cutting this stone, he remarks that "flint was undoubtedly used." (*Ib.*, 184.) According to the same author, "the stones are cut in *parallelopipeds* of about twelve inches in length and six in breadth, the interstices filled up with the same materials of which the terraces are composed." (*Ib.*, 127.) This statement denies the use of mortar made of lime and sand. Stephens is equally explicit in stating that the mortar was of lime and sand; and he is perhaps the better authority, having taken the masonry apart. A soft coralline limestone could be easily worked when first taken from the quarry, and would harden after exposure to the air. The size and nature of the stones used is some evidence of limited advancement in solid stone architecture.*

These structures, as reproduced by Stephens and Catherwood, may well excite surprise and admiration for the taste, skill, and industry they display. When rightly understood they will enable us to estimate the material progress they had made, which was truly remarkable for a people still in barbarism, but well advanced in the middle period.

FIG. 19. Pyramidal Platforms.

We have seen that the style of architecture in New Mexico brought the Indians to the housetops as the common place of living, to which the flat roofs were adapted. At first suggested for security, it became in time a settled habit of life. The same want was met in Central America by a new expedient—namely, a pyramidal platform or elevation of earth, twenty, thirty, and forty feet high, and for small buildings still higher, upon the level summits of which their great houses were erected. Selecting, when practicable, a natural elevation, the top was levelled or raised by artificial means, the sides made rectangular and sloping, and faced with a dry stone wall; the ascent being made by a flight of stone steps. It was not uncommon to form two such platforms, and sometimes three, one above the other, as shown in the figure.

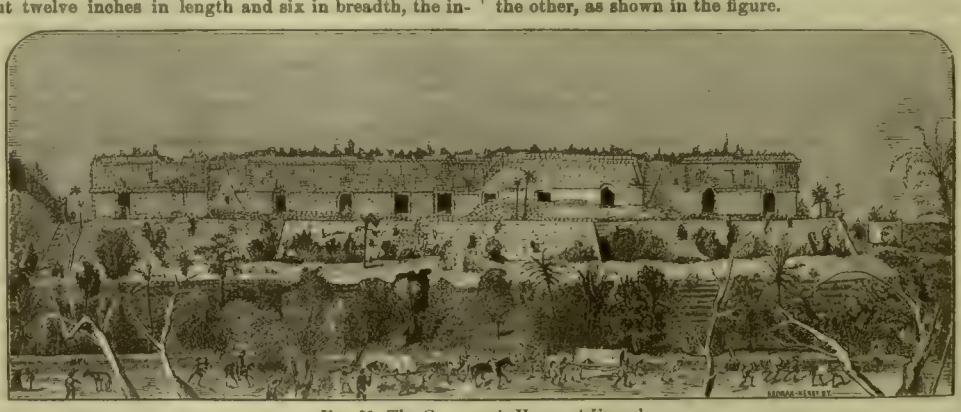

FIG. 20. The Governor's House at Uxmal.

These edifices are almost invariably but one story high, and but two rooms deep, the walls being carried up vertically to an equal height on all sides, and terminating in a flat roof. The doorways opened upon a platform-area, usually called the terrace, and the place was defended on the line or edge of the terrace-walls. Neither adobe brick nor rubble masonry nor timber roofs could withstand this tropical climate with its pouring rains during a portion of the year. Stone and a vaulted ceiling were indispensable to a permanent structure. Thus elevated, they enjoyed the same security as the Village Indians of New Mexico on their roof-tops and within their walls. They were also above the flight of the mosquitoes and other flies, the scourge of this tropical region. Considering the surrounding conditions, single-storied houses upon raised platforms was a natural suggestion, and harmonizes with this communal type of architecture as fully as the forms found in New Mexico.

For the details of this architecture reference must be made to published works which are easily accessible. The front elevation of the Governor's House, taken from Stephens's work, will answer as a sample of the whole. It stands upon the upper of three platforms, of which the lowest is 575 feet long, 15 feet broad to the base of the middle platform, and 3 feet high; the second, 545 feet long, 250 feet broad, and 20 feet high; and the third is 360 feet long, 30 feet broad, and 19 feet high. The upper platform is formed upon the back half of the middle one; of which last Stephens observes that "this great terrace was not entirely artificial. The substratum was a natural rock, and showed that advantage had been taken of a natural elevation so far as it went, and by this means some portion of the immense labor of constructing the terrace had been saved." (*Incidents of Travel, etc.*, i. 128.)

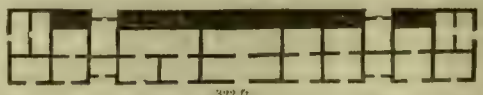

FIG. 21. Ground-Plan of Governor's House.

The house is symmetrical in structure—322 feet long, 39 feet deep, and about 30 feet high. It has eleven doorways, besides two small openings in front, and contains twenty-four apartments, two of which are each sixty feet long. The rear wall is solid, and in the central part nine feet thick. A parallel wall through the centre divides the interior into two rows of apartments, of which those in front are eleven feet six inches deep, and those back of them thirteen feet deep. Both inside and out the walls are of dressed stone, laid in courses.

This view of the interior of a room in the House of the Nuns shows the form of the triangular ceiling common to

* The so-called *idols* at Copan are the largest stones worked by the Central Americans. They are about eleven feet high, by three feet wide and deep, each face being covered by sculptures and hieroglyphics. In a field near the ruins, and near each other, are nine of these elaborately ornamented statues. By the side of each is a so-called *altar*, about six feet square and four feet high, made of separate stones. They have been supposed to have some relation to their religious system, with human sacrifices in the background. From their position and character it may be conjectured that these idols are the grave-posts and the altars the graves of Copan chiefs. The type of both may still be seen in Nebraska in the grave-posts and grave-mounds by their side of Iowas and Otoes, and formerly in all parts of the country E. of the Mississippi. If Mr. Stephens had opened one of these altars, and this conjecture proved true, he would have found within or under it an Indian grave, and perhaps a skeleton, with the personal articles usually entombed beside the dead.

all the edifices at Uxmal, Palenque, and in Central America generally. It is a triangular arch without a key-stone, with

FIG. 22. Section of Interior of Room.

the edges of the stones bevelled, and forming a perfect vault over each apartment, except a space a foot or more wide in the centre, which is carried up vertically about two feet and covered with a cap of stone. The mechanical principle is the same as in the New Mexican arch, but here applied on a more extended and more difficult scale. It is the most remarkable feature in this architecture, mechanically considered. But when we come to know that this vaulted ceiling was constructed over a core of solid masonry within the chamber, afterwards removed—which was the fact—it will be seen that these Indian masons and architects were still feeling their way towards a scientific knowledge of the art of arts. A projecting cornice is seen above the doorway, which balances somewhat the interior inward projection of the ceiling; and, as it is carried up flush with the cornice, the down-weight of the superincumbent mass sustained the masonry. The front rooms are twenty-three feet high to the top of the arch, and the back rooms twenty-two. Over the front doorways were originally wooden lintels, upon the decay of which a portion of the masonry had fallen. Those over the doorways through the partition walls were found in place. The proof of the comparatively modern date of these structures is conclusive from these facts alone.

It will be noticed that there are six single apartments, which have no connection with the remainder of the building, and that the others are in pairs, a back room connecting with the one in front, and neither with any others. It seems to show very plainly, in the plan of the house itself, that it was designed to be occupied by distinct groups of families, each group a large household by itself. If the communal principle existed in fact among them, its expression in the interior arrangement of the house, and in this form, might have been expected. This striking and significant feature runs through all the structures in Central America of which ground plans have been obtained.

"The House of the Nuns," says Mr. Stephens, "is quadrangular, with a courtyard in the centre. It stands on the highest of three terraces. The lowest is three feet high and twenty feet wide: the second, twelve feet high and forty-five feet wide; and the third, four feet high and five feet wide, extending the whole length of the front of the building. The front [building] is 279 feet long, and above the cornice, from one end to the other, is ornamented with sculpture. In the centre is a gateway ten feet eight inches wide, spanned by the triangular arch, and leading to the courtyard. On each side of this gateway are four doorways, with wooden lintels, opening to apartments averaging twenty-four feet long, ten feet wide, seventeen feet high to the top of the arch, but having no connection with each other. The building that forms the right or eastern side of the quadrangle measures 264 feet long; that on the left

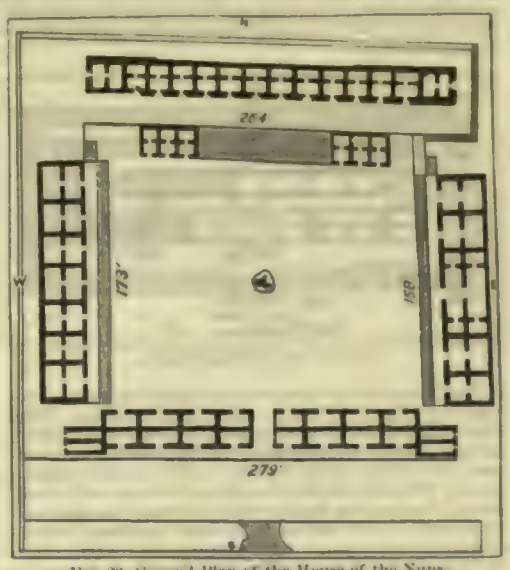

FIG. 23. Ground-Plan of the House of the Nuns.

is 173 feet long; and the range opposite, or at the end of the quadrangle, measures 264 feet. These three ranges have no doorways outside, but the exterior of each is a dead wall, and above the cornice all are ornamented with the same rich and elaborate sculptures." (*Ib.*, i., 299.)

The four buildings contain, in all, seventy-six apartments, which in size vary from ten to twelve feet wide and from twenty to thirty feet long. There are twenty single apartments and twenty-four pairs of apartments, half of which, as in the Governor's House, are dark, except as they are lighted by the doorways connecting with the rooms in front. In the structure on the right there are six rooms connecting with each other, which number is so unusual as to attract attention. Each of these great edifices would accommodate, after the fashion of Village Indians, from 600 to 1000 persons.

It should also be noticed that there is neither a fire-place nor a chimney in either of these houses; neither has one been found, so far as the writer is aware, in any ancient structure in Central America. Fires were not needed for warmth, but since they were for cooking, it shows that no cooking was done within these houses. A presumption at once arises that the inmates prepared their food in the open court or on the lower terraces by household groups, making a common stock of their provisions, and dividing from the earthen caldron. It may be presumed, also, that the Iroquois usage of but one daily meal prevailed among them. Fortunately, we are able to present some proofs bearing directly upon the question of the ancient practice of communism in these houses. It is found in the present usages of their descendants, which may reasonably be supposed to have been derived from their ancestors, although they may show a deteriorated form of those usages. At Nohcacab, a short distance E. of the ruins of Uxmal, there is a settlement of Mayn Indians, whose communism in living was accidentally discovered by Mr. Stephens when among them to employ laborers. It will be remembered that Yucatan was inhabited by Maya Indians at the epoch of the Conquest. He remarks as follows: "Their community consists of a hundred labradores or working men; their lands are held in common, and the products are shared by all. Their food is prepared at one hut, and every family sends for its portion; which explains a singular spectacle we had seen on our arrival—a procession of women and children, each carrying an earthen bowl containing a quantity of smoking hot broth, all coming down the same road, and dispersing among the different huts. . . . From our ignorance of the language, and the number of other and more pressing matters claiming our attention, we could not learn all the details of their internal economy, but it seemed to approximate that improved state of association which is sometimes heard of among us; and as this has existed for an unknown length of time, and can no longer be considered experimental, Owen and Fourier might perhaps take lessons from them with advantage. . . . I never before regretted so much my ignorance of the Maya language." (*Ib.*, ii., 14.) A hundred working men indicate a total of five hundred persons who were then depending for their daily food upon

a single fire, the provisions being supplied from common stores, and divided from the caldron. It is, not unlikely, a truthful picture of the mode of life in the House of the Nuns and in the Governor's House at the period of European discovery.

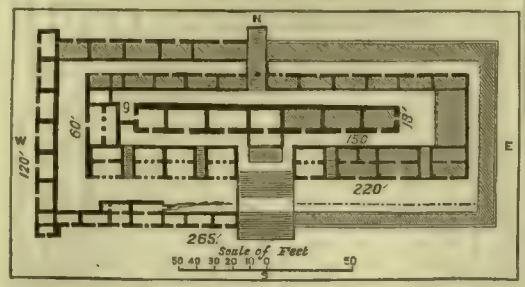

FIG. 24. Ground-Plan of Zayi.

Near Uxmal are the interesting ruins of Zayi, which present a new feature in Central American architecture. Upon a low eminence are three independent structures, one within and above the other, presenting the appearance, in the distance, of a single quadrangular edifice in three receding stories. But each stands on a separate terrace, and is built against the one immediately above it, except the inner one, which stands on the summit. The outer quadrangle stands upon the lowest terrace. The measurements of the several buildings are indicated on the plan. Together they contain eighty-seven apartments, assuming the part in ruins to have corresponded with the parts preserved. The rooms, as usual, are mostly single or in pairs. A staircase upon the front and rear sides interrupts the buildings on these sides from the lower terrace to the upper. The dots in the apertures indicate columns, which are found in this and several other structures.

Attention has been called to this pueblo—which would accommodate 2000 or more persons—for a special reason. It seems to furnish conclusive proof of the manner in which these great edifices were erected in order to make the peculiar triangular ceiling which is the striking characteristic of this architecture. The annexed cross-section of a single apartment shows the relations of the walls to the chamber and its ceiling. The chamber, with its ceiling, was constructed over a solid core of masonry, laid simultaneously with the walls, which was removed after the latter had become seasoned and settled. It tends to show that with small stones of the size used the triangular ceiling, as it projected towards the centre in rising, required the interior support of a core to ensure the possibility of construction by their methods. Once put together over such a core, and carried up several feet over the top of the arch, the down-weight of the superincumbent mass would articulate and hold the masonry together. It shows, further, that the essential feature of the arch is wanting in this contrivance.

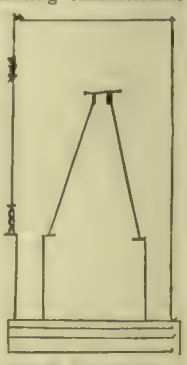

FIG. 25. Cross-Section through one Apartment.

The proof of this assertion is the actual presence of the unremoved core in one of these edifices in all of its apartments. Mr. Stephens found every room of the back building on the second terrace filled with masonry from bottom to top. He remarks that "the north side of the second range has a curious and unaccountable feature. It is called the *Casa Cerrada*, or 'closed house,' having ten doorways, all of which are blocked up on the inside with stone and mortar. . . . In front of several were piles of stones which they [his men] had worked out from the doorways, and under the lintels were holes through which we were able to crawl inside; and here we found ourselves in apartments finished with walls and ceilings like all the others, but filled up, except so far as they had been emptied by the Indians, with solid masses of mortar and stone. There were ten of these apartments in all, 220 feet long and 10 feet deep, which, thus being filled up, made the whole building a solid mass; and the strangest feature was, that the filling up of the apartments must have been simultaneous with the erection of the buildings, for, as the filling in rose above the tops of the doorways, the men who performed it never could have entered to their work through the doors. It must have been done as the walls were built, and the ceiling must have closed over a solid mass." (*Ib.*, ii., 22.)

It does not seem to have occurred to Mr. Stephens that the masonry within each room was a core, without which a vaulted chamber in this form could not have been constructed with their knowledge of the art of building. It shows the rudeness of their mechanical resources and the real condition of the art among them, but at the same time increases our estimate of their originality, ingenuity, and industry. They were working their way experimentally in architecture, as all other people have done; and they might well point with pride to these structures as extraordinary memorials of the progress they had made.

An important conclusion follows — namely, that this "closed house" was the last, in the order of time, erected, and had not been emptied of its core and brought into use when the Spanish irruption forced the people to abandon their pueblo. It would fix the period of its construction at or after 1520; thus settling the question of its modern date, and removing one of the delusions concerning the Central American ruins.

A brief reference to Palenque will conclude this article, already too long, but far from exhaustive of the facts. There are four or five pyramidal elevations at this pueblo, quite similar in form and relative situation to those at Uxmal. One is much the largest, and the structures upon it are called the "Palace." Several distinct buildings are here grouped upon one elevated terrace and are more or less connected. Altogether, they are 228 feet front and 180 deep, occupying not only the four sides of a quadrangle, but the greater part of what originally was, in all probability, an open court. Nearly all the edifices in Central America agree in one particular — namely, in being composed of three parallel walls with partition walls at intervals, giving two rows of apartments under one roof, usually, if not invariably, flat. Where several are grouped together on the same platform, as at Palenque, they are under independent roofs, and the spaces between, called courts, are simply open lanes or passage-ways between. The plan of the Palenque structures, like all the others in Central America, seems to show that they were designed to be occupied by groups of persons, consisting of a number of families, whose private boundaries were fixed by solid partition walls. They are exactly adapted to this mode of occupation; and this special adaptation, so plainly impressed upon all this architecture, leads irresistibly to the inference that they were occupied on the communal principle, and were consequently neither more nor less than communal houses, of a model which may be called, distinctively, that of the American aborigines. None of these edifices are as large as those on the Rio Chaco, and, besides, they have but a single story; but with the broad terraces which were their gathering-places, they would probably accommodate more persons, in equal spaces, than the former.

The structures upon each pyramidal elevation were also a fortress. It proves the insecurity in which they lived. An impression has been propagated that they were surrounded by dense populations living in temporary habitations, to which Stephens has given some countenance (*Central America, Chiapas, and Yucatan*, ii., 235), but the suggestion is preposterous. It does not even need refutation. It sprang from the assumed existence of a state of society far enough advanced to develop potentates and privileged classes, with power to enforce labor from the people for personal objects. There is no evidence whatever to support such an assumption. They were animated by the same spirit as the Cibolans in what related to personal independence. Rather than live in subjection to Spanish taskmasters, the very Indians who erected these houses with so much labor "set in order all their goods and substance, their women and children, and fled to the hills, leaving their towns as it were abandoned," preferring a return to a lower stage of barbarism rather than a loss of personal freedom.

American aboriginal history has been perverted, and even caricatured, in various ways, and among others by a false terminology, which of itself is able to vitiate the truth. When we have learned to substitute Indian confederacy for Indian empire, head-chief and chief for emperor, king, and prince, Indian villages for great cities, communal houses for palaces, together with a large number of similar substitutions of simple for deceptive as well as improper terms, the Indian of the past and present will be presented understandingly, and placed in his true position in the scale of human advancement. While the Aryan family has lost nearly all traces of its experiences anterior to the closing period of barbarism, the Indian family, in its different branches, offered to our investigation not only the state of savagery, but also that of both the first and of the middle period of barbarism. The facts of these several conditions, and particularly of the last, were more perfectly and strikingly exemplified among them than else-

where upon the entire earth. It was because of their undisturbed development upon a great continent. Further than this, their organizations were living and their works existent. Through a study of their progressive development a rational knowledge of the experience of our own ancestors while in the same condition might have been recovered. But the rare opportunity has been wasted; and worse, for we have romance where we might have had the truth.

Finally, the following conclusions may be stated as reasonable from the facts presented: First, that all there ever was of Uxmal, Palenque, Copan, and other Central American pueblos, building for building and stone for stone, is there now in ruins. Secondly, that the inhabitants were Village Indians, living in single great houses of the communal type, or in several such houses grouped together and forming one pueblo. Thirdly, that they were probably organized in gentes, and as a consequence were broken up into independent nations or tribes, with confederacies here and there for mutual protection. Fourthly, that from the plan and interior arrangement of these houses the practice of communism may be inferred, and that it entered into and determined their character. Fifthly, nothing herein stated is inconsistent with the supposition that some of the structures in the Central American pueblos may have been devoted to religious uses. And lastly, that a common type runs through all the architecture of the American aborigines—that of communism in living, which in turn tends to show their common origin.

When we attempt to understand the Palace at Palenque or the Governor's House at Uxmal as the residences of Indian potentates, they are wholly unintelligible; but as communal houses, embodying the social, the defensive, and the communal principles, we can understand how they could have been erected and so elaborately and laboriously finished. It is evident that they were the work of the people, constructed for their own protection and enjoyment. Enforced labor never created them. On the contrary, it is the charm of all these edifices that they were raised by the Indians for their own use with willing hands, and occupied by them on terms of entire equality. And it is highly creditable to the Indian mind that while in the middle period of barbarism they had developed the capacity to plan, and the industry to rear, structures of such architectural design and imposing magnitude. LEWIS H. MORGAN.

Ar'chon [Gr. ἄρχων, from ἄρχω, to "be first"], the title of the highest magistrates or rulers of Athens. On the death of Codrus, king of Athens (1068 B. C.), the title of king was abolished, and Medon, the son of Codrus, became the first archon, with limited power. The office was at first hereditary and held for life, but in 752 B. C. the term of office was limited to ten years, and in 714 it ceased to be hereditary and became open to all patricians. In 683 the number of archons was increased to nine, who were elected annually. One of the nine was called archon *eponymus* (ἐπώνυμος), because his name was used to designate the year; the second, who was styled *king* (βασιλεύς), had charge of religious affairs; the third was called *polemarch* (commander-in-chief), and originally had the command of the army. The other six, who were styled *thesmothetæ* (θεσμοθεται), "law-givers," conducted criminal trials, and had power to ratify treaties with foreign states. In the latter period of Athenian history all citizens were eligible to the office of archon. The word archon (translated *ruler*) occurs in the New Testament as the title of several Jews, among whom was Nicodemus (John iii. 1).

Archy'tas [Ἀρχύτας], a celebrated Greek philosopher, general, and mathematician, was born at Tarentum. He flourished about 400–350 B. C., was a Pythagorean in philosophy, and was an intimate friend of Plato, whose life he is said to have saved when the tyrant Dionysius was about to put him to death. As general of Tarentum, to which office he was elected seven times, he commanded with success in several campaigns. He was also employed in important civil affairs, for which he displayed excellent capacity. His virtue was as conspicuous as his ability. He is reputed the first that applied geometry to practical mechanics, and the first to solve the problem of the doubling of the cube. He was drowned on the coast of Apulia. Only fragments of his works are extant.

Arcis-sur-Aube, ar'se'sür-ōb, a town of France, in the department of Aube, and on the river Aube, 16 miles N. by E. of Troyes. It has manufactures of cotton hosiery. On the 20th of Mar., 1814, an indecisive battle was fought here between Napoleon and Prince Schwartzenberg, who commanded a portion of the allied army. Pop. in 1866, 2784.

Arco'la, a village of Northern Italy, on the Alpone, near its entrance into the Adige, 15 miles E. S. E. of Verona. Here Napoleon gained an important victory over the Austrian general Alvinzy. The French commenced the battle on the 14th of Nov., 1796, by an attempt to cross a bridge over the Alpone, but were repulsed. The action was renewed on the 16th, and ended on the 17th, when Alvinzy retreated. Pop. 2180.

Arcola, a post-village and township of Douglas co., Ill., on the Chicago division of the Illinois Central R. R., 158 miles from Chicago. It has three weekly newspapers. Pop. of township, 2332.

Ar'cos de la Fronte'ra, a town of Spain, in Andalusia, on the right bank of the Gaudalete, 30 miles N. E. of Cadiz. It is called Arcos, because it is built in the form of a "bow." Its site is a high rock, which commands an extensive and beautiful prospect. Here are celebrated manufactures of tanned leather. This town was once strongly fortified. In 1519, Magelhaens started from here for the first circumnavigation of the globe. Pop. 11,532.

Arcot, or **Aruca'ti,** a city of British India, in the presidency of Madras, is situated in the Carnatic, on the river Palaur, 71 miles by rail W. S. W. of Madras; lat. 12° 54′ N., lon. 79° 23′ E. It was ceded to the British in 1801, before which it had been the capital of the Carnatic. Here are the ruins of the nawab's palace. It is one of the centres of the Protestant missions in India. Pop. estimated at 45,000, mostly Mohammedans.

Arc'tic [Lat. *arc'ticus*; Gr. ἀρκτικός, "belonging to [the constellation of] the Bear" (ἄρκτος), which is near the North Pole], a term signifying "northern," or, rather, "far to the north," "near the North Pole."

ARCTIC CIRCLE, a circle drawn around the North Pole of the earth, 23° 28′ from the Pole and 66° 32′ from the equator. It forms the boundary between the north temperate and the north frigid zone. Within this circle the sun does not set at the summer solstice nor rise at the winter solstice.

ARCTIC CURRENT, so called because it is supposed to originate in the ice of the Arctic seas, whence it runs along the eastern shore of Greenland and round Cape Farewell to the western shore of Greenland, in N. lat. 66°, where it turns southward, forming the *Hudson's Bay Current*. Thence it passes near the Bank of Newfoundland, and, meeting the Gulf Stream, crosses it as an undercurrent, flowing into the Caribbean Sea. Another portion passes along the coast of North America, and reduces the temperature of the land. The Arctic Current, which is cold, replaces the warm water removed by the Gulf Stream.

Arctic Discovery. See POLAR RESEARCH, by C. P. DALY, LL.D.

Arc'tic O'cean, or **Sea,** the ocean which surrounds the North Pole, washes the northern shores of Europe, Asia, and America, and is nearly coextensive with the Arctic Circle. It communicates with the Pacific by Behring's Strait, and with the Atlantic by a wide passage between Greenland and Norway. The navigation of this ocean is obstructed by perpetual congelation, but it is supposed that a portion N. of 80° is an open polar sea. The Arctic Ocean encloses many large islands, and comprises large bays and gulfs, which deeply indent the adjacent continents, as Baffin's Bay, the White Sea, and the Gulf of Obi. The water of this ocean is extremely pure and clear, and the ice is remarkable for the beauty and variety of its tints. Those parts of this sea which have been explored are occupied by large fields of floating ice and icebergs in almost perpetual motion. Captain Ross measured an iceberg which rose 235 feet above the water in which it floated. There are masses that present a front of 200 feet in height, and fields from ten to forty feet thick sometimes extend over 100 miles. Icebergs often have a violent rotation, and are dashed against each other with a tremendous force. Fogs, storms, and almost endless night add to the dangers which beset the explorer. Among the navigators who have explored it in search of a north-west passage are Parry, Ross, Sir John Franklin, and Kane. Drs. Hayes and Hall, and various Scandinavian and Dutch navigators, are among the recent explorers. Parry in 1827 reached lat. 82° 45′ N., lon. 19° 25′ E., and found there floes of ice, with open water between. In 1854, Kane penetrated to lat. 81° 22′ in lon. 65° 35′ W. He argued that there is an open sea, not frozen, around the Pole, from the fact that "a gale from the N. E. of fifty-four hours' duration brought a heavy sea from that quarter, without disclosing any drift or other ice." There are valuable whale-fisheries in the Arctic Ocean.

Arctu'rus [from the Gr. ἄρκτος, a "bear," and οὐρά, a "tail"], a fixed star of the first magnitude in the constellation Bootes, so called because it is near the tail of the Great Bear. It is designated in catalogues as a Bootes.

Arcua'tion [from the Lat. *arcus*, a "bow"], a term formerly applied to a mode of propagating trees: the shoots of the trees, cut off near the ground, are bent over and

partly covered with earth, which causes them to take root. It is generally called *inarching*.

Arcueil, a village of France, 3 miles S. of Paris, on the railway from that capital to Sceaux, has a fine aqueduct constructed by Marie de Médicis; also the remains of a Roman aqueduct built by the emperor Julian. It is a place of resort on holidays for the Parisians. Pop. in 1866, 5024.

Arcy, Grotto of, an ancient limestone quarry in France, in the department of Yonne, remarkable for its size and the beauty and extent of its stalactites and incrustations, which have almost completely obliterated all traces of the labor of man.

Ardabil', or **Ardebil,** a town of Persia, in the province of Azerbijan, on the Kara-Soo, 90 miles E. by N. of Tabriz. It is visited by the trading caravans from Tiflis, Derbend, and Ispahan. Pop. estimated at about 10,000.

Ardèche, a river of France, rises among the mountains of Cevennes, flows south-eastward through the most magnificent and romantic scenery, and enters the Rhone 1 mile from Pont Saint Esprit, after a course of 45 miles. Near its mouth is a natural curiosity called the Bridge of Arc.

Ardèche, a mountainous department in the S. E. of France, is bounded on the N. by the department of Loire, on the E. by Drôme, on the S. by Gard, and on the W. by Lozère and Haute-Loire, and drained by the Ardèche. Area, 2134 square miles. The surface is diversified by extinct volcanic peaks, deep craters, ranges of basaltic columns, and romantic valleys, forming combinations of scenery which are highly magnificent and picturesque. The valleys near the Rhone produce good wine, olives, figs, almonds, and Spanish chestnuts, the annual crop of which latter is about 400,000 bushels. Mines of copper, iron, lead, antimony, and coal are worked in this department. It is subdivided into 3 arrondissements, 31 cantons, and 339 communes. Capital, Privas. Pop. in 1872, 380,277.

Ar'den (commonly written ARDENNES, which see), a forest in which Shakspeare places the scene of his play called "As You Like It." There was formerly a forest of this name on the western borders of Warwickshire, which is believed to have occupied a great part of the midland counties, and it is noteworthy as the maiden name of Shakspeare's mother.

Ar'den, a township of Berkeley co., W. Va. Pop. 1528.

Ardennes, or **Arden** (anc. *Arduen'na Syl'va*), a hilly and densely-wooded tract which includes a part of Belgium and of France, and is situated on both sides of the river Meuse. The forest of Ardennes in Cæsar's time was more extensive, and occupied nearly all the space between the Sambre, Moselle, and Rhine. The highest points of the Ardennes are about 2200 feet above the sea. The predominant rocks are clay-slate, grauwacke, and limestone. The channel of the Meuse presents rugged and precipitous rocks about 600 feet high. Many important military events have occurred among the Ardennes, at Rocroi, Sedan, Mézières, etc.

Ardennes, a department in the N. E. of France, bounded on the N. by Belgium, on the E. by the department of Meuse, on the S. by Marne, and on the W. by Aisne, was part of the old province of Champagne. Area, 2020 square miles. It is intersected by the Meuse, which flows northward, and by the Aisne, which flows westward. The surface is partly hilly, and covered with the forest of Ardennes. The valley of the Aisne is fertile and produces much grain. Among the mineral resources of this department are iron, lead, marble, and slate. The canal of Ardennes, connecting the Meuse and the Aisne, affords facilities for trade. Here are manufactures of glass, metallic wares, woollen cloths, shawls, firearms, earthenware, etc. It is subdivided into 5 arrondissements, 31 cantons, and 478 communes. Capital, Mézières. Pop. in 1872, 320,217.

Ar'doch, a small village of Scotland, in the county of Perth, 8 miles S. S. W. of Crieff. Here is an ancient Roman camp, the most entire now in Britain. The intrenched works form a rectangle 500 by 430 feet, the north and east sides of which are protected by five ditches and six ramparts.

Ar'dor [from *ar'deo*, to "burn"], a Latin word signifying heat, fervor of passion, zeal, intensity of feeling. In medicine it denotes an intense or morbidly-increased sensation of heat, as *ar'dor febri'lis*, "feverish heat."

Ardoye, a town of Belgium, in the province of West Flanders, 6 miles N. W. of Courtray. Pop. in 1866, 6253.

Ardshir', or **Ardsheer'** (BÂBEGAN), a king of Persia, the founder of the dynasty of the Sassanides, was a man of obscure origin. He raised himself by his courage and energy, and revolted against Artabanus (or Ardovan), king of Persia, whom he defeated and killed. He extended the boundaries of Persia by conquests, and afterwards reigned in peace for many years. He was celebrated as a sage and a legislator, and was the author of maxims which are still preserved by the Persians. The Greeks called him Artaxerxes. He died about 260 A. D., and was succeeded by his son Shapur (or Sapor).

Are [Fr., from the Lat. *area*, a "space of ground"]. In the metric system of weights and measures the are is the unit of measure of surface. It is the square of ten mètres = 119.60332 square yards. The are is not practically employed, the hectare = 100 ares, or 2.47114 English acres, the deciare (one-tenth of an are), and the centiare (one-hundredth of an are), being the only agrarian measures practically used in this system.

A'rea [a Latin word signifying, originally, an "open space," a "courtyard," a "threshing-floor"], any plane surface. In geometry it means quantity of surface, the surface included within any given lines. The calculation of areas is one of the ultimate objects of geometry, and the measuring units employed are a square inch, a square foot, etc. The area of a rectangle is equal to the product of the length and breadth. That of a circle is found by multiplying the square of the diameter by the decimal .7854.

Are'ca, a genus of palm trees having pinnate leaves and double spathes, a fruit which is a one-seeded drupe, or nut with an outer fibrous husk. The *Areca Catechu*, called pinang palm or betel-nut palm, is a native of the East Indies, and grows to the height of forty or fifty feet. It bears a fruit called areca-nut or betel-nut, which is astringent and tonic, and is extensively used in the East as a masticatory. (See BETEL.) It also yields a part of the catechu of commerce. The *Areca oleracea* (the cabbage-palm) grows in the West Indies, and is more than 100 feet high, but has a very slender stem. The terminal leaf-bud is nutritious, and is used for food. It also bears nuts, the kernel of which is sweet.

A'remberg', or **Arenberg,** the name of a noble family of Germany, which adhered to the Roman Catholic Church and to Philip II. of Spain. They own large estates in Hanover and Prussia.

Are'na, a Latin word signifying "sand," was anciently applied to an open space of ground strewed with sand on which athletes and pugilists contended for mastery, and to the open central part of the amphitheatre where gladiators and wild beasts fought. This was usually covered with sand. In modern language, *arena* signifies any scene of contest or field of intellectual exertion; any public place in which men display their talents or contend for mastery in debate.

Are'na, a post-township of Iowa co., Wis. Pop. 2131.

Ar'enac, a post-township of Bay co., Mich. Pop. 459.

Arena'ceous [Lat. *arena'ceus*, from *are'na*, "sand"], sandy, of the nature of sand; a geological term applied to strata which are composed entirely or chiefly of grains of sand. Such are the beds of loose sand which occur in the tertiary or more recent formations. The arenaceous rocks of the carboniferous and Devonian ages are composed of grains of sand cemented together, and are called sandstone. When the sandstone is coarse-grained it is called *grit*, or, if the particles are as large as pebbles, it is termed *conglomerate* or "pudding-stone."

Ar'endahl, a post-township of Fillmore co., Minn. P. 853.

Ar'endal, a city of Norway, 41 miles N. E. of Christiansand, on the Cattegat, in lat. 58° 23′ N., lon. 8° 53′ E. It is built partly on the mainland and partly on islands, giving it the name of "Little Venice." Pop. in 1865, 7181.

Arenic'ola [literally, an "inhabitant of the sand," from *are'na*, "sand," and *co'lo*, to "till," to "inhabit"], the lugworm, *Arenic'ola piscato'rium* (*i. e.* "of fishermen"), found in the sand of the seashore, is much used by fishermen as a bait. It bores in the sand, and forms for itself a tube in which it moves with perfect freedom. When touched, the lugworm throws out a quantity of yellow fluid that stains the hand.

Ar'enzville, a post-township of Cass co., Ill. P. 884.

Areoi. See ARREOY.

Areom'eter, or **Aræometer** [from the Gr. ἀραιός, "thin," and μέτρον, a "measure"], an instrument used to measure the specific gravity of fluids and ascertain the strength of spirituous liquors, usually called HYDROMETER (which see).

Areop'agus [Gr. Ἄρειος πάγος], (*i. e.* "hill of Mars"), a hill in Athens W. of the Acropolis; also a celebrated court of justice which held its sessions on the same spot in ancient times. This court or council was remarkable for its high character and great antiquity, having been organized before the first Messenian war, the date of which

was 740 B. C. It was merely a criminal tribunal before the time of Solon, who made important changes in its constitution, and extended its jurisdiction to political and moral affairs. He ordained that this court should be composed of those archons who had performed their official duties faithfully, and who had passed with credit the scrutiny to which all archons were subjected at the expiration of their term of office. Its influence was conservative, and tended to restrain the excesses or the progress of democracy. The political power of this court was much reduced by Pericles about 458 B. C., but it maintained a high reputation long after that date. The name of the Areopagus occurs in the history of the apostle Paul, who uttered a memorable discourse on Mars' Hill. (See Acts xvii. 22–31.)

Arequi'pa, a department of Peru, bordering on the Pacific Ocean, is bounded on the N. by Ayacucho and Cuzco, on the E. by Cuzco and Puno, on the S. by Moquega, and on the W. by the ocean. Area, estimated at 201,000 square miles. The eastern part is mountainous. The soil is fertile, and produces chiefly wine. Gold, silver, zinc, lead, and coal are found here. Capital, Arequipa. Pop. about 180,000.

Arequipa, a city of Peru, capital of the above department, is finely situated about 40 miles from the Pacific Ocean, on the river Chili and on the plain of Quilca, 7850 feet above the level of the sea; lat. 16° 24′ 28″ S., lon. 71° 37′ 30″ W. It is reputed one of the best built and most beautiful towns of South America. It is the seat of a bishop, and has a cathedral, a college, and several convents. The public edifices and private houses are built of stone, one or two stories high. It has been ruined by earthquakes several times. It has an active trade, facilitated by a railroad which extends to Mollendo on the Pacific. Gold and silver are found in the vicinity. The adjacent country is fertile. Here occurred a great earthquake, Aug. 13 and 14, 1868, destroying property worth more than $12,000,000, and said to have caused the death of more than 500 persons. Pop. estimated at 40,000.

Arequipa, Volcano of, a celebrated volcanic peak of the Peruvian Andes, is about 14 miles E. of the city of Arequipa. It rises to the height of 20,300 feet above the level of the sea, and has the form of a regular truncated cone, with a deep crater, from which ashes and vapor continually issue.

A'res [Gr. *Ἄρης*], the god of war in the Greek mythology, corresponded to the Roman Mars (which see).

Aretæ'us [Gr. *Ἀρεταῖος*], an able Greek medical writer of Cappadocia, is supposed to have lived between 50 and 150 A. D. The events of his life are not known, but he is considered by some persons to rank next to Hippocrates. He wrote a work in eight books on the causes, symptoms, and cure of acute and chronic diseases, which is still extant and is highly esteemed. The style is singularly elegant and concise. The Greek text has often been printed, and has been translated into English by T. F. Reynolds (1837).

Arethu'sa [Gr. *Ἀρέθουσα*], in classic mythology, one of the Nereids, of whom Alpheus was enamored. Also the name of a fountain near Syracuse, into which it is said she was transformed. (See Alpheus.) Arethusa was invoked by Virgil as a source of inspiration in his tenth eclogue.

Aretin'ian Syl'lables are *ut, re, mi, fa, sol, la,* which Guido d'Arezzo used to designate his notes in his musical system of hexachords.

Aretino (Guido). See Guy d'Arezzo.

Areti'no (Pietro), [Lat. *Areti'nus*], a satirical and licentious Italian writer, born at Arezzo in 1492. He was a man of low birth, and was not liberally educated. He became a resident of Venice in 1527, and found several powerful patrons, among whom were the emperor Charles V. and Francis I. Among his numerous works were comedies, dialogues, sonnets, and letters (6 vols., 1538–57). He gained by his writings great applause and large sums of money. His satires, which were personal and bitter, procured for him the surname of the Scourge of Princes. His habits were extremely licentious. Died in Venice in 1557. (See Berni, "Vita di P. Aretino," 1537; Dujardin, "Vie de Pierre Arétin," 1750; Mazzuchelli, "Vita di Pietro Aretino," 1763.)

Aretino (Spinello), a skilful Italian painter, born at Arezzo about 1315. He painted frescoes at Florence, Arezzo, and other towns, and acquired a high reputation. Some frescoes which he painted in San Miniato, near Florence, are still preserved. His invention and coloring are highly commended. The best of his extant works is a "History of Pope Alexander III.," painted in the town-hall of Sienna. Vasari considers him superior to Giotto. Died about 1400.

Are'zzo, a province of Central Italy, is bounded on the N. by Florence, on the E. and S. by Perugia, and on the W. by Sienna. Area, 1279 square miles. The country is chiefly mountainous, and is traversed by the Arno and Chiano. Chief town, Arezzo. Pop. in 1871, 259,901.

Arezzo (anc. *Arre'tium*), a city of Italy, capital of the province of its own name, is on the Chiana, 55 miles by rail S. E. of Florence. It is a very ancient town, having been founded by the Etruscans several centuries before the Christian era. Its walls are evidently Etruscan. It has two colleges, a seminary, a lyceum, a school of technology, an academy of sciences and arts, and many silk, cloth, iron, and other factories. Among the public edifices are a cathedral, several churches rich in works of art, a museum, and the famous *Loggia* of Vasari. Arezzo is remarkable for the great number of eminent men who were born in it—namely, Maecenas, Petrarch, Vasari, Pietro Aretino, Guy d'Arezzo, Redi the physiologist, and Cesalpino. Pop. in 1872, 38,907. Ancient Arretium was celebrated for the manufacture of terra-cotta vases. The cathedral contains rich sculptures by Giovanni Pisano, and some of the finest glass windows in Italy.

Argæ'us, Mount [Turk. *Arjish-Dagh*], the highest mountain in Asia Minor, is in the pashalic of Karamania, about 12 miles S. of Kaisariyeh, and is connected with a branch of Mount Taurus. It rises 13,100 feet.

Argali (*Capro'vis ar'gali,* the *O'vis am'mon* of some writers), the large wild sheep of Central Asia and Siberia. Another variety or species is found in North America W. of the Rocky Mountains (*O'vis Monta'na*). It is sometimes called Big-horn or Rocky Mountain sheep, and has enormous horns about four feet long and from eighteen to twenty inches in circumference. It is about four feet high, has coarse hair, and moves with great agility.

Argali.

Ar'gall (Sir Samuel), born at Bristol, England, in 1572, was deputy-governor of Virginia (1617–19), and was detested by the colonists for his tyranny and rapacity. Died in 1639.

Argand (Aimé), a Swiss chemist, born at Geneva about 1750, is noted as the inventor of the Argand Lamp (which see). He lived in England, and produced the model of the lamp in 1782. It appears that he derived little profit from the invention. Died in 1803.

Argand Lamp, a lamp invented in 1782 by A. Argand, noticed above, was designed for burning oil. He invented a wick in the form of a hollow cylinder, through which a current of air ascends, so that the supply of oxygen is increased. This contrivance prevented the waste of carbon, which in the old lamps escaped in the form of smoke, and it greatly increased the amount of light. He also added the glass chimney, by which a draft is created and the flame is rendered more steady. This lamp was patented in 1787.

Ar'gelan'der (Friedrich Wilhelm August), a distinguished German astronomer, born at Memel March 22, 1799, was a pupil of Bessel. He became in 1823 director of the observatory at Åbo, in Finland, and commenced observations on the fixed stars which have a perceptible proper motion. In 1832 he became professor at Helsingfors. In 1837 he was appointed professor of astronomy at Bonn. Published a celestial atlas entitled "Uranometria Nova" (1843), and "Astronomical Observations" (1846), which gives the positions of 22,000 stars and a later catalogue of more than 200,000 stars. He demonstrated that the solar system has motion in space, and studied the variable stars with great care. Died Feb. 17, 1875.

Argemo'ne, a genus of plants of the natural order Papaveraceæ. The *Argemone Mexicana* is an annual herbaceous plant, with yellow flowers and sinuated spiny leaves, a native of Mexico and the U. S., now naturalized in India, Africa, South America, etc. It has seeds which are emetic and purgative, and have been used as a substitute for ipecacuanha.

Argens, d' (Jean Baptiste de Boyer), Marquis, a French writer, born at Aix, in Provence, June 24, 1704. He served in the army in his youth, and gained distinction by his "Jewish Letters" ("Lettres Juives," 6 vols., 1738–42), and "Chinese Letters" (6 vols., 1739–42). These procured for him the favor of the crown prince of Prussia, afterwards Frederick the Great. He went to Berlin, and became an associate of that prince, who after his accession

appointed him director of the Academy of Fine Arts. Among his works is "Histoire de l'Esprit Humain," 14 vols., 1765–68. Died at Toulon Jan. 11, 1771.

Argenso'la, de (Bartolomé Leonardo), an eminent Spanish poet, born at Barbastro, in Aragon, in 1566. Having entered the Church, he became a canon of Saragossa, and historiographer of Aragon. He published a number of poems and a "History of the Conquest of the Moluccas" (1609). He and his brother were called the Horaces of Spain. Died Feb. 26, 1631.

Argensola, de (Lupercio Leonardo), a popular poet, born at Barbastro in 1565, was a brother of the preceding. He was appointed historiographer of Aragon by Philip III., and secretary of state by the viceroy of Naples in 1610. He produced tragedies, entitled "Filis," "Isabela," and "Alejandra;" also lyric poems which were very successful. The poems of these two brothers display much similarity. Died in 1613. Bouterwek commends his true poetic feeling, and recognizes in his works an imagination more plastic than creative. (See Ticknor, "History of Spanish Literature;" N. Antonio, "Bibliotheca Hispana Nova.")

Argenson, d', a French family which has produced many men eminent in letters and in public affairs.—Marc René de Voyer d'Argenson (1652–1721) was a prominent academician and public officer.—His son René Louis, marquis d'Argenson (1694–1757), was a foreign minister and an author of distinction.—Marc Pierre, count d'Argenson (1696–1764), a brother of the foregoing, was an able statesman and a patron of letters.—Marc Antoine René de Paulmy d'Argenson (1722–87), a son of the marquis René Louis, was an academician and the collector of a famous library.—Marc René, born in Paris Sept. 10, 1771, served as the adjutant of General La Fayette, and fought afterwards for the republic. Throughout his life he was a prominent leader of the ultra-republicans. Died Aug. 2, 1842.

Argentan [Lat. *Argen'tæ*], a town in the N. W. of France, in the department of Orne, on a railway which connects Alençon with Caen, 16½ miles by rail N. N. W. of the former. It is well built, and has a fine Gothic church and a college; also manufactures of linen, and lace called *point d'Argentan*. Pop. in 1866, 5401.

Argenteuil [Lat. *Argento'lium*], a town of France, in the department of Seine-et-Oise, on the Seine, 11¾ miles by rail from Paris. Here was a convent to which the celebrated Héloise retired about 1120. It is now in ruins. Pop. in 1866, 8176.

Argenteuil, a county of Canada, in the western part of Quebec, and in the district of Terrebonne. The Ottawa River forms its southern boundary. Area, 850 square miles. Much of the soil is excellent. Burr millstone is found, and there is extensive water-power. Capital, Lachute. Pop. in 1871, 12,806.

Argen'teus Co'dex, an old uncial manuscript of the Four Gospels, written in the Mœso-Gothic dialect on vellum, is so called because the letters are formed of silver, except the initials. It is supposed that it was written in the sixth century. It is a copy of the translation made by Ulphilas, bishop of the Mœso-Goths, and was found in the abbey of Werden, Westphalia, in 1597.

Ar'gentine (*Scopelus*), a genus of small fishes of the family Salmonidæ, found in the Mediterranean and the Atlantic. They derive their name from the silvery lustre of their scales, and are valuable for the *nacre* which is obtained from the outside of their air-bladders. One or more species occur in the U. S. waters, but no commercial use is made of them.

Argentine [from the Lat. *argen'tum*, "silver"], a variety of carbonate of lime, having a silvery-white lustre and a slaty or curved lamellar structure.

Argentine, a post-township of Genesee co., Mich. Pop. 1061.

Argentine Republic [Sp. *La Republica Argentina*, named from the *Rio de la Plata*, *i. e.* the "river of silver," *argentum*], a South American federal republic, is bounded on the N. by Bolivia and Paraguay, on the E. by Brazil, Paraguay, Uruguay, and the Atlantic Ocean, on the S. by Patagonia and the Atlantic Ocean, and on the W. by the Andes, which separate it from Chili. It extends from lat. 22° to 41° S., and lon. 54° to 72° W. The area is estimated at 871,000 square miles. The disputes with Bolivia and Paraguay concerning the boundary-line are not yet (1873) settled. If the claims of the Argentine government should ultimately prevail, the area of the republic would be about 1,000,000 square miles. The population, according to the census of 1869, amounted to 1,877,490. The area and population of the fourteen states or provinces into which the republic is divided are, according to the latest official reports (see Behm and Wagner, "Bevölkerung der Erde," Gotha, 1872), as follows:

Provinces.	Area in sq. miles.	Pop. in 1869.	Capitals.	Population.
1. Buenos Ayres	82,900	495,107	Buenos Ayres	177,787
2. Santa Fé	24,000	89,117	Santa Fé	10,670
3. Entre Rios	47,900	134,217	Concepcion	6,513
4. Corrientes	70,100	129,023	Corrientes	11,218
5. La Rioja	42,500	48,746	La Rioja	4,489
6. Catamarca	42,500	79,962	Catamarca	5,718
7. San Juan	39,300	60,319	San Juan	8,353
8. Mendoza	71,600	65,413	Mendoza	8,124
9. Cordova	71,600	210,598	Cordova	28,523
10. San Luis	23,700	53,294	San Luis	3,748
11. Santiago	42,500	132,898	Santiago	7,775
12. Tucuman	15,900	108,953	Tucuman	17,438
13. Salta	59,500	88,933	Salta	11,716
14. Jujuy	36,100	40,379	Jujuy	3,071
Army in Paraguay		6,276		
Gran Chaco		45,291		
Missiones		3,000		
Pampas Argentinas		21,000		
Patagonia		24,000		
In foreign countries		41,000		

Physical Geography.—The country, which has the form of an elongated quadrilateral, can be divided with regard to the formation of the ground into four regions: 1st, the regions of the Andes, which run along the western boundary; 2d, "the Argentine Mesopotamia," between the Uruguay and the Parana; 3d, the Pampas or southern plains; 4th, the northern or interior plains, which extend into the Gran Chaco far into Bolivia. The characteristic feature of the country, excepting the region of the Andes, is the plain. The true Pampas are situated between the Rio Negro and the Rio Salado. About the mouth of the Rio Negro, beyond Buenos Ayres and some distance up the Parana, the ground consists of a fine deposit of sand and clay, which have been washed down from the mountains in the course of time. For hundreds of miles S. and W. of Buenos Ayres not a stone is to be found. In the Pampas the principal vegetation consists of grasses, which serve as food for the numerous herds of cattle. In the interior cacti and thorny mimosæ are frequent. Timber trees are not met with. Towards the N. the vegetation becomes extremely varied; along the rivers it becomes luxuriant; the trees, however, are not extraordinarily high. Land capable of being cultivated is found only along the rivers. The strip of country between the eastern branches of the Andes and the Parana is more or less sterile and deserted, and even the western states are partly separated from each other by deserts. Large tracts in the interior are covered by volcanic ashes and pumice-stone. The southern plains are broken by several ranges of hills, some of which stretch 150 miles to the S. and S. W. of Buenos Ayres, and run from S. E. to N. W. Their elevation above the plain never exceeds 300 feet. Parallel to these are the Ventana Mountains, whose highest point is 3500 feet above the level of the plain. These ranges mostly consist of granite, which in some parts is covered by quartz. In the lower diluvian strata many fossil remains of marine animals occur, which are also found occasionally in the mountains at a height of 14,000 feet. The next higher stratum to the one last mentioned is rich in fossil remains of extinct mammals of an enormous size, which have a striking resemblance to the present mammals of South America and Africa (*e. g.* the large armadillo, the giant sloth, the mastodon, fossil horses). The mountains, especially the Aconquija Cordilleras, which separate Tucuman from Catamarca, are rich in valuable metals, especially gold, silver, and copper. In the Famatina range, in the province of Rioja, much iron ore is found. In the Gran Chaco it was ascertained by the expedition of Porter Cornelius Bliss in 1863 that the ground is covered for miles around with iron, which contains about 10 per cent. of nickel. A piece of this was brought to the British Museum weighing about 1400 pounds. Up to the present time, however, the republic imports the iron it uses from Europe. In the south-western provinces extensive coal-fields have been discovered, while sulphur, alum, etc. are found in large quantities in the Andes.

Rivers, Lakes, and Swamps.—Almost all the rivers which come down from the Andes, the southern slope of the central Brazilian ranges, and the heights forming the watershed of Buenos Ayres, unite to form the Rio de la Plata, which has a wider mouth than any other river on the globe. Between the capes San Antonio and St. Mary it has a width of 170 miles; 50 miles farther up-stream, at Montevideo, it has narrowed down to 75 miles, and the water becomes fresh. At Buenos Ayres, 150 miles farther up, the low shores cannot be seen from the middle of the river. The current can be noticed as far as 100 to 200 miles out in the ocean, although the depth of the river is not very great. Above Montevideo, which is the only good port on it, its navigable channels are so obstructed by sand-banks that vessels of light draught, which go to Buenos Ayres, are

compelled to anchor from six to nine miles from the city. Even small boats have such difficulty in getting ashore that the passengers are generally landed by means of wagons with very high wheels. The chief branches of which the La Plata is formed are the Parana (with its affluent, the Paraguay) and Uruguay, which are respectively navigable for steamers for 1000 and 250 miles. Many of the eastern tributaries, especially the Rio Vermejo and the Rio Salado, are navigable for smaller vessels for 400 or 500 miles. The smaller tributaries coming from the E. are generally unsuited to navigation by reason of their strong currents. Those coming from the Andes, however, slowly wend their way through the endless plains, and are of the greatest importance for commerce. The rivers of the interior which do not belong to the system of the La Plata are mostly unimportant, as they are lost in swamps or temporary lakes, or entirely dry up in summer. These temporary lakes, lagoons, and swamps are found in great number, and are sometimes of considerable extent. Those to the E. of the Paraguay and Parana generally contain fresh water, while those W. of these rivers are brackish, almost without exception. Among the former the lake of Ybera in the province of Corrientes is the most important. Those to the W. of the great rivers usually dry up at the end of the rainy season, and leave the ground covered with a crust of saline matter several inches in thickness. The salts are of different kinds. In the plain around Fort Melincue, W. S. W. of Buenos Ayres, sulphates of magnesia are found which yield a profitable article of commerce. Good cooking-salt is found in large quantities S. of Buenos Ayres and in the neighborhood of San Luis.

Climate.—The most prominent characteristic of the climate of the Argentine Confederation is extreme dryness. Although the territory W. of the Parana has plenty of rain, still the plains in the interior suffer extremely from drought, because the S. W. winds, being stopped by the Andes, discharge their rain in Chili, and the eastern equatorial winds have already exhausted their rain at the tropic. Buenos Ayres and the country immediately surrounding are often exposed to warm N. winds, which come down the valley of the Parana loaded with vapor. The mean temperature of Buenos Ayres is 64° F.; the mean for the summer 72°, for the winter 52°. In many places a warm and a cool season can be distinguished, the former lasting from October to May, the latter from May to September. The time of the change from one to the other is the chief rainy season. The heavy thunder-storms, sometimes accompanied by hail-storms, often produce very sudden changes of temperature. Nevertheless, the climate is very healthy. This is partly due to the Pampero, a strong S. W. wind coming from the Andes. Also the nights, which are cool throughout the year, and which tend to make the heat of the day less felt, contribute much towards this end. In the plains of the interior the hot Zonda, the strong and lasting N. wind, is very much dreaded.

Animal and Plant Life—Products.—With very few exceptions, the animals of the present day have the same characteristics as the gigantic fossils found in the country, except that they are considerably smaller. The animal peculiar to the plains is the llama. The vicuña, related to the llama, is hunted in the W. Of other wild animals are found the puma, the tapir, the capibara, and the ounce. Among the birds the birds of prey, as the condor and the Caracara vulture, are especially numerous. The American ostrich and different kinds of humming-birds and parrots are also often met with. The vegetation of the plains of the La Plata is poor. Even in Entre Rios the lack of wood is often seriously felt. To the S. clumps of willows are found here and there. But the shores of the Parana are covered with beautiful forests, and both towards the tropics and the Cordilleras the vegetation becomes varied and luxuriant. The most characteristic plants of the Gran Chaco, as well as of the Pampas, are mimosas and cacti, and not until the foot of the Cordilleras in Salta and Mendoza is reached are palms and the other ornaments of tropical forests met with. The native plants and animals of these regions are, however, mostly superseded by naturalized species. The apple tree, which at the present day forms large woods in the S. of Chili and towards the sources of the Rio Negro, has been transplanted by the Indians farther N. on the eastern slopes of the Cordilleras. The peach tree is largely cultivated on the islands at the mouth of the Parana. A wild species of artichoke and impenetrable thickets of thistles cover the ground for miles to the W. and N. W. of Buenos Ayres. Wine is extensively grown in Mendoza and La Rioja.

Agriculture, Industry, Trade.—Only during the last fifteen years has agriculture been generally introduced, especially in the coast provinces. In the region of the Andes, where the ground is more easily irrigated, considerable wheat, wine, and fruits of all kinds have been produced for a long time. At present, wheat, corn, oats, and other grain and vegetables are cultivated on a large scale. Sugar-cane, tobacco (especially in Corrientes and Tucuman, but also in Salta and Catamarca), cotton, peanuts, and flax are also cultivated, although these plants have only been lately introduced. Labor, instruction, and mechanism are sadly wanting. Even now the raising of cattle, the old national occupation, is much more important than agriculture. The natives had at the time of the discovery no other domestic animal than the llama or guanaco. Mendoza introduced the horse in 1536; in 1550 goats and sheep were brought from Peru; in 1553 the ox was brought from the coast of Brasil. From these importations have descended the millions of cattle which now roam over the plains of the republic. The breeds are almost all good. The sheep have been greatly improved. In recent times the breeders of cattle have suffered considerable losses, as, in consequence of the high tariff of the U. S., they have no market for their products. Wild cattle are no longer to be found. All are enclosed, though often in very large ranges. The large *estancias* of former times are becoming a thing of the past, and they are cut up more and more into smaller estates. While the price of land has risen considerably (in some places it has doubled within twenty years), the increase of the cattle has been so large that the supply exceeds the demand largely, and manure is made of the unsold meat. About 3,000,000 hides of cattle are exported annually, and in the large slaughter-houses (*saladeros*) 60,000 cattle are killed annually. The herds of horses seem to diminish gradually, but are still so large that 250,000 horse-hides are annually exported. The Pampa horse is small and of coarse build, but excels in fleetness and endurance. It roams about in herds of 6000 or 8000, and is caught by the Gauchos with the lasso or the bolas. Mules are raised in large numbers, and are exported to Peru and other places. General industry and manufactures are unimportant in the La Plata states. The manufacture and export of "Liebig's extract of meat" is extensive. Besides this, tanning and the soap manufacture are carried on on a large scale. Valuable embroidered cloths, wearing apparel, gorgeous blankets, and ponchos are made of the finest wool. The Indian women of the S. also make wonderfully fine quilted ponchos, belts, horse-blankets, and harness. A laborer is paid from $1 to $3 in gold per day.

The commerce with the interior is unimportant; that with Chili and Bolivia is of more consequence. To these countries oxen, mules, and asses are exported in large numbers. The commerce by sea is about twenty times as large as that by land. It is limited almost entirely to Buenos Ayres and Rosario. The river-ports, Santa Fé, Parana, Corrientes, Gualeguay, Concepcion, and Concordia, supply themselves from Buenos Ayres. The inland trade is almost entirely carried on by caravans of thirty or forty wagons. The articles of export are, besides those obtained from the herds of cattle, horses, and sheep, chiefly ostrich feathers, Patagonian and artificial guano, furs, honey, copper, gold and silver bars. The total exports amounted in 1870 to $23,320,000, and the imports to $39,400,000. In 1870, 1154 vessels, of 388,796 tons, entered, and 1074 vessels, of 339,759 tons, cleared from the port of Buenos Ayres. About one-half of the exports are hides and three-eighths wool.

Roads are sadly wanting throughout the entire country. Diligences run from Rosario to Mendoza, San Juan, Cordova, Rioja, Catamarca, Santiago del Estero, Tucuman, Salta, and Jujuy. Couriers keep up the communication between the 125 post-offices. In 1865, 1,167,611 letters were transmitted. According to the president's message in 1871, 605 miles of railroad were in operation, 139 miles in construction, and 2248 miles were projected. According to the same message, 1461 miles of telegraph were in operation, and 2414 miles were projected in 1871. A submarine telegraph from Buenos Ayres to Montevideo has been in operation since 1866. In the same year the Americans, Hopkins & Cary, received a charter to construct a telegraph from Buenos Ayres to Chili.

Inhabitants.—The native tribes are divided into three different groups: 1st, the Araucanians, who roam as far N. as the Rio Salado; 2d, the Quechuas, who were formerly subject to the incas of Peru, and live E. of the Cordilleras as far as Santiago; 3d, the Guaranis, who formerly ruled from the Gulf of Mexico to the Rio de la Plata, and from the Atlantic to the Andes. These races are uncivilized to the present day. But the most of the Guaranis, Quechuas, and some of the Araucanians, have been blended together with the Spaniards, and this mixed race constitutes the larger part of the population of the republic. The number of the foreign-born population is very large, and is increasing rapidly. The immigration from 1857 to 1862 amounted to 28,066, and from 1863 to 1867 to 65,599 souls. The following table presents the immigration of each year, arranged according to nationalities:

	1863.	1864.	1865.	1866.	1867.
Italians	4,494	5,435	5,001	4,245(?)	8,455
Frenchmen	2,334	2,736	2,282	2,870	3,671
Spaniards	1,377	1,586	1,701	954(?)	1,258
British	883	1,015	1,583	1,370	1,672
Swiss	567	329	502	958	933
Germans	527	289	363	274	436
Other nations	216	192	335	3,025(?)	597
Total	10,398	11,582	11,767	13,696	17,022

In 1868 the number of immigrants amounted to 29,384, in 1869 to 37,934, in 1870 to 39,667, and in 1871 to 31,614. T. C. Ford says in his report of 1867 that there were ten colonies in the republic, each having on an average 7000 or 8000 inhabitants, which were all Europeans. In recent times much has been done to promote immigration.

Manners and Customs.—In Buenos Ayres, where the foreign population gains the ascendency more and more, European dress and manners have been rapidly naturalized. The lower classes, which are chiefly mestizoes and half-breeds, combine the inclination of the higher classes for gaming and a dissolute life with the plain and rough mode of living of the Gaucho of the Pampas. The Gaucho wears a jacket of coarse cloth or sheepskin, and pantaloons of the same stuff, which are open from the knee down. His poncho is a square piece of cloth with an opening in the middle for the head. His ornaments consist of spurs with large silver rowels, and a large knife, with the handle inlaid with silver, which is carried in the belt. The women are dressed almost exactly like the men, only they have the neck and arms bare. The rancho or hut of the Gaucho consists of a trellis-work of brushwood, which is covered with mud. The roof is covered with straw or cow-hides, and in the place of a door is a horse-hide. The food of the Gaucho consists almost entirely of meat and water. From 1850 to 1860 there was one marriage for every 140 inhabitants, 1 birth for every 22, 1 death for every 44, and 5 children for every family; one-fifth of all the children are illegitimate. The mean length of life in the country and the smaller cities is 40 years. Since 1780 the population has almost quadrupled itself. The predominating religion is the Roman Catholic; Protestants are only found among the immigrants. Under the archbishop of Buenos Ayres are the bishop of the Littoral (with his seat in Parana), of Cordova, of Cuyo (San Juan), and of Salta. There are very few monasteries, but a large number of nunneries. There are missions on the Indian frontier, where several hundred have been converted. Popular education until recently has been very poor. Only 28,000 persons can write. But since the accession of President Sarmiento much has been done to improve the education of the people. Universities have been established at Buenos Ayres and Cordova, while colleges exist in those two cities and in Concepcion, and several others are in course of erection. Of the forty-three printing establishments, Buenos Ayres has sixteen, and of the thirty-seven newspapers published in the republic, it has sixteen. In 1869, Congress passed a law that the new civil code (*codigo civil*) compiled by Dr. Sarsfield, at that time minister of the interior, was to be introduced throughout the whole republic on Jan. 1, 1871.

Constitution.—The constitution was adopted May 11, 1853, and was revised in 1860 and 1862. At the head of the republic is a president, elected for a term of six years by 133 representatives of the provinces. The congress consists of a house of representatives with fifty-four members, and a senate with two members for each state. In 1862, Congress transferred the seat of government to Buenos Ayres, and introduced several clauses into the constitution with regard to the relations of the city to the confederation. The province of Buenos Ayres elects its own governor, but the city is under the direct jurisdiction of the president and congress. The judiciary is entirely independent. There is a supreme court and tribunals in every state. The freedom of the press, of religion, of association, of education, and free disposition of property, as well as equality before the law, is guaranteed to everybody.

Army, Navy, and Finances.—The army consists, exclusive of the militia and national guard of Buenos Ayres, of 7414 men, inclusive of 29 generals, 273 commandants, and 632 other officers. The republic possesses seven men-of-war, one of which is armed with twelve guns. The public debt in 1871 amounted to 76,576,385 pesos fuertes (1 peso fuerte = $1.01). The income in 1870 amounted to 14,833,904, the expenditures to 22,199,445, leaving a deficit of 7,365,544 pesos. Each province has its own budget.

History.—The La Plata was discovered by Juan Diaz de Solis in 1516, who took possession of the country for the crown of Spain. Buenos Ayres was founded by Don Pedro de Mendoza, who became governor in 1535. The city was not, however, firmly established against the attacks of the Indians until after its third rebuilding in 1580, and after Santa Fé, Mendoza, and other cities in the interior had been founded. The government of the countries of the La Plata was subject to the viceroy of Peru until 1778, in which year a viceroyalty was formed of the provinces of Rio de la Plata, Paraguay, Uruguay, and Bolivia, with Buenos Ayres as its capital. After 1806–07, Buenos Ayres and Montevideo were for a short time in the hands of the British, who, however, were not able to hold them. Soon after liberal ideas began to gain ground. The viceroy was expelled, and on May 25, 1810, a *junta gubernativa* was installed. Cordova, Paraguay, and Uruguay, however, did not recognize this junta, and a long succession of civil wars ensued. Soon after the districts in the interior also joined the Confederation. In 1813 a constituent assembly met in Buenos Ayres, the Spanish flag was given up, and the republic issued its own coin. In the previous year Montevideo, which had remained longest connected with Spain, had been taken. In 1816 the representatives of all the provinces assembled in congress at Tucuman, declared the La Plata states independent, and appointed General Pueyrredon dictator of the republic. The Spanish troops were severely defeated at Chacabuco in 1817, and at Maypu in 1818. The last and decisive victory was gained in 1821. In the mean while the republic was the scene of serious encounters between several ambitious leaders. In 1825 the "Unitarians" (who favored a strong central government) succeeded in restoring unity and established a new constitution. But Rivadiva was their only president. Juan Manuel de Rosas, the leader of the Gauchos, in connection with other malcontents, forced him to resign, and caused Dorrego to be elected governor of Buenos Ayres. After a counter-revolution under Lavalle, which was for a time successful, Rosas was elected governor in 1826, in which position he remained for six years. In 1835 he declined a re-election, but accepted the position of dictator of the republic with unlimited powers, which he held until 1852. During this entire period Congress did not assemble. The civil wars nevertheless continued uninterruptedly. The independence of Uruguay, which had assumed the title of "Republica Oriental del Uruguay," had been recognized in 1828. But Rosas did not relinquish his plans. He assisted Governor Oribe, while France took sides with his rival, Rivera. Peace was concluded in 1840, but in 1845 new difficulties arose, which led to an armed intervention of France and England. They blockaded Buenos Ayres and occupied the island Martin Garcia, but were compelled to recall their fleets the next year. The provinces of Corrientes and Entre Rios seceded from Rosas soon after, and on Feb. 3, 1852, he was defeated by the united forces of Brazil, Uruguay, Paraguay, and Urquiza, the head of the opposition, in the battle of Monte Caseras, in consequence of which he was compelled to fly to England. After a short administration of Vincente Lopez, Urquiza declared himself president, and recognized on June 23, 1852, the independence of Paraguay. In September another revolution took place, and Buenos Ayres resolved to secede from the Confederation. In the mean while, Congress had adopted a new constitution (May, 1853), and Urquiza was elected president. Buenos Ayres remained independent, but consented to the conclusion of two treaties in Dec., 1854, and Jan., 1855. The attempts at a reunion were not suspended, but several difficulties caused the suspension of the treaties. A war followed, and Buenos Ayres was defeated. Urquiza gained a victory at Cepada on Oct. 23, 1859, and by the treaty of peace of San José de Flores of Nov. 10, 1859, and the union of Parana, Buenos Ayres again entered the Confederation. In 1861 new difficulties arose on account of taxation, and General Mitré completely defeated the federal troops on the Pavon (a small tributary of the Parana) on Sept. 17, 1861. The president, Santiago Derqui, resigned in consequence of this, and General Mitré was appointed president *pro tem.*, with the direction to call a congress on May 25, 1862, at Buenos Ayres. Mitré was elected president of the reunited Confederation on Dec. 14 of the same year. In 1866 great dissatisfaction arose in several provinces in consequence of the war with PARAGUAY (which see). In several places, as Mendoza and Catamarca, serious disturbances arose, which were secretly encouraged by Peru, Chili, and Bolivia. In 1867 the disturbance, under the command of Videla, began to assume serious proportions in Mendoza, and even extended to La Rioja and San Juan. General Pannero, although not till Mitré had joined him with 4000 men, completely defeated the insurgents, and triumphantly entered Mendoza on May 14. Both houses of Congress passed a resolution to transfer the seat of government to Rosario, which was, however, vetoed by the president. In 1868, Sarmiento was elected president for a term of six years. Since that time the country has been rapidly increasing in prosperity. In 1870 a rebellion broke out in Entre Rios, at the head of which was General Lopez Jordan, a son-in-law of Urquiza. This old patriot was

murdered by the rebels in his palace at San José. The rebellion, although rapidly gaining, was opposed by almost all the other states. On Sept. 23, Jordan was completely routed at Santa Rosa, and lost all his infantry and artillery. In April, 1871, he was again completely defeated, and the rebellion was suppressed. In Mar. and April, 1871, the city of Buenos Ayres was visited by the yellow fever, and suffered terribly from its ravages. The citizens and the government did their utmost to prevent its spread, but still the total of its victims was found to be 13,103—a figure which, although large, was still considerably below the estimate made by the press. In Feb., 1872, a revolution broke out in Corrientes, which, however, was soon ended. In Entre Rios, Lopez still continued to agitate in secret, but without success. On Jan. 1, 1872, a band of Gauchos, under a Bolivian fanatic calling himself a *Dios medico* (God physician), entered the town of Tandil, and crying "Death to the Masons and Gringos!" massacred thirty-five persons. They were afterwards captured: fourteen were put to death, fifteen imprisoned for fifteen years, and the Dios medico was shot by the populace.

In April, 1872, Gail Jordan was reported to be on the frontier of Brazil, at the head of 2000, intending to revive the dream of Artigas and Urquiza concerning the establishment of an independent republic, to consist of the Argentine provinces of Corrientes and Entre Rios and the republic of Uruguay. At the beginning of the year the border provinces had to suffer from a new invasion of the Araucanian Indians under their chief Calfucura, who are reported to hold more than 3000 Argentine citizens as prisoners. In May, 1873, the province of Entre Rios was once more invaded by Lopez Jordan, who captured several towns and threatened the two neighboring littoral provinces. The government declared Entre Rios in a state of siege, and at once placed a number of the national guard in the field; at the same time President Sarmiento sent a special message to Congress requesting the adoption of vigorous measures for the suppression of the invasion.

Literature.—Compare, besides the works of Nuñez, King, Mansfield, and Page, ANDRÉE, "Buenos Ayres und die Argentinischen Provinzen" (1856); MANNEQUIN, "Les provinces argentines et Buenos Ayres" (1856); DE MUSSY, "Description géographique et statistique de la Confederation Argentine" (1861 and 1864); BURMEISTER, "Reise durch die La Plata Staaten" (1861); FORD, "La Republique Argentine" (1867); TRELLES, "Registro Estadistico" (1867); L. BECK BERNHARD, "Le Rio Parana, etc." (1865); MOUCHEZ, "Nouveau Manuel de la navigation dans le Rio de la Plata, etc." (1865); SCHNEPP, "Mission Scientifique dans l'Amerique du Sud" (1864); the "Annales del Museo publico de Buenos Ayres," published yearly by Burmeister since 1864; DOMINGUEZ, "History of the Argentine Republic," translated by G. Williams (1866); M. G. and E. T. MULHALL, "Handbook of the River Platte" (1869); WAPPÄUS, "Argentinische Republik," in Stein and Hörschelmann's "Handbuch der Geographie und Statistik" (7th ed. 1863–70). A. J. SCHEM.

Argenton-sur-Creuse (anc. *Argentom'agus*), a town of France, in the department of Indre, on the river Creuse, 19 miles by rail S. W. of Châteauroux. It has ruins of an old castle, and manufactures of woollen cloth. Pop. in 1866, 5219.

Ar'ges, a genus of small fishes of the family Siluridæ, which are often thrown out by some of the South American volcanoes with torrents of hot and muddy water. This remarkable fact was noticed and published by Humboldt, who described one species, now called *Arges cyclopum*. They are ejected near Quito in such quantities that fevers are caused by their putrefaction. It is supposed that they come from lakes in the caverns of the mountains. The craters from which they are ejected are 16,000 feet or more above the level of the sea.

Ar'gil [from the Lat. *argil'la*, "white clay"], a term sometimes applied to clay or potter's clay, and, in a technical sense, to pure clay or to alumina.

Argilla'ceous [from the Lat. *argil'la*, "clay"], clayey; having the properties of clay, or partly composed of clay. Limestones are called argillaceous if they contain as much as 10 per cent. of clay. A conchoidal fracture usually indicates the presence of clay in a mineral.

ARGILLACEOUS ROCKS. This term is generally applied to rocks or strata of which clay is the principal ingredient. Pure clay, called *kaolin* or porcelain clay, is a hydrated silicate of alumina, and is derived from the decomposition of felspar. Common clay contains also sand and other impurities. Among the argillaceous rocks are shales and slates. Clay which has been indurated and metamorphosed is called clay-slate. Plastic clays fit for pottery occur in the tertiary formation and more recent deposits. The argillaceous rocks may be distinguished by the odor which they emit when a person breathes on them.

Ar'gives, or **Argi'vi,** the inhabitants of Argos and of Argolis, a state of ancient Greece. During the Trojan war Agamemnon was king of the Argives, who were then the most powerful or prominent among the Greek tribes. The name Argives was used by Homer and other ancient authors as a generic appellation for all the Greeks.

Ar'go, an extensive southern constellation, so called from the mythical ship of the Argonautæ. It is usually divided into four: Argo, Argo in Carina (in the keel), Argo in Puppi (in the stern), and Argo in Vela (in the sails). Canopus, a star of the first magnitude, belongs to this constellation, part of which is invisible in our latitude.

Ar'gol, crude tartar, a salt which is deposited by wine in crystalline crusts on the interior of vats, barrels, and bottles. Being less soluble in alcohol than in water, the increasing proportion of alcohol during fermentation causes it to separate. It consists chiefly of potassic bitartrate, $KHC_4H_4O_6$, but contains also variable quantities of calcic tartrate, coloring and mucilaginous matter. It is purified by solution in hot water, clarification by the addition of clay, and recrystallization. By repeating the process it becomes white, and is then sold under the name of *cream of tartar*, and extensively used in connection with sodic bicarbonate for raising bread. Cream of tartar is shamefully adulterated with gypsum, flour, etc., many samples containing two-thirds or more of such fraudulent admixtures. Argol is used for the preparation of tartaric acid, Rochelle salt, and potassic carbonate, the latter being often called *salt of tartar*.

Ar'golis ['Αργολίς], a state of ancient Greece, in the N. E. part of the Peloponnesus (Morea), bordering on the sea. It consists partly of a peninsula between the *Saronicus Sinus* (Gulf of Ægina) and the *Argolicus Sinus* (Gulf of Nauplia). It was bounded on the S. by Laconia and on the W. by Arcadia. The surface is diversified by mountains which are about 5000 feet high. Near the sea is the large plain of Argos, which is rendered unhealthy by marshes. Argolis was one of the most famous and powerful states of ancient Greece, and was the scene of many memorable events or myths in the heroic ages. Here Hercules was born, and Pelops and the Atridæ reigned. The inhabitants were called Argives (Argivi). The chief towns were Argos, Mycenæ, Epidaurus, Hermione, Sicyon, and Trœzene, each of which was a separate kingdom. The Argives were skilful musicians, and cultivated the fine arts with success, but were never distinguished as poets or philosophers.

ARGOLIS AND CORINTH is the name of a nomarchy of modern Greece. Area, 1447 square miles. Pop. in 1870, 127,820. Capital, Nauplia.

Ar'gonaut (*Argonau'ta*), a genus of mollusks of the

Argonaut within its shell.

class Cephalopoda, is commonly called "paper nautilus." The latter name is derived from the fragile nature of the boat-like shell in which the argonaut floats on the surface of tranquil seas. The shell is not chambered like that of the true nautilus, but has one spiral cavity, into which the animal can retire and be completely hidden. There is no muscular attachment of this animal to the shell, which is said to be peculiar to the female, who uses it for incubation as a nest. Several species are known. They have eight arms, two of which are expanded into broad membranaceous disks, which were formerly believed to be sails, and the other arms were regarded as oars; but, though the fable is perpetuated by the poets, it has long been known

that the animal really propels itself by ejecting water from its funnel. When it desires, it folds its arms, retires within its shell and sinks to the bottom.

Ar'gonau'tæ [Gr. Ἀργοναῦται, *i. e.* "the sailors of the Argo"], in English **Ar'gonauts,** the famous Greek heroes who, according to tradition, lived before the Trojan war, and acquired celebrity by an adventurous navigation of unknown seas. This is the most ancient voyage of discovery mentioned by classic poets or historians. They derived their name from the ship Argo, in which, under the command of Jason, they performed the expedition to Colchis, on the Euxine, in order to recover the Golden Fleece, which was guarded by a sleepless dragon. Among the Argonauts were Hercules, Theseus, Castor, Pollux, and Orpheus. In the course of the voyage they landed at several points and passed through many perilous adventures. Among the obstacles which they encountered were the enmity and treachery of Æetes, king of Colchis, but they were aided by his daughter Medea, a powerful sorceress, and finally carried off the Golden Fleece.

Ar'gos [Ἄργος], a capital city of ancient Greece, situated in Argolis, about 3 miles from the *Argolicus Sinus,* or Gulf of Nauplia. It was considered the oldest city of Greece, and was supposed to have been founded by Inachus, the father of Io, about 1500 B. C. It was a famous city in the heroic age, and was the residence of Pelops and Agamemnon. Argos was the head of a league of Doric cities before Sparta acquired the supremacy in the Peloponnesus. Its site is occupied by a modern town of the same name, 6 miles N. N. W. of Nauplia. Pop. about 10,000. Here are remains of ancient cyclopean structures.

Argos, a post-village of Marshall co., Ind.

Argos'toli, a seaport-town of Greece, the capital of Cephalonia, one of the Ionian Islands, is on the S. W. coast. It has a good haven. Pop. 8000.

Argot, a word of uncertain derivation, applied in France to a peculiar language or gibberish invented for purposes of concealment by those whose pursuits make them dread the arm of the law. In all the countries of Europe a language of this kind prevails, and has prevailed perhaps to some extent from immemorial time. In England it is called "thieves' Latin," "St. Giles's Greek," "peddler's French," "flash," and other names; in Italian, "zergo" (or "gergo") and "furbesco" (from *furbo,* a "rogue"); in Spanish, "Germania;" in German, "rothwelsch" (or "rothwälsch"). An able French writer, M. Nodier, remarks that "Argot, a language invented by thieves, often sparkles with imagination and wit." The following examples may serve to illustrate the truth of the foregoing remark: *Apôtre* ("apostle") applied to the fingers, because they are "sent forth." *Sans feuille* ("without leaf"), the "leafless" tree—that is, the "gallows." *Epouser la veuve* (to "marry the widow"), to "be hung;" implying that those who had previously been joined in the same marriage were deceased. *Aspic* (an "asp," or poisonous serpent), a "slanderer." *Sancho Panza,* "justice of the peace," in allusion to Sancho Panza having been under Don Quixote magistrate of the Isle of Barataria. *Sanglier* (a "boar," an animal having long teeth), applied to priests, in allusion to their frequent fasting; the phrase "having long teeth" was equivalent to "being very hungry." Sometimes the principle on which the word (in argot) is formed is a mere resemblance of sound: thus, *arsenic* is used for "arsenal." In a somewhat similar manner *solir* is used for *ventre* ("belly"), because *sollir,* "to sell," in argot signifies the same as *vendre,* which resembles *ventre* in sound. Considerable attention has of late years been paid to the study of argot. Francisque Michel has written a large volume on argot (Paris, 1856), which is said to be by far the most complete work on the subject. Several distinguished novelists, including Bulwer, Dickens, and Victor Hugo, have introduced frequent specimens of this language into their works; it may suffice to refer the reader to "Pelham," "Paul Clifford," "Oliver Twist," and "Les Misérables."

Argout, d' (Antoine Maurice Apollinaire), Count, born in Isère in 1782. He became prefect of Gard in 1817, and a peer of France in 1819. In July, 1830, during the revolution, he negotiated between the popular party and the king, from whom he obtained concessions, but it was then too late. He was appointed minister of commerce in 1831, minister of the interior in 1833, and governor of the Bank of France in 1834. He retained that office many years. Died in 1858.

Argue'lles (Augustin), a liberal Spanish statesman, born in the Asturias in 1775. He was elected to the Cortes, and was a member of the committee which produced the liberal constitution of 1812. He gained distinction as an orator, and became very popular with the liberal party. On the restoration of Ferdinand VII., in 1814, he was imprisoned for several years, but was released by the revolution of 1820. He was minister of the interior for several months in that year, and was an exile from 1823 to 1832. After that date he was a leader of the moderate party in the Cortes, and in 1841 was appointed tutor to the young queen Isabel. Died in 1844. (See Evaristo San Miguel, "Vida de D. A. Arguelles," 1850.)

Ar'gument [Lat. *argumen'tum,* from *ar'guo,* to "make clear"], a reason offered for or against a proposition, opinion, etc.; a series of reasonings; a debate or disputation. In logic, an expression in which, from something laid down as granted (*i. e.* the premises), something else (*i. e.* the conclusion) is to be deduced. "Socrates," says Addison, "introduced a catechetical method of arguing. He would ask his adversary question upon question, until he had convinced him out of his own mouth that his opinions were wrong. . . . Aristotle changed this method of attack, and invented a great variety of little weapons called syllogisms. As in the Socratic way of dispute you agree to everything which your opponent advances, in the Aristotelic you are still denying and contradicting some part or other of what he says. Socrates conquers you by stratagem, Aristotle by force. . . . When our universities found there was no end of wrangling this way, they invented a kind of argument which is not reducible to any mode or figure in Aristotle. It was called the *argumentum basilinum* (others write it *bacilinum* or *baculinum*), which is pretty well expressed in our English word *club-law.* When they were not able to confute their antagonist, they knocked him down." (*Spectator,* No. 239.) In the tables used in the exact sciences, the term *argument* signifies the leading numbers, or quantities, arranged in order at the top or sides to guide to the tabular number sought.

Argumen'tum ad Hom'inem (*i. e.* an "argument [applied] to [the particular] man" whom you are addressing), an argument derived from the principles or conduct of an antagonist, or an appeal to the prepossessions or prejudices of a person to whom the argument is addressed.

Ar'gus [Gr. Ἄργος], a fabulous personage who, according to an ancient Greek legend, had a hundred eyes, some of which were always awake. Having been employed by Juno to guard the cow into which Io was transformed, he was killed by Mercury. Juno is said to have transferred his eyes to the tail of her favorite bird, the peacock. Another mythical Argus was king of Argos, and a son of Jupiter and Niobe.

Argus [named in allusion to the Argus of the Greek mythology, having a hundred eyes; for a more particular explanation see below], a genus of gallinaceous birds remarkable for rich and brilliant plumage. The only known species is the *Argus giganteus,* formerly called *Phasianus Argus,* and now commonly called argus pheasant. It is a native of Sumatra and other parts of the East Indies, and is about equal in size to a common barndoor fowl. Two of the tail-feathers of the male are about four feet long. The name argus is given in reference to the beautiful circular, eye-like markings which adorn the plumage of the male, especially on the secondaries of the wings.

Argyle, ar-gil', a post-township of Penobscot co., Me. It has manufactures of lumber. Pop. 307.

Argyle, a township of Sanilac co., Mich. Pop. 151.

Argyle, a post-village and township of Washington co., N. Y., 46 miles N. N. E. of Albany. It is the seat of an academy. The township contains beautiful lakes and a mineral spring. Pop. of village, 351; of township, 2850.

Argyle, a post-township of La Fayette co., Wis. Pop. 1634.

Argyle, or **Argyll,** Dukes of, marquesses of Lorne and Kintyre, earls of Campbell and Cowal, viscounts of Lochow and Glenilla, barons of Inverary, Mull, Morven, and Tiry (1701), earls of Argyll (1457), barons Campbell (1445), barons of Lorne (1470, in Scotland), Lords Sundridge and Hamilton (1766, in Great Britain).

Argyle (Archibald **Campbell**), Marquis of, a Scottish peer, born in 1598, was a son of the seventh earl of Argyle. In the civil war he fought against Charles I., and was a leader of the Scottish Covenanters. He was defeated in battle by Montrose in 1644. Having become an adherent of Charles II., he took arms for him against Cromwell in 1651. After the restoration of 1660 he was convicted of submission to the usurpation of Cromwell, and was beheaded May 27, 1661.

Argyle (Archibald **Campbell**), ninth earl of, was the eldest son of the preceding. He fought for Charles II. at Dunbar in 1650. The estate of his father was restored to him, with the title of earl, in 1663. When he took the test-oath which was exacted in 1681, he added the phrase, "So far as is consistent with the Protestant faith." For

this offence he was condemned to death, but he fled to Holland. He returned with a small body of armed men, was captured, and executed June 30, 1685.

Argyle, or **Argyll'** (GEORGE DOUGLAS **Campbell**), THE EIGHTH DUKE OF, born April 30, 1823, succeeded his father, the seventh duke, in 1847, before which he was styled the marquis of Lorne. He published in 1848 "Presbytery Examined," in which he defends the Presbyterian system against prelacy. Having entered the House of Lords, he supported the liberal party, and distinguished himself by his oratorical ability and soundness of judgment. He became lord privy seal in 1852, and postmaster-general in 1855. When the Tories obtained power in 1858, he resigned office, but he was reappointed postmaster-general and lord privy seal in 1860. In 1866 he published a philosophical work called "The Reign of Law," one of the ablest of recent works advocating a theistic view of creation. He has also published "Primitive Man" (1869) and other works. He resigned with his colleagues in June, 1866, but was secretary for India 1868–74. He married Elizabeth Gower, daughter of the late and sister of the present duke of Sutherland. His son, the marquis of Lorne, married H. R. H. the princess Louise, daughter of Queen Victoria.

Argyle'shire, a large county of Scotland, bordering on the Atlantic Ocean. It is bounded on the N. by Inverness-shire, on the E. by Perthshire and Dumbarton, on the S. and W. by the sea. It includes the islands of Mull, Islay, Jura, Tiree, Coll, Iona, Lismore, Colonsay, etc. Area, 3255 square miles. The surface is rugged and mountainous, and presents some of the grandest and most picturesque scenery in Scotland. The highest peaks are Bedanamoran, 3760 feet, and Ben Cruachan, 3668 feet. The rocks which predominate here are granite, mica-slate, trap, limestone, and quartz. Long arms of the sea, called Loch Linnhe and Loch Fyne, extend into this county, which also contains Loch Awe, a fresh-water lake. The chief occupation of the farmers is the raising of cattle and sheep. The land is owned by a few proprietors, among whom are the duke of Argyle and the marquis of Breadalbane. Inverary and Campbellton are the chief towns. P. in 1871, 75,635.

Ar'gyro-Cas'tro (modern Gr. *Argyron-Kastron*; Turk. *Ergree-Kastree*), a town of Albania, on the river Deropuli, 50 miles N. W. of Yánina. It is built on the steep declivity of a mountain. The best Turkish snuff is manufactured here. Pop. estimated at 8000.

A'ria ("air"), in music, a rhythmical song, a tune, a measured lyrical piece for one or several voices; commonly applied to a song introduced into a cantata, opera, or oratorio, and intended for one voice supported by instruments.

Ariad'ne [Gr. Ἀριάδνη], a daughter of Minos, king of Crete, became the lover of Theseus when he visited Crete. She gave him a clue of thread by which he was enabled to find his way out of the Cretan labyrinth. Her mythus is not uniform, but, according to one account, she was abandoned by Theseus at Naxos, and subsequently became the wife of Bacchus. Others say that Diana slew her at Naxos with her arrows. She bore twin sons to Theseus. Her name is given to the forty-third asteroid. (See THESEUS.)

Arial'dus, a deacon of the church of Milan, noted for his zeal against the marriage of priests, was born in Lombardy. His preaching led to a schism in the Church, attended with violent tumults. Arialdus was killed June 28, 1066. (See MURATORI, "Annali d'Italia.")

Arian (nations). See ARYA.

Aria'na, the ancient name of a region in the W. central part of Asia, inhabited by the Aryan or Arian race. It probably comprised ancient Persia and Bactriana. "The latest and most vigorous offshoot of these branches" [the Semitic and Iranian], says Bunsen, "the glorious Arian tribe, has outgrown all the rest, as it is the Arian races that have given a new turn to the wheel of history and remodelled the earth." (See ARYA and ARYAN.)

Aria'na, a township of Grundy co., Ill. Pop. 337.

Aria'no, a town of Italy, in Avellino, among the Apennines, 23 miles N. E. of Avellino. It is the seat of a bishop. It has a mountain-fortress, a fine cathedral, several churches, a gymnasium, a normal school, and considerable manufacture of silk. Wine and butter are exported. Pop. in 1861, 12,588.

Arians. See ARIUS.

A'rias Monta'nus (BENEDICTUS), [Sp. *Beni'to A'rias Monta'no*], an eminent Spanish biblical scholar and Orientalist, born in Estremadura in 1527. He was a member of the Council of Trent in 1562, and under the auspices of Philip II. edited a Polyglot Bible, which was published at Antwerp (1568–72), and is highly commended. He wrote, besides other works, "Jewish Antiquities" (1593). Died at Seville in 1598. (See LOUMYER, "Vie de B. A. Montano," 1842; N. ANTONIO, "Bibliotheca Hispana Nova.")

Ari'ca, a maritime town of Peru, in Moquega, on the Pacific Ocean, 239 miles S. W. of La Paz. It was once more important than it is now. It is the principal shipping place of the exports of Bolivia, which are copper, silver, alpaca-wool, and guano. Pop. about 4000.

Arichat, a seaport-town, capital of Richmond county, Nova Scotia, situated on the S. coast of Madame Island, near the Gut of Canso, and on a small bay or inlet of the Atlantic; lat. 45° 28′ N., lon. 61° W. It owes its importance to fisheries. It is the seat of a Roman Catholic bishop. Pop., including Little Arichat, 2719.

Ariç'ia, an ancient and celebrated city of Latium, on the Appian Way, at the foot of Mons Albanus, 16 miles S. E. of Rome. It was an important town in the reign of Tarquin the Proud. The Aricians took part in a war of the Latins against Rome, which ended in their defeat at Lake Regillus, 498 B. C. Cicero speaks of it as in his time a wealthy and flourishing *municipium*. Here was a celebrated temple of Diana, and here is a beautiful lake called Lago di Nemi. The modern town, *La Riccia*, is on or near the site of the ancient Aricia.

Ar'icine, Cincho'natine, Cusco'nine, or **Quin'onine,** an alkaloid found in the white cinchona-bark from Arica. Its salts are easily soluble and crystalline. Its formula is $C_{20}H_{24}N_2O_4$. It is useless in medicine.

Ariége, a river of France, rises in the Pyrenees, flows nearly northward through the department of its own name, passing by Foix and Pamiers, and enters the Garonne a few miles S. of Toulouse. Length, about 90 miles.

Ariége, a department in the S. of France, is bounded on the N. and W. by Haut-Garonne, on the E. by Aude and Busillon, and on the S. by Spain, from which it is separated by the Pyrenees. Area, 1889 square miles. The surface is mostly mountainous, the highest mountains being in the southern part. Among the highest summits are Montcalm, about 10,600 feet, and Serrère, 9592 feet high. It is drained by the rivers Ariége and Salat. The soil of the lower lands is fertile. Here are rich iron-mines, which furnish the chief article of export. It is subdivided into 3 arrondissements, 20 cantons, and 335 communes. Capital, Foix. Pop. in 1872, 246,298.

A'riel, a word signifying "lion of God" or "ark of God," was sometimes applied to the city of Jerusalem. Among the Jews of a more recent date the name was given to a water-spirit.—ARIEL is also the name of one of the principal characters in Shakspeare's drama of "The Tempest," where he is represented as a spirit of air.

Ariel Gazelle (*Gazella dorcas*, var. *Arabi'ca*) is the gazelle of Western Asia, the true gazelle belonging to Northern Africa. The ariel gazelle is one of the most beautiful of antelopes, is twenty-one inches high at the shoulder, of a dark-fawn color, the belly white, with a black or brown band running along the flanks. It is a variety of the species to which the African gazelle belongs. It is hunted both for sport (by falconry) and for its flesh and skin, both highly prized. Gazelles are often hunted in *battue*, for they cannot be successfully followed in the chase, their speed excelling that of the greyhound. They are great favorites in the East when tamed, and the beauty of their eyes is proverbial.

A'ries [the Latin of "ram"] is the name of a sign of the Zodiac; that is, the first thirty degrees of the Zodiac measured from the point at which the equator intersects the ecliptic —*i. e.* the vernal equinox. Longitudes (celestial) are reckoned from this point. Aries is also the name of a constellation of the Zodiac which once coincided with that sign, but which now occupies the same place as the sign *Pisces*. Among the ancient Romans, *aries* was the name of a battering-ram—a machine with an iron head used to batter down the walls of besieged towns or forts.

Ariet'ta, a township of Hamilton co., N. Y., in the Adirondack regions, contains Pisseo Lake, a popular summer resort. Pop. 139.

Ar'il [Lat. *aril'lus*], a botanical term applied to a membrane or peculiar covering of some seeds, formed by an expansion of the *funiculus* or of the placenta. Mace, for example, is the *aril* of the nutmeg. The aril never appears until after the seed is fertilized.

Ari'on [Ἀρίων], an ancient Greek musician and poet, a native of Lesbos, lived probably about 700 B. C. Herodotus has preserved a curious legend, according to which he was returning from Sicily to Corinth by sea with much treasure, to get which the mariners resolved to kill him. Having obtained permission to play one tune, he threw himself into the sea, and was received on the back of a dolphin, which had been charmed by the music, and carried him to land. This dolphin is supposed to be the same as that which figures among the stars.

Arios'to (Lodovico), a celebrated Italian poet, was born at Reggio, near Módena, Sept. 8, 1474. He was educated at the College of Ferrara, and afterwards, in compliance with the wish of his father, studied law, which he disliked and soon abandoned. After the death of his father, who left many children younger than Lodovico, he devoted much time to the support and education of his brothers and sisters. His early lyrical poems procured for him the patronage of Cardinal Ippolito d'Este, whose service he entered in 1503. He was employed by this cardinal, and his brother, the duke of Ferrara, in embassies to several Italian courts. In the intervals of his busy life he meditated and matured his great romantic and fantastic poem, "Orlando Furioso," which was published in 1516, and soon acquired universal popularity. More than sixty editions of it were issued in the sixteenth century. The subject of this imaginative epic is the chivalrous adventures of the paladins of the age of Charlemagne. The best English translations of it are those of Harrington and William Stuart Rose. In 1517 he entered the service of Alfonso, duke of Ferrara, in whom he found a liberal patron. He is said to have been a favorite associate of that prince, and to have enjoyed some ecclesiastical revenues. In 1521 he was appointed governor or commissary of Garfagnana, where he was required to enforce order among a turbulent and rude population addicted to brigandage and violence. In the latter part of his life he married privately a widow named Alessandra Benucci. He had continued to polish and revise his "Orlando Furioso," of which he published an enlarged edition in 1532, in forty-six cantos. He also produced, in Italian, five comedies in verse, seven satires formed on the Horatian model, a number of sonnets, and some Latin poems. He died at Ferrara June 6, 1533, leaving two natural sons. "Ariosto," says Hallam, "has been, after Homer, the favorite poet of Europe. His grace and facility, his clear and rapid stream of language, his variety and beauty of invention, his very transitions of subject, so frequently censured by critics, but artfully devised to spare the tediousness that hangs on a protracted story, left him no rival in general popularity. . . . The 'Orlando Furioso,' as a great single poem, has been very rarely surpassed in the living records of poetry. He must yield to three, and only three, of his predecessors. He has not the force, simplicity, and truth to nature of Homer, the exquisite style and sustained majesty of Virgil, nor the originality and boldness of Dante." (See Harrington, "Life of Ariosto," 1634; Giuniore, "La Vita di Lodovico Ariosto," 1807; Barotti, "Vita di L. Ariosto," 4 vols., 1766; Fabroni, "Elogi di Dante, di Poliziano, di Ariosto, e di Tasso," 1800; Carl L. Fernow, "Lebenslauf L. Ariosto's des Göttlichen," 1809.) William Jacobs.

Arioviʹstus [Ger. *Ariovist* or *Ehrenvest*], a chief of the ancient Suevi or Marcomanni, was a German. Solicited by the Sequani to aid them in a war against the Ædui, he marched (72 B. C.) with an army into Gaul, and took possession of that part which was afterwards Burgundy. The Gauls then applied to the Romans to liberate them from their new master. Ariovistus was defeated by Cæsar near Vesontium (Besançon) in 58 B. C., and fled across the Rhine.

Aris'pe, a township of Bureau co., Ill. Pop. 1216.

Aris'ta (Mariano), a Mexican general, born July 16, 1802, entered the army in his youth. Having served in several civil wars, he was made general of brigade in 1833, and was banished in that year by Santa Anna. He returned in 1835, became a general of division in 1841, and commanded the army which was defeated by General Taylor at Palo Alto in May, 1846. In June, 1848, he was appointed minister of war, and in 1850 was elected president of Mexico. Under his administration Mexico was disturbed by the usual chronic revolts and anarchy, and Arista was driven from power by Santa Anna early in 1853. He died in Spain Aug. 9, 1855.

Aristæn'etus [Ἀριστaίνετος], a Greek rhetorician of Bithynia, was a friend of Libanius. He was killed by an earthquake at Nicomedia in 358 A. D. He, or another of that name, is the reputed author of some fifty fictitious erotic letters (edited by Boissonade, 1822).

Aristæ'us [Gr. Ἀριστaῖος], a personage of classic mythology, represented as a son of Apollo and Cyrene. He married Autonoë, a daughter of Cadmus, was the father of Actæon, and a lover of Eurydice. He was worshipped as a divinity who presided over flocks and herds, and taught men the art of raising or managing bees. (See Virgil, "Georgics," book iv.)

Aristar'chus [Gr. Ἀρίσταρχος] **of Samos,** an eminent Greek astronomer, supposed to have flourished about 275 B. C. The events of his life are unknown. Archimedes, in one of his works, states that "Aristarchus of Samos supposes that the earth revolves about the sun in the circumference of a circle." All of his writings are lost except a short treatise "On the Magnitudes and Distances of the Sun and Moon." He calculated that the sun is twenty times farther than the moon from the earth. (See Fortia d'Urban, "Histoire d'Aristarque de Samos," 1810.)

Aristarchus, a Greek grammarian, educator, and critic, born in Samothrace, was a pupil of Aristophanes of Byzantium. He flourished about 150 B. C., and founded a school of grammar at Alexandria, in Egypt, where he passed the greater part of his life. He educated the sons of Ptolemy Philopator. His life was chiefly devoted to the critical study, explanation, and restoration of the works of Homer and other Greek poets. He is regarded by some persons as the greatest critic and philologist of antiquity; and it is generally agreed that as a commentator and critic of Homer he was more successful and meritorious than any other. He wrote commentaries on various poets, and some works on grammar, of which only fragments are extant. Died at the age of seventy-two. (See C. L. Matthesius, "Disputatio de Aristarcho Grammatico," 1725; K. Lehrs, "De Aristarchi Studiis Homericis," 1833.)

Aristi'des, or **Aristei'des** [Gr. Ἀριστείδης], surnamed the Just, an eminent Athenian statesman, a son of Lysimachus, was born in Alopeke, a demos of Attica. His political tendencies were conservative or aristocratic. He was one of the ten generals who had the command of the army when the Persians invaded Greece in 490 B. C. Each general had a right to the chief command for one day, but Aristides persuaded his colleagues to resign or waive their claims, so that Miltiades commanded at Marathon when it was not his turn. Aristides became chief archon in 489, and a political adversary of Themistocles, the leader of the democracy. On the pretext that his influence was dangerous to the public interest, he was ostracised in 483 B. C. On this occasion a citizen who was personally a stranger to him, and who could not write, requested him to write *Aristides* on a shell to be used in voting. He asked this voter if Aristides had injured him. "No," replied the citizen, "but I am tired of hearing him always called Aristides the Just." When Xerxes, king of Persia, invaded Greece with a mighty army in 480 B. C., Aristides sought an interview with Themistocles, took a prominent part in the battle of Salamis, and recovered his popularity. He commanded the Athenian troops, which, aided by other Greeks, defeated the Persians at Platæa in 479. Aristides and Cimon were appointed in 477 B. C. commanders of the Athenian forces which co-operated with other Greek armies against the Persians. Pausanias the Spartan had the chief command of the allied army, but he offended the allies by his arrogance, while Aristides by mildness and prudence gained general favor, and promoted the supremacy or predominance of Athens among the states of Greece. He died poor in 467 B. C., leaving a son and two daughters, who received dowries from the public treasury. Few statesmen have left so pure and honorable a reputation as Aristides. (See Plutarch, "Life of Aristides;" Cornelius Nepos, "Life of Aristides.") William Jacobs.

Aristides (Ælius), a Greek Sophist and rhetorician, born in Bithynia about 124 A. D., was a pupil of Polemon and Herodes Atticus. He acquired a high reputation for eloquence, and produced many orations and panegyrics, which display a brilliant style and skill in the choice and arrangement of words. He resided at Smyrna when that city was ruined by an earthquake in 178 A. D., and persuaded the emperor Marcus Aurelius to rebuild it. Died in 189 A. D. About fifty of his orations and treatises are extant. These were published by Dindorf in 3 vols., 1829.

Aristides of Thebes, an eminent Greek painter who lived about 350 B. C., and was a contemporary of Apelles. He had a brother, Nicomachus, who was a skilful painter. According to Pliny, Aristides was the first who expressed on the countenance the passions and movements of the soul. He painted a battle between the Greeks and Persians, which the Roman consul seized among the spoils of war and took to Rome.

Aristip'pus [Gr. Ἀρίστιππος], a Greek philosopher, the founder of the Cyrenaic school, was born at Cyrene, in Africa, about 425 B. C. He was a pupil of Socrates, but did not adopt his principles or imitate his mode of life. He travelled extensively, indulged freely in sensual pleasure, was intimate with the courtesan Lais at Corinth, and flourished as a courtier and philosophic voluptuary at Syracuse in the reign of Dionysius the Elder. Though he recognized pleasure as a proper subject of pursuit, he appears to have observed some moderation in that pursuit, and to have been remarkable for self-control and equanimity as well as versatility, and a faculty of adapting himself to the vicissitudes of fortune. Plato is reported to have said that "Aristippus was the only man he knew who could wear with equal grace fine clothes and rags." He was celebrated for his witty sayings and repartees, some of which are recorded

by Diogenes Laertius. His works, if he wrote any, have not come down to us. He despised or neglected mathematics and physical sciences. He died after 366 B. C., and left a daughter, Arete, who was distinguished as a philosopher. Wieland wrote in German a romance of "Aristippus and his Contemporaries" (4 vols., 1800–02). (See G. H. Lewes, "Biographical History of Philosophy;" F. Mentz, "Aristippus Philosophus Socraticus, sive de ejus Vita," 1719; Ritter, "History of Philosophy.")

Aris'to or Aris'ton [Gr. Ἀρίστων] **of Chios,** surnamed the Siren, a Stoic philosopher who lived about 275 B. C., was a disciple of Zeno. He taught at Athens, and confined his attention to moral philosophy. He maintained that the chief good consists in indifference to everything except virtue and vice.

Aristobu'lus [Gr. Ἀριστόβουλος], a Greek historian who took part in the expedition of Alexander the Great against Persia, about 332 B. C., and wrote a history of the same, which is not extant. It was highly esteemed by the ancients.

Aristobulus, a Jew and philosopher who lived at Alexandria about 175–150 B. C. He was the reputed author of a Commentary on the Books of Moses, the aim of which was to show that the ancient Greek writers had borrowed much from the sacred books of the Hebrews.

Aristobulus I., high priest of the Jews, was a son of Joannes Hyrcanus. He assumed the title of king in 107 B. C., and died in 105, when he was succeeded by his brother, Alexander Jannæus.

Aristobulus II., a nephew of Aristobulus I., and a son of Alexander Jannæus, became king of the Jews about 70 B. C. Jerusalem was taken in 63 by Pompey, who gave the throne to Hyrcanus, a brother of Aristobulus, and carried the latter as a captive to Rome. Died about 48 B. C.

Aristoc'racy [Gr. ἀριστοκρατία, from ἄριστος, the "best," and κρατέω, to "govern"] signifies ideally a form of government controlled and administered by the best or noblest citizens. It is enumerated by Aristotle among the principal forms of government. Aristocracy is of very ancient origin, and in some countries of ancient times it prevailed as subsidiary to monarchy. The word may be defined as a government controlled by the nobility or privileged class, or a government in which a minority of adult males constitutes the ruling class. Such was the republic of Venice. The aristocratic element also predominated originally in the republic of ancient Rome, which was governed by patricians, whose power was hereditary. The feudal system of the Middle Ages favored the formation of powerful aristocracies. Among modern nations England is perhaps that in which the aristocracy is most influential and respectable. A title of nobility is the great prize for which British statesmen and soldiers compete, and the ranks of the ancient noble families are often reinforced by men of genius, who are raised to the peerage. There is probably no country where rank is more highly prized and ardently coveted, although the political power of the aristocracy has been reduced by the Reform Bill of 1867. In modern language, this word is used to denote nobility, or the higher class of society, without reference to government.

Aristogi'ton, or **Aristogeiton** [Gr. Ἀριστογείτων], an Athenian conspirator, an accomplice of Harmodius in the assassination of Hipparchus. He was put to death by Hippias in 514 B. C. He was regarded as a patriot by the Athenians, who erected statues to him and to Harmodius.

Aristolo'chia [from the Gr. ἄριστος, the "best," and λοχεία or λόχια, "childbirth"], a genus of plants of the natural order Aristolochiaceæ, are mostly natives of tropical countries, and have twining stems. The genus is characterized by a tubular oblique perianth, and by stamens adherent to the style. Some of the species climb to the tops of high trees and have handsome flowers. The *Aristolochia serpentaria,* or Virginian snakeroot, is a native of the U. S., possesses stimulant and tonic properties, and was once supposed to be a remedy for the bite of serpents. Similar virtues are ascribed to various species in different parts of the world. The root of this plant is exported from the U. S. to Europe, and is highly esteemed as a remedy in certain fevers. The *Aristolochia Clematitis* (birthwort) is a native of Europe, a perennial plant, with cordate leaves, erect stem, and grows in waste places, hedges, and among rubbish. The roots of these and many other species, which possess powerfully stimulating properties, have been used in medicine.

Aristolochia'ceæ, an order of exogenous plants, of which *Aristolochia* is the type. It comprises more than 130 species, mostly herbaceous plants or climbing shrubs, natives of warm climates, and particularly abundant in South America. The leaves are alternate, simple, and petiolate; the flowers are tubular perianths, axillary and solitary, and the stamens are epigynous. Several species are cultivated in hot-houses, and prized for the beauty of their flowers. The *Aristolochia Sipho* (pipe vine or Dutchman's pipe), a native of the U. S., and a climbing shrub, is planted in Europe to form shady bowers. The U. S. have several other species.

Aristom'enes [Gr. Ἀριστομένης], a famous Messenian general who commanded the army of his state in the Second Messenian war. He was renowned for personal valor and daring enterprises. Having been finally defeated in 668 B. C., he went with his daughter and son-in-law to Rhodes. (See Jourdan, "Histoire d'Aristomène," 1749.)

Aristoph'anes [Gr. Ἀριστοφάνης], the greatest comic poet of Greece, was born about 444 B. C., and is supposed to have been a native of Athens. Considering his celebrity, the materials for writing his biography are surprisingly meagre. His first work was "The Feasters" (427 B. C.), which is not extant. In 426 he produced "The Babylonians," the aim of which was to satirize the demagogue Cleon, who was his personal enemy. His "Acharnians" obtained the first prize in 425, and is still extant. Among his most admired dramas is "The Knights" (424 B. C.), in which he attacked and caricatured Cleon with great wit and virulence. In the performance of this play, which gained the first prize, the author acted the part of Cleon, as no other actor would venture to incur the resentment of that powerful popular favorite. Aristophanes was a conservative, and opposed innovations in politics, religion, and the social order. He was more distinguished for his ability to expose the depravity of human nature than for his capacity to appreciate its noble attributes and manifestations. Among his masterpieces is "The Clouds" (423 B. C.), an ingenious and powerful satire directed against the Sophists, of whom he represented Socrates as the head and master-spirit. He ridiculed and vilified Socrates, and excited the popular prejudice against him as a skeptic and corrupter of youth. He composed about fifty-four comedies, of which only eleven are extant, viz.: "The Acharnians" (425); "The Knights" (424); "The Clouds" (423); "The Wasps," which gained the prize in 422; "The Peace" (419); "The Birds" (414); "Lysistrata" (411); "Thesmophoriazusæ" (411); "Plutus" (408); "The Frogs" (405); "Ecclesiazusæ" (392 B. C.). These plays belong to the old comedy. His wit is so involved in allusions to local events that modern readers find it difficult to appreciate or enjoy it. The purity of his style is greatly admired, and is said to be the only thing pure about his works. He died about 380 B. C. "The Acharnians," "The Knights," "The Birds," and "The Frogs" have been translated into English by J. Hookham Frere. (See H. T. Rötscher, "Aristophanes und sein Zeitalter," 1827; H. Pol, "Dissertatio de Aristophane," 1834; C. F. Ranke, "Commentatio de Aristophanis Vita," 1845.) William Jacobs.

Ar'istotle was born at Stagira, a city of Thrace, but a Grecian colony, in the first year of the 99th Olympiad, or 384 B. C. His father was Nicomachus, a physician and friend of Amyntas, king of Macedon and father of Philip. The family of Aristotle was distinguished by the hereditary profession of medicine, and was wont to trace its origin to Machaon, son of Æsculapius. Left an orphan at an early age, he was brought up by Proxenus of Atarneus, in Mysia, to whose guardianship he seems to have been entrusted by his father, and whose memory Aristotle held so dear in after life that he erected a statue to him, and both instructed his son Nicanor in the liberal arts and adopted him as his heir. In his seventeenth year he went to Athens, and became a pupil of Plato, with whom he continued twenty years, and by whom he was called the reader and the intellect of the school, and likened, in his ardor and restiveness, to a colt, which needed the bit more than the spur. Upon the death of Plato (348 B. C.) he accepted an invitation of Hermeas, tyrant of Atarneus, his former fellow-pupil in the school of Plato, to take up his residence with him. Here Aristotle spent the three following years of his life, when Hermeas, conquered by a Persian invader, was sent a prisoner to Persia, where he was put to death by Artaxerxes. To avoid a like fate, Aristotle fled to Mitylene, taking with him Pythias, whom he married, and who is variously described as the mistress, the sister, and the niece of Hermeas. After her death he married his concubine Herpyllis, the mother of his son Nicomachus.

When Alexander of Macedon was born, Philip, his father, is said to have sent this letter to Aristotle: "Be it known unto you that I have a son, and that I am thankful to the gods, not so much for his birth as that he was born in your time. For if you will but take the charge of his education, I assure myself that he will become worthy of his father and of his future kingdom." The philosopher accepted the commission of the king, and there is evidence that he gave early directions respecting the care and cul-

ture of the infant prince. When Alexander was fifteen, Aristotle assumed the personal oversight of his instruction, taking up his residence at the court, and continuing there during the lifetime of Philip, and for two years after his pupil had ascended the throne. When the conquest of the East was undertaken, Aristotle returned to Athens, and taught philosophy in the Lyceum, a temple dedicated to the Lycian Apollo, with walks ornamented by trees, fountains, and colonnades. From these shady walks (περίπατοι) his school received the name of Peripatetic. He here abode and taught thirteen years, when, after the death of Alexander, he was accused by the Athenians of impiety, and fled to Chalcis in Eubœa, the present Negropont, in order to escape the fate of Socrates, or, as he said, that Athens might not have the opportunity to sin against philosophy again. Here he died (B. C. 322), in his sixty-third year.

His Character.—Aristotle's was one of the most highly gifted intellects of all the ages. All agree that his wealth of scientific knowledge, his unbiassed judgment, his constructive power, and his depth and breadth of speculative insight are unsurpassed in ancient or modern times. But the verdict is not so unanimous respecting his moral traits. By some of the ancients he is extolled for his patriotism, his reverence, his modesty, his moderation, his love of truth, and his attachment to his friends, while others hold him up as selfish, ungrateful, sordid, gluttonous, and impious. It must be owned, however, that few of the stories told in proof of either of these sides will bear a sharp look. They rest on frail grounds. But while we have little direct showing that can be trusted respecting the personal character of Aristotle, some points seem clear. The regard in which he ever held the memory of Proxenus, and the beautiful hymn to virtue which he composed in honor of Hermeas, and which we still have, show that he was not incapable of gratitude or of love to his friends. The charge often made that he was jealous of Plato does not hang with the fact of Aristotle's continued intimacy with Xenocrates, Plato's devoted disciple and successor, nor with an elegy, some verses of which have come down to us, in which Aristotle calls Plato one whom the bad might not even praise, and who first taught the world how a man could be at the same time good and happy. In his will he shows not only a judicious care, but an affectionate solicitude, for his family, while in his writings a lofty moral tone appears and a winning frankness and sincerity seem to shine.

His Writings.—These were very numerous, though only a small part, perhaps a fourth, remain, all of which probably differ more or less from the state in which Aristotle left them. Incompetent editors and ignorant transcribers have made almost as much mischief as the mould and mildew by which some of the original manuscripts are said to have been sadly injured, and some destroyed. But while the fragmentary and skeleton-like form which many of the so-called Aristotelian writings possess, joined to the evident omissions and the repetitions and contradictions which they contain, show the work of some other hands than those of the great master, there remains a solid nucleus of considerable size, whose purity of style and depth of speculative content bring us into the unmistakable presence of Aristotle himself.

His Philosophy.—Aristotle's method is exactly the reverse of Plato's, which he does not tire of making manifest. The attention which Plato had given to the unity of all being, Aristotle directs to the manifoldness of the phenomenal world. He is as analytic and discursive as Plato is synthetic and intuitive. While Plato finds in the universal the only light in which the particular can be seen, Aristotle sees the particular to be necessary in order that we may have any knowledge of the universal. So he gathers particulars from all quarters. History, the human mind, and all departments of nature furnish him contributions. He has no rival in the variety and extent of the facts which he has collected, and has never been surpassed in the patient industry of his investigations. But it is a great mistake, though one easily and often made, to judge thereby that Aristotle sought for nothing beyond experience, or that he and Plato represented only the opposite extremes of empiricism and idealism. The idea was as truly the object of Aristotle's search as it was of Plato's. Both Plato and Aristotle also agreed that the reality or the essence of individual things was in the idea. Aristotle also held as strongly as Plato to the objective existence of the idea. The doctrine of the Nominalists in the Middle Ages, that the idea or the universal is only a subjective product in which objects are represented, and by which they are named, though often ascribed to Aristotle, is but little less foreign to him than to Plato. But while to Plato the idea had an objective existence independent of the individual object which participated in it, to Aristotle the idea was immanent in the individual, and had no being separate from it. This accounts for the prodigious attention which Aristotle gave to individual facts. He collected these in such vast measure, not because they had any interest in themselves, and not because their collection and classification could give a satisfying science, but only for the sake of the idea which was immanent in them, and which was the only proper object in scientific inquiry, since it was the only object which could be truly known.

This immanence of the idea in the individual shows what was the most essential difference between Plato and Aristotle, and also what was the most characteristic and important doctrine in the Aristotelian philosophy. Aristotle criticises Plato because the Platonic ideas, being separate from and independent of phenomena, could not explain the existence of the phenomenal world. They are, in the Aristotelian view of Plato's doctrine, only potential, not actual, sources of individual things. But to the idea as universal Aristotle ascribes an activity which individualizes, but this individualization is not a change to anything without, nor because of anything without, but is wholly within the universal itself; it is a change thus into a difference which is at the same time an identity, a determining which is a self-determining, wherein the universal or the idea realizes or actualizes itself. This self-realizing of the idea is conformity to an end which is at the same time a self-end, a true Final Cause, wherein is the living principle and rational explanation of individual things. This doctrine of the final cause, or sufficient reason, which it is the immeasurable merit of Aristotle to have introduced into philosophy, carries us back to a principle deeper than that of efficient causation, and brings us from the world of necessity to that of freedom. Our modern physicists would gain a profounder view of nature and a more successful pursuit of science if they could know this principle as Aristotle taught it. They would find him, as the ancients called him, "the father of those who know." (See STAHR, "Aristotelia;" LEWES, "Aristotle;" GRANT, "Ethics of Aristotle;" TRENDELENBURG, "Comm. ad 'De Anima;'" HEGEL, "Geschichte der Philosophie;" RITTER, UEBERWEG, and SCHWEGLER, ditto.) J. H. SEELYE.

Aristox'enus [Gr. Ἀριστόξενος] **of Tarentum,** a Greek philosopher, a pupil of Aristotle, lived about 350–320 B. C. He wrote numerous works, which are lost, and a treatise on music ("Elements of Harmony"), which is extant and is accounted valuable. It was published by Meursius in 1616. He founded a school of musicians, who rejected the system of Pythagoras, and judged of the notes in the diatonic scale by the ear exclusively.

Arith'metic [Gr. ἀριθμητική, from ἀριθμός, a "number"], the science which treats of numbers or the art of computation, is a branch of mathematics. In the ordinary use of the term it is the art of expressing numbers by symbols, combining these symbols, and applying to them rules of the greatest practical utility. Among the ancient Greeks, Pythagoras, Archimedes, and others cultivated the science of numbers, but they labored under the disadvantage of a clumsy mode of notation, and had no sign for zero or naught. The Roman numerals, I, V, X, L, C, etc., continued to be commonly used in Europe until the fifteenth century. The invention of the symbols called Arabian numerals, now in use, is attributed to the Hindoos. The use of the cipher (0) gives the modern arithmetic a great advantage over the ancient. In the modern system of notation every symbol has a *local* as well as an *intrinsic* value. The intrinsic value of a symbol is the number it represents; the local value depends, *first,* upon the number of symbols used, and *secondly,* on the position of that symbol with respect to the others. The ordinary system is called *decimal,* because the calculations are performed by ten symbols or digits.

Arithmet'ical Mean, The, of two numbers is equidistant from those numbers, and is found by adding them together and dividing by 2. The mean of a series of numbers is the quotient obtained by dividing their sum by their number; thus the arithmetical mean of 1, 2, 7, and 10, is 5.

Arithmet'ical Progres'sion, a series of three or more numbers that increase or diminish by a common difference, as 5, 7, 9, 11, 13. To find the sum of such a series, multiply the sum of the first and last terms by half the number of terms.

A'rius (classical pronunciation *Ari'us*), or **Arei'us** [Gr. Ἄρειος], the founder of Arianism, was born at Cyrene, in Africa, near the middle of the third century. He was made a deacon by the patriarch Peter at Alexandria, and was placed in the highest rank in the clergy by the patriarch Alexander. About 318 A. D. a controversy arose between Arius and Alexander, which caused Constantine to summon a general council at Nicæa (Nice). This council pronounced the doctrines of Arius (who denied that the Son was coessential and coeternal with the Father) to be

heretical, and Arius, who was present at the council, was exiled to Illyricum. This sentence, however, was soon after revoked. Arianism was approved by the Synods of Tyre and Jerusalem in 335 A. D., soon after which Arius returned to Alexandria, where his presence created such a disturbance that he was under the necessity of retiring to Constantinople. He suddenly died in 336 A. D. Arianism was supported as the state religion by the emperor Constantine and by Valens. The Goths, Vandals, Suevi, and Longobardians of the fifth, sixth, and seventh centuries were mostly Arians. After the reunion of the Longobardians with the Catholic Church (662), Arianism as a sect soon ceased to exist. The followers of Arius were sometimes called Eusebians, from Eusebius, bishop of Berytus and Nicomedia. They became divided into two portions—the "Hetero-ousians" (strict or ultra-Arians), and "Homoiousians," who allowed the "similar essence" of the Son with the Father. (See NEANDER, "History of the Christian Church," and MAIMBOURG, "Histoire de l'Arianisme," a popular though not very trustworthy work.)

Arius, a genus of siluroid fishes in which the body is partially protected by strong bony plates. It has been suggested by Huxley that the ancient placoderm fishes (*Pterichthys* and *Coccosteus*) may have modern representatives in the plated siluroids, such as *Arius*, *Clarias*, etc.

Arizo'na, a Territory of the U. S., lying between the Rocky Mountains and the Sierra Nevada, bounded by Nevada and Utah on the N., New Mexico on the E., the republic of Mexico on the S., and California and Nevada on the W. It extends from 109° to 114° 25′ W. lon. from Greenwich in breadth, and from 31° 37′ to 37° N. lat., and has an area of 113,916 square miles, or 72,906,240 acres, varying very little from the united areas of New York, New Jersey, Pennsylvania, Delaware, and Maryland.

Surface, Mountains, Rivers, etc.—The surface of the Territory is generally elevated, and consists of wide plateaus, having a mean elevation in the N. of 7000 to 7500 feet above the sea-level, and sloping gradually southward, though occasionally broken by precipitous cliffs, till in the region S. of the Gila it has a height of from 60 to 100 feet above the sea. These plateaus are occasionally crossed by ranges of high mountains, and diversified by towering, isolated peaks, reaching an altitude of 12,000 to 14,000 feet above the sea. They are also riven in all directions by rivers and streams, which have, by ages of erosion, cut for themselves channels through the different strata to a depth varying from 1000 to nearly 7000 feet. These cañons, as they are called, are in some instances of great length, and their perpendicular walls of from 4000 to 7000 feet in height are occasionally broken by side cañons, of less depth, from tributaries of the larger rivers, which discharge their waters in cataracts over these walls. The Grand Cañon of the Colorado, 400 miles in length and ranging from 1500 to 6000 feet in height, with its numerous cataracts and its dark cavernous rapids and whirlpools, is one of the wonders of the world. The mountain-chains, which are mostly spurs and outliers from the Rocky Mountains, traverse the country, with one or two exceptions, from N. E. to S. W. The principal ranges are the Piloncillo, the Pinaleno, and Santa Catarina in the S. E.; a low range along the N. bank of the Gila; the Mongollon in the E., between the Gila and the Colorado Chiquito; the Zuni Mountains, between the Zuni and Rio Puerco, also in the E.; the Sierra de Tuni or Catamaza Mountains in the N. E.; the Sierra del Carizo and the San Francisco Mountains in the N.; the North-Side Mountains in the N. W.; the Aquarius and Black Mountains in the W.; and the Castle Dome Mountains in the S. W. There are also many isolated peaks and buttes in the Territory, some of them of great height. In the N. there is an isolated table-land of considerable extent, more than 1000 feet above the elevated plateau, called the Mesa de la Vaca, or "Table-land of the Cows." Nearer the centre of the Territory are the Blue Peaks, and farther W. Mount Kendrick, Mount Sitgreaves, Music Mount, Picacho Mount, and Mount Bill Williams. The San Francisco Mountains, which we have already mentioned, seem to have been a group of volcanoes, none of them now active, but centuries ago they poured out immense streams of lava, which flowed northward to the banks of the Colorado Chiquito. The geological formation of most of these mountains and mountain-ranges is granitic, though in the more western ranges there are indications of gneiss and of talcose, micaceous, and clay slates. The soil of the valleys and plateaus between the ranges generally consists of the detritus of these rocks, thus indicating that they underlie much of the surface of the country. It is computed that the successive cañons of the Colorado and its upper affluents expose to view, in all, geological strata to the thickness of 25,000 feet of the earth's surface; and all the formations known in American geology, up to the tertiary and drift formations, are found in their regular places. Nowhere on the globe is there a better opportunity of studying the geological structure of the earth. The whole Territory is drained by the Colorado of the West and its tributaries. This magnificent river, which has a length of more than 1200 miles, and drains a region more than 300,000 square miles in extent, is formed in Utah by the junction of the Green and Grand rivers; the former rising in Western Wyoming, the latter in the mountains of Colorado. From their union the Colorado flows S. W. to the northern boundary of Arizona, and, continuing in the same direction there for a short distance, turns sharply to the S. S. E., and thence W. N. W., until it strikes the Nevada boundary, where for 35 miles more, flowing N. W., it forms the northern boundary of Arizona; and at Fortification Rock turns directly S., and, forming the western boundary between Arizona, Nevada, and California, discharges its waters into the Gulf of California. For nearly 600 miles of its course in Arizona it flows through deep cañons, receiving numerous streams (more than 200 in all), and effecting a descent in its course through the Territory of not less than 3000 feet. The descent of the river through these formidable cañons, rapids, and cataracts has been several times attempted, and Colonel Powell, U. S. A., accomplished it with great peril to himself and party in 1869, and again in 1871. It is navigable, though with some difficulty, from its mouth as far as Callville, Nev., at the entrance to the Grand Cañon. The other rivers of Arizona, all of them affluents of the Colorado, are the Colorado Chiquito, or Little Colorado, a large stream, which, like the preceding, flows through deep cañons; the Gila, which crosses the Territory from E. to W. between the 33d and 34th parallels, and discharges its waters into the Colorado near its mouth; Bill Williams' Fork, Yampa Creek, and Diamond River, tributaries to the Colorado between the Colorado Chiquito and the Gila; the Zuni, Rio Puerco of the West, Cottonwood Fork, Bouche's Creek, Chevelon's Creek, and Cataract Creek, affluents of the Little Colorado; and the Rio de los Palos, Rio Prieto, Rio San Carlos, Rio Salinas, Rio Verde or San Francisco, which lower down takes the name of the Saladas, Agua Frio, Copper Creek; and on the S. side, Rio San Domingo, Rio San Pedro, and Rio Santa Cruz, affluents of the Gila. None of these rivers have much value for navigation, their principal importance depending on the demand for their waters for irrigation, mining, and manufacturing purposes.

Mineralogy.—Arizona probably surpasses every other State and Territory of the Union in the abundance and variety of its mineral treasures. Gold is found in every part of the Territory, both in placers and veins; silver is abundant and easily mined in the southern part of the Territory, the Heintzelman mine, or Cerro Colorado, yielding from $350 to $1000 to the ton of ore, and the Mowry, Santa Rita, Salero, Cahuabi, and San Pedro mines proving profitable for many years. Many gold and silver mines had been worked by the Spaniards and Mexicans successfully for years before the Territory came into possession of the U. S., and these mines are still largely productive. There are quicksilver-mines near La Paz; tin, nickel, and cinnabar are found in several localities; copper of great purity; lead, platinum; iron ore of several varieties, including the ores best adapted to making the finer qualities of iron and steel; bituminous coal near Camp Apache, and other qualities adapted to smelting purposes at several other localities; salt, sulphur, and gypsum, valuable mineral springs, natural loadstones of great magnetic power, and fossil woods in great variety occur in different portions of the Territory. There are also opal pebbles, garnets, red, white, and yellow; azurite, malachite, chalcedony, opals, sapphires, and possibly some diamonds.

Soil and Vegetation.—Aside from the barren and lava-covered sides of the isolated peaks, and the precipitous cañons and *mesas* or lofty table-lands, the soil of Arizona is generally fertile, needing only systematic irrigation to make it yield abundantly. Even those apparently worthless alkaline deserts, on which the candelabra cactus, the chapparal, the sagebush and the greasewood constitute the only vegetation, yield abundant crops when water is conducted to them. The region of the lower Colorado, which is often overflowed by the Colorado and the Gila, yields most astonishing crops. The great Colorado plateau of North-eastern and Eastern Arizona is for the most part covered with a heavy growth of forest trees—mainly the short-leaved southern pine, fir, and hemlock, scrub-oak, cedar, and juniper; while the mesquite, cottonwood, palo-verde, and mountain mahogany are found in the more elevated valleys, and the cactus of numerous varieties in the lower and drier plains. The greater part of Arizona is an excellent grazing region, and if it could be protected from the raids of the Indians the Territory might become the finest stock-raising country on the continent. By the aid of irrigation where it is needed, and without it in the south-

ern portion along the lower Colorado and Gila, the cereals, maize, beans, onions, and semi-tropical fruits can be cultivated with great success. There is abundant evidence that this Territory once maintained a very dense population. The ruined cities, and the numerous and costly *acequias* (aqueducts) for conducting water for irrigation and other purposes, show that the intelligent and industrious tribes who were driven out by the Apaches had made great advances in civilization. Many of these acequias are still capable of being used with but moderate repairs.

Zoology.—All the wild animals of the Rocky Mountain and Sierra Nevada slopes are found here, and some genera and species which are rare or unknown farther N. The bison or American buffalo is not as abundant here as farther N., but deer of at least two species, antelopes, the big-horn or mountain sheep, are found in great numbers; the plains of Southern Arizona have large herds of wild horses, or mustangs; and of the beasts of prey there are pumas, jaguars, ocelots, black and grizzly bears, wild-cats, the red and the gray wolf, foxes, some peccaries, raccoons, and opossums, the sage-rabbit, several species of squirrels and prairie-dogs. Of birds there is a very great variety, Lieut. Wheeler's exploring expedition having sent to the Smithsonian Institution 500 specimens of 183 species; among them, a swamp-swallow never before found W. of the Rocky Mountains, and another species supposed heretofore to inhabit only the Arctic regions. Game birds are very abundant, especially in Southern Arizona, as well as many of the vulture and eagle tribes; the king vulture, or king of the buzzards, an enormous vulture, little inferior in size to the condor or the lämmergeier, being occasionally seen. Fish of species elsewhere unknown are found in the Colorado and its tributaries, and some species have been discovered in the mineral springs. Many of the fishes of these rivers are of very fine flavor and delicate flesh. There are also numerous species of mollusks. The serpents and reptiles of Arizona are very numerous and formidable. The rattlesnake abounds on the sandy mesas or table-lands, and among the chapparal and around the gigantic cereus or saguana, scorpions, lizards, centipedes, and horned toads are found. In some of the rivers of Southern Arizona there are alligators.

Climate.—In Northern and Central Arizona the air is dry and pure, sometimes cold, but there is seldom any snow, except on the mountain-summits, and frosts are rare. The heat of summer on the table-lands, where the forests are wanting, is sometimes great, but transient, and owing to the dryness of the atmosphere and the cool breezes from the mountains the nights are invariably comfortable and refreshing. Southern Arizona has a mild and delightful climate in winter, but the summers are excessively warm. The mercury rises at the mouth of the Gila to 120°, or even 126° F. in the shade, and to 160° or higher in the sun. This lower valley of the Colorado is overflowed every summer by the river, and there is considerable sickness from malarial fevers in consequence. The rainfall throughout the Territory occurs principally in June, July, August, and September, this being known as the rainy season. During the remainder of the year the cultivated fields must rely upon irrigation for their moisture.

Products.—According to the census of 1870, there were in that year 14,585 acres of improved land, and 7222 acres of unimproved land, in farms in Arizona, the value of which was estimated at $161,340, and the value of farming implements on them was $20,105. The wages paid to farm-laborers was $104,620, and the total estimated value of farm products was $227,998. This was exclusive of the lands cultivated by the Indians on reservations in the Territory, which must have been quite as much more. The number of horses broken to saddle or harness was 4432, of which only 335 were on farms; the number of neat cattle was 38,632, of which 33,500 were on the stock-ranges and the remainder on farms. The agricultural products reported were 27,052 bushels of wheat, 32,041 of corn, and 55,077 of barley. The commissioner of the land office estimated in 1870 that 6,000,000 acres of the Territory by the aid of irrigation are capable of yielding very large crops; that 55,000,000 acres were excellent grazing-lands, and the remainder was inarable from its broken and mountainous surface or the persistent drought. From the report of Lieut. Wheeler, now engaged in the survey of the Territory, it would appear that the fertile and arable lands are of larger extent than the commissioner had estimated. Lieut. Wheeler states that the Territory contains more good and arable lands than Nevada, and that even the high and apparently barren mesas or table-lands under the influence of irrigation, which, from their relation to the rivers, is almost universally practicable, would yield abundant crops.

There are few *manufactures*, and these only of the simpler and ruder kinds. The great industry of the Territory is *mining*, and this is prosecuted at so much hazard, from the depredations and outrages of the Apaches and some Mexican outlaws, that comparatively little is accomplished. Many of the gold and silver mines have been worked for nearly 200 years, but are now abandoned from the danger incurred in working them; others are of more recent discovery. There is no definite information concerning either the number or the annual yield of gold and silver in the mines now opened and worked in the Territory. There are probably fifty or sixty mines and placers on which some work has been done; but many of the mines, besides the danger from the Indians, have as yet an inadequate supply of water, and many others, yielding so far only the lower grade of silver ores (those yielding from $15 to $40 per ton of ore), are rendered unprofitable by the great expense of transportation between the mines and the smelting establishments. These difficulties will soon be obviated by the construction of mining canals and aqueducts and the building of railways. The Heintzelman mine is thus far the most productive, but the Mowry, Santa Rita, Salero, Cahuabi, San Pedro, Vulture, Tiger, and some of the newer mines, are yielding well.

Railroads.—There are as yet no railroads in the Territory, but two lines from the Mississippi to the Pacific coast: one starting from Vicksburg, following the 32d parallel to the vicinity of Tucson, and thence along the valleys of the Santa Cruz and Gila to the Colorado River, and having its termini at San Diego, San Pedro, and San Francisco; and the other starting from Memphis, following, with some deviations, the 35th parallel, is to cross Central Arizona, along the valley of the Rio Puerco of the West, and bridge the Colorado at the mouth of Pahute Creek, having for its ultimate destination San Francisco. Both these roads are now in active progress, work being prosecuted on them at both ends, and they will probably be completed in four or five years.

Finances.—The assessed value of real and personal property in Arizona in 1870 was $1,410,295; the true value, $3,440,791, exclusive of government property—forts, barracks, stores, etc.—and of property in the hands of Indian agents for distribution. The total local taxation the same year was $31,323, and the local debt, $10,500. This debt was paid off before Jan., 1872. The government expenses for territorial offices amount to $15,000. There are no banks, savings banks, or insurance companies in Arizona. The commerce of the Territory is conducted mainly through San Francisco and Santa Fé, N. M. The Territory had sent for coinage to the U. S. mint, up to June 30, 1872, $1,015,274.47, although much the greater part of its silver ores was sent to Swansea, Wales, for reduction, and the bullion subsequently sold in London. Several of the mining companies which reduced their own ores were English, and these shipped the bullion directly to England.

Population.—The population of Arizona, then a portion of New Mexico, was in 1860, 6482, leaving out of the count Indians not taxed—that is, still retaining their tribal organization. In 1870 there were 9658 of the settled population, including 9581 whites, 26 colored persons, 20 Chinese, and 31 civilized Indians. There were also 32,052 Indians sustaining tribal relations, of whom 4352 were on reservations or in villages, and it was estimated that 27,700 were nomadic. Of the 4352 Indians in villages or in reservations, 1277 were men, 1396 women, 925 male children, and 754 female children. Of the 9658 persons regularly enumerated, 5809 were of foreign birth. Of these, 4348 were natives of Mexico, 686 were natives of Great Britain and Ireland, 379 of Germany, 202 from other European states, 142 from British America, and 20 from China. Of the native-born population, 3849 in number, 1240 were born in the Territory, and the remainder in New York, Pennsylvania, Ohio, California, and Missouri. Of the 9658 persons, 6887 were males and 2771 females. The density of the population, excluding tribal Indians, is .085 to the square mile. The settlements of whites are mostly along the lower Colorado, the lower Gila, and the Santa Cruz rivers, in which regions are the greater number of silver and gold mines which have been worked of late. The Indian tribes of the Territory are the Apaches, who are subdivided into Tontos, Pinals, Arivapas, Mescaleros, Bonitos, and Cochise's Apaches; the Seviches, Apache Mohaves, Apache Coyoteros, and Cosninas; the Pimos, Maricopas, Papagos, Yumas, Mohaves proper, Pahutes, Hualapais, Chemehuevis, and Utes. There are also on the elevated mesas of the northern plateau some villages of the Moquis and other *pueblo* or town Indians, the small remainder of the ancient Aztec race, and some of them, perhaps, of a still earlier race, who had acquired many of the arts and refinements of civilization. Of these tribes, the six Apache tribes are all hostile, and have constantly been the terror of the settlers, as well as of the other Indians. Guerrillas, robbers, and murderers by profession, no portion of the settlements has been exempt from their daring and bloody raids. The territorial

legislature in 1871, in a memorial presented to Congress, furnished sworn evidence that in the two years previous 166 persons had been murdered, and 801 horses and mules and 2437 cattle killed or stolen by these lawless tribes. Recently, after a very severe punishment, they have for the first time sued for peace, and pledged themselves to remain on the reservations the government had assigned to them. Their repentance is not likely to be very enduring unless enforced with the strong hand. The other Indian tribes are either indifferent or strongly friendly to the whites.

Education.—The census statistics of 1870 report 149 children, all whites, as attending school, 64 natives and 85 of foreign birth, 79 males and 70 females, while 2690 persons of ten years of age and over could not read, and 2753 could not write. Of the latter, 262 were natives and 2491 of foreign birth. Under the heading "schools of all classes," it gives 1 school, with 7 teachers and 132 pupils, having an income of $6000 per annum. In Nov., 1871, Governor Safford stated in his message that by the first of January following they would have a free school in every district (there are thirty-four districts) in the Territory.

Libraries and Newspapers.—There were in the Territory in 1870 one public (territorial) library, with 1000 volumes, and five private libraries, with an aggregate of 1000 volumes in the five. There was at the same time one weekly newspaper, having a circulation among 280 subscribers, and issuing annually 14,560 copies.

Churches.—In 1870 there were 4 churches (all Roman Catholic) in the Territory, and 4 church edifices, having 2400 sittings and property worth $24,000.

Constitution, etc.—The Territory was organized from New Mexico Feb. 24, 1863, and its constitution and government are still territorial. The legislature meets annually in January. The governor is appointed by the President, and serves four years. The secretary of state, the treasurer (who is also receiver-general), and the auditor, as well as the delegate to Congress, are elected by the people. There is a U. S. district court for the Territory, the judge of which is also chief-justice of the territorial supreme court. There are two associate judges of this supreme court, and all three are appointed by the President. The supreme court holds one session annually at Tucson. There are also probate courts in each county. The territorial legislature has passed an act concerning common schools, which provides for the organization of districts and the levying of taxes for their support by the boards of county supervisors.

Counties.—There were in 1870, 4 counties—viz. Mohave, population 179; Pima, 5716; Yavapai, 2142; and Yuma, 1621. In 1872 the N. W. corner of the Territory, embracing the lowest of the great bends of the Colorado River, and what is known as the Black Cañon, was set off as Pahute county. Its population must be very small.

Principal Towns.—Tucson, the capital, in 1870 had 3224 inhabitants. It is situated on the Santa Cruz River, in Pima county, in the southern part of the Territory, in lat. 32° 14′, and within a short distance of some excellent mines. The only other towns of importance are Arizona City, in Yuma county, situated in the S. W. corner of the Territory, on the Colorado, at the mouth of the Gila, and opposite Fort Yuma; population in 1870, 1144; Prescott, the county-seat of Yavapai county, and the former capital of the Territory, situated in about lat. 34° 35′ N., and lon. 112° 10′ W. from Greenwich; it had in 1870 a population of 668; Adamsville, Apache Pass, and Camp Grant, in Pima county; Ehrenberg and La Paz, in Yuma; Salt River Valley and Wickenberg, in Yavapai.

History.—The southern part of this Territory was occupied by the Spaniards and Spanish missionaries very early. The Jesuits had missions on the Santa Cruz River as early as 1600, and the ruins of their churches and convents are still in existence. There were also settlements in the seventeenth century on the Gila, the Rio Verde, and the Salinas. The whole Territory, as well as that of New Mexico, formed an integral part of the Mexican republic until 1848, when that portion lying N. of the Gila was ceded to the U. S. The Territory of New Mexico had originally for its northern boundary the 37th parallel to the 117th meridian, where it touched the boundary of California. In 1853 the U. S. government purchased from Mexico the territory lying S. of the Gila River and W. of the Rio del Norte, now known as the "Gadsden Purchase," and the triangular section S. of the 37th parallel, and between the 114th and the 117th meridians, was transferred to Nevada. Arizona was a county of New Mexico until Feb., 1863, when it was set off as a separate Territory and organized Feb. 24 of that year. Its growth and prosperity have been much hindered by the constant depredations and outrages of the Apaches, and prior to its organization as a Territory it was also the favorite haunt of outlaws from Mexico, Texas, Nevada, and California. These have now been mostly driven out, and its population is enterprising and law-abiding.

Governors.—

John A. Gurley, 1862–63.	Richard C. McCormick, 1866–68.
John N. Goodwin, 1863–64.	A. P. K. Safford, 1869–73.
M. M. Crocker (military), 1864–66.	

L. P. Brockett.

Arizo'na, a post-township of Burt co., Neb. Pop. 534.

Arizo'na Cit'y, a post-village of Yuma co., Arizona Ter., on the Colorado River, at the mouth of the Gila, 175 miles from the mouth of the Colorado. It has an extensive river-trade carried on in steamers. Pop. 1444.

Arjish', a river of European Turkey, rises in the East Carpathian Mountains, flows south eastward through Wallachia, and enters the Danube 42 miles S. S. E. of Bucharest. Length, estimated at 175 miles.

Arjish-Dagh. See Argæus, Mount.

Ark [Lat. *ar'ca*], a chest, a coffer, a large vessel. The term is principally used in a scriptural signification.

Ark of the Covenant [Heb. *aron;* Gr. κιβωτος]. This ark, together with the mercy-seat, was especially invested with sacredness and mystery by the ancient Jews. It is said to have been an oblong chest two and a half cubits long by one and a half broad and deep, overlaid within and without with gold, and supporting upon its lid the mercy-seat, with the cherubims. Its principal purpose or use was to contain inviolate the tables of stone upon which were written that "covenant" from which it derived its title. It was also the receptacle for the pot of manna and the rod of Aaron. It occupied the most holy spot (the "Holy of Holies") of the whole sanctuary, and thus excluded any idol from the centre of worship. (See Exodus xxv., xxxvii., xl.; also Smith's "Dictionary of the Bible.")

Arkadel'phia, a post-village, capital of Clark co., Ark. It is situated at the head of steam-navigation on the right shore of Washita River, 65 miles S. W. of Little Rock, on the Cairo and Fulton R. R. It has water-power, an active trade, one weekly newspaper, and is the seat of a State normal school; and was, during the first two years of the late civil war, a principal military dépôt for the States of Arkansas, Missouri, and Louisiana. On Feb. 15, 1863, a skirmish took place between a detachment of Union troops under Capt. Brown and a party of Confederates, in which the latter were defeated. Pop. 948.

Arkan'sas, a river of the U. S., next to the Missouri the longest affluent of the Mississippi, rises in the Rocky Mountains and in the W. central part of Colorado. Its general direction is eastward for more than 500 miles through extensive plains, large portions of which are sterile. Having crossed the eastern boundary of Colorado into the State of Kansas, and reached nearly the 98th degree of W. longitude, it turns and flows south-eastward through Kansas and the Indian Territory to Fort Smith, on the western boundary of Arkansas; continuing thence in a south-eastern course, it traverses the State of Arkansas, which it divides into two nearly equal portions, and enters the Mississippi in lat. 33° 54′ N., lon. 91° 10′ W. The whole length is 2170 miles. It is navigable by steamers 800 miles from its mouth during nine months of the year. The difference between high and low water in this river is about twenty-five feet.

Arkansas, one of the South-western States of the Union,

the twenty-fifth in the order of its admission as a State, bounded on the N. by Missouri, on the E. by Missouri, Tennessee, and Mississippi, being separated from the two latter by the Mississippi River; S. by Louisiana, and W. by Texas and the Indian Territory. Its area is 52,198 square miles, or 33,406,720 acres—about the same size as

England without Wales. It lies between the parallels of 33° and 36° 30′ N. lat., and between the meridians of 89° 40′ and 94° 42′ W. lon. from Greenwich.

Surface.—The surface of the State presents great variations of altitude. The eastern portion, from 30 to 100 miles W. of the Mississippi, is generally low, containing numerous lakes, bayous, and swamps, and, except some of the more elevated bluffs, is subject to inundation by the annual overflow of the Mississippi River. Beyond this level region the surface is moderately hilly, rising gradually towards the W. and N. W. The western and northwestern sections consist of extensive and elevated prairies, broken by the passage across them of the Ozark Mountains in a north-westerly direction from Little Rock to South-western Missouri, and S. of the Arkansas River of the Masserne range, which stretches south-westerly from nearly the same point. The hills of the Ozark range rise to a general elevation of 1500 to 2000 feet, while some of the higher ridges and summits attain an altitude of 3000 feet. Besides these two ranges there are the Black Hills in the N., and the Ouachita or Washita Hills in the W. The country N. of the Ozark range is very beautiful with its diversified scenery of hills, plains, prairie, and woodland, and the soil is very fertile and well watered. Indeed, the whole State may be said to be extremely well watered. The Mississippi River washes its eastern boundary from the N. line of Tennessee to the northern boundary of Louisiana. The Arkansas River, entering the State on the W. in lat. 35° 15′, crosses it diagonally, and discharges its waters into the Mississippi in about lat. 33° 40′. The St. Francis, the White River (with its large affluent, the Big Black), the Ouachita (with its tributary, the Saline), and the Red River (with one or two large branches), traverse portions of the State, and discharge their waters into the Mississippi at different points. These are all navigable rivers for at least three-fourths of the year. Almost every county is drained by these or some of their smaller tributaries. Forty-three counties are traversed by navigable streams, and the navigable waters of the State exceed 3000 miles in length.

Geology.—The eastern portion of the State, including the swampy and overflowed lands, is of alluvial or post-tertiary formation, and at no distant geological period formed a portion of the great lake or estuary which occupied the whole valley of the lower Mississippi. At the mouth of the Arkansas River this post-tertiary belt attains its greatest width in the Mississippi Valley, about 75 miles. It passes as the land rises gently into tertiary, which in turn is succeeded by a wedge-shaped tract of cretaceous rocks, narrow N. E. of the Arkansas River, and coming to a point nearly opposite Cairo, but widening rapidly between that and the Red River. N. of the Red River, and occupying some of the south-western counties, is a tract of primitive or azoic rocks, which extends into the Indian Territory, and is the only azoic tract in the State. Adjoining the cretaceous rocks on their N. W. border is a triangular tract of Silurian rocks, having its apex in Saline county and its base in Missouri. W. of this, and occupying all the remaining territory of the State except the small tract of azoic rocks already mentioned, are the carboniferous rocks, and on either side of the Arkansas River, between Little Rock and the western boundary of the State, are the two tracts of coal-measures which will eventually make Arkansas one of the largest coal-producing States in the Union. It will be seen, then, that the geological formations of the State include azoic, Silurian, carboniferous, cretaceous, tertiary, and post-tertiary rocks.

Mineralogy.—Gold has been found, but it is thought not in paying quantities, in White county. The galena of Sevier and Pulaski counties, and it is believed also the deposits of lead ore in Washington, Benton, Madison, Carroll, Newton, Marion, Searcy, Izard, Independence, Lawrence, and Randolph counties are argentiferous, yielding in some instances 73 per cent. of lead and 52½ ounces of silver to the ton. This is a higher percentage of silver than most of the argentiferous galena ores elsewhere yield. The zinc ores of the State are said to be equal to those of Silesia. Copper, manganese, and iron of the best quality are among the other metallic products of the State. The iron ores are of two or three kinds, and when combined produce an iron of great purity and tenacity. Some of the ore-beds are situated in close proximity to the coal-mines, and are worked to great advantage. The coal-fields cover about 12,000 square miles on both sides of the Arkansas River, and coal of good quality has been mined in Washington, Crawford, Sebastian, Franklin, Scott, Johnson, Yell, Pope, Perry, Conway, White, and Pulaski counties. The veins are from three to nine feet in thickness, and the coal is semi-bituminous, easily accessible, and containing very little sulphur. An analysis of a five-foot vein at Green's Bank in Sebastian county gave the following result: volatile matter, 13.75; coke, 86.25; and for the ultimate constituents, water, 1.40 per cent.; gas, 12.35; fixed carbon, 82.25; ashes, flesh-color, 4 per cent. There are also extensive beds of lignite in the south-eastern part of the State, of such quality as to be in demand for steamboat fuel. Marble of the pink and gray tints, and of excellent quality, has been found in various localities; Madison county has many quarries of it. Slate, said to be equal to the best Vermont, and suitable for all purposes, is quarried in Pulaski, Polk, Pike, and Sevier counties. There are extensive quarries of novaculite or "Arkansas hone or oil stone," by far the best hone-stone known, in Hot Springs and Grant counties. The Ozark Mountains are composed of the "millstone-grit formation," and the grindstones from that region are superior to the Nova Scotia burr-stones. Rock or quartz crystals of marvellous purity and transparency, and of large size, are found in Montgomery county and elsewhere in what are called the Crystal Mountains. Kaolin or porcelain clay, mineral paints or ochres, nitre earths, granite of excellent quality, building stone (both sandstone and limestone), marls, greensand, and salt are among the other mineral treasures of the State. "The Hot Springs of Arkansas," very widely known everywhere for their healing qualities, are situated in Hot Springs county, about 60 miles S. W. from Little Rock. The springs are fifty-four in number, and range in temperature from 93° to 148° F. They contain a large amount of carbonic acid and the carbonates of the alkalies and alkaline earths, and have a very high reputation in diseases of the lungs and liver, and indeed in most chronic diseases. There are many other mineral springs in the State, and in Fulton county a mammoth spring, apparently charged with carbonic acid, which is constantly effervescing, has a uniform temperature of 60° F. in winter and summer, and flows at the rate of 8000 barrels per minute.

Vegetation.—Arkansas has extensive forests of valuable timber. Pine of the finest quality is found in the hill-country, and occasionally in the bottom-lands. It is said that the yellow-pine timber-lands cover one-fourth of the area of the State. Dense forests of cypress grow on the bottom-lands and along the lakes and bayous, and single trees are often met with that will yield 6000 feet of lumber. There are many varieties of oak in the State, the most valuable of which are the white oak and a kindred species called the "overcup oak," which grows to a great size, its trunk being often five feet or more in diameter. This is much used for the manufacture of pipe-staves for sugar and tobacco hogsheads. The other timber trees of the State are red cedar, of which there are large tracts in the northern and western sections; black walnut, tupelo gum, wild cherry, maple, black locust, sassafras, red mulberry, and Osage orange, the latter growing to a great size in the Red River valley. There are also among the forest trees ash, hickory, gum, beech, pecan, sycamore, elm, cottonwood, cedar, buttonwood, and hackberry, and of ornamental trees and evergreens the holly, willow, catlep, China tree, box-elder, butternut, palmetto, dogwood, plum, hornbeam, ironwood, mockernut, juniper, and laurel. The undergrowth of the forests consists chiefly of scrub oak, arrowwood gum, sassafras, hazel, sumac, hickory, dogwood, and kinnikinnick, with extensive canebrakes in the lowlands. Among the wild fruits and berries are the pawpaw, persimmon, haw, whortleberry, wild plum, and chinquapin. The cultivated fruits are abundant and of excellent quality. Apples are especially fine in the hill-country. Peaches ripen from the first of June to the first of November, and pears from midsummer to January. Plums, apricots, cherries, nectarines, and all the small fruits, as grapes, blackberries, strawberries, etc., are of fine quality and yield profusely. The grape is extensively cultivated both for the table and for wine, and in the long and moderately warm seasons it comes to a rare perfection. All the cereals, as well as Indian corn, yield abundant crops. Root crops do well, and the native grasses of Arkansas, which include thirty-five varieties, are remarkable for their succulence and their fattening properties. The hay crop is more important in Arkansas than in any other Southern State. Cotton is the great staple, and is largely grown, both on the alluvial lands and on the hills. There is hardly another State in the Union which has so large a proportion of arable lands.

Zoology.—Wild game, consisting of bears, deer, turkeys, ducks, prairie-chickens, and quail, is abundant, and the rivers, lakes, and bayous are well stocked with fish, among which are pickerel, black bass, buffalo, and catfish, the latter sometimes weighing 150 pounds. In the bayous and lakes, and in the Red, Ouachita, and Arkansas rivers, the alligator occasionally makes his appearance, though less abundant than in Louisiana and Texas. Serpents and other reptiles are plentiful in the lowlands, and the rattlesnake and moccasin are found in the hills.

Climate.—Arkansas has as a whole a very fine climate. It is sheltered from the northers by the mountains on the N. and N. W., and from the fierce heats of the Louisiana lowlands by its diversified surface and its long river-valleys. The eastern portion of the State is low and hot, and in the swampy and overflowed lands there is considerable malarial disease—fever and ague, congestive chills, and sometimes yellow fever—but on the higher lands the temperature is equable and the range of the thermometer not excessive. In 1870 the extreme range of the thermometer for the year at Little Rock was 92°; the highest point reached was 96° for one day in September; the lowest point was 4° above zero for one day in December; the average temperature of the four months, June, July, August, and September, was 78° 30′; and the average of the three winter months, December, January, and February, 43°. The mean temperature for the year was 62°. The rainfall ranges from 55 to 60 inches annually. The climate has a high reputation for the relief of pulmonary diseases, and from the vital statistics of the census of 1870 would seem to deserve it.

Products.— The agricultural products of the State in 1872 were: Indian corn, 17,710,000 bushels; wheat, 702,000 bushels; rye, 40,000 bushels; oats, 703,000 bushels; rice (in 1870), 73,021 pounds; peas and beans, 47,376 bushels; potatoes, Irish (*Solanum tuberosum*), 400,000 bushels; potatoes, sweet (*Batatus edulis*), 712,000 bushels; tobacco, 770,000 pounds; hay, 12,500 tons; cotton, 283,372 bales of 450 pounds each; wool (in 1870), 214,784 pounds; beeswax (in 1870), 12,789 pounds; honey, 276,324 pounds; butter (in 1870), 2,753,931 pounds; cheese, 2119 pounds; milk sold, 31,350 gallons. The orchard products in 1870 were $157,219; products of market-gardens, $55,697; forest products, $34,225; wine, 3734 gallons; cane-sugar, 92 hogsheads; maple sugar, 1185 pounds; cane molasses, 72,008 gallons; sorghum molasses, 147,203 gallons; maple molasses, 75 gallons. The number of acres of improved land in farms in 1870 was 1,859,821; of unimproved land in farms, 5,737,475 acres, of which 3,910,325 were in woodland, and 1,827,150 in other unimproved lands; so that only 22.6 per cent. of the land of the State is as yet taken up in farms. The present cash value of the farms of the State (in 1870) was $40,029,698, and of farming implements and machinery, $2,237,409. The total amount of wages paid for farm labor during that year was $4,061,952, and the total estimated value of all farm productions, including betterments and additions to stock, was $40,701,699. The valuation of all live-stock in 1870 was $17,222,556, and of animals slaughtered for provisions, $3,843,923. In Jan., 1873, the number of horses, as estimated by the agricultural department, was 160,700, and their value, $14,302,300; the number of mules was 82,800, and their value, $9,108,000; the number of milch cows was 150,300, and their value, $3,081,000; the number of oxen and other cattle was 251,300, and their value, $4,523,400; the number of sheep was 160,400, and their value, $321,200; the number of swine was 1,067,400, and their value, $4,269,600; making the total value of live-stock at that time, $35,604,500.

The manufacturing industry of the State, though not fully represented in the census, is not large; but it will doubtless increase, as no State in the Union has more abundant water-power, cheaper fuel, or a larger supply of the raw material for manufactures in close proximity to fuel and to good markets. The State had in 1870 two cotton-mills, capital $13,000, using 66,400 pounds of cotton of the value of $13,780, and producing $22,362 worth of goods, at a cost for labor of $4100. There were at the same date 13 woollen manufactories, with $32,500 capital, using 115,330 pounds of domestic wool, valued at $55,782, and producing goods valued at $78,690, with a cost of labor of $6870. There were also 283 establishments for ginning cotton, with a capital of $344,825; 35 for the manufacture of leather, capital $32,100; 212 saw-mills, capital $694,400; 272 flour and meal mills, capital $477,151. The whole number of manufacturing establishments in the State was 1364, capital $2,137,738; steam-engines, 300, with 6980 horse-power; water-wheels, 134, with 1599 horse-power, employing 4133 males above sixteen years of age, 48 females above sixteen, and 271 children; wages paid during the year, $754,950; value of materials used, $4,823,651; value of annual products, $7,699,676. The home manufactures of the State, not included in these, were reported in the census of 1870 to amount to $807,573.

Railroads.—The railroads already completed, and to be completed by Jan. 1, 1874, have an extent of 1169 miles. Of these roads, only 128 miles were completed on the first of Jan., 1870, and ten years earlier there were but 38½ miles in operation. Of the roads now nearly or quite completed, several are trunk-roads, forming portions of the great routes to the Pacific or to Texas. Thus, the Memphis and Little Rock and the Little Rock and Fort Smith, both, we believe, now in operation, form important sections of the Pacific road which is now in progress along the 35th parallel. They will also connect by a short link with nearly 3000 miles of complete railway to the North-west. The Mississippi Red River and Ouachita R. R., starting from Chicot on the Mississippi River and extending westward to Fulton on the Red River, will sustain nearly the same relations to the Pacific road along the 32d parallel and to the International of Texas as the roads previously named do to the line of the 35th parallel. More than 70 of its 155 miles are completed. The Cairo and Fulton R. R., extending from Cairo (Ill.) and from St. Louis, *viâ* the Iron Mountain R. R., to Fulton on the Red River, where it joins the International of Texas, traversing fifteen counties of the State, and forming a part of the grand trunk-line from Chicago and St. Louis to Texas, and ultimately to Mexico, is one of the most important of the Arkansas railroads. It is 301 miles in length, is nearly completed, and will be finished by Jan. 1, 1874. Other important railways in the State are the Arkansas Central, from Little Rock to Helena; the Little Rock Pine Bluff and New Orleans R. R. and its branch, extending from Little Rock to the Mississippi River at Chicot and to the Louisiana line; the Helena branch of the Cairo and Fulton R. R.; the Memphis Shreveport and Jefferson Branch R. R., which leaves the Memphis and Little Rock at Duvall's Bluff; the Arkansas and Louisiana R. R. from Little Rock to Alexandria (La.), not yet graded; and the Arkansas Western, which is to be the connecting link between the road on the 35th parallel and the network of railroads in Kansas and South-western Missouri. There have been awarded to these railroads by the State the loan of its credit to the extent of $15,000 per mile to roads having no land-grant, and $10,000 per mile to those having land-grants. These credits and bonds, having thirty years to run and bearing interest at 6 per cent., the interest to be paid by the roads, have been awarded to the extent of 850 miles, or $11,400,000, but only a portion of the bonds have yet been issued. The land-grants to these companies are not far from 6,000,000 acres.

Finances.—The State debt of Arkansas, present and (so far as the railroads are concerned) prospective, amounts to $19,398,000, and is classified as follows: funded debt, including the amount due to the Smithsonian Institution, loaned to the State many years ago by the general government, $4,430,000; State-aid railroad bonds, as specified above, $11,400,000 (not all issued yet); levee bonds, $3,000,000 (only about $1,600,000 yet issued); ten-year bonds to supply casual deficits, $300,000; floating debt, $268,000. The railroads will generally be able to pay the interest on their bonds, so that the financial position of the State is not discreditable to it. The valuation of property is rapidly increasing: in 1870 the entire assessed valuation, real and personal (which was about 50 per cent. of the real values), was $94,528,843; in 1872 it had increased to nearly $120,000,000, of which a little more than $80,000,000 was real estate, and not quite $40,000,000 personal property. The true valuation in 1870, according to the ninth census, was $156,394,691. Aside from the State debt, there are county debts, mostly the issue of county bonds to railroads, etc., and town and city debts. The former amounted in 1870 to $536,649, and the latter to $154,986. The taxation (aside from national taxes) in 1870 reached the sum of $2,866,890, of which $950,894 was the State tax, $1,738,760 county taxes, and $177,236 town and city taxes. The State tax now yields a little more, and the credit of the State is fast improving. As an interior and riparian State, Arkansas has no foreign commerce and no large river-port. Her cotton is mostly shipped through Memphis and New Orleans. Her interior commerce through her navigable rivers and her rapidly extending railroad system is already considerable, and is fast increasing.

Banks and Private Banking-houses.—There are two national banks in the State—the Merchants' National at Little Rock, with a capital of $150,000, and the National Bank of Western Arkansas at Fort Smith, capital $55,000. There are no State banks and no savings banks. There are ten private banking-houses—three at Little Rock, two at Fayetteville, two at Pine Bluff, and one each at Augusta, Camden, and Helena.

Insurance.—There were no life, fire, or marine insurance companies in the State up to Oct., 1872, but several of the St. Louis, Memphis, Richmond, and New Orleans companies, and perhaps others, had agencies at Little Rock and other points.

Population.—Arkansas was organized as a Territory in 1819, and its first appearance as a distinct Territory in the census was in 1820, when it had 14,255 inhabitants, though settlements within its present boundaries, but then belonging to the Territory of Louisiana, had been reported in 1810 as having 1062 inhabitants; in 1830 the number was 30,388; in 1840, after it had been admitted as a State, 97,574; in 1850, 209,897; in 1860, 435,450; and in 1870, 484,471. Its

population now considerably exceeds 525,000. The density of the population at the last census was nearly 9.3 inhabitants to the square mile. The greater part of the State is considerably below this average, and only a tract comprising six or seven counties on both sides of the Arkansas River in the centre of the State is materially above it. Of the population in 1870, 362,115 were whites, 122,169 colored, 98 Chinese, and 89 Indians. Of the whole number, 479,445 were natives of the U. S., and 5026 were of foreign birth; of the natives, 10,617 had one or both parents foreign, 9893 had a foreign father, 8484 a foreign mother, and 7760 had a foreign father and foreign mother. Of the natives, 170,398 whites, 62,463 colored, and 21 Indians, or nearly one-half, were born in Arkansas, about 230,000 in the other Southern and South-western States, and the remainder in the Northern and Western States and Territories. The foreigners were mostly Germans and Irish. Of the total population, 248,261 were males and 236,210 females; of the native population, 244,491 were males and 234,954 females; of the foreign population, 3770 were males and 1256 females; of the whites, 186,445 were males and 175,670 females; of the colored races, 61,680 were males and 60,489 females. Dividing these, again, into negroes and mulattoes, there were 55,436 male negroes and 54,395 females; 6244 male mulattoes and 6092 females. Of the whole population, 84,645 males and 80,847 females were of school age, or between five and eighteen years.

Education.—The whole number of children attending school during some part of the year 1869–70 in the State was 62,572, of whom 62,546 were natives and 26 foreigners; 56,788 were whites and 5784 colored; 33,068 males and 29,504 females. Of persons ten years old and over, 111,799 could not read, and 133,339 could not write. Of these, 28,298 were white males and 35,797 white females; 34,896 were colored males and 34,326 colored females. There were in the State, according to the census, 1978 schools of all classes, with 2297 teachers, of whom 1653 were males and 644 females; 81,526 pupils, of whom 41,939 were males and 39,587 females. The total income for the support of these schools for the year ending June 1, 1870, was $681,962, of which $7300 was from endowment, $555,331 from taxation and public funds, and 119,331 from other sources, including tuition. Of these 1978 schools, 1744 were public, including 1 normal school, with 3 teachers and 62 scholars, with $10,061 income; 3 high schools, with 6 teachers and 140 scholars, and $3600 income; 225 graded common schools, with 289 teachers and 11,887 pupils, and an income of $93,500; 1515 ungraded common schools, with 1668 teachers, 59,956 scholars, and an income of $445,300. There were also 3 colleges, with 10 professors, 235 students, of whom 125 were males and 110 females, and $7700 income. Of these, St. John's College at Little Rock was founded in 1857 by the Masons, and is sustained by them; Judson University at Prospect Bluff is sustained by the Baptists, and Cane Hill College at Cane Hill by the Christians. There were 30 academies, with 61 teachers and 2144 pupils, of whom 1102 were males and 1042 females, and $25,387 income. There were four technical schools; a State asylum for the blind at Little Rock, established in 1859, which, according to the census, had 4 teachers and 30 pupils (a later report makes the number of teachers and employés 11, and of pupils 40), and an income of $11,000 (the report of commissioner of education says $18,000); one institute for the deaf and dumb, also at Little Rock, with 22 teachers and employés, 72 pupils, and an income of $22,452; 2 schools of art and music, with 3 teachers, 20 pupils, and $1000 income. There were also 187 day and boarding schools, with 241 teachers, 6818 scholars (3484 males and 3334 females), and $67,214 income; and 10 parochial and charity schools, with 11 teachers, 210 pupils, and $6300 income. The "Educational Year-Book" for 1873 makes the number of teachers in the public schools 2035; their salaries in the country, $40 to $100 per month, in the cities, $75 to $125 per month. There are 10 school superintendents, one to each judicial circuit, each having a salary of $3000 per annum. The school fund is $95,501. The number of children of school age is 194,314, of whom 182,474 are registered, but the average attendance is only 32,863. The newly established school system of the State, organized in 1868, and since amended, is very efficient. By the amendments adopted in 1873 education is made compulsory between certain ages. The board of education, which possesses large powers, consists of the State superintendent of schools and the ten circuit superintendents. The State superintendent is elected by the people on the general State ticket, and serves for four years; the circuit superintendents are appointed by the governor for four years. A district trustee is elected annually in each school district, who has charge of the school affairs and local educational interests of his district, and is the executive school officer within his jurisdiction. The State board of education prescribes lists of text-books, puts in operation the provisions of the school law, and makes all needful rules and regulations respecting common schools and the general educational interests of the State. It directs also the establishment of separate schools for white and colored children and youth. The teachers are examined by the circuit superintendents. The schools of Arkansas have received hitherto about $9500 annually from the Peabody fund. A State industrial university to receive the agricultural land-grants was established at Fayetteville in 1871.

Libraries.—The census of 1870 reports 1181 libraries of all classes, public and private, in the State, with an aggregate of 135,564 volumes; of these, 888 were private, and contained 81,232 volumes; of the remaining 293, 1 is the State Library, with 12,500 volumes; 6 are town or city libraries, with an aggregate of 250 volumes; 29 are court or law libraries, with 5747 volumes; 216 were Sabbath-school libraries, with 29,412 volumes, and 37 church libraries, with 4930 volumes. There were also 4 circulating libraries, with 1493 volumes.

Newspapers and Periodicals.—In 1870 there were 56 newspapers and periodicals of all descriptions in the State, having a circulation of 29,830, and issuing 1,824,860 copies annually. Of these, 3 were dailies (4 dailies in 1872), having a circulation of 1250; 1 was a tri-weekly, with a circulation of 300 (there were 2 tri-weekly papers in 1872); 48 were weeklies, having a circulation of 26,280, and 4 were monthlies, with a circulation of 2000. Two of these were agricultural, with a circulation of 1000, and printing 12,000 copies annually; 52 were political—viz. 48 weekly, 1 tri-weekly, and 3 daily—with an aggregate circulation of 27,830, and printing annually 1,800,860 copies; 1 was religious, a monthly, with a circulation of 500, and an annual issue of 6000 copies; and 1 educational, with the same circulation and annual issue.

Churches.—There were, according to the census in 1870, 1371 church organizations of all denominations in the State, and 1141 church edifices, having 264,225 sittings, and holding church property valued at $854,975. Of these, 463 were regular Baptist churches, with 394 edifices, 103,250 sittings, and $195,725 of church property (the "Baptist Almanac" for 1873 gives the number of churches in 1872 as 648, with 408 ministers and 36,040 members); of other Baptist denominations (Christians, Disciples, etc.), there were 100 churches, 68 church edifices, 15,150 sittings, and property valued at $38,725; of Episcopalians there were 15 churches, 13 church edifices, 3695 sittings, and property valued at $43,450 (the "Protestant Episcopal Almanac" for 1873 gives Arkansas 1 diocese, 1 bishop, 11 presbyters, 715 communicants, 153 baptisms, and 131 confirmations); there was 1 Jewish synagogue, with 300 sittings and $6500 of property; 2 Lutheran churches and 2 church edifices, with 1025 sittings and property valued at $10,000; there were 583 Methodist congregations, 485 church edifices, 91,890 sittings, and property valued at $276,850. It is difficult to ascertain the exact numbers of the Methodists in the State, as they belong to four or five different organizations, some of which do not publish detailed statistics. The Southern Methodist Church had about 34,000 members in 1872; the Protestant Methodists about 4000; the colored Methodists probably 6000 or 7000, and all others perhaps 10,000; of regular Presbyterians (*i. e.* Presbyterian Church South and Associate Reformed Synod of the South) there were 106 churches, 87 church edifices, 23,175 sittings, $101,625 of church property (there were in 1872 only 39 ordained ministers reported in the "Presbyterian Almanac"); of other Presbyterians (Cumberland) there were 55 churches, 44 edifices, 10,425 sittings, $77,500 of church property (the Cumberland Presbyterians in 1872 had 87 ordained ministers in Arkansas, and probably a larger number of churches); there were 11 Roman Catholic congregations, 11 church edifices, 5250 sittings, $82,500 of church property, 1 diocese, that of Little Rock, or "Petropolis," and 1 bishop; there was 1 Universalist congregation, 1 church edifice, valued at $400, and with 200 sittings; there were 34 congregations designated as Union, 35 church edifices, 9865 sittings, $21,700 church property.

Constitution, Courts, Representatives in Congress, etc.—The present constitution of the State was adopted by the constitutional convention of the State Feb. 11, 1868, and ratified by the people Mar. 13, 1868. It provides, among other things, that the paramount allegiance of every citizen is due to the Federal government in the exercise of all its constitutional powers, as defined by the Supreme Court of the U. S., and that no power exists in the people of this or any other State of the Union to dissolve their connection therewith, or perform any act tending to impair, subvert, or resist the supreme authority of the U. S. The equality of all persons before the law shall be recognized and ever remain inviolate, nor shall any citizen ever be deprived of

any right, privilege, or immunity, nor exempted from any burden or duty, on account of race, color, or previous condition. The State officers are a governor, lieutenant-governor, secretary of state, auditor, treasurer, attorney-general, and superintendent of public schools, all chosen by the qualified electors at a general election. Their term of office is four years. The legislature consists of a senate of 24 members, chosen for four years, and a house of representatives of 82 members, chosen for two years. The legislature meets biennially in January. Every male person born in the U. S., and every male person who is naturalized or has declared his intention to become a citizen, who is twenty-one years old or upward, and has resided in the State for six months next preceding the election—except criminals, idiots, insane persons, soldiers and sailors in the service of the U. S., and certain classes who participated in the civil war—shall be deemed an elector. The supreme court of the State consists of one chief-justice and four associate justices, all appointed by the governor for eight years. It has appellate jurisdiction. There are ten circuits, to each of which there is a circuit court, which has original jurisdiction over all criminal cases not otherwise expressly provided for by law. The judges and district attorneys of these courts are appointed by the governor, with the advice and consent of the senate, for the term of four years. The constitution makes it the duty of the general assembly to establish and maintain free schools. By the act of Congress of Dec. 14, 1871, Arkansas is entitled to four representatives in Congress during the present decade.

Counties.—There are 64 counties in the State, as follows:

Counties.	Pop. in 1870.	Pop. in 1860.	Pop. in 1850.
Arkansas	8,268	8,844	3,245
Ashley	8,042	8,590	2,058
Benton	13,831	9,306	3,710
Boone	7,032		
Bradley	8,646	8,388	3,829
Calhoun	3,853	4,103	
Carroll	5,780	9,383	4,614

Washington	17,266	14,673	9,970
White	10,347	8,316	2,619
Woodruff	6,894		
Yell	8,048	6,333	3,341

Lincoln, Nevada, and Sarber counties were organized by the legislature in 1871.

Principal Towns.—Little Rock, the capital of the State, is also the largest town. It is pleasantly situated on the Arkansas River at a point where it is always navigable, and is now also a railroad centre for six or seven important railroads, several of them trunk-lines. It has also some manufactories. It is growing very rapidly. Its population in 1850 was 2167; in 1860, 3727; in 1870, 12,380; and it has now (1873) nearly 20,000 inhabitants. The other towns of importance are Fort Smith, in Sebastian county, also on the Arkansas River, on the W. line of the State, population 2227; Van Buren, nearly opposite Fort Smith, but in Crawford county, population 3296; Pine Bluff, on the Lower Arkansas, in Jefferson county, population 2081; Helena, on the Mississippi, in Phillips county, population 2249; Hot Springs, in Hot Springs county, the site of the famous mineral springs, population 1276; Camden, in Ouachita county, population 1612; Fayetteville, in Washington county, in the N. W. part of the State, population 955; and Dardanelle, in Yell county, in the W. part of the State, population 926.

History.—The first settlement within the present limits of Arkansas was made in 1670 by the French, on or near the St. Francis River, where it discharges its waters into the Mississippi. It was a portion of the French territory until 1803, when Louisiana Territory, of which it was a part, was purchased from France by President Jefferson to give the U. S. control of the Mississippi River. In 1812, Louisiana having been admitted into the Union as a State, the remaining territory was reorganized as Missouri Territory, and in 1819, Missouri having framed a State constitution, Arkansas and the Indian Territory were organized as Arkansas Territory, and remained in that condition until June 15, 1836, when the State with its present boundaries was admitted into the Union as the twenty-fifth State. Its progress was slow for a time. It had, as we have seen, less than 100,000 inhabitants in 1840, and but 209,897 in 1850. Between 1850 and 1860 its fertile lands and facilities for shipping cotton attracted large numbers of cotton-planters to it from the Atlantic and Gulf slave States, and its population more than doubled during that decade. Settled almost exclusively from the Southern States, its population were very thoroughly identified with the maintenance of slavery, and it entered heartily into the secession movement, though not quite so early as some of the States E. of the Mississippi. The State convention assembled at Little Rock and passed the ordinance of secession Mar. 4, 1861. During the war Arkansas had its full share of the disasters and wretchedness caused by war. A large number of its own citizens were with the Southern armies, and much of its territory was overrun by the hostile forces. The battles of Pea Ridge and Fayetteville, as well as several lesser engagements, were fought in its N. W. section in 1862, the capture of Arkansas Post took place in Jan., 1863, and during the same year Helena and Little Rock were captured, and Gen. Grant's army marched through the bottom-lands W. of the Mississippi to Bruinsburg and Hard Times landings, on their way to the siege and capture of Vicksburg. Before the close of 1863 the State was substantially controlled by the Federal troops. On the 8th of Jan., 1864, a convention was assembled to revise the State constitution. The amended constitution was adopted by the people Mar. 18, 1864, by a vote of 12,177 in its favor and 226 against it. The legislature was reorganized under the new constitution, but it was not recognized by Congress as a legal government. Though ready to abolish slavery, the people were not at that time prepared to remove the disabilities under which the adherents to the Union party had labored, and for the next four years they were remanded to the control of a military government. This was administered generally with lenity and justice, but the people were restless under it. In 1867, Arkansas was united with Mississippi as the fourth military district, and Brigadier-General E. O. C. Ord was placed in command of it. He directed an election for a State constitutional convention to be held in Nov., 1867. The election resulted in a majority of 14,000 for a convention, which met Jan. 8, 1868, and on the 4th of Feb. following reported a constitution, which was adopted and ratified by the people Mar. 13, 1868. The State was restored to the Union by vote of Congress June 22, 1868, over the veto of President Johnson. At the first election of State officers held under the new constitution, Col. Powell Clayton, who had been an officer in the Federal army, was elected governor, and held the office until 1871, when he was elected U. S. Senator, and the lieutenant-governor became acting governor. In 1872 an election took place for governor at the same time with the Presidential election, and Elisha Baxter, Republican, was reported elected by a majority of 3266 over Mr. Brooks, the Democratic and Liberal Republican candidate. There was, however, a contest as to the legality of the vote in some of the districts, and some of the supporters of Governor Baxter becoming dissatisfied with his action, an effort was made to unseat him by a vote of the legislature, declaring the election void through fraud. The supreme court

of the State having decided that this could not be accomplished, Mr. Brooks in June, 1873, proceeded against the governor with an action of *quo warranto* brought in one of the counties of the State.

Governors.—The governors of the State have been as follows:

Territorial.	
James Miller	1819–25
George Izard	1825–29
John Pope	1829–35
William S. Fulton	1835–36
State.	
James S. Conway	1836–40
Archibald Yell	1840–44
Samuel Adams (acting)	1844–44
Thomas S. Drew	1844–48
John S. Roane	1848–52
Elias N. Conway	1852–60
Henry M. Rector	1860–64
Isaac Murphy	1864–68
Powell Clayton	1868–71
Ozro A. Hadley (acting)	1871–72
Elisha Baxter	1872–

Presidential Votes.—Arkansas was admitted into the Union in 1836, and cast her first vote for President in November of that year. This and the subsequent votes have been as follows:

Elect. year.	Elec. vote.	Successful candidate.	Democratic candidate.	Pop. vote.	Whig and Rep. cands.	Pop. vote.
1836	3	Van Buren..	Van Buren..	2,400	Harrison.	1,238
1840	3	Harrison....	Van Buren..	6,049	Harrison.	5,160
1844	3	Polk.....	Polk.....	9,546	Clay.	5,504
1848	3	Taylor	Cass.....	9,300	Taylor.	7,588
1852	4	Pierce.....	Pierce.....	12,173	Scott.	7,404
1853	4	Buchanan ...	Buchanan ...	21,910	Fillmore.	10,787
1860	4	Lincoln	Breck'ridge.	28,732	} Bell.	20,094
					} Dougl's.	5,227
1864		no vote	no vote			
1868	5	Grant	Seymour.	19,078	Grant.....	22,112
1872	6	Grant	Greeley.	37,927	Grant.....	41,073

L. P. Brockett.

Arkansas, a county in the E. S. E. of Arkansas, contains about 1200 square miles. It is bounded on the S. W. by the Arkansas River, and bounded on the E. by the White River, both of which are navigable for steamboats. The surface is generally level, and forms part of the Grand Prairie. This county is made up of fine prairie and bottom lands. Corn and cotton are the staple crops. Capital, De Witt. Pop. 8268.

Arkansas, a township of Arkansas co., Ark. Pop. 683.

Arkansas City, on the southern border of Kansas, in Cowley co., is at the confluence of the Arkansas and Walnut rivers. The town commands the trade of the adjoining country and territory. Although the town is but three years old, it has one weekly newspaper, a wagon-and-carriage manufactory, stores, shops, etc. in abundance. Three years ago it was the hunting-ground of the Osage Indians, who frequently visit the place to trade. The location of the town is high, dry, and healthy. Its support is from the vast farming region by which it is surrounded, and from the Texan cattle and Indian trade.

C. M. Scott, Pub. "Arkansas City Traveller."

Arkan'sas In'dians, now generally called **Quapaws,** a tribe allied by language to the Dakotas, formerly resided on the Ohio. Like the northern Dakotas, they appear to have been once divided into several bands or minor tribes. Driven from their old haunts by the Illinois and other Indians, they went southward, and became the constant and powerful allies of the French of Louisiana. They number at present some 200, and live in the Indian Territory.

Arkansas Post, a post-village of Arkansas co., Ark., on the left bank of the Arkansas River, 50 miles from its mouth, 117 miles S. E. of Little Rock, settled by the French in 1685. During the civil war this post was garrisoned and fortified by the Confederates. On Jan. 11, 1863, a combined attack of the U. S. military and naval forces under General McClernand and Admiral Porter was made upon the place, and its works were finally carried by storm. A large number of prisoners were captured, and immense quantities of *matériel,* stores, etc.

Arkansas Stone, a material largely employed for hones and oil-stones, consists of novaculite, which is quarried extensively in Hot Springs and Grant counties, Ark. Some of it is wrought in the neighborhood, but most of it is carried to New Albany, Ind., where it is cut and prepared for market. It is a very beautiful and valuable stone.

Ark'ansite, a name given to the thick black crystals of brookite (titanic acid), found at Magnet Cove in the Ozark Mountains of Arkansas.

Arko'na, or **Arcona,** a promontory on the N. side of the Prussian island of Rügen, in the Baltic. Here is a lighthouse on the site of the heathen temple of Swantewit, which King Waldemar of Denmark burned in 1168.

Ar'kose, a rock composed of fragments of felspar; a kind of felspathic sandstone.

Ark'wright, a township of Chautauqua co., N. Y. Pop. 1030.

Arkwright (Sir Richard), an English inventor noted for his great improvements in the cotton manufacture, was born at Preston, in Lancashire, Dec. 23, 1732. He learned the trade of a barber, which he soon abandoned, and applied himself to the invention of machinery for spinning cotton. At that time no machine had been invented that could produce cotton yarn of sufficient strength and tenuity to be fit for warp. In 1768 he set up at Preston his first spinning-frame, for which he obtained a patent in 1769. He removed to Nottingham in 1769, and formed a partnership with Need and Strutt. His machine caused a great extension of the cotton manufacture, and greatly promoted the prosperity of the nation. He became the proprietor of several cotton-mills moved by water-power, which he managed with great ability and success, and he may be called the founder of the factory system, for he introduced a system of management so admirable that it was generally adopted, and has never been materially improved. Although his patent was infringed, and he was defeated in several lawsuits which he instituted to defend his rights, his business prospered, and he amassed a fortune of about £500,000. He was knighted by George III. in 1786. Died Aug. 3, 1792. (See "Edinburgh Review" for June, 1827; Baines, "History of the Cotton Manufacture in Great Britain," 1835.)

Arlar'ka, a township of Macon co., N. C. Pop. 542.

Arlaud (Jacques Antoine), a Swiss miniature-painter, born at Geneva May 18, 1668, worked in Paris and London with success. He was a friend of Sir Isaac Newton. Died at Geneva May 25, 1746.

Arles (anc. *Ar'elas, Arela'te,* or *Arela'tum*), a city of France, in the department of Bouches-du-Rhône, and on the E. bank of the Rhone, 15 miles from the Mediterranean and 53 miles by rail N. W. of Marseilles. The railway which connects Lyons with Marseilles passes through it. It has a cathedral of the seventh century, a museum, a college, and a public library. It was once the capital of the kingdom of Arelate. Important councils of the Church were held here in 314, 354, 452, and 475 A. D. Here are the remains of a grand Roman amphitheatre, and an ancient granite obelisk which was dug out of the Rhone about 1389. Arles has manufactures of hats, silk, brandy, etc. Its trade is facilitated by the steamboat navigation of the Rhone and by two canals. A famous statue called "Venus of Arles" was discovered here. Pop. in 1866, 26,367.

Arlincourt, d' (Victor), Vicomte, a French poet and novelist, born near Versailles in 1789. Among his chief works is an epic poem called "Charlemagne, ou la Caroléide" (1818), and "Le Solitaire," a novel (1825), which had some success. His style is eccentric. Died in 1856.

Ar'lington, a post-village of Westfield township, Bureau co., Ill., on the Chicago Burlington and Quincy R. R., 92 miles S. W. of Chicago.

Arlington, a post-village and township of Middlesex co., Mass., 7 miles by railroad N. W. of Boston. It has a gas company, water-works, and horse and steam railroad to Boston. A large supply of ice is sent to market. There are five churches, and important manufactures. The principal business is market-gardening. The town has a savings bank, a public library, and a weekly newspaper. Pop. of township, 3261. J. L. Parker, Ed. "Advocate."

Arlington, a post-township of Van Buren co., Mich. Pop. 1360.

Arlington, a post-township of Sibley co., Minn. Pop. 752.

Arlington, a post-township of Phelps co., Mo. Pop. 1190.

Arlington, a post-village and township of Bennington co., Vt., 15 miles N. of Bennington. Here are marble quarries, a mineral spring, and a cave with stalactites. It has extensive manufactures of wooden ware, lumber, sash, blinds, doors, etc. Pop. of township, 1636.

Arlington, a post-township of Alexandria co., Va. Here are the old mansion of the Custis family, two national cemeteries, a "freedmen's village," and other points of interest made historic during the late civil war. Pop. 1374.

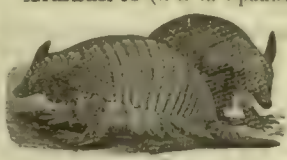
Arlington, a township of Columbia co., Wis. Pop. 822.

Arlington (Henry **Bennet**), Earl of, born in 1618, served as a royalist in the civil war (1642–45), was knighted at Bruges (1658), became secretary of state (1662), a baron (1664), a member of the "Cabal" (1667), received the Garter, and was sent as ambassador to the king of France in the same year; was impeached by the Commons, resigned, and was appointed lord chamberlain (1674). Died July 28, 1685.

Arlon (anc. *Orolaunum*), a frontier town of Belgium, capital of the province of Luxembourg, 22 miles by rail W. N. W. of Luxembourg. It has manufactures of wool-

len stuffs, and an active trade in grain, etc. Pop. in 1866, 5779.

Arlt (FERDINAND), a distinguished German oculist, was born April 18, 1812. He wrote, among other works, "Krankheiten des Auges" (3 vols., 1851–56; 4th ed. 1867), "Pflege der Augen im gesunden und kranken Zustande" (3d ed. 1865).



Arm (THE HUMAN) consists of two portions—the arm proper and the fore arm; the former having one bone, the humerus, which moves freely upon the scapula, forming the shoulder joint; and the latter having two bones, the radius and ulna, which move upon each other and upon the humerus, forming the elbow-joint. These connect below with the eight small bones of the carpus or wrist. The humerus is attached to the acromion process of the shoulder-blade by a ball-and-socket joint, allowing great freedom of motion; and were it not for the muscles surrounding the joint, it would be frequently dislocated, but it is supported by muscles on all sides except at the armpit, into which the head of the bone is sometimes driven. The roundness of the shoulder is due to the head of the humerus, so that displacement is generally accompanied by a flattening which suggests the nature of the accident. On the shoulder is a large muscle, the deltoid, which lifts the arm from the side. At the back is the triceps, which extends the fore arm; in front are two muscles which bend it—the biceps and the brachialis anticus; and on each side below are muscles passing to the fore arm and hand; while above the great muscle of the back (latissimus dorsi) and that of the chest (the pectoralis major) are inserted on each side of the groove, wherein lies one of the tendons of the biceps. The motions of the ulna are flexion and extension, its projections being received in these movements into corresponding depressions on the humerus. The rotatory movements of the hand are principally due to the radius, the head of which rolls upon the ulna, turning the palm downward (pronation), or upward (supination), these movements being effected by muscles which, taking their fixed points from the humerus and ulna, turn the radius upon the latter. The elbow-joint is hinge-like, and has strong lateral ligaments; but it is liable to dislocations, often accompanied by fracture, especially in the young. The arm affords interesting illustrations of some principles of mechanics. The insertion of the muscles so near to the fulcra or centres of motion involves a loss of power; there is, however, a corresponding gain in velocity at the end of the lever; and for most of the purposes to which the hand is put agility is of far greater moment than dead strength. The arm is supplied with blood by the brachial artery, the continuation of the axillary. The superficial veins collect into large trunks, which unite at the bend of the elbow, and then pass to the axillary—on the outside by the cephalic vein, on the inside by the basilic. The nerves pass from the brachial plexus by the side of the artery, and diverge from it to their ultimate distribution; the musculo-spiral passing back to appear on the outside, and giving off the radial and posterior interosseous nerves; the ulnar running behind the internal condyle, for which it has obtained the name of "crazy bone," from the electric-like thrill which passes along the arm when the nerve is struck. The median, as its name implies, keeps a middle course with the artery. In wounds of the fore arm the bleeding may be controlled by pressure of the brachial artery, on the inner side of the biceps, against the bone. Much interest is also furnished by the comparison of the arm and hand of man (see HAND) with the anterior extremities of other animals. Essentially the same bones and other parts are found in the fore limb of a mole, the fore leg of a horse, the paddle of a whale, and the wing of a bird, although modified in each to suit the uses of the animal. In variety of movement and facility of prehension the arm of man far excels that of any other creature.

REVISED BY WILLARD PARKER.

Arma'da, a post-township of Macomb co., Mich. Pop. of village, 494; of township, 1721.

Arma'da, The Spanish, often called the "Invincible Armada," a great Spanish fleet or armament which was fitted out by Philip II. for the conquest of England in 1588. It consisted of about 130 vessels, some of which were of enormous size, carrying in all 2431 guns and more than 19,000 soldiers. The command of this armada was given to the duke of Medina Sidonia, who was not a competent naval commander. Lord Howard of Effingham commanded the English fleet, which was greatly inferior in size. The armada sailed from Spain about the end of May, 1588, and in passing through the English Channel was harassed by the English, who avoided a general engagement. During a night in August, Lord Howard sent eight fire-ships against the armada, and produced a panic and great disorder, in consequence of which the English captured or destroyed about twelve ships early the next morning. This defeat induced the Spanish admiral to abandon the invasion of England, and he resolved to return to Spain by sailing around the Orkney Islands, the passage of the English Channel being closed by the enemy. Many of the Spanish ships were wrecked on their circuitous voyage, and only fifty-three returned to Spain.

Armadil'lo (*i. e.* in Spanish, the "little [animal] in armor"), (the *Dasypus* of the naturalists), a genus of animals of the order Edentata, natives of South and Central America. They derive their name from a bony armor which covers the body, and consists of polygonal plates not connected by joints, but united to form solid bucklers, one over the rump and one over the shoulders. Between these two bucklers are a number of plates disposed in transverse bands, which are movable and allow freedom of motion. The head is protected by a similar buckler, not connected with that of the body. The largest species is about three feet long, exclusive of the tail. They have short legs and feet adapted to burrowing in the ground, in which, when pursued by enemies, they bury themselves quickly. These animals are nocturnal, and feed on insects, carrion, and vegetable food. Their flesh is often eaten by the natives, but, owing to its rank and strong flavor, it is not agreeable to European palates. The *Glyptodon* is an extinct and gigantic kind of armadillo.

Armadillos.

Armaged'don [supposed to be equivalent to *Ar-Megiddo*, "mountain of Megiddo"] is applied by some writers to the elevated table-land of Esdraelon, the great battle-field of Palestine.

Ar'magh, an inland county of Ireland, in Ulster, is bounded on the N. by Lough Neagh, on the E. by Down, on the S. by Louth, and on the W. by Monaghan and Tyrone. Area, 512 square miles. The surface is undulating or level, except the S. W. part, where Slieve Gullion rises to the height of 1893 feet. The soil is mostly fertile. The chief rivers are the Bann, Blackwater, and Callan. Granite, trap, carboniferous limestone, and lower Silurian rocks underlie the county. Capital, Armagh. Pop. of the county (exclusive of the city) in 1871, 179,221.

Armagh (*Ard-magha*, the "high field"), a city of Ireland, capital of the above county, is situated on high ground 36 miles by rail S. W. of Belfast. It is built of limestone quarried in the vicinity, and has a Protestant cathedral of red sandstone crowning the central eminence, down the sides of which the streets diverge. Armagh is the archiepiscopal seat of the primate and metropolitan of all Ireland, both in the Anglican and Roman Catholic churches. It has a Roman Catholic cathedral, a large public library, and a lunatic asylum. It was the capital of Ireland in the sixth and seventh centuries, and was renowned as a school of theology, etc. Pop. in 1871, 8952.

Armagh, a post-village of East Wheatfield township, Indiana co., Pa. Pop. 177.

Armagh, a township of Mifflin co., Pa. Pop. 1873.

Armagnac, a former name of a region in France, now comprised in Gers and parts of Haut-Garonne, Tarn-et-Garonne, and Lot-et-Garonne. Its ancient counts were feudal to the crown of France until the time of Henry IV., who united it in his own person to the crown. In later times the title of count of Armagnac was an honorary one.

Armagnac, d' (BERNARD), COUNT, constable of France, was an ambitious and turbulent nobleman. He became in 1407 the enemy of the duke of Burgundy and the chief of the faction called "Armagnacs," who waged a civil war against the Burgundians. In 1415 he obtained the office of constable of France, the highest in the nation. Having excited by his tyranny the odium of the Parisians, he was killed by the populace June 12, 1418.

Armagnac, d' (JEAN V.), COUNT, a grandson of Bernard, noticed above, was born about 1420. He was notorious for his crimes, and was excommunicated by the pope. As a party to the League of Public Good, he revolted against Louis XI. in 1465. He was put to death by order of that king Mar. 5, 1473.

Armand (CHARLES), MARQUIS DE LA ROUARIE, a French officer, born in 1756, fought for the U. S. 1777–83. He rose to the rank of general of brigade. Died in France Jan. 30, 1793.

Arman'di (PIER IE DAMIEN), an officer of the French army, was born in Italy in 1778. He served as colonel under Napoleon I. In 1848–49 he fought for the Italian patriots against Austria. He wrote in French an able "Military History of Elephants" (1843). Died in 1855.

Ar'mansperg', von (Joseph Ludwig), Count, an able German statesman, born in Bavaria in 1787. He became a leader of the liberal party, Bavarian minister of finance in 1826, and minister of foreign affairs in 1828. By the influence of the Catholic priests he was removed from office in 1831. From Jan., 1833, to Feb., 1837, he governed Greece as regent or chief minister under King Otho, who was a minor. Died in 1853.

Armato'li, or Ar'matoles, a body of Greek militia organized about 1500 A. D., or earlier. They lived and operated in mountainous regions that were difficult of access, and were very tenacious of their independence. They were employed by the Turkish sultan to protect the fertile plains from the raids of the *klephts* (mountain-robbers) of Thessaly. Northern Greece was divided into about sixteen districts, each of which was placed under the supervision of an armatol. In the war of Greek independence the armatoles fought against the Turks, and distinguished themselves by daring exploits.

Ar'mature [from the Lat. *armatu'ra*, "armor"], a piece of soft iron which is placed in contact with the poles of an artificial magnet to preserve its magnetic power. If a magnet remains long idle, having no object on which to exert its attractive force, it loses part of its strength. The armature when placed against the poles of a magnet becomes itself a magnet, the north pole of which is in contact with the south pole of the horseshoe magnet. A larger weight can be suspended from the armature, thus placed, than the poles of the other magnet can sustain without an armature.

Arme'nia [Turk. *Erminee'yeh*], an important country of Western Asia which has now no political existence, but is historically very interesting as the original seat of an ancient civilized people (Armenians), who have preserved their nationality to the present time. Armenia, the boundaries of which varied in different periods, was situated between Asia Minor and the Caspian Sea. It was mostly included between lat. 37° and 42° N., and between lon. 36° and 49° E. It was divided into Armenia Major and Armenia Minor, the former of which was bounded on the N. E. by the river Kur, on the E. by the Caspian Sea, and on the W. partly by the Euphrates. The Lesser Armenia was situated on the western side of the other. This country is an elevated table-land, enclosed on several sides by the ranges of Taurus and Anti-Taurus, and partly occupied by other mountains, the highest of which is the volcanic peak of Ararat. It is drained by the Euphrates and Tigris, which rise within its limits, and traversed by the river Aras (Araxes). Among its physical features are the large lakes of Van and Sevan, the former of which is saline. It abounds in romantic mountain-scenery. The chief towns of ancient Armenia were Artaxata, Anni, and Tigranocerta. The Armenians call themselves *Haiks*, or *Haikans*, a name derived from Haik or Haig, represented as the first king of Armenia and a descendant of Japhet. Among the most famous of their ancient kings was Dikran or Tigranes, who lived about 550 B. C., and was a friend and ally of Cyrus the Great. The kingdom was conquered by Alexander the Great in 325 B. C., and recovered its independence about 190 B. C. It was afterwards ruled by the Parthian Arsacidæ, among whom was Tigranes the Great, a son-in-law of Mithridates, king of Pontus. He waged war against the Romans, and was defeated about 63 B. C. The Armenians adopted the Christian religion about 250 A. D., and still adhere to that faith. Since the Christian era this country has been the subject and scene of many bloody contests between the Romans, Persians, Byzantine Greeks, Saracens, Turks, etc., who have successively been masters of it. It is now divided between Russia, Persia, and Turkey. The scourge of war and persecution for religious opinions drove great numbers of the Armenians from their native land, and they are now dispersed in various parts of Europe and Asia Minor. The number of Armenians is estimated at from 2,500,000 to 3,000,000, of whom about 1,000,000 live in Armenia. The climate of Armenia is very cold in the highlands, while the summer heat of the valleys is intense. Here is a variety of soils, some of which in the valleys produce good crops of cotton, rice, tobacco, and grapes. Grazing and cattle-breeding are more extensively followed than agriculture. Among its mineral resources are copper, iron, lead, alum, and salt. The chief modern towns are Erivan, Erzroom, and Van. The Armenians (who are now only a small minority of the population) are physically a fine variety of the Indo-European race. They have excellent talents for business, and are especially skilful in banking and mercantile pursuits. (See St.-Martin, "Mémoire historique et géographique sur l'Arménie," 1818; Curzon, "Armenia," 1854; Strecker, "Beiträge zur Geographie von Hoch-Armenien," 1869.)

Armenia, a post-township of Juneau co., Wis. P. 254.

Armenian Church. Christianity is said to have been introduced into Armenia by the apostle Thaddæus, and is admitted to have become, through the influence of Gregory the Illuminator, the established religion of the state in 289. Political troubles prevented the Armenian Church from taking part in the Council at Chalcedon (451). Hence a misunderstanding, which led the Armenians to set up a separate communion in 491, without ever having become really monophysitic. Among their greatest divines was Nerses of Klah (about 1150), whose works have been repeatedly published. The head of the Armenian Church, called catholicos, resides near Erivan, the capital of Russian Armenia, to which place every Armenian is required to make a pilgrimage once in his life. The Armenians believe in the worship of saints, but not in purgatory, and are especially rigid in the observance of fasts. A small portion of the Armenians in Turkey, Persia, Austria, and Russia have recognized the supremacy of the pope, and are called United Armenians. Of late, a split has taken place among the United Armenians of Turkey, as the majority of their bishops opposed the changes which the pope made in the ancient constitution of their Church. They were on that account excommunicated by the pope, and in 1872 entered into official communication with the Old Catholics of Germany. In 1830 a Protestant mission among the Armenians was organized by the American Board of Commissioners of Foreign Missions. The mission was very successful, and in 1872 more than 3000 Armenians were members of the Protestant churches. (See the "Life and Times of S. Gregory the Illuminator," by Rev. S. C. Malan, London, 1868; Hamachod, "Chronological Succession of Armenian Patriarchs," 1865.) Revised by R. D. Hitchcock.

Armenian Language and Literature. The Armenian language is a branch of the Indo-European stock, and, according to Fr. Müller, belongs to the Iranian group. The old Armenian, the language of the classic literature, is now extinct, and has been supplanted not only as conversational language, but even in literature, by the modern Armenian, which is mixed with many Turkish elements, and is divided into four principal dialects. The Armenian language has its own alphabet, which was introduced by Miesrob in 406, and contains thirty-six letters. Grammars of the Armenian language have been published by Petermann (1837; an abridgment of it in 1841) and Lauer (1869); dictionaries by Aucher (1821, 2 vols., Armenian and English) and Tchaktchak (1837, Armenian and Italian).

Except a few old songs or ballads, no remains of the literature of Armenia exist of a date earlier than the introduction of Christianity into that country. After this event, however, the Greek language and literature became favorite objects of study, and the works of many Greek authors were translated into Armenian. The most flourishing period of Armenian literature extended from the fourth to the fourteenth century. The Armenian Bible, translated from the Septuagint version by Miesrob and his scholars (411 A. D.), is a model of classic style. The theological writers and chroniclers of this era are considered, both in adherence to facts and good taste, superior to the general order of Oriental historians. (See Neumann, "Gesch. der armen. Literatur," 1836.)

Armentières, a town of France, in the department of Nord, on the river Lys, 12 miles by rail N. W. of Lille. It has manufactures of cotton, linen, lace, and sailcloth. Pop. in 1866, 15,579.

Arm'felt (Gustaf Mauritz), a Swedish general and courtier, born in the province of Abo in 1757. He became a favorite of Gustavus III., who, after he was mortally wounded by an assassin in Mar., 1792, appointed Armfelt governor of Stockholm. This appointment was nullified by the duke of Sudermania, who was the enemy of Armfelt, and acted as regent during the minority of Gustavus IV. The regent sent him on a mission to Naples, and during his absence charged him with treason, for which he was sentenced to death. When Gustavus IV. began to reign in 1799 he restored Armfelt to honor and office. He became governor-general of Finland in 1805, and commanded the army in a war against Norway in 1808. Having entered the service of Russia in 1810, he obtained several high civil offices. Died in 1814.

Armi'da, the name of a beautiful sorceress in Tasso's poem of "Jerusalem Delivered." She attempted to seduce Rinaldo and other crusaders. The former was fascinated for a time, but finally returned to the war against the infidels, and converted Armida to Christianity.

Ar'millary [from the Lat. *armil'la*, a "bracelet" or "large ring"] **Sphere,** an ancient and obsolete astronomical machine, consisted of an assemblage of rings or circles

fixed together, so as to represent the principal circles of the celestial sphere in their proper relative positions. These rings were movable round the polar axis within a meridian and horizon, as in the celestial globe. The observations of Hipparchus were made by means of the armillary sphere.

Arminius, Arminianism. The name of Arminius in his native language was JACOBUS HERMANS, identical with Herman, the name of the hero of Germany, who destroyed the Roman legions under Varus. And as this name was transformed into Arminius by Tacitus and other Roman writers, so, in accordance with the custom of the age when Latin was the language of current literature, this name was Latinized, and has come down in modern English as JAMES ARMINIUS. He was born in 1560 at Oudewater ("old water"), a small town in the Southern Netherlands. He lost his father in early childhood, and his mother being left in straitened circumstances, the promising intellect of the boy so attracted the attention of patrons that he was taken to school at Marburg. When fifteen years of age his native town, Oudewater, was taken by the Spaniards, and his mother, brother, and sister were all massacred, leaving him the sole survivor of his family. He was sent by his patrons to the new university at Leyden, where he remained six years. Such was his proficiency that the city of Amsterdam adopted him as her *vesterling* or foster-child, to be educated at the public expense, being bound by a written obligation to be at the command of the city through life. He studied at Geneva under Beza, as well as at Basle under Gryneus. At the latter place he was offered a doctorate, but declined the honor on account of his youth. By Beza he was commended to Amsterdam in high terms. He then went to Italy to become accomplished in philosophy under Zarabella, and having visited Rome and the other principal cities, returned to Amsterdam, where he was installed minister at the age of twenty-eight.

Arminius's ministry in Amsterdam, of fourteen years' duration, forms the second period of his life. His learning and eloquence were rapidly rendering him one of the leading theologians and preachers of his age. He was of middling size, had dark, piercing eyes, and voice light but clear, and possessing a winning mellowness. His manners were magnetic, and he had the power of fastening firm friends. He was condescending to the lowly and a sympathizing guide to the religious inquirer. At the same time he was an independent seeker and follower of truth.

In 1585, the extreme predestinarianism prevalent in the Netherlands had been for ten years so effectively attacked by Richard Coornhert, an eminent patriotic and acute layman of Amsterdam, that Arminius was invited by the city to refute him. In a debate at Delft between Coornhert and two high Calvinistic clergymen, the latter were so hard pressed that they yielded, and took the lower or sublapsarian ground, and published a pamphlet against the higher view. The extreme Calvinists called upon Martin Lydius, professor of theology in Friesland, to refute them, but he handed over the task to Arminius, who had thus a double request on his hands. He bravely undertook the task, but was soon convinced of the untenableness of either the higher or lower predestination. At the expense of an ignominious failure in even *attacking* Coornhert, he resolved to pursue the light of honest conviction. Avoiding the entire subject in public, he prosecuted his investigations with earnest study. Yet, in lecturing on Romans vii., having given the non-Calvinistic interpretation, he found himself generally assailed by the high Calvinists as a Pelagian and Socinian. He was arraigned before the ecclesiastical courts, where he successfully defended himself on the ground that, though adverse to the prevalent opinions, his interpretation contradicted nothing in the standards—namely, the Belgic Confession and the Catechism. Being questioned as to predestination, he declined to answer, as no fact was alleged against him.

In prosecuting his inquiries he determined to consult privately the best theologians of the day. He commenced a confidential correspondence with Prof. Francis Junius of the University of Leyden, the most eminent of the Dutch theologians. He was delighted to find how far Junius coincided with him, but when he addressed to Junius the arguments for still more advanced views, the professor kept the letter by him unanswered for six years, when he died. The friends of Arminius believed that this silence arose from the fact that Junius found more than he could answer or was willing to admit. Unfortunately, this correspondence was inadvertently exposed by Junius to discovery, and was used to the disadvantage of Arminius. Arminius also, having received a treatise in favor of predestination by Professor Perkins of Cambridge, prepared an epistle to him, but was prevented by Perkins's death from sending it. His letters both to Junius and Perkins are embodied in his published works, and, whatever may be thought of the validity of the argument, no one will deny that in candor, courtesy, and Christian dignity they are hardly to be surpassed.

On the death of Junius the curators of the University of Leyden looked to Arminius as his successor. The reluctant consent of Amsterdam being at length gained, Arminius assented. But the predestinarians, led by Gomarus, senior professor of theology at Leyden, opposed his election. After a long series of strifes, Arminius offered to meet Gomarus and satisfy his objections. The meeting took place, and Gomarus, admitting that he had judged Arminius by hearsay, after Arminius had fully declared his entire opposition to Pelagianism and Socinianism, fully renounced his objections. So far as predestination was concerned, each professor was to deliver his own sentiments with moderation, and all collision with the other was to be avoided; and Arminius was thereupon elected.

The six years of his Leyden professorship closing with his death are the most important yet troublous period of his career. The terms of peace were broken within the first year by Gomarus, who delivered a violent public harangue on predestination in terms of insult to Arminius, who was personally present; to which the latter prepared a refutation clothed in terms of personal respect towards his opponent. Gomarus afterwards confessed that he could easily live at peace with Arminius but for the clergy and churches, who were intensely hostile to his liberal doctrines. Their Belgic Confession, Calvinistic as it was, was sacred in their hearts as being the banner under which they had fought the battle of civil and religious liberty against Spain and popery; and they now, alas! were making it the instrument of religious intolerance. Arminius was held as invalidating that Confession, and so was everywhere traduced by the clergy as a papist, a Pelagian, and a Coornherter. Yet, really, the doctrines he taught were essentially the doctrines of Saint Chrysostom, Melanchthon, Jeremy Taylor, and John Wesley. In regard to the Confession, he ever treated it with reverence, and only claimed the right of that same liberality of interpretation which Lutherans exercised with the Augsburg Confession—a liberality similar to that which the English clergy now exercise in regard to the seventeenth of their Thirty-nine Articles. A voluntary Church may, like any other voluntary association, be, if it pleases, stringent in its interpretations, but a state Church, which strains all to a tight interpretation of a very specific creed under pain of state disabilities, runs into religious despotism. This was therefore a genuine contest for religious liberty. Arminius was proscribed by the clergy, harassed by irresponsible deputations, and his students were subjected to persecutions and exclusions from the ministry. The more intelligent laity, including the magistracy, and especially the chief magistrate, Olden Barnevelt, were favorable to Arminius, who at length appealed to the national legislature (called the States General) for protection. That body appointed a committee or council, who, having heard both Gomarus and Arminius in full, reported that the latter taught nothing but what could be tolerated. Before the States General themselves Arminius delivered a full oration, expounding his entire views, which is published in the American edition of his works. The clergy demanded the appointment of a national synod, consisting purely of ecclesiastics, but the States General, well knowing what would be the fate of Arminius in their hands, refused. Under the constant pressure of these years of persecution the gentle spirit of Arminius at length sunk. He was taken from the bloody times that followed the Synod of Dort. His nervous system was prostrated, and, attended by his faithful pupil, the afterwards celebrated Episcopius, he died in the faith he had maintained, Oct. 19, 1609, a martyr to his views of truth.

ARMINIANISM, as the customary antithesis to Calvinism, is, within the limits of the evangelical doctrines, the theology that tends to freedom in opposition to the theology of necessity or absolutism. This contrast rises into thought among all nations that attain to reflection and philosophy. So in Greek and Roman thinking, Stoicism and all materialistic atheism held that mind, *will*, is subject to just as fixed laws in its volitions as physical events are in their successions. When, however, men like Plato and Cicero rose to a more transcendent sense of moral responsibility, especially of eternal responsibility, they came to say, like Cicero, "Those who maintain an eternal series of causes despoil the mind of man of free-will, and bind it in the necessity of fate."

Theistic fatalism, or Predestination, consists in the predetermination of the Divine Will, which, determining alike the volitions of the will and the succession of physical events, reduces both to a like unfreedom; but those who hold Predestination very uniformly hold also to volitional necessity, or the subjection of will in its action to the con-

trol of strongest motive force. And as the Divine Will is held subject to the same law, so Necessity, as master of God, man, and the universe, becomes a universal and absolute Fate. This doctrine, installed by Saint Augustine, and still more absolutely by John Calvin, in Christian theology, is from them called Augustinianism, or more usually Calvinism.

In opposition to this theology, Arminianism maintains that in order to true *responsibility, guilt, penalty*, especially *eternal penalty*, there must be in the agent a *free-will*: and in a true responsible free-will the freedom must consist in the power, even in the same circumstances and under the same motives, of *choosing either way*. No man can justly be eternally damned, according to Arminianism, for a choice or action which he cannot help. If fixed by Divine decree or volitional necessity to the particular act, he cannot be held responsible or justly punished. In all such statements, however, it is presupposed, in order to a just responsibility, that the agent has not responsibly abdicated or destroyed his own power. No agent can plead in bar of responsibility any incapacity which he has freely and wilfully brought upon himself. It is also to be admitted that there may be suffering which is not penalty—finite sufferings for which there are compensations, and for which every one would take his chance for the sake of life. But eternal suffering, for which there is no compensation, inflicted as a *judicial penalty* on the basis of *justice*, can be justly inflicted only for avoidable sin. If Divine decree or volitional necessity determine the act, it is irresponsible, and judicial penalty is unjust.

Arminianism also holds that none but the person who freely commits the sin can be guilty of that sin. One person cannot be guilty of another person's sin. A tempter may be guilty of tempting another to sin, but then one is guilty of the sin, and the other of solely the sin of temptation. There can thus be no vicarious guilt; and as punishment, taken strictly, can be only infliction *for guilt upon the guilty*, there can literally and strictly be no vicarious punishment. If innocent Damon die for Pythias guilty of murder, Damon is not guilty because he takes Pythias's place in dying, and his death is not *to him* a punishment, but a suffering, which is a substitute for another man's punishment. The doer of sin is solely the sinner, the guilty, or the punished. These preliminary statements will elucidate the issues between Calvinism and Arminianism on the following points:

1. *Foreordination.*—Calvinism affirms that God does unchangeably and eternally foreordain whatsoever comes to pass. That is, God from all eternity predetermines not only all physical events, but all the volitions of responsible agents. To this Arminianism objects that the predetermination of the agent's volitions destroys the freedom of his will; that it makes God the responsible predeterminer and willer of sin; and that it makes every sinner to say that his sin accords with the Divine Will, and therefore, so far as himself is concerned, is right. It makes God first decree the sin, and then punish the sinner for the sin decreed. The Arminian theory is this: God does from all eternity predetermine the laws of nature and the succession of physical and necessary events; but as to free moral agents, God, knowing all possible futurities, does choose that plan of his own conduct which, in view of what each agent will ultimately in freedom do, will bring out the best results. His system is a system of his own actions. And God's predeterminations of his own acts are so far contingent as they are based on his prerecognition of what the agent will freely do; yet as his omniscience knows the future with perfect accuracy, so he will never be deceived nor frustrated in his plans and providences.

Some Arminians deny God's foreknowledge, on the ground of the intrinsic impossibility of a future contingency being foreknown. As the performance of a contradictory act is impossible, intrinsically, even to Omnipotence, so, say they, the knowability of a future contingency, being an essential contradiction, is impossible even to Omniscience. A contradiction is a nothing; and it is very unnecessary to say in behalf of God's omnipotence that he can do all things, and all nothings too. So it is equally absurd to say in behalf of his omniscience that he knows all things, and all nothings too. The exclusion of contradictions does not *limit* God's omnipotence or omniscience, but *defines* it. Arminians do not condemn this reasoning, but generally hold that their theory is maintainable against Calvinism on the assumption of foreknowledge. They deny, as against the Calvinist, that foreknowledge has any influence upon the future of the act, as predetermination has. Predetermination *fixes* the act—foreknowledge *is fixed* by the act. In foreordination God determines the act as he pleases; in foreknowledge the agent fixes the prescience as he pleases. In the former case God is alone responsible for the creature's act; in the latter case God holds the creature responsible, and a just divine government becomes possible. Yet most Arminians probably would say, with the eminent philosopher Dr. Henry More, If the divine foreknowledge of the volitions of a free agent contradicts the freedom, then the freedom, and not the foreknowledge, is to be believed.

2. *Divine Sovereignty.*—Calvinism affirms that if man is free God is not a sovereign. Just so far as man is free to will either way, God's power is limited. Arminians reply that if man is not free, God is not a sovereign, but sinks to a mere mechanist. If man's will is as fixed as the physical machinery of the universe, then *all* is machinery and not a government, and God is a machinist and not a ruler. The higher man's freedom of will is exalted above mechanism, so much higher is God elevated as a sovereign. Here, according to Arminians, Calvinism degrades and destroys God's sovereignty, and Arminianism exalts it; that the freedom of man no more limits God's power than do the laws of nature by him established; that in both cases, equally, there is simply a self-limitation by God of the *exercise* of his power; that Arminianism holds to the absoluteness of God's omnipotence just as truly as Calvinism, and to the grandeur of his sovereignty even more exaltedly.

3. *Imputation of Adam's Sin.*—Calvinism affirms that Adam's posterity is truly *guilty* of Adam's sin, so as to be eternally and justly punishable therefor without a remedy. As *guilty* of this sin, God might have the whole race born into existence under a curse, without the power or means of deliverance, and consigned to eternal punishment. Upon this Arminians look as a dogma violative of the fundamental principles of eternal justice. They deny that guilt and literal punishment can, in the nature of things, be thus transferred. Their theory is, that upon Adam's sin a Saviour was forthwith interposed for the race as a previous condition to the allowance of the propagation of the race by Adam, and a provision for inherited disadvantages. Had not a Redeemer been provided, mankind, after Adam, would not have been born. The race inherits the nature of fallen Adam, not by being held *guilty* of his sin, but by the law of natural descent, just as all posterity inherit the species-qualities, physical, mental, and moral, of the progenitor. Before his fall the presence of the Holy Spirit with Adam in fulness supernaturally empowered him to perfect holiness—the tree of life imparted to him a supernatural immortality. Separated from both these, he sunk into a mere *nature*, subject to appetite and Satan. The race in Adam, without redemption, is totally incapable of salvation; yet under Christ it is placed upon a new redemptive probation, is empowered by the quickening spirit given to all, and through Christ may, by the exercise of free agency, attain eternal life.

4. *Reprobation.*—Of the whole mass of mankind thus involved in guilt and punishment for sin they never actually committed, Calvinism affirms that God has left a large share "passed by"—that is, without adequate means of recovery, and with no intention to recover them—and this from the "good pleasure of his will" and for a display of his "glorious justice." The other portion of mankind God does, from "mere good pleasure," without any superior preferability in them, "elect" or choose, and confers upon them regeneration and eternal life," all to the praise of his glorious grace." Arminians pronounce such a proceeding arbitrary, and fail to see in it either "justice" or "glorious grace." The reprobation seems to them to be injustice, and the "grace," with such an accompaniment, unworthy the acceptance of honorable free agents. Election and reprobation, as Arminianism holds them, are conditioned upon the conduct and voluntary character of the subjects. All, submitting to God and righteousness, by repentance of sin and true self-consecrating faith, do meet the conditions of that election; all who persist in sin present the qualities upon which reprobation depends. And as this preference for the obedient and holy, and rejection of the disobedient and unholy, lies in the very nature of God, so this election and reprobation are from before the foundations of the world.

5. *Philosophical or Volitional Necessity.*—Calvinism maintains the doctrine that all volitions are determined and fixed by the force of strongest motive, just as the strokes of a clock-hammer are fixed and determined by the strongest force. The will can no more choose otherwise in a given case than the clock-hammer can strike otherwise. There is no "power of contrary choice." Calvinism often speaks, indeed, of "free agents," "free-will," "self-determining power," and "will's choosing by its own power;" but bring it to analysis, and it will always, say the Arminians, be found that the freedom is the same as that of the clock-hammer—the freedom to strike as it does, and no otherwise. Arminianism affirms that if the agent has no power to will otherwise than motive-force determines, any more than a clock-hammer can strike otherwise, then there is no justice in requiring a different volition any more than a different

clock-stroke. It would be requiring an impossibility. And to punish an agent for not performing an impossibility is injustice, and to punish him eternally, an infinite injustice. Arminianism charges, therefore, that Calvinism destroys all just punishment, and so all free volition and all divine government.

6. *Infant Damnation.*—Holding that the race is truly *guilty*, and judicially condemnable to endless torment for Adam's sin, Calvinism necessarily maintains, according to Arminians, that it is just for God to condemn all infants to eternal punishment, even those who have never performed any moral act of their own. This was held by Augustine, and wherever Calvinism has spread this has been a part of the doctrine, more or less explicitly taught. Earlier Calvinists maintained against the Arminians that there is actual reprobation—that is, a real sending to hell—as well as particular election, of infants. Arminianism, denying that the race is judicially *guilty*, or justly damnable for Adam's sins, affirms the salvation of all infants. The individual man as born does, indeed, irresponsibly possess within his constitution that nature which will, amid the temptations of life, commence to sin when it obtains its full-grown strength. He is not, like the unborn Christ, "that holy thing." There is, therefore, a repugnance which God and all holy beings have towards him by contrariety of nature, and an irresponsible unfitness for heaven and holy association. If born immortal, with such a nature unchangeable, he must be for ever unholy, and for ever naturally unhappy under the divine repugnance. Under such conditions Divine Justice would not permit the race, after the fall, to be born. But at once the future Incarnate Redeemer interposes, restores the divine complacency, and places the race upon a new probation. Man is thereby born in a "state of initial salvation," as Fletcher of Madely called it, and the means of final salvation are amply placed within the reach of his free choice.

7. *Pagan Damnation.*—On its own principle, that power to perform is not necessary in order to obligation to perform, Calvinism easily maintains that pagans, who never heard of Christ, are rightly damned for want of faith in Christ. They may be damned for original sin, and for their own sin, and for unbelief in Christ, without any Saviour. Arminianism, on the contrary, maintains that there doubtless are many in pagan lands saved even by the unknown Redeemer. They, not having the law, are a law unto themselves. Nay, they may have *the spirit of faith*, so that were Christ truly presented he would be truly accepted. They may have faith in that of which Christ is the embodiment, like the ancient worthies enumerated in Heb. xi. There may not be as great differences in the chances for salvation in different lands as Calvinism assumes. Where little is given, much is not required. Arminianism holds that no one of the human race is damned who has not had full chance for salvation. Missions are none the less important in order to hasten the day when *all* shall be converted. If that millennial age shall come, and be of long duration, Arminianism hopes that the great majority of the entire race of all ages may be finally saved.

8. *Doctrines of Grace.*—Calvinism maintains that the death of Christ is an expiation for man's sin: first, for the guilt of men for Adam's sin, so that it is possible for God to forgive and save; and second, for actual sin—that thereby the influence of the Spirit restores the lapsed moral powers, regenerates and saves the man. But these saving benefits are *reserved for the elect only*. Arminianism, claiming a far richer doctrine of grace, extends it to the very foundations of the existence of Adam's posterity. Grace underlies our very nature and life. We are born and live because Christ became incarnate and died for us. All the institutes of salvation—the chance of probation, the Spirit, the Word, the pardon, the regeneration, the resurrection, and the life eternal—are through him. And Arminianism, against Calvinism, proclaims that these are for ALL. Christ died for all *alike*; for no one man more than for any other man, and sufficient grace and opportunity for salvation is given to every man.

Calvinism maintains the irresistibility of grace; or, more strongly still, that grace is *absolute*, like the act of creation, which is called *irresistible* with a sort of impropriety from the fact that resistance in that connection is truly unthinkable. Against this Arminians reply that will, aided by prevenient grace, is free even in accepting pardoning grace; that though this acceptance is no more meritorious than a beggar's acceptance of an offered fortune, yet it is accepted freely and with full power of rejection, and is none the less grace for that.

9. *Justifying and Saving Faith.*—Faith, according to Calvinism, is an acceptance of Christ wrought absolutely, as an act of creation in the man, whereby it is as impossible for him not savingly to believe as it is for a world to be not created or an infant to be not born. And as this faith is resistlessly fastened in the man, so it is resistlessly kept there, and the man necessarily perseveres to the end. Faith, according to Arminianism, is, as a *power*, indeed the gift of God, but as an *act* it is the free, avoidable, yet really performed act of the intellect, heart, and will, by which the man surrenders himself to Christ and all holiness for time and eternity. In consequence of this act, and not for its meritorious value or its any way compensating for or earning salvation, it is accepted for righteousness, and the man himself is accepted, pardoned, and saved. And as this faith is free and rejectable in its beginning, so through life it continues. The Christian is as obliged, through the grace of God assisting, to freely retain it as first freely to exercise it. It is of the very essence of his probationary freedom that he is as able to renounce his faith and apostatize as to reject it at first.

10. *Extent of the Atonement and Offers of Salvation.*—Earlier Calvinism maintained that Christ died for the elect alone; later Calvinism affirms that he died for one and all, and so offers salvation to all on condition of faith. But Arminianism asks, With what consistency can the atonement be said to be *for all* when, by the eternal decree of God, it is foreordained that a *large part* of mankind shall be excluded from its benefits? How also can it be *for all* when none can accept it but by efficacious grace, and that grace is arbitrarily withheld *from a large part*? How can it be for *all* when God has so fastened the will of a large part of mankind, by counter motive-force, that they are unable to accept it? The same arguments show the impossibility of a rightful *offer* of salvation to *all*, either by God or by the Calvinistic pulpit. How can salvation be rationally offered to those whom God by an eternal decree has excluded from salvation? What right to exhort the very men to repent whom God determines, by volitional necessity, not to repent? What right to exhort men to do otherwise than God has willed, decreed, and foreordained they shall do? If God has decreed a thing, is not that thing right? What an awful sinner is the preacher who stands up to oppose and defeat God's decrees! If a man is to be damned for fulfilling God's decrees, ought not that imaginary God to be, *a fortiori*, damned for making such decrees? If a man does as God decrees, ought he not to be by God approved and saved? And since all men do as God decrees, wills, and determines they shall do, ought not all men to be saved, so that the true theory should be Universalism? How can grace be offered to the man whom God had decreed never to have grace? or faith be preached to those to whom God has made faith impossible? or conditions proposed to those from whom God withholds the power of performing conditions? Hence, the Arminian affirms that in all public offers of a free or conditional salvation to *all* the Calvinistic pulpit contradicts its own creed.

11. Such is an outline of the usual argument on the subject; and it is not difficult to determine on which side the logic predominates. If we consider the question from its more abstract, more metaphysical premises, the Arminian theory has equally the advantage. Most of the difficulties of this and all similar inquiries doubtless arise from the limitations of our faculties, or rather of our language. We unwarrantably attribute to the Infinite Mind the modes of thought which are peculiar to our finite intellects. The most subtle perplexity of this controversy grows out of the idea of *time*—its past, present, and future—and the attempt to reconcile foreknowledge with contingency or free-will. But what is time? It is no entity, no substance, like iron, air, oxygen. It is, as Kant teaches, subjective, not objective. It is but a habit of the mind, an association of thought, suggested, as Locke says, by the succession of ideas, and arising from the finite limitations of our faculties. We cannot, therefore, logically transfer to the Infinite Mind the temporal distinctions of past, present, and future. A succession of ideas, by which alone the conception of time is possible, necessarily implies a limitation which cannot be predicated of the Absolute Mind. Nor is it necessary for us to assume that all duration is an *eternal now* with God; for here, again, we use a distinction of time. We can rightly assume but three facts: first, that, owing to limitations of our faculties, and especially of language, we have habitudes of thought which do not belong to the Infinite Mind, and from which arise our baffling difficulties in the investigation of themes like the present. Secondly, that, however incomprehensible, to us, may be the nature and action of the Divine Mind, yet the obvious facts of the conscious freedom of man's will and his moral responsibility—facts which are the indisputable basis of laws and rights, of reward and penalty, of virtue and society—must remain incontestable, and be, in some way, perfectly reconcilable with the divine government. They are facts within the comprehension of our finite faculties, they are positive and certain, and therefore the mysterious, the unknown, cannot be incompatible with them. With better

faculties, and especially with a better terminology, the chief difficulties of this controversy may vanish, and it may be seen that we have been contending only about words, and confounded in a mere logomachy. Hence, as Buckle (*History of Civilization*, i. 1) says, "Among more advanced thinkers there is a growing opinion that both doctrines (predestination and free-will) are wrong, or, at all events, that we have no sufficient evidence of their truth."

12. *Analogy of Temporal Superiorities.*—Calvinism argues that in this world God distributes advantages, such as wealth, rank, beauty, vigor, and intellect, not according to desert, but purely as a sovereign. Hence, in the same way he may bestow on one faith and eternal life, and on others unbelief and eternal death. Arminianism replies that this very analogy between the temporal and the eternal bestowment proves the precise reverse. In this probationary world advantages are *professedly* distributed *without regard to judicial rectitude*. Men are not rewarded according to their works or voluntary character. The wicked are set on high, and Satan is this world's god. And the very difference between the dispensation of the world and that of the kingdom of God is, that in the latter blessedness is placed at every man's choice, and the result is judicially according to voluntary faith and works. The Bible nowhere places beauty or intellect at our own choice, but it does declare faith, repentance, and eternal life to be in our own power, and holds us responsible for not exerting the power.

Basis of Morality.—Calvinism claims that the very severity of its system, its deep view of human guilt and necessary damnability by birth and nature, its entire subjection to divine absolutism irrespective of human ideas of justice, tend to produce a profound piety. Arminianism replies that this is missing the true ideal of piety. It seems to be basing Christian morality on fundamental immorality. For God to will and predetermine the sin, and then damn the sinner—for him to impute guilt to the innocent, and so eternally damn the innocent as guilty—are procedures that appear fundamentally unrighteous, so far as the deepest intuitions of our nature can decide. Thus, first to make God in the *facts* intrinsically and absolutely bad, and then require us to *ascribe* holiness and goodness to his character and conduct, perverts the moral sense. It is to make him what we are in duty bound to hate, and then require us to love and adore him. Such adoration, secured by the abdication not only of the reason, but of the moral sense, and the prostration of the soul to pure, naked absolutism, naturally results in the sombre piety of fear; just as children are frightened into a factitious goodness by images of terror. While the piety of Jesus is serene, firm, winning, and gently yet powerfully subduing, the piety of absolutism tends to be stern and Judaic-like. While thus apparently defective at the roots, it does nevertheless often present an objective character of rectitude, a practical hardihood and aggressive energy in the cause of morality and regulated freedom. Arminianism, in order to a true and rational piety, sees the ideal of rectitude in the divine character and conduct, not by mere *ascriptions* contradicted by *facts*, but both in the *facts* and the *ascriptions*. A harmony of facts and intuitive reason is produced, love to the Divine Being becomes a rational sentiment, and a piety cheerful, hopeful, merciful, and gladly obedient becomes realized.

Civil and Religious Liberty.—As the freedom of the individual, and his own intransferable responsibility for his own voluntary character and conduct, are fundamental principles with Arminianism, it is in its own nature adverse to civil or religious despotism. It has been said that when Romanism persecutes, it accords with its fundamental *principle*, the denial of right of private judgment, while when Protestantism persecutes, it contradicts itself. So when Calvinism persecutes, it obeys an intrinsic absolutism, while if Arminianism persecutes, it contradicts its own freedom and individualism. Yet *position* has often in history produced in all these parties palpable violations of, and discordances with, their *principle*. Romanists often become by *position* asserters of ultra-democracy, and Protestants of absolute despotism. And so Calvinism has, historically, been *by position* the advocate for revolution, and Arminianism the asserter of authority. In fact, as Arminianism has been, as above shown, the ruling doctrine of the Church, and Calvinism an insurgent specialty, so the historical *position* of the first has been favorable to the assertion of authority, and the normal position of the latter has been revolt. This may be called one of the *accidents of history*. So the learned Selden in his "Table-Talk" remarked on the curious contradiction in the English civil war, that the advocates of absolutism in religion were the advocates of political liberty, and *vice versâ*. Yet it may perhaps be truly said that when the religious absolutist gains the power he is apt to be an absolute though a conscientious despot. He makes a better rebel than ruler. Prof. Fisher, a Calvinist, gives a severely true picture of the conscientious despotism of Calvin at Geneva. A similar despotism on a larger scale in England under Cromwell rendered the nation willing by reaction to rush into the depravities of the Restoration. Driven to America, even while under the rule of an Arminian monarchy, a similar despotism on a small scale overspread New England.

Nor was Calvinism, as Prof. Fisher truly affirms, the advocate of liberty of conscience. Not only did Calvin himself banish Bolsec, ruin Castellio, and favor the execution of Servetus, but he maintained, doctrinally, the *duty of the magistrate to punish heresy*. Beza, his learned successor, wrote a treatise in favor of punishing heretics. Bogerman, the president at the Synod of Dort, was the translator of Beza's essay. It is but too evident that the Protestant Calvinists differed with the Romanists not about the punishment of heretics, but about who the heretics to be punished were. In this respect the Calvinism of the new Church and the Arminianism of the old were nearly upon a par. The new Church, however, belonged to the progressive order of things; but whether, finally, the Calvinism or the Arminianism of the new Church first actually proclaimed toleration is a matter of question.

Comparative Morality.—Mr. Froude endeavors by comparison to show that Calvinism is superior to Arminianism in morals by selecting his own examples. But the Arminian may perhaps in reply make also *his* selections. Scottish Calvinism has an unquestioned severity of morals, but are Scotch character and history, as a whole, even ethically superior to the English? Is the morality of Presbyterianism in its entire aspect superior to that of Moravianism, Quakerism, or Wesleyan Methodism? Are our American Calvinistic Baptists more Christian in morals than the Free-will Baptists? Is there any umpire qualified to decide that the devout Presbyterian is superior to the devout Episcopalian? Did Jonathan Edwards present a type of piety superior to that of Fletcher of Madely? or John Calvin to that of James Arminius? Can Calvinism show a grander type of an evangelist than was John Wesley in England or Francis Asbury in America? Has she produced, in all her history, a system of evangelism as earnest, as self-sacrificing, as aggressive as the itinerant ministry of English and American Methodism? Taking the entire body of Calvinism since the Reformation, does it excel in purity, martyrdom, doctrine, and missionary enterprise the (Arminian) Church of the first centuries? If it comes to counting persons, has any section of the Church nobler names than Justin Martyr, Ignatius, Irenæus, Origen, Athanasius, Tertullian, Jerome, Chrysostom, John of Damascus, Hincmar of Rheims, Erasmus, Luther, Melanchthon, Sir Thomas More, Calixtus, Savonarola, Arminius, Grotius, Episcopius, Limborch, Curcellæus, John Milton, John Goodwin, Jeremy Taylor, Cudworth, Bishop Butler, Bishop Bull, Bengel, Wetstein, Wesley, Fletcher, and Richard Watson?

Comparative Republicanism.—Nor did, nor does, Predestination as compared with Arminianism, possess any peculiar affinity with republicanism against monarchy. By its very nature Calvinism establishes an infinite and eternal distinction between different parts of mankind made by divine prerogative, by which one is born in a divine aristocracy, and the other in an eternal helpless and hopeless pariahism; whilst Arminianism, holding every man equal before God, proclaims an equal yet resistible grace for all, a universal atonement and Saviour alike to all, an equal power of acceptance in all, a free, unpredestined chance for every man to be the artificer of his own eternal, as well as temporal, fortunes. Caste, partialism are the characteristics of the former; equality, universality, republicanism, of the latter. It is as plain as consciousness can make any fact that it is the latter that is the natural ally, not of monarchies, aristocracies, or hierarchies, but of regulated freedom. Hence, neither Luther nor Calvin was any more a republican than Eck or Erasmus. Augustine and Gottschalk were good papists, and Augustinianism was as entirely at home under the tiara of Gregory the Great as under the cap of Bogerman—in the court of Charlemagne as in the camp of the Covenanter. Irrespective of their Calvinism, the Reformers everywhere acted *according to conditions*. Where kings and nobles favored them, they favored kings and nobles; where (as was generally the case) they were rejected by rank and power, and had nothing to make royalty and aristocracy out of, they fashioned a theocratic Commune, out of which modern political experience has picked some aids and methods for voluntary government. Modern experience has eliminated the theocracy, the intolerance, and the predestinarianism, and added the elements to make republicanism. For all this it duly thanks the Reformers, but does not thank their Calvinism.

History of Arminianism.—The theology of freedom, essentially Arminianism, in opposition to predestination, necessitated volitions, and imputation of guilt to the inno-

cent, is universally acknowledged to have been the doctrine of the entire Christian Church through its most glorious period, the martyr age of the first three centuries. The Calvinistic historian of theology, Hagenbach, says (vol. i., p. 155): "All the Greek Fathers, as well as the apologists Justin, Tatian, Athenagoras, Theophilus, and the Latin author Minucius Felix, exalt the autonomy or self-determination of the human soul. They know nothing of any imputation of sin, except as a voluntary and moral self-determination is presupposed. Even Irenæus and Tertullian strongly insist upon this self-determination in the use of freedom of the will." Again (157): "Even the opponents of human liberty, as Calvin, are compelled to acknowledge this remarkable unanimity of the Fathers, and in order to account for it they are obliged to suppose a general illusion about this doctrine!"

Arminians contend that we know as well when predestination was introduced into the Church—namely, by Augustine—as we do when transubstantiation and image-worship were introduced; that it was in the fourth century, when Pelagius upon one extreme made free-will dispense with divine grace, Augustine on the other extreme made divine grace irresistibly nullify free-will, and thus both lost their balance; that both invented dogmas never before recognized in the Church; that, tried by the previous mind of the Church, both were equally heretical; that the heresy of one, pushed to extreme, becomes rationalism and pure deism—the heresy of the other, pushed to extreme, becomes presumptuous antinomianism. They assert that the Eastern Church maintained her primitive position, neither Pelagian on one side nor Augustinian on the other, essentially in the position of modern Arminianism; that hence Arminianism is not a *compromise*, but the primitive historical position, the permanent centre, rejecting innovations and extremes on either side; that the Western Church, in spite of the great name of Augustine, never became Augustinian. It is indeed customarily said by anti-Arminian writers that this was because the "age of systematic theology" had not then arrived. Arminians reply that a theology not only unrecognized during that best period of the Church, but, still more, a theology unanimously condemned as heretical by that period, has little right now to lay claim to pre-eminent Christian orthodoxy. The Eastern Church—namely, the churches of Asia, with whom the language of our Lord and his apostles was essentially vernacular; the Greek Church, to whom the language of the New Testament was vernacular; and the Russian Church, embracing many millions—all inherited and retain, firmly and unanimously, the theology of freedom, essential Arminianism. The learned Calvinistic scholar Dr. Shedd, in his "History of Doctrines" (vol. ii., p. 198), says: "The Augustinian anthropology was rejected in the East, and, though at first triumphant in the West, was gradually displaced by the semi-Pelagian theory, or the theory of inherited evil [instead of inherited guilt] and synergistic [or co-operative] regeneration. This theory was finally stated for the papal Church in exact form by the Council of Trent. The Augustinian anthropology, though advocated in the Middle Ages by a few individuals like Gottschalk, Bede, Anselm, slumbered until the Reformation, when it was revived by Luther and Calvin, and opposed by the papists." It will thus be seen, on a review of the universal Church in all ages, how small though respectable a minority Augustinianism or Calvinism, before the Reformation, ever was. With minor exceptions, Arminianism was the doctrine of the universal Church.

The accuracy of Dr. Shedd's statement of the general non-existence of Augustinianism during the Middle Ages is not invalidated by the fact of the great authority of Augustine's name, arising from the powerful genius and voluminous writings of the man. It was no proof that a man was truly Augustinian because he belonged to the "Augustinian order" or quoted Augustine's authority. Such Schoolmen as Bernard, Anselm, and Peter Lombard modified Augustine's doctrine materially; Bonaventura and Duns Scotus were essentially Arminians, and Hincmar of Rheims and Savonarola literally so. Gottschalk, the high predestinarian, was condemned for heresy, and Thomas Bradwardine, the "second Gottschalk," made complaints, doubtless overstrained, that in his day "almost the whole world had become Pelagian."

At the Reformation, however, we encounter the phenomenon that all the eminent leaders at first not only adopted, but even exaggerated, the absolutism of Augustine. This might seem strange, for it was apparently natural that the absolute papacy should identify itself with the absolute, and that asserters of freedom would have stood on the free-will theology. The twin doctrines of the supremacy of Scripture and of justification by faith were amply sufficient, without predestination, for their purpose to abolish the whole system of popish corruption. The former dethroned alike the authority of tradition and the popedom; the latter swept away alike the mediations of Mary, saints, and priests. But the first heroic impulse of reform tends to magnify the issues to their utmost dimensions. The old free-will theology belonged universally to the old historic Church, and was identified by the first Reformers with its corruptions. Luther at first, in his reply to Erasmus "On the Bondage of the Will," uttered fatalisms that probably had hardly ever before been heard in the Christian Church, and perhaps it would be hard to find a Calvinist at the present day who would adopt the trenchant predestinarian utterances of Calvin. Under the indoctrinations of these leaders, especially of Calvin at Geneva, the absolute doctrines were diffused and formed into the creeds of Germany, the Netherlands, France, England, and Switzerland. But in Germany the "second sober thought" of Melanchthon, who at first coincided with Luther, receded from predestination, and Melanchthon himself intimates that Luther seceded with him; so that the Lutherans are now essentially Arminian. In the Netherlands the same "second thought," led by Arminius himself, was suppressed by state power. In France, Protestantism, which was Calvinistic, was overwhelmed in blood. In England the Calvinism was generally of a gentle type, and the same "second thought" was awakened by the Arminian writings of Grotius and Episcopius diffused through Europe. And as the English Church gradually inclined to the ancient high episcopacy of the old Church, so it adopted the ancient Arminianism. Calvinism, persecuted and oppressed, overthrew monarchy and Church, and for a brief period ruled with hardly less intolerance, until, overthrown in turn, Calvinism took refuge in America, and laid foundations here. Even here past sufferings did not teach tolerance, and that doctrine had to be learned from checks and lessons administered by surrounding sources. Calvinism has, nevertheless, here acted a noble part in our Christian civilization. It perhaps about equally divides the evangelic Church with Arminianism.

Arminianism, proper and Protestant, came into existence under the severe persecution by Dutch Calvinism, in which the great and good Arminius himself was a virtual martyr. The Synod of Dort, the standard council of the Calvinistic faith, made itself subservient to the unprincipled and sanguinary usurper Maurice; and even during its sessions the judicial murder of the great Arminian and republican statesman Olden Barnevelt was triumphantly announced at Dort to overawe the Arminians at the synod, who were bravely maintaining their cause under the leadership of the eloquent Episcopius. Then followed the banishment of Episcopius, the imprisonment of Grotius, the ejection of hundreds of Arminian ministers from their pulpits, and the firing of soldiers upon the religious assemblies of Arminian worshippers. The great Arminian writers of Holland, Episcopius, Grotius, and Limborch, are claimed by Arminian writers to be the first public proclaimers of the doctrine of liberty of conscience in Europe, as those two Arminian Puritans, John Milton and John Goodwin, were its earliest proclaimers in England.

Wesleyan Methodism is now by all admitted to be a great modern Arminian development. Beginning most humbly as a half-unconscious awakening amid the general religious chill of Protestantism, it has not only quickened the religious life of the age, but gathered, it is said, twelve millions of worshippers into its congregations throughout the world. Its theology is very definite, and very nearly the exact theology of James Arminius himself, and of the first three centuries. Cradled in both the Arminianism and High-Churchism of the English establishment, Wesley's maturer years earnestly approved the Arminianism, but severed it from the High-Churchism. The connection between Arminianism and High-Churchism is hereby clearly revealed to be historical and incidental rather than intrinsic or logical. Yet, even after adopting the doctrine that every Church has the right to shape its own government, as a lover of the primitive, post-apostolic Church, as well as from notions of Christian expediency, Wesley preferred, and provided for American Methodism, an episcopal form of government. Arminian Methodism has, in little more than a century of her existence, apparently demonstrated that the Augustinian "systematic theology" is unnecessary, and, what it deems, the primitive theology amply sufficient for the production of a profound depth of piety, a free ecclesiastical system, an energetic missionary enterprise, and a rapid evangelical success. She exhibits in her various phases every form of government, from the most decisive system of episcopacy to the simplest congregationalism, all voluntarily adopted, and changeable at will. The problems she has thus wrought suggest the thought that the free, simple theology of the earliest age may be the universal theology of the latest. (See CALVINISM, by PROF. A. A. HODGE, S. T. D.)

D. D. WHEDON.

Arminius. See HERMANN.

Ar'mistead (LEWIS ADDISON), a general, born at Newbern, N. C., Feb. 18, 1817, graduated at West Point in 1836. He served in the Mexican war (1846–47), and joined the Confederate army in 1861. He was killed at Gettysburg July 3, 1863.

Armistead (WALKER KEITH), an American general, born in Virginia about 1780. He became chief of the corps of engineers, and served in the war of 1812. He commanded an army against the Indians in Florida. Died Oct. 13, 1845.

Ar'mistice [from the Lat. *ar'ma*, "arms," and *sto* (or *sis'to*), to "stand still"], a truce; a suspension of hostilities between two armies or belligerent powers, which often agree to suspend operations for a definite time while the diplomatists are negotiating the preliminaries of a peace. During the third Crusade, Richard Cœur de Lion and Saladin made a truce for three years three months and three days. In modern times the duration of armistices is much less. After the Germans captured Paris, Jan. 30, 1871, the French people, having no regular government, desired to elect a national assembly, for which purpose an armistice was granted by the Germans. The armistice, during which the armies on both sides were bound to remain stationary, ended in a treaty of peace, the preliminaries of which were ratified on Feb. 26, 1871. The definitive treaty of peace was signed at Frankfort in May of that year.

Ar'mitage (EDWARD), an English historical painter of high reputation, born in London in 1817. Among his masterpieces are "St. Francis before Pope Innocent III.," and the frescoes in the new Houses of Parliament.

Armitage (THOMAS), D. D., was born at Pontefract, England, Aug. 2, 1819, and became in his youth a Methodist preacher. In 1838 he came to New York, and entered the ministry of the Methodist Episcopal Church. In 1848 he became a Baptist, and settled as a pastor in New York. He warmly advocated the movement for Bible revision, which led in 1850 to the formation of the American Bible Union, of which organization he became an efficient officer, and subsequently the president. He occupies a high rank as a pulpit orator and as a writer of great power and elegance. His position as a leader in the denomination with which he is identified is generally acknowledged.

Armitage (WILLIAM EDMOND), D. D., a bishop of the Protestant Episcopal Church, was born in New York City Sept. 6, 1830. He graduated at Columbia College in 1849 and at the General Theological Seminary in 1852. He became rector of an Episcopal church at Portsmouth, N. H., and afterwards at Augusta, Me. In 1859 he accepted a similar position in Detroit, Mich. In 1866 he was appointed assistant bishop of Wisconsin, and in 1870 he became bishop of that diocese, which position he held until his death. Died in New York City Dec. 7, 1873.

Ar'mor [Lat. *armatu'ra*], the defensive covering or coat-of-mail worn by a soldier; the apparatus which in former times men used for personal defence in war, and was often called *harness*. Since the invention of gunpowder, armor has fallen into disuse. The principal parts of the ancient armor were the helmet, breastplate, and shield. The material generally used for this purpose by the Greeks, Romans, and other nations of antiquity was brass or bronze. The most ancient description of such a panoply or complete armor is given in 1 Samuel xviii., which says Goliath "had an helmet of brass upon his head, and he was armed with a coat-of-mail; and the weight of the coat was five thousand shekels of brass. And he had greaves of brass upon his legs, and a target of brass (margin, *gorget*) between his shoulders; . . . and one bearing a shield went before him." The Greeks of the Homeric age used a large circular shield made of several folds of bull's hide, bound and embossed with brass. They also wore a helmet, a breastplate, and greaves, and a leather petticoat which descended nearly to the knee, and was covered by narrow strips of metallic plates or scales hinged together so as to permit freedom of movement. The coat-of-mail worn by the knights of the Middle Ages, and sometimes called chain-armor, was formed of a network of steel or iron rings attached to a foundation of leather. The modern Europeans also used an interlaced ring-armor of Oriental origin, which was made in the form of a shirt with small steel rings, which were not stitched to any foundation. Chain-mail or ring-armor fell into disuse in the fourteenth century, and was succeeded by plate-armor. The cuirass, almost the sole existing relic of mediæval armor, is now of no practical importance. The term is also applied to iron-plate covering applied to modern war-vessels and fortifications. (See IRON-CLAD, IRON PLATING, and SHIELDS.)

Armor'ica [from the Cymric *ar*, "upon," and *mor*, "sea"], the ancient name of the north-western part of Gaul, bordering on the ocean, and extending from the Seine to the Loire. The Armoricans had numerous ships, and were extensively engaged in maritime pursuits. About 400 A. D. Mariadec, a Briton, obtained the chief power in Armorica, which became an independent state. In consequence of the immigration of Britons or Welsh in the sixth or seventh century, the name of Armorica was changed to Bretagne. The language of the country is closely allied to the Welsh.

Ar'mory [Lat. *arma'rium*, from *ar'ma*, "arms"], a storehouse for arms; a place where arms and instruments of war are deposited; a collection of ancient armor, as that in the Tower of London. In the U. S., armory signifies a place where arms are manufactured. The U. S. government has extensive armories at Springfield, Mass., and Rock Island, Ill. (See ARSENAL, by P. V. HAGNER, U. S. Army.)

Arms [Lat. *ar'ma*], weapons of war; offensive weapons or instruments, which are divisible into two great classes—firearms, and arms which are used without gunpowder or any explosive substance. The latter, which are the more ancient, are the sword, spear, dart, javelin, lance, arrow, battle-axe, cutlass, dagger, dirk, bayonet, scimetar, pike, sling, etc. The ancient Greeks, according to Homer, used the spear chiefly as a missile, which they hurled at a distant enemy. The most effective weapon of the steel-plated cavalry of the Middle Ages was a ponderous lance nearly eighteen feet long. The principal varieties of firearms are described under the appropriate heads. (See FIREARMS.)

Arms, or **Armo'rial Bear'ings,** the name given in heraldry to devices borne on shields; ensigns armorial. "There is no doubt," says Hallam, "that emblems somewhat similar have been immemorially used both in war and peace. The shields of ancient warriors, and devices upon coins or seals, bear no distant resemblance to modern blazonry. But the general introduction of such bearings as hereditary distinctions has been sometimes attributed to tournaments, wherein the champions were distinguished by fanciful devices; sometimes to the Crusades, where a multitude of all nations and languages stood in need of some visible token to denote the banners of their respective chiefs. In fact, the peculiar symbols of heraldry point to both these sources, and have been borrowed in part from each. Hereditary arms were perhaps scarcely used by private families before the beginning of the thirteenth century. From that time, however, they became very general, and have contributed to elucidate that branch of history which regards the descent of illustrious families."

Arm'strong, a county in W. Central Pennsylvania. Area, 750 square miles. It is intersected by the Allegheny River, bounded on the N. by Red Bank Creek, and on the S.W. by the Kiskiminetas, and also drained by Mahoning Creek. The surface is hilly or rolling, the soil is mostly fertile. Dairy products, wool, grain, and hay are extensively raised. Iron, coal, salt, and limestone are found here. The county is traversed by the Allegheny Valley R. R., and has important manufactures. Capital, Kittanning. Pop. 43,382.

Armstrong, a post-tp. of Vanderburg co., Ind. P. 1290.

Armstrong, a township of Indiana co., Pa. P. 1435.

Armstrong, a township of Lycoming co., Pa. P. 1424.

Armstrong (GEORGE DODD), D. D., a brother of Dr. W. J. Armstrong, born in 1813 in Mendham, N. J., graduated at Princeton in 1832, studied theology in Union Seminary, Prince Edward co., Va., was professor of chemistry and mechanics in Washington College, Lexington, Va. (1838–51), and since then pastor of a Presbyterian church in Norfolk, Va. He has been a large contributor to periodicals, and has published "The Summer of the Pestilence," "The Doctrine of Baptism," "The Christian Doctrine of Slavery," "The Theology of Christian Experience," etc.

Armstrong (JAMES), U. S. N., born at Shelbyville, Ky., Jan. 17, 1794, entered the navy as a midshipman in 1809, was captured by the British while serving in the Frolic in 1814, received the regular promotions, becoming a captain in 1841, commanding the East India squadron (1855–58), and captured the Barrier Forts in the Canton River in 1857. Jan. 12, 1861, he was compelled to surrender Pensacola navy-yard to a greatly superior force of Confederates. He became a commodore in 1866, and died Aug. 27, 1868.

Armstrong (JAMES F.), U. S. N., born Nov. 20, 1817, entered the navy as a midshipman Mar. 7, 1832, became a passed midshipman in 1838, a lieutenant in 1842, a commander in 1861, a captain in 1862; retired at his own request Sept. 27, 1866. From 1862 to 1866 he commanded the State of Georgia in the North Atlantic blockading squadron, and April 25, 1862, took part in the bombardment of Fort Macon, which resulted in its surrender to the combined army and naval forces.

FOXHALL A. PARKER, U. S. N.

Armstrong (John), M. D., a poet, born at Castleton, in Roxburghshire, Scotland, in 1709. He studied medicine at Edinburgh, where he graduated in 1732, and soon after began to practise in London. His poem called "The Economy of Love" (1739) was censured as indecent. In 1744 he produced a didactic poem on "The Art of Preserving Health," which is his principal work, and has had an extensive popularity. He was physician to the English army in Germany in 1760. Among his other works are "Benevolence," a poem (1751), "Taste," an epistle in verse (1753), and a volume of "Medical Essays" (1773). He was a friend of the poet Thomson and Dr. Young. Died Sept. 7, 1779.

Armstrong (John), an American general, born at Carlisle, in Pennsylvania, Nov. 25, 1755. He served in the Revolutionary war with the rank of major. He was the author of the anonymous and celebrated "Newburg Addresses," written in Mar., 1783, in order to obtain from Congress a payment of the money due to the officers of the army. He was a member of the old Congress, and in 1800 was sent to the U. S. Senate from New York. He was sent as minister to France in 1804, and was appointed secretary of war in Jan., 1813. He was censured because he failed to defend Washington in 1814, and resigned in September of that year. Died April 1, 1843.

Armstrong (John), M. D., an English writer, born in the county of Durham in 1784. He graduated as M. D. in the University of Edinburgh in 1807, after which he practised at Sunderland. In 1816 he published a work on "Typhus Fever," which widely extended his reputation. He removed in 1818 to London, where he practised with great success. Dr. Armstrong and Edward Grainger founded in 1821 a medical school in Webb street, where the former lectured and acquired popularity. He died Dec. 12, 1829. (See F. Boot, "Memoir of the Life of J. Armstrong," 1834.)

Armstrong (John), a native of Pennsylvania, commanded successfully the expedition sent in 1756 against the Indian allies of the French at Kittanning, served as brigadier-general in the Revolutionary army at Fort Moultrie, and commanded the militia at Brandywine and Germantown. He was a member of Congress (1778–80 and 1787–88). Died at Carlisle, Pa., Mar. 9, 1795.

Armstrong (Richard), D. D., born in Northumberland co., Pa., in 1805, graduated at Dickinson College in 1827, studied theology at Princeton, and went in 1832 as a missionary to the Sandwich Islands, where he served as minister of instruction, privy councillor, and president of the board of education. He received fatal injuries by a fall from his horse, and died Sept. 23, 1860.

Armstrong (Robert), Brigadier-General, born in 1790 in Eastern Tennessee, served in the Creek war of 1813–14, and at the battle of New Orleans as an officer of Tennessee volunteers, and in 1836 as a brigadier-general of volunteers in the Florida war. He was consul at Liverpool (1845–52), and for a time editor of the "Washington Union." Died Feb. 23, 1854.

Armstrong (Samuel T.), a bookseller of Boston, born in 1784. He was chosen lieutenant-governor of Massachusetts, and acted as governor in 1836, in consequence of the resignation of Governor Davis. Died in 1850.

Armstrong (Sir William George), F. R. S., LL.D., D. C. L., noted as the inventor of the Armstrong gun, was born at Newcastle-upon-Tyne in 1810. He became in 1845 a proprietor of an establishment for the manufacture of hydraulic cranes, engines, and bridges. After numerous experiments, he invented, in 1854, a wrought-iron rifled cannon of extraordinary power and precision, which bears his name. These guns are made of bars of wrought-iron two inches wide, heated to whiteness, twisted spirally round a steel bar or core, and welded; other bars are twisted over these in a similar way, but with an opposite turn of the spiral. Another heating to whiteness precedes a thorough welding of all the layers of bars by a steam hammer. The internal core is removed, and the bore is rifled by machinery. It is stated that one of these guns will throw a ball of thirty-two pounds to the distance of five miles. The inventor was knighted by the queen, and appointed chief engineer of rifled ordnance. (See Artillery, by Gen. Barry.)

Armstrong (William Jessup), D. D., a clergyman of the American Presbyterian Church, born at Mendham, N. J., Oct. 29, 1796, was pastor of the First Presbyterian church in Richmond, Va., from 1824 to 1834. In this latter year he accepted the appointment of secretary of the American Board of Commissioners for Foreign Missions, which office he held till his death, which occurred by shipwreck in a voyage between New York and Boston Nov. 27, 1846. His Life and a collection of his sermons were published.

Armstrong's Grove, a post-township of Emmet co., Ia. Pop. 45.

Army. The title or expression "army" is of modern origin. During the Italian wars of Louis XII. his soldiers began to Frenchify the expression *armata*, which the Italians used, or rather *armada*, the term employed by the Spaniards. The latter term is constantly used not only in the German, but even the Swedish reports of the Thirty Years' war; whence from *armada*, *armée*, *army*. Previous to this the French indicated that which we look upon as appropriately styled army, by *bataille*, *ost* (*host*, *hærst*, Germano-Swiss), *exercite* (*exercitus*, Latin; *exercito*, Span., Ital.), or *milice*. The latter word was preferred by several writers of the eighteenth century as having a more precise and general signification, as *milice* (*militia*) has its root in *miles*, a "soldier," which, in the accepted meaning of soldier, a "paid fighter," a militiaman certainly is not.

Since the earliest history of the world, fabulous or authentic, not alone the physical fate of empires, but the intellectual progress of humanity, the very development of mind, has depended upon the efficiency of the force which is defined an army. There is no doubt that civilization and Christianity—for the development of true civilization is the extension of Christianity—have been wafted to the end of the world upon the wings of commerce; but trade is transitory, and whatever is fixed has been made so by the force of arms. Even the most commercial nations, Phœnicia, Carthage, Holland, and England, could have accomplished little had they not occupied and held with an army or the fragments of an army what their sailors had discovered.

"Peace is the dream of philosophers, but war is the history of men;" and if almost universally, but erroneously, admitted to be "the greatest of evils," it is also one of the oldest. It is doubtful if some attempt at reducing war to a science is not the eldest of man's efforts at progress. "It preceded among all nations the arts and sciences proper, and perished in proportion as these developed." "The means of attack and defence appear to have been among the first essays of human invention, and to have called forth the powers of the mind in a greater degree than any of the arts of peace." The first expression of the art and science of war was an army. This may be defined as a certain proportion of a nation raised by means of "election" (Roman), conscription, voluntary enlistment, or otherwise, organized, armed, disciplined, and administered conformably to a digested system. It is an artificial combination of human and mechanical forces into a movable engine for defensive or aggressive purposes, of which discipline is the motive and regulating power. An army, in fact, is an aggregated force of men converted into soldiers, of each of whom it has been well said:

> "'Tis drilling that makes him, skill and sense—
> Perception—thought—intelligence,"

under a chief

> "Who has the energy—who the mind—
> The flashing thought—and the fearless hand—
> Together to bring, and thus fastly bind,
> The fragments"

into a homogeneous unit of force of which the soul is discipline.

An army as it should be is as Foy represented it to be in his time: "The army constituted a homogeneous and individual mass, in which, ascending from the conscript six months under arms to the field-marshal, there was no difference encountered in seeing and feeling."

In this connection a curious fact presents itself. Some of the most successful commanders on sea have been those who had their training in the land-forces of their country; more than one as cavalrymen. Not to encumber this article with names, consider almost all the Carthaginians' admiral-generals; Duilius, who first taught the Roman soldiers how to conquer on the most opposite element; Cæsar, Pompey; in modern times, Wrangel, Monk, Blake, Rupert, Opdam; the last three originally officers of cavalry.

Great captains have likewise proved the ablest organizers, administrators, statesmen, and negotiators: witness Gustavus, Torstenson, William III., Marlborough, Prince Eugène, Villars, Bentinck, Boufflers (the last two negotiated the Peace of Ryswick), Frederick the Great.

Although recent explorations have thrown some light upon the national military organizations of Nineveh and of Babylon, they are too vague to entitle them to more than the passing remark that they were based on scientific principles and administered in obedience to laws—laws which were sufficient for their era and extremely practical. They carried on campaigns at long distances from their base, and they besieged strong places, and took them after protracted efforts, and they fought battles; all of which proves that they must have comprehended and applied that which constitutes the art and science of war. Indeed, it would be very safe to assert that recent discoveries demon-

strate that all the ancient armies were better organized, administered, and manipulated than we have been accustomed to believe. This remark, indeed, applies to all armies worthy the appellation. Even Tamerlane has left behind him a treatise that shows that his wild hordes were subjected to a military direction by which skill and tact were enabled to employ their very native habits to the best advantage. The armies of antiquity had peculiar tactics, it is true, but these were congenial to the people and country; and, however peculiar, they understood them and applied them. Whoever will examine the Bible carefully will find in its descriptions the strongest evidence of a discipline of iron, of order, cadenced step, organization, tactics, stratagem, and strategy—all that modern pride considers the result of its intelligence—such as has not existed even within the last four centuries except in the small armies of Alva, Maurice, Gustavus, and on a larger scale in those of Marlborough and Frederick the Great. Some of the passages are magnificent in their portrayal of an army worthy of the inspection and leading of the greatest captains, complete in every arm or branch of the service. There we find expressions which cannot be surpassed in descriptive grandeur and comprehensiveness (*procellæ equestres*, "hurricanes of cavalry," "whirlwinds of chariots," etc.). The finest light cavalry of all times, imitated with so much success by the Saracens, were the Numidians of Hannibal ("the Cossacks of the ancient world"), and the Parthians were the predecessors of those arrays which culminated under Timour (Tamerlane) in the overwhelming of an antagonistic system under Bajazet at Angora, 28th July, A. D. 1402. Their tactics might be expressed by the term "swarm attack," which, against a force broken into by the other arms, is no despicable method of employing mounted troops. Tamerlane's heavy cavalry was likewise admirable.

The first army of which we know anything definite was the Egyptian. Perhaps since men have aggregated into nations no army has ever been maintained in every sense in a better condition commensurate with the times; and if history is at all reliable, the results were stupendous, considering the difficulties against which logistics had then to contend. If Sesostris (Se-seos-t-re or Rameses, "son of the Supreme and Gift of the Sun") and his campaigns are not a myth, the conception and campaigns of Alexander shrink into dwarfs before those of the armies which he made and directed; likewise those of the Romans, although they planted their eagles against the arctic and within the equatorial circle. The genius and generalship of Sesostris, which carried his own peculiar aquiline symbols of Apis eastward beyond the Ganges and northward of the Caspian, westward to the Ister or Danube, and southward towards the swell of the Mountains of the Moon, were not inferior to that "inspiration" of Alexander which bore those of the Macedonian Jove to the Indus, or that other inspiration which bore the eagles of the first triumvir to his unfulfilled invasion of Britain.

One question, however, presents itself which has a parallel in a more recent period, and this within a century and a half. Did Sesostris make his army or simply make use of it? The organization of the greatest of Egyptian armies, and the creation of the military spirit with which it was imbued, are said to have been due to his father, Amenophis III. Here we have an exact type of the preparation of Frederick William I., and the application by his son, Frederick (II.) the Great, although the latter has been compared in a critical analysis and examination to Philip II., the founder of the Macedonian power, rather than to Alexander the Great, its developer. To compare Frederick the Great to the son, rather than to the father, is preferable.

Between the Egyptian and better known organizations of civilizations more clearly understood, the Persian army deserves consideration, in that its cavalry was excellent, and even in the period of its decay it demonstrated that if properly commanded it was capable of achieving great things. This was shown at the battle of the Granicus, where its gallant behavior excited the admiration of every Macedonian officer, from the royal general-in-chief down to the humblest commander of a company. This is one side of the question. The conduct of the Persian horse at Platæa (B. C. 479) scarcely justifies a favorable criticism, although their defeat is mainly attributable to the fall of their leader, Masistius.

Close following on the Egyptian comes the better understood phalangian array of the Greeks, doubtless derived from the idea of that "impregnable phalanx" of the Nilish genius and organization which Cyrus found that even his Persians were unable to break. This disposition of force was exquisitely adapted to the Greek systematic and geometrical mind. The mutual dependence which made a phalangite nothing more than a particle of a grand machine was in perfect accordance with the national character. And it would be almost sufficient to prove the thorough efficiency of the discipline arrived at through the training *in* and *for* the phalanx to cite one example which it would trouble the critic to parallel—the march described by Xenophon, known as the "Retreat of the Ten Thousand."

Even although the career of the phalanx was short (say 200 years, from B. C. 550, Cyrus, to B. C. 350, Pyrrhus of Epirus), and it did go down before the Roman legion, its spirit revived from time to time in the return to dense formations, since, after all, the Greeks recognized the phalanx in any army corps disposed in compact order or "in mass," and even applied the term to Roman armies when they were drawn up without intervals (*ordre plein*). Short-lived in comparison, it had already accomplished great things in the "exact" wars which made Greek generals famous, and the tactics of Epaminondas proved a guide for the greatest, a key to success on modern fields. It is claimed that the three classes of the Greek infantry may be considered analogous—the first, the *hoplitæ*, to the grenadiers or to the line infantry; the second, the *peltastai*, to the light infantry; the third, the *gumnetai*, to the riflemen, tirailleurs, or sharpshooters of modern armies. It was in the time of Pericles that the Athenian soldiers were first paid, material changes made in clothing and armor, the second class of infantry intermediate between the heavy troops and skirmishers was added, and the distinction drawn between heavy and light cavalry. This was the acme of the glory of the Greek national citizens. With Alexander, artillery (ballistæ and catapultæ) accompanied armies to the field, and the commissariat became an acknowledged branch of the art of war.

In comparing the phalanx with the legion, in order to express the deficiencies of the former and the better characteristics of the latter, the critic is almost justified in claiming that the first was human, the second divine—the first the creation of human intelligence, the second the result of an inspiration of a superior power, or as Vegetius (A. D.? 375–390) has it: "Non tantum humano consilio sed etiam divinitatis instructu, legiones a Romanis arbitror constitutas," which Clarke translates well: "Heaven certainly inspired the Romans with the establishment of the legions, so superior does it seem to human invention" (xxi. 77), "or the idea of the legion must have been inspired by a god (Saxe, *Traité des Legions*, p. 39), for man was incapable of originating so perfect a military machine"—one destined in the course of events to conquer and consolidate for the future.

A clear idea of the striking difference between the phalanx and the legion can be conveyed to any reader's mind by saying that the first was mass or weight, and the second mobility or momentum; or, as a further demonstration, the first possesses little, the second perfect elasticity; the first little, the second perfect adaptability to any ground. The field had to be fit for the phalanx; the legion could be fitted to any stage of action. The best proof of the inferiority of the phalanx and the superiority of the legion was in one case its limited sphere as to theatre and existence; in the other, the fact that it outlived itself, that its spirit continued to conquer when the substance had almost completely deteriorated—when the legions of Fabius, Marcellus, Marius, Scylla, Cæsar, and Pompey had degenerated into a feeble militia; for instance, when Rome had ceased to be anything but a name; when Stilicho (A. D. 405–406) defeated Radagasius, and compelled a capitulation at Florence which had no parallel in the circumstances, of a monarch made prisoner and in the numbers surrendered, for fourteen centuries and a half, until Sedan, 1870.

It is a somewhat extraordinary fact that the only Eastern nation, the sixth Oriental monarchy, Parthia, the only one which successfully resisted the Roman armies at a period when as yet they had lost none of their efficiency—when it is claimed that among the Romans "the art of war had been brought to its highest point"—never possessed a standing army; their military organization was nearer that of the feudal times than any that we know of in antiquity. In A. D. 217 the Parthian king Artabanus fought a three days' battle at Nisibis with the Romans, and if he did not actually defeat them utterly, he compelled them "ignominiously to purchase a peace" (the mere permission to retreat cost $8,000,000); and, what is still more curious in this consideration, the tactics which lost the battle of the Pyramids won the battle of Nisibis, gunpowder having restored to the infantry the relative force or shock which was previously inherent in the cavalry. In the heavy horsemen (*καταφρακτοι*) of the Parthians is to be found a perfect exemplification of Marmont's cuirassiers armed with lances, or the feudal chivalry. The Parthian light horse represents, as well as the Numidians of Hannibal, the modern hussar, or rather mounted riflemen, if riflemen could shoot from the saddle at full speed, or the estradiots of the Venetian military era.

The principles of the phalanx survived in the Saxon

wedge of Harold, and revived again in the Swiss wedge of Sempach, July 9, 1386. In the condition of arms in the ninth, tenth, and eleventh centuries the Saxon wedge (the Roman *cuneus*, only one of the many phases of Roman formation) would have been irresistible had the Saxons, bravest of people, maintained anything like a regular army. It was the scientific wedge to all intents and purposes, driven by the beetle of invincible determination. As in the era of Hastings, even so the principle of the legion gives vitality to the very tactics of our own time. The tactics of Leo VI. (Flavius the Wise, or the Philosopher, A. D. 865–911), with a change of nomenclature and weapons, would serve as a valuable text-book for to-day; and when Gustavus Adolphus inaugurated a new system of tactics, it was a new birth of those of republican Rome, and his triumph at Leipsic (Aug. 28–Sept. 7, 1631) was simply a modern victory of the legion over the phalanx, of the Swedish brigade (open order) over the Tercias (masses) of Tilly.

If this antagonism should be traced back to first principles, it would be found that the contest between the phalanx and the legion has been going on ever since the first shock in arms of organized bodies of men. Even at this day we recognize the principles of the phalanx in the dense column (for instance, that of the English at Fontenoy, that living tower of strength which Foy represented as possessing the magic power of repairing the breaches made in it), and the legion in the deployed line-of-battle. The battle of the Pyramids is a curious example in a case the reverse of one previously stated. Whenever weight was required to resist the shock of momentum the idea of the phalanx revived. On the other hand, whenever the ground would not permit of this massed organization the legionary system prevailed, and the primary idea of the legion was revived in the lines-of-battle. In the Macedonian phalanx was combined all that was excellent in the other different Greek systems, while all their defects were avoided, and every improvement introduced which expediency recommended or necessity required. Thus completed, the Macedonian phalanx was capable of conquering every opposing organization, to be in turn conquered by the world-conquering Romans, as its principle and direction ever must be by superior tactics and greater mobility and adaptability.

The real birth of the modern standing army, in the present comprehension of the term, does not date back farther than the middle of the fifteenth century (1445–48). There were, it is true, from time to time, if not always, imperial and royal guards maintained, like the Varangians of the Byzantine court; also municipal guards, such as those recently in the service of the Free Cities, but standing armies, none. This occurred at the East in the reorganization of the Janizaries by Amurath I., 1350–72, originated by his father, Orchan, 1329. These Janizaries, organized into a regular force when the arrays of the Christian powers consisted of a disorderly militia, were invincible for a long period through a species of discipline to which fanaticism, blind obedience, courage, and enthusiasm gave a strength which it did not possess in reality. It was *esprit de corps*—a substitute, but an imperfect one, for true discipline. Amurath or Murad I. perfected likewise the institution of the *Spahis* (cavalry), and, wonderful foresight, of the *woinaks* (a sort of soldiers of the train). If this is correct, he was 450 years ahead of the first train corps in any Christian army. It is claimed that the Turkish regular army dates from Aladin or Ala-Eddyn (1219–36), but whether this is true or not, it certainly preceded that of Charles VII. by a whole century. Be this as it may, the new birth of the army took place at the West by the establishment of the "Companies of Ordonnance" by Charles VII. of France. It would not be an actual error to style him the father of standing armies, were it not that his regular force did not combine the three arms; it embraced only the second, mounted troops. It remained for his astute son, Louis XI., to perceive that no arm of the three could develop itself without the appropriate support of the other two. He was to Charles VII. what Remington cum suis, and previously Col. Poncharra, as to rifled and breech-loading small arms, and Louis Napoleon (or whoever was the real factor) as to rifled and breech-loading artillery, were to Colonel Ferguson of King's Mountain celebrity; what Torstenson was to Wurmbrand in mobilized cannon 250 years ago; what the infantry system of to-day and of the future is to that of de Guibert. Louis XI. was the father of field-artillery. What his wily brain conceived has been better done or further developed, but the glory of the conception *by* him it is impossible to deny *to* him, the most sagacious, at the same time most unprincipled, king that ever administered French affairs—the first sovereign of Europe style l "majesty." The result was, that his son, Charles VIII., invaded Italy in 1494 (he entered Rome on New Year's day, 1495) with the first real army which the modern world had seen—with the first real army that the Romans, with whom the legion originated, had seen since the legion disappeared from its soil (Charlemagne in Italy, A. D. 773) nearly a thousand years previous, swarmed out by the hordes or hosts of barbarians which superficial history deceives careless readers by styling armies.

Moreover, it is very remarkable that the new birth of a permanent force, with its first train of real artillery, its cavalry, the heavy, very much like that of the Parthians (Κατάφρακτοι), and resembling that recommended by Marmont in his "Institutions," and partially adopted in Russia (cuirassiers with lancers), and its light types of hussars,—this new birth in arms and its advent in the country of art led to a new birth of the arts and sciences. This discovery of Italy had more effect upon the sixteenth century, says Michelet, than that of America. War and commerce inevitably seek the same channels; even so do the arts, for scientific war is always the precursor of peace, and the triumphs of tranquillity are borne along on the lava-floods whereon fertility resumes its sway with greater force and beauty when the fiery torrents have cooled.

It is impossible to refrain from translating a few paragraphs which present a lively picture of the first national army whose descent into Italy cleft the barrier of centuries, whence issued forth to the world through the re-birth (*renaissance*) of the art of war—the new birth of all that elevates, refines, beautifies the advance of humanity; of all that can justify luxury, the inevitable consequence of the development of combined industry and art.

The army, 60,000 strong when it passed the Alps, having left detached corps all along the road, scarcely numbered 30,000 when it reached Rome. But these constituted the very sinew, the boldest and the best armed; relieved of its weaklings and stragglers, it was only the more formidable. To the music of its drums, with cadenced step, the wild battalion of Swiss and Germans led the march. In short tunics and tight pantaloons they shone in a hundred various colors. Many were of enormous stature, and to exalt it the more their casques were surmounted with lofty plumes. Besides the sword, they were armed as a rule with sharp lances of ash; one quarter of them carried halberds—the blade hatchet-shaped, surmounted with a four-sided spike. This (originally the Danish or pole-axe) was a deadly weapon in their hands. It served both to slash and to stab; in fact, represented a gigantic sword-blade bayonet. To each thousand halberdiers there were one hundred musketeers. The Swiss despised the cuirass; the front rank alone wore iron corselets. Behind these Swiss giants marched five or six thousand little, dark-complexioned, sunburnt men, vicious-looking, Gascons, the best marchers in Europe, full of fire, of intelligence, of resources, hard and quick hitters, each of whom was good for ten mortal shots.

The mounted gendarmes followed, 2500, covered with iron, each accompanied by his page and two valets; plus, 6000 light cavalrymen. In appearance these were feudal troops, but in reality the very contrary. As a rule, the captains were no longer noblemen leading their vassals, but the king's men commanding those more noble than themselves. "In France," said Guicciardini, "every one can attain command." The heavy horses of this cavalry, bobbed and cropped in French fashion, without tails and without ears, astonished the Italians, and appeared to them as monsters.

The light-horsemen carried the English long bow of Agincourt and of Poitiers, which launched strong cloth-yard arrows. Thus the French had adopted the weapons of their enemies.

Around the king, on foot, besides the Scotch guard, 300 archers and 200 knights, all gold and purple, shouldering iron maces, served as escort.

Behind these came thirty-six bronze cannon, each weighing 6000 pounds; then the long culverins (guns of position); then 100 falcons (lightest field-pieces), rolling briskly along, not dragged slowly by oxen, according to the Italian method. Each piece had a team of six active horses, on a mobilized carriage, which in action was unlimbered and at once was in battery.

Every beholder comprehended that this display indicated a great revolution in military affairs, and not the mere passage of an ordinary army.

This era of Charles VII., father, Louis XI., son, and Charles VIII., grandson, was an era of warlike innovations in every branch of the military service. Louis XI. was the first French monarch who had a large quantity of cannon. He first introduced cast-iron and bronze guns; cast iron shot superseded stone bullets, and in his intrenched camp of instruction in 1480 he had a large and respectable park of artillery. During his reign the medical service began to hold up its head for the first time since the legionary organization foundered, with its surgeon to each cohort, its hospital attendants and much of what is now deemed

indispensable, but had not been dreamed of for centuries. In the succeeding reign of Louis XII., France had one of those terrible awakenings whose vigor astonishes the world. In 1510, Gaston de Foix being commander-in-chief, a native French Napoleon of the first quarter of the sixteenth century, the French *Enfants Perdus*, or light troops (footmen) appeared, the best marchers for centuries which Europe had seen, and for centuries were to feel. At Ravenna, on Easter Sunday, 1512, they had a fearful baptism of blood and fire. This was the era of the introduction of the German Landsknechts (mercenary foot) and Hachenschützen (arquebusiers), the regimenting of infantry, the protection or support of artillery with picked troops, and "the disappearance of chivalry." Immediately the order of battle of necessity had to be adapted to the use of the rapidly improving firearms, and armies, as men of this century comprehend the term, were in being.

Thus the passage of the Alps by the young king Charles VIII., feeble, big-headed, six-toed to each foot, realized what Bismarck remarked of the Prusso-French war of 1870–71. This invasion of Italy by an organized national army was more than an invasion or an episode of war in the common application of the term—it was a historical phase. The existing conditions of society were crumbling and ready to pass away, and new developments of civilization were in the process of germination or ready for the shock to fecundate them. War is ever the necessary agent of this, and this new birth, like every other bringing forth of any new existence in human affairs, like human parturition, must be accompanied with anxiety intense, agony extreme, and loss of blood profuse; with an actual tearing to pieces. Thus armies are the midwives of progress.

It is in vain for other nations to attempt to deny that the military art and science owe the *impulse* of their progress to France and to French ideas; witness the introduction into all other services of so much of its nomenclature; but they also owe their highest practical development and close application to the Saxo-Germanic mind.

The military forces of Greece and Rome, of all antiquity indeed, except Egypt (native) and Phœnician or Carthaginian (mercenary), and of every other nation prior to 1450, were militia, more or less highly organized, subjected to a greater or lesser degree of discipline and instruction. Whether or not Philip of Macedon maintained a standing army is open to discussion. The advantage of an army of natives over one composed of mercenaries is shown especially in reverses. A national army may be beaten, but it is difficult to destroy it so that it may not revive from its very ashes; as, for instance, that of Rome after Cannæ. It will learn by experience, by being beaten, to conquer or persevere, as was the case with the Romans against Hannibal, the Russians against Charles XII., the Austrians against Frederick the Great, the Allies against France republican and imperial. With mercenaries, however, disaster or dearth is dissolution or worse, as happened more than once to Carthage, and to those who employed German or Swiss landsknechts and reiters. Still, the iron hand of Discipline and the genius of a master like Hannibal could organize invincible troops from the most discordant materials. This would indicate that while nothing can afford an antidote to indiscipline, discipline can remedy almost everything. An idea can make good defective discipline, and ideas amounting to fanaticism almost, but not entirely, supply the place of discipline; but, *cæteris paribus*, discipline is the *nephesh* or living spirit of an army, without which it is dead. Such armies as Hannibal's are like the "Grand Company" of Werner and Fra Moreale in the fourteenth century—vast forces of condottieri, which, led by great captains such as Saxe-Weimar, Baner, Torstenson, and Frederick the Great; their "Monks of the Flag" anneal into masses almost as irresistible as fate. Indeed, Hannibal, greatest of generals and war administrators, has been actually compared to a condottiere on the grandest scale, even though no one was fit to be named as his parallel for eighteen centuries, until Baner, the second Gustavus, and Torstenson, "the inimitable," demonstrated, under similar circumstances, that armies are ever subjected to the same laws and influenced by the application of like qualities in a leader. There was comparatively no discipline in the French republican armies, especially that wonderful army which from the Maritime Alps carried victory eastward to the last Alpine ridge before it sinks into the Austrian plain, and southward to the Gulf of Tarentum. Critics, eye-witnesses, and associates admit this. Enthusiasm took its place, and a belief in its innate force, its invincibility, such as permeated the U. S. army in Mexico, and made the escort of a wagon-train willing to encounter any force which sought to bar its way.

The only existing national army which continues to be militia, pure and simple, is that of Switzerland, unless the old Bönder system still holds good in Norway. The military force or army of Holland was a union of regulars and militia, to the uninitiated something like that of the U. S., but in reality vastly superior and more reliable. Prussia's organization is a union of regulars and militia in the strictest definition of the term (using the word "militia" in the sense of "the gallant and well-exercised militias of the principal republics of Greece," which were overthrown by the forces of Philip of Macedon, that "*may be termed* a standing army"). The Prussian system has been imitated in Sardinia—a feeble imitation, as was demonstrated in the campaigns of Custoza and Novara—and, later, in Turkey, and may be said to operate wherever a Landwehr and Landsturm, "ordinary and extraordinary militia," are recognized as the bases, constituting besides the regular force, equally important elements of the national army.

The famous English bowmen—who won such victories as Falkirk, 22d July, 1298; Halidon Hill, 19th July, 1333; Crecy, 25th Aug., 1346; Poitiers or Maupertuis, 19th Sept., 1356; Agincourt, 25th Oct., 1415; Pinkey, 10th Sept., 1547—were warlike militia, and nothing else—militia in the true sense of the expression, as were the Franks of Charles Martel, and not in the signification in which the term is misunderstood in the U. S. From the time of the Balearic slingers, taught in childhood to rely upon their peculiar weapons for their food (fifth century B. C.), and the Carduchians, who slaughtered the legionaries of Crassus, there were no marksmen or sharpshooters for many centuries, until the Indian wars in America developed the capabilities of the rifle (whose regular introduction into European armies dates from the American Revolution), with the exception of the above-mentioned English long-bowmen, who well deserved the proud term applied to them: "In the forefrount, he (Richard III., no mean general nor authority) placed the archers like a strong fortified trench or bulwarke." These archers were equivalent to such unsurpassed skirmishers as were many of our woodsmen who glorified the war for the Union. Even so from Maharbal to Ziethen and Seydlitz no cavalry existed worthy of the fame which these have connected immutably with their names. Charlemagne's armies are claimed to have been organized according to the old Roman discipline, but this is impossible. Still, that there was an acknowledged system needs no other proof than the success and extent of his campaigns against the most different peoples—from the obstinate Saxon to the intellectual Moor, from the brutish Hun to the Latinized Goth. Each of these had an army of its own, with peculiar weapons and tactics. To meet them the Netherlandish hero and emperor must have had armament, discipline, and a system of logistics. Even without proof the results obviate any demonstration that his armies could not have been mere hordes like those of the Crusaders.

Modern war as a *fixed* or exact science dates from Maurice of Nassau or Gustavus Adolphus, in the beginning of the seventeenth century. The first real articles of war published were those of the latter. The first infantry which, in square, laughed to scorn the efforts of the best existing cavalry, the Polish, at Wallhof, 7th Jan., 1626 (type of Bonaparte's battle of the Pyramids), were likewise his. His was the first artillery, whether its effective development was due to him or Torstenson, which manœuvred and played the part of modern artillery according to modern ideas. His was the first cavalry which charged in successive lines, with reserves or supports to rally on. (Here it may be as well to remark that in appearance, except as to armor, the cavalry of the Thirty Years' war resembled in dress and duties those of the "great American conflict" as near as might be. With their felt hats, drooping feathers, short tunics, heavy boots, scraggy, ill-groomed horses, and accoutrements, the picture of one of their columns might pass for one of ours on a raid.) His were the first field-engineers, although the Turks had retained a rude knowledge of this art, derived from the Romans or Byzantines. Vauban, Montecuculi, and Prince Eugène have left their testimony of this. Witness the last's successful operations against Lille in 1708, "a happy medium between the Turkish mode of never relieving their people until the end of a siege, and our system (British) of so frequently changing." (See "*War in Low Countries*," 34, 35.) His was the first organized staff administered systematically. His was the first camp which bred a series of scientific generals, who, through a succession of great captains, changed the fate of every European nation in whose service they were commissioned. Even in England this was so through Leslie, who crushed Montrose, victor in seven battles, and it might be said in as many campaigns, at Philipshaugh, 13th Sept., 1645. "These warriors, trained in the school of Gustavus and his successor, Bernard of Weimar, Baner, Horn, and the *inimitable* Torstenson, were scattered through the different countries of Europe," etc.

There is no doubt that a number of men ahead of their time, but imbued with the principles of the scientific military past, or taught by personal experience of what was needed, worked in to the result achieved by Gustavus

Adolphus: Simon Stevin of Bruges in fortification; Coligny in rapid marches and concentration and combination; de Rohan in tactics and handling of troops, especially mountain-warfare; Maurice of Nassau in equipment and detail—Maurice, whose camp was the finest school of officers which had existed for centuries; Torstenson for artillery; Königsmark for partisan operations, flying columns, so styled, on a grand scale demonstrating their effectiveness.

But the time has now arrived when a standing army has become a necessity for the maintenance of government. With the introduction of firearms it was no longer a question of individual foresight and exertion, but of national effort and preparation. These last involved time and outlay, the application of a sovereign's prerogatives, a national expenditure. "Among his arguments in favor of standing armies in modern times, Adam Smith enumerates the greater difficulty of preserving any considerable degree of order and prompt obedience from the noise of firearms, the smoke, and the invisible death to which every man feels himself every moment exposed as soon as he comes within cannon shot, and frequently a long time before the battle can be well said to be engaged. 'In an ancient battle,' he says, 'there was no noise but what arose from the human voice; there was no smoke; there was no invisible cause of wounds or death. Every man, till some mortal weapon actually did oppose him, saw clearly that no such weapon was near him.'" With the introduction of small-arms and artillery another new element of success had to be taken into consideration, precision of aim, as well as rapidity of fire. The effects of a point-blank volley delivered by an extensive deployment of cool and practised troops would invariably determine a battle were there no supports or reserves to retrieve the effect of such a volcano. Witness that scathing discharge at thirty paces of Wolfe's veterans upon Montcalm's gallant charge at Quebec, in 1759; or those volleys, again, of the duke of Cumberland's column at Fontenoy, in 1745, which actually annihilated in succession every French line of battle which attempted to stop their audacious advance. It was not until the ammunition of the English was wellnigh exhausted, their formation breached with point-blank discharges of artillery, and the gaps penetrated by fresh and furious cavalry, that, with victory almost within their grasp, the intrepid troops were compelled to relinquish their efforts, and sullenly withdraw from the field of their everlasting glory. (*Henderson's Duke of Cumberland*, 77–96.) The republic of Venice, wisest in its generation, comprehended this at once, and passed laws for the training of its arquebus-men. Very few students are aware of the immense influence in this regard exercised by the elector Maximilian of Bavaria. Had the other Roman Catholic sovereigns evinced a like prescience, the Thirty Years' war might not have eventuated in favor of free thought. Few monarchs ever paid more attention to musketry fire or thorough organization. Fortunately, his sphere was small, and he found few imitators, and his enemies, not his allies, profited by his examples and efforts.

With the Thirty Years' war began a new era of military history, and the world was henceforth to bow beneath the crushing weight of standing armies.

Prussia, which now stands first in rank as a military power, was the first to set an example of the mobilization of cavalry proper and of horse-artillery. Fehrbellin was a turning-point. There the great elector, Frederick the Great's great-grandfather, vanquished those Swedes, hitherto unconquered, who had beaten all others. He demonstrated what singleness of objective, the perception of it and of the value of time and celerity, and determination in execution, must accomplish. These, when combined, constitute the secret of success in war. From this time forward Prussian troops made their mark on almost every battle-field of Europe. The reign which saw these great changes inaugurated—that of Louis XIV.—saw them almost completed. The introduction of the bayonet restored to infantry that aggressive power which was lost with the just contempt of the knights on horseback for the villain or serf on foot. Since then but little changes have occurred, except in amelioration and perfection. The general introduction of uniforms has even been attributed to Louis XIV. This is an error. In his army, however, the identifying regimental clothing was first carried out thoroughly and splendidly. The distinctive dress dates back to the Carthaginians, in whose army every nationality wore peculiar clothing and bore particular arms. For instance, their Spanish forces wore white faced with purple; so the Grecian phalanx had made all the field resplendent with crimson and gold, or brass burnished into the brightness of the more precious metal. In the first we have the type of the Austrian, in the second that of the English uniform. Ezekiel (600 B. C.) alludes to blue as the distinguishing color of the Assyrian uniforms, "clothed most gorgeously." Nahum (710 B. C.) speaks of the "valiant men" of the forces confederated against Nineveh as wearing scarlet garments and as carrying red shields. At Angora (1402), in Tamerlane's army, Mohammed's contingent from Samarcand were uniformed complete by regiments. In the fifteenth century, at the relief of Neuss, the bishop of Münster's troops (7400 men) were clad all in green. In the army of Gustavus Adolphus different organizations wore distinctive colors in cloth and facings. With Louis XIV., however, uniform became the rule, the law. Here we have an army in the strictest sense of the word—regular, paid, permanent, uniformed, armed alike in each arm and branch of the service, disciplined, with pontoon trains, engineer corps; in fact, every appliance which science and service demanded. Never before had such existed. There was room for improvement, but nothing required a beginning. The idea was born and had a strong growth. The future could add little but adaptability to changed customs, habits, advanced and extended civilization. Armies were now tolerably complete as to all working purposes, if not perfectly complete in every particular and detail with staff and staff corps, for the first time since the legion was in its prime. It is well, however, to bear in mind that it was not until the end of 1797 that the staff (*état major*) of armies assumed its present form. In 1682 companies of cadets were formed for the instruction of young men destined for the service. Companies of miners (engineer troops) were now also, for the first time, regularly instructed and embodied. In the next few years and campaigns the value of these organizations was fully tested, and their efficiency proved. At the first siege of Luxembourg, 1684, in which they were present, exercising functions such as engineers of to-day discharge, eight were killed and nineteen wounded. In 1692 another less important but more remarkable change occurred. The pike, which since the first formation of armies, and for thousands of years, had been the principal weapon of infantry, was superseded by the bayonet, introduced, like many other notable ameliorations, such as copper pontoons, improved tactics, etc., by General Martinet, an officer the reverse of the popular opinion entertained of him. Steinkirk, 1692, was the last battle in Europe in which any bodies of infantry were armed with pikes. The contest in which the bayonet was first used is much disputed. According to some, it was at Turin, 1692, and the first charge at Spire in 1703. The pike or half pike, eight feet long, still lingered in the hands of officers, under the name of esponton or spontoon, down to the beginning of this century, and its manual or mention was to be found in our militia regulations within the memory of the writer: "The militia law of the United States requires that the commissioned officers shall, severally, be armed with a sword or hanger, and esponton." It is doubtful if this law of 1792 has been repealed.

The armies of Louis XIV. and those confederated against him accomplished all any army had accomplished or can accomplish. Witness Marlborough's march to Blenheim, 13th Aug., 1704, and Eugène's to Turin, 7th Sept., 1706. The first has never been surpassed, the second seldom equalled, in the annals of warlike achievements. Henceforward, the histories of European armies present magnificent efforts in obedience to surpassing genius, but it is always the same old story over again, with a variation of detail, but no important difference.

If judging from cause and effect is a criterion, one of the finest armies that ever existed was that of Cromwell, 1643–58. It deserves attention because it constituted a connecting link between the organizations of Maurice and Gustavus and those of William III., Louis XIV., and Marlborough. For its size it was as complete a working army as the world ever saw. England never possessed a native army but that of Cromwell, if indeed at any time it exhibited one to compare with it. For their day, and perhaps for any day, Cromwell's "Ironsides" were the best mounted, equipped, armed, uniformed, disciplined, and effective cavalry that ever charged an enemy. Their "get up" was in its way perfect, but they were so few they can only be considered as a model *in petto* of what all cavalry should be. In this they resembled the Swedish hussars of the Guard upon whom Nolan dwelt with so much emphasis—a very perfect text for the head of an exercise, with a blank page below.

English infantry, likewise, had already made a name which justified Bugeaud's remark, quoted by Trochu, that it was lucky for the world there were so few of them. Napoleon I. said, "I think that if I were at their head I could make them capable of anything."

But to return to the armies of the close of the seventeenth and first decade of the eighteenth centuries. Little has been better done than they did with the means at their commands, either in field operations or sieges. The siege of Maestricht, 29th of June, 1673, is remarkable for being the first at which European armies made use of the zigzags, or the present mode of tracing approaches in attacking a fortified place. They were introduced by Vauban, who

borrowed them from the Turks. It is generally believed that parallels were first employed at this siege; but this is a mistake, and Vauban's talents and skill do not require any erroneous statements to give them a false glare. Trenches, to contain the assailants, had been excavated parallel to the works of the fortress to be attacked from the earliest times. Vauban's improvement consisted in tracing the approach or communication from the parallel, so that it should not be enfiladed, and which the Turks had done long before. Montecuculi, in his Mémoires, talking of the Turks, of whose military skill, as it existed in his time, he had very deservedly a high opinion, says: "They do not construct their trenches upon the shortest line, flanking them with redoubts from distance to distance, but they make them in curved lines, transversal, parallel to the place they are approaching, so that they can neither be enfiladed from the place nor damaged by its cannon."

There is another article in the Turkish system of discipline relative to sieges, as quoted by Montecuculi, which, in a modified degree, might be with advantage introduced into our service. Those who have witnessed the little labor performed by soldiers, the negligence in general of (in other respects) good officers, when employed upon working-parties, the time lost in relieving the detachments, and the hurry they are invariably in to be relieved, will perhaps agree that a medium between the two customs would be an improvement. "They (the Turks) do not change the guards of the trenches nor the working-parties: when they (the troops) have once been assigned to a position, they remain there to the end of the siege; their food, water, wood, and every other necessary are brought to them."

In reflecting upon the stupendous lines of earthworks executed almost at a nod by the opposing armies in the Low Countries in the wars of William III. and Marlborough, thinking men are at a loss whether most to admire the docility and good-will of the soldier, or the great and capacious minds which could conceive and direct such operations. They are equal to anything ever done by the Romans, and only require the pen of a Cæsar to be duly appreciated. Take those thrown up by Villeroi and Boufflers in 1695, from the Lys to the Schelde, twenty miles; those from the Schelde to the Mehaigne in 1701; those from the Little Gette to the Meuse, not less than thirty-two miles, in 1705; from Mons to the Sambre in 1707; those of Marlborough against Villars in 1711, twenty-two miles. Moret, in his "Fifteen Years of Louis XIV." (i. 131), speaks of Boufflers' lines as 150 miles long, enveloping Belgium; and Captain Parkes, who saw them, states in his "Memoirs" (77) that "Villeroi's lines were prodigiously strong;" they "surrounded the whole Spanish Netherlands." Our late civil war furnishes examples parallel to the above; for instance, the defensive works about Washington, D.C., 37 miles long, and strongly fortified; and the lines of the Union and Confederate armies before Richmond and Petersburg, Va.

Some of the marches of that era were likewise extraordinary; twenty-eight miles on a day, with such heavy arms, equipments, and clothing, is astonishing, when carefully considered and the condition of the roads and country taken into account. In Aug., 1711, in turning Villars' "*ne plus ultras*," Marlborough's troops marched sixteen hours without once halting (*Alison*, 281), and in Sept., 1791, the prince of Hesse, 49 miles in fifty-six successive hours (*Ibid.*, 224). Even as late as 1776 the British army in America carried sixty pounds per man, when uniform and equipments, everything, had been greatly simplified and mobilized. The British light infantry wore then a model dress. How much greater was the load under which Marlborough's veterans bore up! Nevertheless, the very movements of the day of Oudenarde are exemplary. In motion at 2 A. M., the allies marched 15 miles and crossed the Schelde to begin a battle which lasted from 3 P. M. until the obscurity of night alone put an end to the firing, and diminished the already wonderful results of the victory.

"Since the days of Marlborough," remarks a distinguished officer of British engineers, Sir James Carmichael Smith, "a most excellent system of tactics has been unquestionably introduced into the British army. Changes of front are made with rapidity and precision; columns are deployed, or the line formed into columns, with an accuracy and celerity formerly never even contemplated. It appears, however, open to discussion, whether, in the great and essential points which ought to form the character of the soldier, such as cheerfulness under privations, readiness to encounter fatigue as well as danger, perseverance under toil, and courage in the field, the army of Marlborough has, or ever can be, excelled."

The next stride in advance in all army organization matters was made by Frederick II. (the Great). With him, however, in many cases it was the practical application of improvements in theory originated in the reign of his common-sense father, so misjudged and misunderstood. As early as the first decade of the eighteenth century the Prussian was the pattern discipline, and Prussian *esprit de corps* acknowledged and renowned. The introduction of the iron ramrod was due to the "Old Dessauer," general-field-marshal of the Prussian armies; and this simple improvement gave a double force to the Prussian infantry, which his tactics—he is considered the father of the world's present tactics—quadrupled again by augmenting their manœuvring capacity. Frederick the Great was his pupil in beginnings, but he soon soared far beyond the vision of the pedagogue. The pupil seemed competent to realize the impossible. He lent "wings to the lightning" by the introduction of flying (horse) artillery (first battery 1759). Under him the reforms in the tactics of the three arms became accomplished facts in active service, but especially on the battle-field. His line tactics were as the working of machinery, and his revival or application of the oblique order of battle gave him victories such as Fame has seldom recorded—gave him one, Leuthen, such as has never been equalled since war has had reliable annals. Under him and his lieutenants, Ziethen and Seydlitz, Europe, the world, first saw cavalry such as it never yet had beheld since those of Hannibal's lieutenant, Maharbal—unless, perhaps, those Trabants of Charles XII. of Sweden, if they were what they were represented to be, and the chimeras dire of opponents without discipline—cavalry such as it should be, such as it never has been since. When the Seven Years' war was forced upon Frederick in 1756 the "use of cavalry in the Prussian army was at its highest perfection." These, whose magnitude can scarcely be comprehended by an unmilitary mind, were still but a few of the great and beneficial changes he inaugurated. He administered, marched, moved, and fought armies as they never had been before handled and battled, and he appreciated, first had a realizing sense, of what was well known, no doubt, as a theory and neglected as a fact, that "an army, like a serpent, goes on its *belly*." But why dwell on Frederick? This world has existed six thousand years, and with the means at his command no equal to "der Einzige" has ever appeared on its stage. Through his army he elevated little Prussia to the rank of a first-rate power. He did more: he showed it the possible future—the way through its army to that future. He did even more: while he enforced a discipline which was hailed as exemplary, he permeated his army and his people with an idea. And Napoleon has left us his witness of a fact that he discovered too late, and to his ruin—that "the moral is to the physical in war as three to one." In regard to every subordinate matter which unites in the consideration of the subject "Army," Frederick's stand is the pre-eminent position of the statue upon the column. He must rank among the very first generals and administrators of the world. Others had and have fought armies grandly and successfully; but he made one—an example of a fighting army, susceptible of everything required of an army. He left an army which, notwithstanding its misfortunes, served as an example, a base-course qualified to bear any weight imposed upon it, as time has shown. It still exists imbued with the Frederickian idea of its invincibility—the first, the cynosure, among the six or seven military powers of Europe: 1, Prussia (or Germany, but Prussia is the vital force); 2, Russia; 3, France; 4, Austria; 5, England; 6, Italy; 7, Spain.

Before closing this article upon the army organization of the seven great Christian powers of Europe in the past —of which, however, only four, Prussia, Russia, France, and Austria, were truly great—the pre-eminence in every respect must be given to Prussia. Russia may have a larger numerical force, but Prussia (or Germany) has the most reliable, and must be regarded as the greatest military power. If the opinion of Napoleon is entitled to consideration, it may be looked upon as perfect. He said that a country in which the whole male population fit to bear arms were cemented together by discipline or grouted into a cohesion by thorough organization, would have a perfect army. Were Prussia's national resources derivative from commerce, internal and external, from fertility of soil and agricultural proficiency, from manufacturing industry and mining commensurate with her military organization—were the nation on a par with the army—there would be scarcely any limit to its aggressive capabilities.

It is a curious fact that the elements or principles of the military system or organization of Prussia are the oldest of which there are authentic records. Of course, in this view of the case the Egyptian must be omitted, because the critic is dependent for his facts upon records which, whatever reliability is conceded, are nevertheless very open to question. Although in the Rosetta Stone a key was discovered, it does not follow that that key unlocks every difficulty. Like the method of interpretation of the inscriptions disentombed at Nineveh, worked out with so much skill and perseverance by the German scholar Grotefend, the result is by no means

fixed, and until further corroboration is found it is little better than a process of more or less accurate guesswork.

"The principles of the Prussian system are to be observed in the military institutions of David, the second king of Israel. Like those of Prussia, it is remarkable that the natural foundation of all this grandeur was laid in the very beginning of a civil war of five years' continuance, which, to all appearance, was wasteful, and would be ruinous, both to him and his people. But whilst his enemies, for that reason, left him unmolested, he employed that whole time partly in gaining over the tribes to him, and partly in training up all those who sided with him to arms - his own tribe first, and all the rest gradually as they joined him; and all this under a specious and unsuspected color of keeping up a proper force against Ishbosheth his rival. And as his army at no time exceeded the number of twenty-four thousand men, so small a number created no suspicion, nor gave any jealousy to his neighbors, who never reflected that these troops were changed every month, and an equal number of new men brought into military discipline; or if they observed that it was so after some time, possibly this gave them less suspicion, apprehending that there was less to be feared from a body of raw, undisciplined men; little considering that by this monthly and regular rotation every man in his dominions must in a little time be trained up to arms, and in the course of a few circulations thoroughly disciplined, as in fact it came to pass. For we find him, in little more than eight or nine years, able to withstand the united force of all his neighbor nations invading him at once, which perhaps never was the case of any other prince from the foundation of the world."

"It is true, other princes (Alexander the Great, for example, and Charles XII. of Sweden) have been combined against and invaded by some of their neighbors in the beginning and (as they deemed it) infancy of their reigns; but I cannot recollect that ever I heard or read of any general combination unanimously entered into against any princes of any nation, and yet totally defeated, except David."

Thus far is a quotation from "The Historical Account of the Life and Reign of David," published in London in 1752, just four years before the commencement of the Seven Years' war, when Frederick the Great of Prussia was assailed by a confederation of nations whose population was to his own as nearly, if not more than, twenty-five to one—when the same Prussia which he raised to such a rank among the European kingdoms had fallen lower than he found it in consequence of the Peace of Tilsit: a system analogous to that of David raised it again, through its army, and its army alone, to its pristine position of pride and strength.

Scharnhorst was the chief of the commission for the reorganization of the army. Among its other members was von Boyen, who afterwards became minister of war under Frederick William III. and IV.; Grolmann; and, lastly, the gentle, kind, but particularly clever, Augustus von Gneisenau.

Although to Scharnhorst was entrusted the carrying out the reform of the army, Stein, who reorganized the civil administration, influenced the result materially with his clear sense and master mind. Whatever credit enures to the military men, without Stein all would have come to naught, for he it was first recognized in action that the true foundation of the state was "*the people in its unity*," and that a nation which wished to be respected had first to prove its own self-respect by a spirit of freedom and independence. Scharnhorst's system, in the new organization of the army, was based on the general obligation of all citizens to carry arms for the defence of the country; the monopoly of the nobility with regard to commissions in the army was abolished; any man might rise from the ranks, even to be a general—in war, by bravery and presence of mind; in peace, by military knowledge and acquirements. Corporal punishment was done away with, the pigtail was cut off, and "the worship of pipeclay" vanished. The restrictive clause of the Peace of Tilsit, according to which Prussia was allowed to keep only 42,000 troops, Scharnhorst quietly evaded by making new levies every year, and the trained soldiers returning to their homes, from whence they might be summoned in right time to form the nucleus of an army. The first idea of the "Landwehr" and "Landsturm," which afterwards led to such surprisingly fortunate results, was, even at that time, conceived and first developed by Scharnhorst.

The Russian army, the offspring of Peter the Great, has always, since it deserved the title of an army, been remarkable for the steadiness of its infantry. Zorndorf is one of the most wonderful instances of an infantry blasted away by a superlative infantry, mowed down by an efficient artillery, and stormed into by the finest cavalry in the world, all three arms directed by pre-eminent ability, "beaten without flying:"—an infantry which under a Suwarrow could emulate, and even surpass, the dash of the republican French. But solidity and obedience need nevertheless something more; and it is well to remember the remark of Wellington, who, after witnessing a review of 132,000 Russian infantry, 28,000 cavalry, and 540 guns on the plains of Vertus, 10th of Sept., 1815, said to the marquis of Londonderry, "Well, Charles, you and I never saw such a sight before, and never shall again: the precision of the movements of these troops was more like the arrangements of a theatre than those of such an army; but still, I think my little army would move round them in any direction while they were effecting a single change."

The organization of the English army, based upon voluntary enlistment, has been pronounced by foreign officers of thorough education and acute observation as unworthy of scientific study—that is, for home application, although the United States have borrowed a great deal from it—in the writer's opinion, to their detriment. Great merit, however, has been conceded to the British engineers and artillery. The excellence of the British infantry has been ascribed to the natural qualities of the people, and the dash of its cavalry to their habits of life. Almost all the marvellous achievements of England's footmen must be credited to their unshakable determination or pluck, and the judgment of the Russian general upon the charge at Balaklava, that "it was very magnificent, but it was not war," can be applied with some exceptions to the most notable exploits of the British horse. The staff corps, whose service is connected with logistics, have proved themselves as unreliable as our own developed a capacity which excited the admiration of all competent to criticise. If the former had not been backed by the resources of the wealthiest of nations—profuse expenditure making good the shortcomings of red-tape and misdirection—they would have neutralized all that bravery and fortitude could achieve—qualities which have rendered the British arms pre-eminently conspicuous. The military organization of Spain affords little to instruct, and less to imitate. With rare exceptions—and even the majority of these attributable to foreign direction—the military forces of the Spanish Peninsula have demonstrated a want of efficiency, especially within three centuries, which almost raises a doubt as to the validity of the encomiums lavished upon the Spanish infantry said to have been destroyed at Rocroi. So much so, that unbiassed criticism can equitably ask if the superiority of the Spanish arms in the zenith of their renown was not attributable to circumstances and comparison with inferior opponents, and (except in certain cases, as, for instance, that of Gonsalvo de Cordova, the "great captain") to Teutonic elements, much more than to those of Spanish proper or cognate origin.

Prior to the Prusso-French war of 1870–71 the French army organization was considered the best in Europe, and yet a few days sufficed to demonstrate the hollowness of that which seemed the acme of solidity, and the feebleness of that which appeared adequate to resist any strain. In theory perfect, in application it proved directly opposite. Why? Because it wanted vitality, living, sentient discipline. Thus, for a practical application it was the antithesis to that of the United States—scarcely considered worthy of more than a short paragraph or passing notice in any work consulted upon military affairs. Looked upon by experts as too defective for study, the military system of the U. S. displayed an elasticity and strength which showed that our skeleton formation, through the inherent force of our people, could be clothed upon with the muscle of an athlete, reversing the opinion of the duke of Alva—held for three centuries in Europe as an irreversible judgment—that veterans constituted the bone, sinew, and vital force of an army, to which new troops added no strength, but only plumpness and appearance. This capacity for expansion without destroying efficiency called forth from the famous French engineer-officer Rossel, shot at Sartory by the Thiers administration of vengeance, one of the most eloquent tributes ever paid by an able and accomplished officer to the military force and army of a foreign nation (*Abrégé de l'Art de la Guerre*, Paris, 1871): "Since the grand wars (terminating in 1815) progress has been especially a question of technology. In Europe the Prussians alone have shown themselves investigators, and have made war subservient to great political designs, but there is little of art in their campaigns. Theirs are lessons thoroughly learned, theirs are improvisations studied out for fifty years and recited to perfection. But if there is a difference between modern war and war as it was made at the beginning of the nineteenth century, it must be sought out in the study of the war of secession in the U. S. The war of secession was an industrial, progressive war—humane, if the term is acceptable.

"As a military element, the corps of West Point officers is assuredly better (I do not say more instructed) than all the

officers of Europe; as a political, a giant democracy, rugged for work, jealous of all its leaders. There all the new methods were tried, all the old ones were resurrected again; now, chambers of mines, such as were constructed in the sixteenth century; now, again, railroad trains brought into play against cavalry. As soon as a warlike procedure is recognized and appreciated, it is pushed to the extreme; abuse or excess of field fortifications; abuse of battles; abuse of skirmishers; of the navy, of guns. There were defences of forts such as should make all the commandants of fortified places in France and Alsace sink into the ground; battles of eight days, without termination and without pity; improvised armies staked and lost in less time than is necessary in Europe for a declaration of hostilities. There war constructed railroads, created ports, turned the course of rivers; to sum up, there the world beheld the application to this terrible science of all the exuberance of life, of a people seriously active, young, intelligent, and incapable of fear.

"Of military genius there was little or none, or at least confined to the second rank. Genius is something not practical, nor of commodious employment—above all, among these republicans. But, to make up for this, there was a very great deal of practical intelligence; the genius of commerce applied to war; the fever of production made use of to destroy. There war is not a speculation or a result, as with us; it is a business; and he was the good general who was capable of figuring out his balance-sheet and passing to his profit account the active and passive balances of the wise use of the time, of the money, and of the blood at his disposal. If we wish to begin anew, it is there in the United States that we must seek the elements and bring them down to our measure." In Von Hardegg's "Vorlesungen über Kriegsgeschichte," published at Stuttgart in 1852, the curious reader will find "chronological tables" that refer to leading works on military matters, which will enlighten him on almost every point referred to under this head, "Army." This valuable work was republished at Darmstadt and Leipsic, 1868, under the title of "Anleitung zum Studium der Kriegsgeschichte." (For a *Review of the present armies of Europe and America*, see ORGANIZATION — *Existing Army.*)

J. WATTS DE PEYSTER.

Army Corps. See CORPS D'ARMÉE.

Army List, an official publication issued by the British war office, contains the names of all the commissioned officers in the British army, arranged according to the dates of their commissions. Then come the officers of that portion of the queen's army which belongs exclusively to India. The bulk of the work is filled with an enumeration of all the regiments in the queen's army, and all the officers in each regiment.

Army Register is an annual register published by order of the secretary of war, in compliance with an act of Congress, containing lists of the departments, regiments, and commissioned officers of the U. S. army, with the promotions and casualties for the year.

Army Regulations is the name of a volume published by the U. S. war department, containing rules for the management of troops in camp and field, with instructions for keeping accounts and making returns to the army bureaus. It is based upon the Articles of War and other acts of Congress. (See ARTICLES OF WAR.)

Army Worm, in the Northern States the larva or grub of a night-flying moth (*Leuca'nia unipunc'ta*). It varies considerably in color and size with age and locality, but its markings are characteristic. It is usually from less than an inch to an inch and three-quarters in length; dark gray, with three narrow yellowish stripes above, and a broader one of nearly the same color on each side; thinly clothed with short hairs, especially about the head, which is of a dull yellow color. The ravages of these worms, which sometimes march over grain-fields in great numbers, are best prevented by ploughing a double furrow around or across the field on which they are moving. Then they may be killed by setting fire to straw in the furrows or by turning pigs and fowls (after removal of the crop) into the field. Crows and blackbirds will also destroy them rapidly.

The army worm of the Southern States, a near relative of the above, sometimes appears in countless hosts and devours the cotton. In the West Indies its ravages have led to a general abandonment of the cotton crop. Water mixed with 2 per cent. of carbolic acid will, it is said, prevent the mischief. Various other destructive larvæ are called by this name.

Arna. See ARNEE.

Arnal'do, or Arnold of Brescia, an eloquent Italian reformer, born at Brescia about 1100. He was a pupil of the celebrated Abelard in France, and adopted the monastic life. As a preacher he boldly reproved the prevalent venality, luxury, and corruption of the clergy. He affirmed that the clergy ought not to possess temporal power or property. The second Council of the Lateran, in 1139, condemned Arnaldo as a disturber of the peace, and banished him from Italy. He retired first to France, where he encountered the hostility of Saint Bernard, and next to Switzerland, where he gained many adherents. In the mean time there was formed in Rome a numerous party which favored the principles of Arnaldo and were friends of civil liberty. These revolted in 1143 against the pope, who fled or was driven out of the city. Arnaldo in 1146 returned to Rome, again raised his voice for religious reform, and endeavored to organize a republic. His success was hindered by the violence and excesses of the populace, which filled the city with disorder for nearly ten years. A reaction ensued, and Pope Adrian IV. reduced the Romans to submission by laying the city under an interdict in 1154. Arnaldo was arrested by the aid of the emperor Frederick Barbarossa, and was hanged in 1155. (See D. H. FRANKE, "Arnold von Brescia," 1825; GREGOROVIUS, "Geschichte der Stadt Rom im Mittelalter;" CLAVEL, "Arnauld de Brescie, et les Romains du XII. Siècle," 1868.)

Arnal'dus Villanova'nus [It. *Arnal'do di Villano'va*], sometimes called ARNALDUS NOVICOMENSIS, an eminent physician, born about 1235. He devoted much attention to alchemy, wrote treatises on medicine, alchemy, and religion, and was suspected of heresy. He was employed in diplomacy by the king of Naples. Died in 1312. (See CAMPEGIUS, "Arnaldi Vita.")

Arnaouts. See ALBANIA.

Arnatto. See ANNOTTO.

Arnaud (HENRI), a pastor of the Waldenses and an able military commander, was born in Piedmont in 1641. He commanded the Waldenses (Vaudois), who in 1689 defeated the French in several actions, and recovered their native valleys, from which they had been driven by persecution. He served as colonel in the allied army in the war of the Spanish succession (1702–13). He published a "Histoire de la glorieuse Rentrée des Vaudois" (1710), translated by Ackland (1827). Died in 1721.

Arnauld (ANGÉLIQUE), called also ANGÉLIQUE DE SAINT JEAN, an eminent French nun, born Nov. 28, 1624, was a daughter of Robert Arnauld d'Andilly. She was educated at Port Royal by her aunt, Marie Angélique, and was a zealous Jansenist. In 1669 she was elected prioress of the convent of Port Royal. She acquired a high reputation for piety, learning, and courageous endurance of persecution. She became abbess of Port Royal in 1678, after which she was persecuted by the Jesuits. She wrote memoirs of her aunt, the abbess Marie Angélique Arnauld (1591–1661). Died Jan. 24, 1684. (See SAINTE-BEUVE, "Port Royal;" also BEARD, "Port Royal.")

Arnauld, formerly written **Arnaud** (ANTOINE), surnamed L'AVOCAT, a famous orator, born in Paris in 1560, was the most eloquent French advocate of his time. He was also distinguished for his probity. He became procureur-général in 1585. His most memorable performance was his defence of the University of Paris against the Jesuits in 1594. He was the father of four distinguished sons (the eminent Arnaulds of Port Royal) and of six daughters. Died in 1619.

Arnauld (ANTOINE), called LE GRAND ARNAULD, a celebrated Jansenist theologian and philosopher, a son of the preceding, was born in Paris on the 6th of Feb., 1612. His mother was Catherine Marion. He was educated in the Sorbonne, ordained a priest in 1641, and published in 1643 a work "On Frequent Communion," which was highly esteemed, but gave offence to the Jesuits, of whom he was a constant and strenuous adversary. This book promoted a reform in the style of French theologians. He became a doctor of the Sorbonne in 1641, and engaged in the controversy between Jansenius and his opponents on the subject of grace. Having retired to Port Royal, a convent near Paris, he passed there many years in seclusion, and wrote numerous works on theology and philosophy. In 1650 he published an "Apology for the Fathers" ("Apologie pour les Saints Pères"). He was expelled from the Society of the Sorbonne in 1656, after which the Jansenists were generally proscribed and persecuted, both by the civil and ecclesiastical powers. He aided Pascal in his "Provincial Letters," and Lancelot in a "Grammaire générale et raisonnée." Among his other works are "Logic, or the Art of Thinking," commonly called "The Port Royal Logic" (1662); "The Moral Theology of the Jesuits;" "The Perpetuity of the Catholic Faith touching the Eucharist defended against Sieur Claude" (1669); and "The Practical Morality of the Jesuits" (8 vols., 1683–94). To escape the persecution which the Jesuits instigated, he became an exile in 1679, and passed the remainder of his life in Flanders and Holland. He died near Liege Aug. 8, 1694.

Boileau, who wrote his epitaph, pronounced him the "most learned mortal who ever wrote." Arnauld was distinguished for his earnestness and simplicity of character, his industry, and his alacrity in controversy. His works occupy forty-five closely printed quarto volumes, which were published in 1775–83. (See P. QUESNEL, "Histoire de la Vie et des Ouvrages de M. Arnauld," 1697; LARRIÈRE, "Vie d'Antoine Arnauld," 1783; SAINTE-BEUVE, "Port Royal," vol. ii.; VARIN, "La Vérité sur les Arnaulds," 2 vols., 1847.)

Arnauld d'Andilly (ROBERT), an able French writer, born in Paris in 1589, was a brother of Antoine Arnauld (1612–94), and the father of Angélique (de Saint-Jean), noticed above. He was appointed intendant of the army in 1634, and retired to the monastery of Port Royal about 1645. He produced a translation of Josephus's "History" (1669), and wrote autobiographical memoirs (1734), besides two volumes of lives of saints, called "Vies des Saintes Pères du désert." Died Sept. 27, 1674. His son Simon was marquis de Pomponne, and his brother Henry (1597–1694) was a devout and zealous Jansenist, and in 1649 became bishop of Angers.

Arnault (VINCENT ANTOINE), a French poet and dramatist, was born in Paris Jan. 22, 1766. He produced a tragedy, "Marius at Minturnæ" (1791), which was warmly applauded, and other tragedies, entitled "Lucretia" ("Lucrèce," 1792) and "Germanicus" (1816). He was appointed in 1808 secretary-general to the University. He was admitted in 1829 into the French Academy, of which he was chosen perpetual secretary in 1833. Among his works is "Souvenirs of a Sexagenarian" (4 vols., 1833). Died Sept. 16, 1834.

Arnd, or **Arndt** (JOHANN), a German Lutheran "pietist," born at Ballendstädt Dec. 27, 1555. He began to preach at Quedlinburg in 1590, and removed to Brunswick in 1599. He published a very popular work "On True Christianity" ("Vom wahren Christenthum"), which was translated into many languages. W. Jacques produced an English translation of it in 1815. He was called the Fénelon of the Protestants. He became superintendent at Zelle in 1611. Died May 11, 1621. (See FR. ARNDT, "Johann Arnd, ein biographischer Versuch," 1838; F. W. KRUMMACHER, "J. Arnd's Leben," 1842; WEHRHAN, "Lebensgeschichte J. Arndts," 1848; H. L. PERTZ, "Commentatio de J. Arndtio," 1852.)

Arndt (ERNST MORITZ), a German patriot and popular political writer, was born in the island of Rügen Dec. 26, 1769. He travelled extensively in Europe after he left college, and was appointed professor of history at Greifswalde in 1806. He published a "History of Serfdom in Pomerania and Rügen," and animated the Germans to resistance against Napoleon in his "Spirit of the Times" ("Geist der Zeit," 1807). He also promoted the patriotic cause by many eloquent and spirited poems and prose-writings. His celebrated national song, "What is the German's Fatherland?" ("Was ist des Deutschen Vaterland?"), is, perhaps, the most popular of all the patriotic songs of Germany. He married in 1817 a daughter of the celebrated Schleiermacher. In 1818 he was appointed professor of history at the University of Bonn. He was suspended in 1819 on account of his liberal opinions, but was restored to his chair in 1840. He was a member of the national assembly which met at Frankfort in 1848, but he seceded with the constitutional party in 1849. Among his works is "Souvenirs of my Outward Life" ("Erinnerungen aus dem äussern Leben," 1840). Died Jan. 29, 1860. (See SCHENKEL, "E. M. Arndt; eine Biographie," 1866.)

Arne (THOMAS AUGUSTINE), MUS. DR., a distinguished English musician, born in London May 28, 1710. He was a skilful performer on the violin. He set to music Addison's "Rosamond" in 1731, and gained a high reputation by the music which he composed for Milton's "Comus" (1738). This formed an era in the history of English music. The national air "Rule Britannia" was his composition. Among his chief productions were "Artaxerxes," an opera (1762), and "Eliza," an opera. He married a vocalist named Cecilia Young in 1740. He excelled especially as a composer of songs. Died Mar. 5, 1778. His sister Susanna was a noted performer.

Ar'nee, or **Ar'na,** a large animal of the order Ruminantia, a native of India, is nearly allied to the ox, and is sometimes called *Bos arnee*. It is regarded by some naturalists as a wild variety of the buffalo. It is larger than an ox, and in the full-grown animal one of the horns measures sometimes more than six feet in length.

Arn'heim, von, or **Arnim** (JOHANN GEORG), a German general and diplomatist, born in Brandenburg in 1581. He gained the rank of field-marshal in 1628, and entered the service of Saxony in 1630. He commanded a wing of the army of Gustavus Adolphus at Leipsic in 1631, and was opposed to Wallenstein in 1633. In May, 1634, he defeated the imperialists at Liegnitz. Died April 18, 1641.

Arn'hem, or **Arn'heim** (anc. *Arenacum*), a fortified town of Holland, capital of the province of Gelderland, on the right bank of the Rhine, 57 miles by rail S. E. of Amsterdam. It is very ancient, well built, has a governor's palace, and a famous church containing the tombs of the dukes of Gelderland; also manufactures of paper and cotton and woollen stuffs. A bridge of boats crosses the river here. Sir Philip Sidney died at Arnhem in 1586. It was taken in 1795 by the French, who were driven out by the Prussians in 1813. Pop. in 1869, 31,626.

Ar'nica [from the Gr. ἄρις, ἀρνός, a "lamb," on account of the softness of its leaf], a genus of herbs of the order Compositæ, sub-order Tubulifloræ. The flowers of the ray are pistillate and ligulate, those of the disk hermaphrodite and tubular. The receptacle is naked, the pappus bristly. The root, leaves, and flowers of *Arnica montana*, or leopard's bane of Europe, are poisonous when swallowed, and are even irritant to the skin, but are administered as a stimulant in paralytic affections, fevers, and other diseases. They are also applied with benefit to bruises. They contain a volatile oil, a resin, and an alkaloid, arnicine. The root is perennial, the stem about two feet high, simple, with few leaves, bearing a head of flowers of a dark yellow, often two inches in breadth. The *Arnica nudicaulis* and *mollis* of North America possess similar properties. Besides these there are five or more species in the Far West.

Arnim. See ARNHEIM, VON.

Ar'nim, von (ELISABETH OR BETTINA), a German authoress, born at Frankfort-on-the-Main April 4, 1785, was a sister of Clemens Brentano. She had a very sensitive spirit and ardent imagination. In her youth she cherished a passionate admiration and platonic affection for Goethe, with whom she corresponded. She was married in 1811 to L. J. von Arnim, noticed below. Among her works are "The Correspondence of Goethe with a Child" (3 vols., 1835), which she translated into English, and "Die Günderode" (2 vols., 1840), which are commended as graceful and fascinating. Died in Berlin Jan. 20, 1859. Her daughter, Gisela von Arnim, is married to Herman Grimm, and published "Dramatische Werke" (3 vols., 1857–63). (See "Blackwood's Magazine," vol. lviii.)

Arnim, von (KARL OTTO LUDWIG), a German traveller and writer, born in Berlin Aug. 1, 1779, wrote several poems, and a work entitled "Passing Remarks by a Passing Traveller" (6 vols., 1837–50). He also published "German National Melodies," with an English version (1816). Died in Berlin Feb. 9, 1861.

Arnim, von (LUDWIG JOACHIM), generally called ACHIM VON ARNIM, a popular and fantastic German poet distinguished for his originality, was born in Berlin Jan. 28, 1781. He devoted some years to the study of the physical sciences, and published a "Theory of Electricity" (1799). He was one of the founders of the romantic school of German literature. In conjunction with Clemens Brentano, whose sister, Bettina, he married, he published a collection of songs entitled "The Boy's Wonder-Horn" (3 vols., 1806). Among his works, which exhibit a rich imagination, are "The Poverty and Riches, Guilt and Repentance of the Countess of Dolores," a novel (1810); "Angelica the Genoese and Cosmus the Rope-dancer;" and "The Crown Guardians" (1817). Died Jan. 21, 1831. A new edition of his works ("Sämmtliche Werke") was published 1853–56, in 22 vols.

Ar'no [Lat. *Arnus*], a celebrated river of Italy, which rises at Mount Falterona in the Apennines, and falls into the sea 7 miles below Pisa, which city, like Florence, is intersected by this stream. Its valley (Val d'Arno) is one of the most beautiful regions in Italy. The banks of the river are partially dyked on account of the floods which sometimes occur, and ordinarily small vessels can ascend to Florence, but since the opening of the railway traffic it is not much navigated. Its length is 150 miles.

Ar'no, a post-village, the capital of Douglas co. Mo., 126 miles S. S. W. of Jefferson City.

Arno'bius (APER), an African rhetorician and Christian writer, born probably near Carthage. He flourished about 300 A. D., and was originally a pagan. The events of his life are mostly unknown. Having been converted to Christianity, he wrote an eloquent work called "Disputations against the Gentiles" ("Disputationes contra Gentes"), in which he exposes the absurdities of paganism. This is not considered strictly orthodox, but it is interesting as an historical document. According to M. Villemain, "It has a character of originality, and a real importance in relation to philosophy and history." (See NEANDER, "History of

the Christian Church;" BAYLE, "Historical and Critical Dictionary.")

Ar'nold (ALBERT NICHOLAS), D. D., born at Cranston, R. I., Feb. 12, 1814, graduated at Brown University 1838, and Newton Theological Institute 1841, ordained pastor of the Baptist church at Newburyport, Mass., Sept. 14, 1841, missionary to Greece 1844–54, professor of church history in Newton Theological Institute 1855–57, pastor at Westborough, Mass., 1858–64, professor of biblical interpretation and pastoral theology in Hamilton (N. Y.) Theological Seminary 1864–69, professor of New Testament Greek in the Baptist Union Theological Seminary at Chicago 1869–73, and author of "Prerequisites to Communion" (1860) and "One Woman's Mission" (1871).

Arnold (BENEDICT), an American general and notorious traitor, was born at Norwich, Conn., Jan. 3, 1740. He was apprenticed to an apothecary, from whom he ran away and enlisted in the army, but soon deserted. In his boyhood he was noted for his audacity and unruly disposition. He became a merchant at New Haven, and the owner of several small vessels employed in trade with the West Indies. In this business he failed, and incurred a suspicion of fraudulent dealing. He obtained a commission as colonel in the service of Massachusetts soon after the war broke out, in April, 1775. In the autumn of that year he commanded a force of about 1000 men sent to capture Quebec, and in the long march through the pathless forests of Maine proved himself well fitted for such a service. Having reached the St. Lawrence River, he effected a junction with General Montgomery, who had the chief command. They attacked Quebec in Dec., 1775, but failed to take it, and Arnold was severely wounded. He was raised to the rank of brigadier-general for his service in this campaign. Before and after this event he was involved in difficulties by his rapacity and pecuniary frauds. He commanded a small flotilla which encountered a superior force on Lake Champlain, Oct. 11, 1776, and displayed there such unflinching courage as well as skill that he gained much applause, although he was not victorious. He was deeply mortified by the action of Congress, which neglected him, while it gave the rank of major-general to five of his juniors in rank. In 1777 he was appointed a major-general, but as he remained below the other five, he was still discontented. He took part in the battle of Bemus Heights, Sept. 19, 1777, where he was involved in a quarrel with General Gates. At the battle of Stillwater, Oct. 7, he entered the field without permission from Gates, rushed into the hottest part of the action, rode about issuing orders in every direction, and acted like a madman. He received on that day a severe wound, which disabled him for some months, and Congress at last accorded him full rank. In June, 1778, he was appointed to the command of Philadelphia, where he lived in an extravagant style and ran into debt. While here he married a daughter of Edward Shippen (afterwards chief-justice of Pennsylvania). His official acts here were so rapacious that a court-martial sentenced him (Jan., 1780) to be reprimanded by the general-in-chief. Before this date he had been for six months plotting treason, and had made overtures to the enemy. He now solicited and obtained (in Aug., 1780) command of West Point, the most important fortress in the U. S., which he offered to betray into the possession of Sir Henry Clinton. The agent chosen by the British general to conduct the negotiations with Arnold was Major John André. (See ANDRÉ, JOHN.) Arnold and André had an interview on the 21st of Sept., and made the final arrangements for the surrender of West Point, but in consequence of the capture of André, Sept. 23, 1780, the plot was detected, and Arnold escaped in the British sloop Vulture, Sept. 25. He received about £6300 from the British government as a reward of his treachery. Having joined the British army and issued an address to the American people in vindication of his course, he obtained command of an expedition against Virginia, which sailed from New York in Dec., 1780, passed up the James River, and burned and pillaged a considerable amount of property. In the autumn of 1781 the troops under his command burned New London, Conn. He went to England about the end of the war, and passed many years in that country, where he was generally despised and shunned. He died in London June 14, 1801. (See SPARKS's life of Benedict Arnold in his "Library of American Biography," vol. iii.) WILLIAM JACOBS.

Arnold (BENEDICT), a Rhode Island colonist, born in England Dec. 21, 1615, was president of Rhode Island 1663–71. He was a citizen of Providence in 1636, and one of the purchasers of Conanicut Island in 1657. He had a good knowledge of the Indian tongues, and thus greatly befriended the New England colonies. Died in June, 1678.

Arnold (GEORG DANIEL), a writer and jurist, born at Strasburg Feb. 18, 1780, became professor of civil law in that city. He published a work on Roman law (1812), and wrote in the Alsatian dialect a comedy of "Whit-Monday," which was praised by Goethe. Died Feb. 18, 1829.

Arnold (GOTTFRIED), a German Lutheran theologian, born at Annaberg, Saxony, Sept. 5, 1666. He preached at Werben and Perleberg. Among his numerous works are "Sophia, or the Mysteries of Divine Wisdom" (1700), and a "History of the Church from the Christian Era to 1688" (3 vols., 1700), which gave offence to the orthodox. Died May, 1714. (See COLERUS, "Historia G. Arnoldi," 1718: ADOLPHE RIFF, "G. Arnold, Historien de l'Église," 1847.)

Arnold (ISAAC N.) was born at Hardwicke, Otsego co., N. Y., in Nov., 1815, was called to the bar in 1835, removed to Chicago in 1836, was a member of Congress from Illinois (1861–65), sixth auditor of the U. S. treasury (1865–66), and published a "Life of Abraham Lincoln" (1866).

Arnold (JOHN), an English watchmaker, born at Bodmin, in Cornwall, in 1744. He improved the chronometer by the invention of the expansion balance and detached escapement. Died Aug. 25, 1799.

Arnold (Dr. JONATHAN), born at Providence, R. I., Dec. 14, 1741, as a member of the colonial assembly brought forward in 1776 a bill repealing the oath of allegiance to Great Britain; was a surgeon in the Revolution, a member of Congress (1782–84). Becoming a resident of St. Johnsbury, Vt., he was long a judge of the Orange county court. Died Feb. 2, 1798.

Arnold (LEMUEL HASTINGS), born at St. Johnsbury, Vt., Jan. 29, 1792, graduated at Dartmouth in 1811, became a lawyer and manufacturer in Rhode Island, was governor of that State, 1831–33, member of Congress, 1845–47. Died at Kingston, R. I., June 27, 1852.

Arnold (LEWIS G.), a general, born in New Jersey, graduated at West Point in 1837, served gallantly in Mexico, and in 1862 became a brigadier-general of U. S. volunteers. Stricken with paralysis in that year while on duty, he was placed on the retired list in 1864. Died Sept. 22, 1871, aged fifty-four.

Arnold (MATTHEW), LL.D., an English poet, a son of the celebrated Thomas Arnold of Rugby, was born at Laleham, in Middlesex, Dec. 24, 1822. He was educated at Rugby and Oxford, and was chosen a fellow of Oriel College in 1845. In 1847 he became private secretary to Lord Lansdowne. He married Frances Wightman in 1851. Among his earliest works is a volume called "The Strayed Reveller, and other Poems" (1849). He was elected professor of poetry at Oxford in 1857, and published in 1865 a volume of "Essays in Criticism," which are highly esteemed. "The strain of his mind," says an anonymous critic, "is calm and thoughtful; his style is the reverse of florid; deep culture and a certain severity of taste have subdued every tendency to gay or passionate exuberance." He published a volume of "New Poems" in 1867, "St. Paul and Protestantism," "Literature and Dogma" (1873), etc.

Arnold of Brescia. See ARNALDO.

Arnold (PELEG) was a delegate to Congress from Rhode Island 1787–88, and afterwards was long chief-justice of the supreme court of Rhode Island. Died at Smithfield, R. I., Feb. 13, 1820.

Arnold (Gen. RICHARD) was born at Providence, R. I., April 12, 1828, and graduated at West Point in 1850. He entered the artillery, and in 1862 became a brigadier-general of U. S. volunteers, serving chiefly in the Gulf States. In 1866 he was brevetted major-general U. S. A.

Arnold (SAMUEL), Mus. Dr., an English musician, born in London Aug. 10, 1740. He became composer to the Covent Garden Theatre about 1762. His opera, "Maid of the Mill" (1765), was very popular. He produced many other operas, among which are "Rosamond" (1767) and "Inkle and Yarico" (1787). He was appointed organist to the king in 1783. His "Cathedral Music" in 4 vols. is still popular. Died Oct. 22, 1802.

Arnold (SAMUEL GREENE), born at Providence, R. I., April 12, 1821, graduated at Brown University in 1841, and at Cambridge Law School in 1845. He was several times lieutenant-governor of Rhode Island, served for a time as a volunteer in the late civil war, and became U. S. Senator in 1863. He published a "History of Rhode Island" (7 vols., 1859–60), and numerous addresses, reviews, and articles for periodicals.

Arnold (THOMAS), D. D., an eminent English teacher and historian, born at Cowes, in the Isle of Wight, June 13, 1795. He entered the University of Oxford in 1811, graduated in 1814, and became a fellow of Oriel College in 1815. At college his habits were studious and his opinions liberal. He gained the chancellor's prize for Latin and Eng-

lish essays in 1815 and 1817. He removed to Laleham, near Staines, in 1819, and married Mary, a daughter of Rev. John Penrose, in 1820. In 1828 he was ordained a priest, and became head-master of Rugby School, which he conducted with eminent wisdom and decided success. He cultivated among the students a sense of duty and a high moral and religious tone, and enforced by his example and personal qualities the influence of Christian principles. He was much interested in the political and religious movements of the time, was a Whig or Liberal in politics, and a strenuous opponent of the High Church and new school of theology represented by Pusey. He would not recognize in the clergy any peculiar sacredness or any trace of mediatorial function. In 1832 he purchased Fox How, a small estate between Rydal and Ambleside, where he afterwards spent his vacations. He contributed to the "Quarterly Review" and "Edinburgh Review," published a good edition of Thucydides (1830–35), and five volumes of sermons (1828–42). His capital work is a "History of Rome" (3 vols., 1838–42), which he did not live to finish. It terminates near the end of the second Punic war. "Intellectually," says A. P. Stanley, "his chief excellence lay not so much in the philosophical and biographical department of history, as in analyzing laws, parties, and institutions." He was appointed regius professor of modern history at Oxford in 1841, and delivered there an introductory course of lectures, which were published in 1842. He died June 12, 1842, leaving two sons—Matthew, an eminent poet, and William D. "He will strike those who study him more closely," says the "Quarterly Review" for Oct., 1844, "as a complete character—complete in its union of moral and intellectual gifts; . . . for his greatness did not consist in the pre-eminence of any single quality, but in several remarkable powers, thoroughly leavened and pervaded by an ever-increasing moral nobleness." (See A. P. Stanley, "Life and Correspondence of Dr. Arnold," 2 vols., 1844; Zinzow, "Thomas Arnold," 1869.)

Arnold (Thomas Kerchever), an English clergyman, born in 1800. He published a number of popular textbooks for schools, among which are manuals for the Greek, Latin, French, and German languages. Died Mar. 9, 1853.

Ar'nott (Neil), M. D., F. R. S., born in 1788, near Montrose, Scotland, was educated at Aberdeen and London, became a surgeon in the East India Company's service, settled in London in 1811, as a physician, published "Elements of Physics" (1827), "Essay on Warming and Ventilating" (1832), a "Survey of Human Progress" (1861), etc. He was distinguished as an inventor and as a benefactor of institutions of learning. Died Mar. 2, 1874.

Arnott (William), D. D., born in Perthshire, Scotland, in 1808, was educated at the University of Glasgow, was ordained in 1839, and subsequently joined the Free Church movement, of which he became one of the ablest champions. In 1863 he removed to Edinburgh. He was a delegate to the meeting of the Evangelical Alliance in 1873 at New York.

Arnotto. See Annotto.

Arnould, or **Arnoult** (Sophie), a popular French actress, born in Paris Feb. 14, 1744. She was very successful as an opera-singer, and was distinguished for her wit and conversational powers. Her society was sought by such men as D'Alembert and Diderot, and her beauty was praised by several eminent poets. Died in 1803.

Arn'prior, a village of McNab township, Renfrew co., Ontario, on the Madawaska River, near the Ottawa, and on the Brockville and Ottawa R. R., 40 miles W. of Ottawa, with which it is also connected by steamboat lines. It has excellent water-power, two weekly newspapers, several mills, and there are marble-quarries in the vicinity. Pop. 1740.

Arns'berg, or **A'rensberg,** a town of Prussia, in Westphalia, is situated on the river Ruhr, 46 miles S. S. E. of Münster. It contains several churches and a gymnasium; also manufactures of broadcloth, linen, etc. In the Middle Ages it was one of the seats of the Vehmic court. Pop. in 1867, 4621.

Arn'stadt, an old town of Germany, in Schwarzburg-Sondershausen, on the river Gera, 10 miles S. of Erfurt, with which it is connected by a railway. It is one of the most ancient Thuringian towns. Here are manufactures of gloves, pottery, etc. A copper-mine has been opened in the vicinity. Pop. in 1871, 8603.

Arns'walde, written also **A'renswalde,** a town in the Prussian province of Brandenburg, 66 miles N. E. of Frankfort-on-the-Oder, has extensive chemical manufactures. It is on the railroad from Stettin to Posen. Pop. in 1871, 6522.

Ar'nulf [Lat. *Arnul'phus*], emperor of Germany, a son of Carloman of Bavaria. The latter was a grandson of Charlemagne. Arnulf was elected king of Germany in 887 A. D., invaded Italy about 894, and captured Rome in 896. He was crowned as emperor by the pope at Rome. He died in 899, and was succeeded by his son, Louis IV. (See Gagern, "Arnulfi Imperatoris Vita," 1837.)

A'rolsen, a town of Germany, capital of Waldeck, on the Aar, 23 miles N. N. W. of Cassel. It has manufactures of woollen cloth. Here is a fine castle of the prince of Waldeck, with a library of 30,000 volumes. Pop. in 1867, 2148.

Aro'ma (gen. **Aro'matis**), [Gr. ἄρωμα], the principle in plants or other substances which constitutes their fragrance; the peculiar odor of aromatic plants, such as nutmeg, cloves, vanilla, and lavender. It is extremely subtle, and seems to be almost imponderable, as these substances diffuse their odors for a long time without sensible diminution of weight. The aroma of plants is imparted to fixed oils by maceration.

Aro'ma, a post-village and township of Kankakee co., Ill., on the Kankakee River, about 60 miles S. of Chicago. Pop. of township, 1100.

Aromat'ics [Lat. *aromat'ica*, from *aro'ma*, a "spice"], spicy plants or drugs; substances which emit aroma or agreeable perfumes, and are generally characterized by a warm, pungent taste, as cloves, cinnamon, ginger. They often contain essential or volatile oils or resins. The term aromatic is also applied to several animal substances, as ambergris, musk, and castor. (See Aroma.)

Aromat'ic Vin'egar is a compound or mixture of ordinary vinegar with aromatic essential oils, and is a powerful perfume. As it is very volatile, and is an excitant when snuffed in the nostrils, it is used as a remedy for fainting and nervous debility. It is often prepared by combining crystallizable acetic acid with the oils of cloves, lavender, rosemary, and *Acorus calamus*.

Aroos'took, a river of the U. S., rises in Piscataquis co., Me., flows north-eastward through Aroostook county into New Brunswick, and enters the St. John's River. Length, about 120 miles.

Aroostook, a county which forms the N. extremity of Maine, bordering on New Brunswick. Area, about 6800 square miles. It bounded on the N. by the river St. John's (which traverses the western part of the county before it reaches the northern boundary), and is also intersected by the Aroostook. The surface in some parts is hilly, and a large part of the county is covered with forests. The chief settlements are in the southern part, the soil of which is productive. Lumber, cattle, wool, butter, oats, buckwheat, hay, maple sugar, and potatoes are extensively produced. Capital, Houlton. Pop. 29,609.

Arpád, the national hero of Hungary and the chief of the Magyars, who in 889 A. D. migrated from Galicia, and conquered the Slavonic people of Croatia and Transylvania. He is called the founder of the kingdom of Hungary. Died in 907 A. D. The dynasty of Arpád terminated in Andrew III., in 1301.

Arpeggio [It. *arpeggia're*, "to play on the harp"], in music, a chord of which the notes are given in succession; or the sounding the notes of a chord in quick succession, so as to imitate the harp.

Arpent, a French land-measure nearly equivalent to an English acre. The French now measure land by the *hectare* instead of the *arpent*, which is obsolete.

Arpi'no (anc. *Arpi'num*), a town of Italy, in the province of Caserta, is pleasantly situated on high ground, 5 miles S. of Sora. It is surrounded by very beautiful scenery, has a royal college, several churches and convents; also manufactures of woollen cloth, paper, etc. Here is a cyclopean wall and other remains of Arpinum, which was founded by the Volsci, and became a Roman *municipium* about 188 B. C. It is celebrated as the native place of Caius Marius and of Cicero. Variegated and white marbles are quarried in the vicinity. Pop. in 1861, 6240.

Ar'quebus, Arquebuse, or **Harquebus,** a hand-gun used by infantry before the invention of the musket. It was originally discharged by a match applied to the touchhole. The battle of Morat (1476) is said to have been nearly the first in which it was used. It was at first so heavy and clumsy that it had to be supported on a forked rest planted in the ground before the arquebusier.

Arraca'cha, the native name of an umbelliferous South American plant (*Arracacha esculenta*). It grows in Colombia, Jamaica, and other tropical regions, and is cultivated for its roots, which are large and sweet, and are eaten after being boiled or roasted. The taste is described as between that of a parsnip and a sweet chestnut. This plant was recommended as a substitute for the potato, and attempts were made to cultivate it in England, but that climate was found to be unfavorable.

Ar'rack', or **Rack,** an alcoholic liquor distilled from

fermented rice, is a common intoxicating drink in the East Indies and other Oriental countries. The term is also applied to a strong drink which is obtained from the fermented sap of the palm tree, and is often called palm wine or toddy. Among the species of palms which yield this drink are the cocoanut-palm and the date-palm. Arrack is imported into England, and used to make punch. When new it has an oily and disagreeable taste, which is improved by age.

Arragon. See ARAGON.

Ar'rah, a town of British India, in the presidency of Bengal, 25 miles W. of Dinapoor. The British here gained a victory over the mutinous Sepoys in 1857. Arrah was the scene of several exciting incidents of that mutiny. Pop. about 15,000.

Ar'ran, an island of Scotland, in the Frith of Clyde, county of Bute, 13 miles W. of Ayrshire, and 4 miles E. of Cantire. It is about 20 miles long, 12 miles wide, and has an area of 165 square miles. The surface is mountainous, the granite peaks of the northern part being remarkably grand. Here is a cavern in which Robert Bruce once hid himself. The geology of Arran, it is said, presents a greater succession of strata than any other equal portion of the British isles. The south-eastern half consists of Devonian sandstone, trap-rock, and carboniferous strata. The north-western half exhibits a central granite nucleus, bordered by mica-slate on one side, and by lower Silurian rocks on the other sides. Pop. about 6000.

Arran, EARLS OF (1762); Viscounts Studley and Barons Saunders (1758, in Ireland), and baronets (1662), a noble family of Great Britain.—PHILIP YORKE GORE, the fourth earl, was born Nov. 23, 1801, and succeeded his uncle in 1837. The dukes of Hamilton in Scotland also have the title of earls of Arran.

Arran, SOUTH ISLES OF, three small islands at the entrance to Galway Bay, about 4 miles from the W. coast of Ireland, and 27 miles W. of the city of Galway. They are named Inishmore, Inishmain, and Inishere (or Innishere). Area, 18 square miles. They once contained twenty churches and monasteries, and a church built in the seventh century is still standing in one of them. Here are also remains of cyclopean forts of unhewn stone, supposed to have been built in the first century, and described as among the most magnificent barbaric monuments of Europe.

Arrangement, a musical term, denotes the adaptation of a piece of music to an instrument different from that for which it was originally composed, as when orchestral compositions are adapted to the piano. The arrangements of Franz Liszt are said to be superior to nearly all others.

Arras (anc. *Nemetacum*, afterwards *Atreb'ates*), a fortified city of France, capital of the department of Pas-de-Calais, on the river Scarpe and on the Railway du Nord, 48 miles by rail N. E. of Amiens, and 120 miles by rail N. N. E. of Paris. It was formerly the capital of Artois, and was the seat of a bishop as early as 390 A. D. It was fortified by Vauban, and ranks as a fortified town of the third class. The citadel is separated from the town by an esplanade, but it is enclosed within the same wall. Arras is well built, partly on a declivity and partly on flat ground, and is adorned by fine public buildings, among which are a cathedral, a town-hall, and a theatre. It has a museum, a school of design, and a public library of about 36,000 volumes. Here are manufactures of hosiery, lace, woollen and cotton goods, etc. In the Middle Ages it was so famous for its tapestry that this article was commonly called *arras* by the English. It was the birthplace of Robespierre. The grain-market of Arras is said to be the most important in the N. of France. Pop. in 1866, 25,749.

Arras'tre, a mill used in Spain and the Spanish colonies for grinding gold and silver ores. It is a circular basin of granite or other hard rock, in the centre of which a vertical wooden shaft revolves, with four horizontal arms, to which large flat stones are attached by chains. The ore is broken into small fragments before it enters the arrastre. The revolution of the shaft is produced by two mules. (See SILVER, by PROF. W. P. BLAKE.)

Ar'rawak Iu'dians, a race or collection of tribes in Guiana, remarkable for the euphony of their language and their mild and friendly disposition towards the whites. They were formerly very numerous and powerful. They have been much benefited by the labors of Moravian missionaries.

Arreoy', or **Areoi,** the name of a licentious society in the Society Islands, composed of both sexes. They were bound to kill all their offspring immediately after birth. The arreoy was first noted by Captain Cook, and more fully described by Ellis in his "Polynesian Researches."

Arrest' [Old Fr.], the apprehension or seizure of a person by lawful authority, usually by the command or direction of some court or officer of justice. It may take place either in civil or criminal cases.

(1) *In Civil Cases.*—In this instance it may be either on *mesne* or final process. The object of the first is to make it certain that the defendant will answer the order of the court. He may either remain in custody or give bail, according to the rules of practice, as security for his appearance. On final process the arrest is in the nature of an execution. The defendant is to be kept in confinement, either in jail or within prescribed limits, until the judgment is satisfied, or until he is discharged by order of the court. In the early common law an arrest was allowed almost as a matter of course, imprisonment for debt being the regular practice. This rule is now greatly modified, and by a statute in England and in a number of the American States an arrest can only be had in special cases and upon a judge's order. The facts necessary to be shown as a basis for the order are presented on affidavit. There are certain persons privileged from arrest by rules of general prevalence, such as members of legislatures, or witnesses while attending the sessions of the legislature or courts, and while going to and returning from the same. The arrest in such cases is irregular, and the party arrested may be discharged on motion. This privilege is secured to members of Congress by the U. S. Constitution. An original arrest cannot be made on Sunday, nor is it lawful to break into a house for this purpose, owing to the legal rule that "a man's house is his castle." This rule does not apply where the defendant has been rescued, and the officer is proceeding regularly to retake him. The common law permits an arrest by night as well as by day. This rule is sometimes affected by statute.

(2) *In Criminal Cases.*—The power to arrest in this class of cases is much less restricted. None are privileged (except ambassadors and their servants), outer doors may be broken open, Sunday is not regarded, and a warrant is not in all cases essential. Such an arrest is made either under a warrant, or by an officer without a warrant, or by a private person without a warrant. A warrant is granted by a magistrate on information in writing and supported by oath, and is executed by the person to whom it is addressed, usually a sheriff or constable. An arrest may be made without a warrant by a peace officer, such as a sheriff or constable, when a felony or breach of the peace is committed in his presence, or where a felony has been committed, or he has reasonable ground to suspect that it has been, though not in his presence, and he has also reasonable ground to suspect the party arrested. The right of a private person to make an arrest without a warrant is much more restricted. He must be prepared to show that a felony has been *actually* committed, as well as reasonable grounds of suspicion that the party arrested was the wrong-doer. A private person is bound to arrest for a felony committed in his presence. In making an arrest necessary force may be used, and in case of felony even life may be taken where arrest is enjoined. An arrest can only properly be made within the jurisdiction of the court. When a person charged with crime escapes from one State to another, his return may be demanded under the laws of Congress. Should he escape to a foreign country, he may in certain cases be retaken under an extradition treaty with that country. (See EXTRADITION.)

The word "arrest" is also used in law in connection with judgment. This means that judgment is not to be entered, although a verdict has been given, on account of some reason appearing upon the record, as where the allegations in the pleadings are not a sufficient basis for an action.

T. W. DWIGHT.

Arrest', d' (HEINRICH LUDWIG), a German astronomer, born in Berlin in 1822. He discovered in 1851 the comet called by his name, and in 1862 the asteroid Freia.

Ar'rian [Gr. Ἀρριανός; Lat. *Arria'nus Fla'vius*], a distinguished Greek historian, born at Nicomedia, in Bithynia, about 100 A. D., was a pupil and friend of Epictetus. He was a Stoic in philosophy, edited his master's "Manual of Ethics" ("Enchiridion"), and wrote the "Lectures of Epictetus" in eight books, of which four are now extant. In 136 A. D. he was appointed governor of Cappadocia by Hadrian. He is said to have served in the army against the Goths and Alani. He chose Xenophon as his model in composition. His most important work is a "History of the Expedition of Alexander the Great," Ἀνάβασις Ἀλεξάνδρου ("The Ascent of Alexander"), which is the chief authority on that subject, and is highly esteemed for accuracy, good judgment, and impartiality. Among his extant works are "Indica," an account of India, a "Treatise on Hunting," and a "Voyage Around the Euxine Sea." (See MAUERMANN, "Arrianus Nicomediensis et Quintus Curtius Rufus," 1835; ELLENDT, "De Arrianeorum Librorum Reliquiis," 1836.)

Arria'za (Juan Bautista), a Spanish poet, sometimes called **Arriaza y Superviela,** was born at Madrid in 1770. He passed some years in London as secretary of legation, and published in 1803 "Emilia," a poem on the influence of the fine arts. Having returned to Spain in 1807, he took an active part in politics, and wrote in support of absolute monarchy. He obtained an important position in the department of foreign affairs. In 1810 he produced "Poesias Patrioticas." Died in 1837.

Arri'ghi di Casanova (Jean Toussaint), duke of Padua, a Corsican general, was born at Corte in 1778. He entered the French army in early youth, and served with distinction at Marengo, Austerlitz, and Friedland, and was raised to the rank of general of division on the field of Essling in 1809. He lived in exile from 1815 to 1820; was elected to the Legislative Assembly in 1849. Died in 1853.

Ar'rington, a township of Wayne co., Ill. Pop. 1640.

Arrington (Alfred W.), born in Iredell co., N. C., in Sept., 1810. His father, Archibald, was a member of Congress 1841–45. The younger Arrington was a Methodist preacher (1829–34), winning much distinction for eloquence. In 1834 he became a lawyer, practising in Missouri, Arkansas, and Texas. He was a district judge in Texas (1850–56), and in 1857 removed to Chicago, where his career as a lawyer was very brilliant. He was the author of a celebrated "Apostrophe to Water," often quoted. Died Dec. 31, 1867.

Ar'ris [from the Lat. *aris'ta*, the "beard of an ear of grain," the "prickle of a fish"], in architecture, the edge or angle formed by two surfaces meeting each other, or the line of meeting of two planes in a sharp edge; a term sometimes applied to the edges which separate the flutings of a Doric column.

Arro'ba, a Spanish weight and measure, used also in Brazil and the Spanish colonies. There are ten kinds of *arroba* for weight, ranging between 21$\frac{52}{100}$ pounds avoirdupois and 32$\frac{53}{100}$ pounds avoirdupois. Only two of the number are as great as 28 pounds. There are eleven kinds of *arroba* for liquid measure, ranging from 2$\frac{73}{100}$ gallons to 9$\frac{91}{100}$ gallons. The arroba for Spain generally is (or was, as it is abolished) 4$\frac{26}{100}$ gallons.

Arrondissement, a French term, signifies a district or circuit, and is the name of the principal civil divisions of the departments of France. Each department is divided into arrondissements, each arrondissement into cantons, and each canton into communes.

Ar'roo', Aroo, or **Arru Islands,** a group of islands in Australasia, situated between lat. 5° 20′ and 6° 55′ S., and between lon. 134° 10′ and 134° 45′ E. The largest island is 70 miles long and 20 miles wide. Some of the natives have adopted Christianity. Here is a town called Dobbo, into which British goods are imported annually to the amount of about £30,000. The exports are pearls, trepang, and birds of paradise.

Ar'row, a long, pointed, and barbed missile formerly much used in war and the chase, and discharged from a bow, cross-bow, or ballista, and even now used by some savage nations. Among the varieties of the arrow were the "cloth-yard arrow" once used by the English archers, and about one yard in length, and the "quarrel," a heavy arrow discharged from the cross-bow. Some South American Indians discharge light poisoned arrows from a blow-pipe. Poisoned arrows are used by many barbarous peoples.

Ar'rowhead (*Sagitta'ria*), a genus of aquatic plants of the order Alismaceæ, natives of both cold and tropical climates. They have unisexual flowers, with many stamens and many carpels, which are compressed and one-seeded. The *Sagittaria sagittifolia*, a native of Europe, is a beautiful plant with arrow-shaped leaves, which rise above the surface of the water. The *Sagittaria variabilis* of the U. S. is very similar to it. The *Sagittaria Sinensis* (Chinese arrowhead) is cultivated in China in ponds and ditches for the sake of its nutritious corms, which abound in starch.

Arrow-Headed Characters. See Cuneiform Inscriptions, by Rev. William H. Ward.

Ar'row Rock, a post-village and township of Saline co., Mo., on the right bank of the Missouri River, 15 miles above Boonville. Pop. of township, 3174.

Ar'row-Root, the starch or fecula from the root of the *Maranta arundinacea* and other species of *Maranta*. It is much esteemed as an easily digestible diet for infants and invalids. Large quantities of it are imported into the U. S. and Europe from Bermuda and Jamaica, where it is cultivated. It is also raised in Georgia and Florida. The roots, or rather rhizomes, yield about 25 per cent. of this starch, which is in the form of a light, opaque, white powder. It is often adulterated with potato-starch and other substances. The name arrow-root is said to refer to the use of the fresh roots as an application to wounds inflicted by poisoned arrows; and the expressed juice has been recommended as an antidote to poisons, and a cure for the stings and bites of venomous insects and reptiles. Some think that the name is really another form of *aru*, which is said to be the Indian appellation of the plant; but it is not improbable that the scales on the root, resembling the

Arrow-root.

point of an arrow, may have suggested the name. In preparing "arrow-root," the rhizomes of the plant, when a year old, are washed, carefully peeled, and beaten in a wooden mortar or by a mill or wheel-rasp to a milky pulp. The pulp is then diluted with water, passed through a sieve of coarse cloth or hair to separate the fibres, and the starch is allowed to settle. Albumen and salts are held in solution, while the starch settles down as an insoluble powder, which is finally dried in the sun. According to Benzon, the fresh rhizomes contain—

Starch	26.00
Cellular fibres	6.00
Albumen	1.58
Gummy substances	0.60
Volatile oil	0.07
Chloride of calcium	0.25
Water	65.50
	100.00

The prepared arrow-root is almost pure starch. It has a peculiar firm feel between the fingers, and when rubbed produces a peculiar crackling sound, like that of dry snow in very cold weather. Like starch from other sources, it is insoluble in cold water, but forms on boiling a gelatinous solution.

The purity of arrow-root is best determined by microscopic examination; as, while the starch granules of different plants (see Starch) are almost identical in chemical composition and properties, they are often very peculiar in size, form, and structure. The granules of the genuine Maranta arrow-root are of a regular ovoid form, of nearly equal size, and smooth on their surface; while the granules of potato starch, one of the most common adulterants, are irregularly ovoid, very variable in size, from $\frac{1}{2000}$ to $\frac{1}{100}$ of an inch in diameter, and streaked and furrowed on their surface. The fecula of many other plants is used either as a substitute or an adulterant for the true arrow-root. *Zamia integrifolia* yields an arrow-root in the West Indies and the neighborhood of St. Augustine, Fla. *Arum vulgare* (wake-robin) yields Portland arrow-root in the isle of Portland. *Curcuma angustifolia* yields East Indian arrow-root. *Jatropha Manihot*, the cassava or tapioca plant, yields Brazilian arrow-root. *Tacca oceanica* yields Tahiti arrow-roots. *Alstrœmeria pallida* yields Talcahuana arrow-root. The *potato* yields, by careful preparation, the English arrow-root. Starch similar to arrow-root is also prepared in the West Indies from the roots of *Dioscorea sativa* or yam, of *Colocasia esculenta*, and from the fruit of *Artocarpus incisa* or bread-fruit tree.

For use, arrow-root should be rubbed to a paste with a little cold water, and while this is stirred a considerable quantity of boiling water should be added. It may be sweetened with sugar and flavored with lemon-juice or

with wines and spices. For infants it may be prepared with milk. A table-spoonful is sufficient for a pint of water or milk. C. F. CHANDLER.

Ar'rowsic, a township of Sagadahoc co., Me. It has an important lumber trade. Pop. 252.

Ar'rowsmith, a township of McLean co., Ill. Pop. 927.

Arrowsmith (AARON), an English geographer, born at Winston, Durham, in 1750, became distinguished as a publisher of excellent maps, over 100 in number. Died in 1823.—His son AARON (now deceased), and his grandson JOHN, also became distinguished for the excellence of their maps.

Arroy'o Gran'de, a post-township of San Luis Obispo co., Cal. Pop. 776.

Arsa'ces I. [Gr. 'Αρσάκης], the founder of the Arsacidæ and of the kingdom of Parthia, lived about 250 B. C. His origin and history are involved in much obscurity, as the statements of ancient historians are confused and contradictory. He is said to have been the chief of a nomadic tribe of Scythians or Bactrians. All his successors assumed the name of Arsaces.

Arsaces III., king of Armenia, was a son of Tiridates III., whom he succeeded about 340 A. D. He waged war against Sapor, king of Persia, and formed an alliance with Julian the Apostate about 360. The defeat and death of Julian are ascribed to the treachery of Arsaces, who deserted him in the campaign of 363 A. D.

Arsaces VI., or **Mithridates I.,** king of Parthia, enlarged his dominions by the conquest of Bactria, and extended his conquests to the Indus. In 138 B. C. he defeated Demetrius Nicator of Syria. After a reign of twenty-five years or more, he died about 135 B. C.

Arsac'idæ, the name of a dynasty of Parthian kings which was founded by Arsaces in 250 B. C., and continued to reign until 226 A. D. The last king of this dynasty was Artabanus IV. (Arsaces XXIX.).

Arsamas, or **Arzamas,** a town of Russia, in Nizhni-Novgorod, is on the river Tiosha, 249 miles E. of Moscow. Pop. in 1867, 10,517.

Ar'senals, public establishments designed for the manufacture and storage of arms and military equipments. The name is derived from the Latin *Arx*, applied to the citadel or central tower of a fortified place, as the part best capable of defence. This became the storehouse for spare arms and warlike material, and hence like depositories were called *Arsenals*.

Weapons of war used more than 1700 years before the Christian era are known to us from sculptures upon old monuments and from arms found in catacombs and tombs of that period. The earliest Egyptian sculptures show foot-soldiers armed with swords, javelins, clubs, slings, and the bow and arrow; and kings, or high officers, on horseback or in chariots, with like offensive weapons, and protected by helmets, shields, or shirts-of-mail. As the Egyptians are the first nation known to have had a military system, we may consider their weapons to have been the earliest weapons of war. Succeeding nations changed very slowly; all of those prominent during the period known as the "*warfare of antiquity*" used nearly the same kind and shape of weapons. Thebes, Carthage, Babylon, Athens, Tyre, and Rome were then the great cities of the world whence the warrior-kings started their military expeditions, and must have all been in turn active workshops for the manufacture of weapons.

The warfare of the Middle Ages is usually said to date from the time of the emperor Augustus of Rome, and to extend to the introduction of the use of gunpowder in war. Although this epoch witnessed great improvements in the organization and discipline of the better class of troops, and in the character of some of the warlike implements used by them—especially in the mechanical excellence and skill shown in their construction—the general form and kind of the chief personal weapons appear to have remained much the same as during the period of ancient warfare. Weapons and armor of the Middle Ages have been preserved to our day in numerous Arsenals and Museums, and specimens of the workmanship of many centuries can be found, requiring almost the same words to describe and name them as those we use for the Egyptian arms nearly 3000 years older.

The chief changes in offensive weapons were in the greater length of the horseman's spear and sword, and in the stronger bows (made of steel and hard wood), giving greater propulsive force to the missiles used with the cross, and long, bows. The usual range of this last, we are told, became (in the hands of the Scythians and English) from 3000 to 4000 yards, and experts could shoot *three arrows per minute*.

In the fifteenth century defensive armor for man and horse had reached the highest point of excellence and embellishment. The trade of the armorer was in great repute, and personal contests for prowess and display were the chief occupation of the Nobles. Foreign wars were mere invasions by hosts hurriedly marched into unprepared countries, where, like an army of locusts, they devoured and destroyed all they met. Surrounding walled cities not anticipating attack, the besiegers could by mere numbers shut off assistance, starve the inhabitants into submission, and by the use of catapults, ballistas, and battering-rams, destroy the walls, or by towers, overleap them. Cities thus attacked were often found so helpless against their fate that the besiegers at Rhodes were enabled to construct and move against its walls, without successful opposition, towers 240 feet high by 47 feet wide, and having twenty stories for troops; and, by the use of towers, the Crusaders captured Jerusalem after only two months' siege.

The cities of Europe now most famous for possessing valuable military relics of the Middle Ages are Dresden, Vienna, Delft, Berlin, Paris, Madrid, and London; possibly, interesting and valuable collections may still exist, unvisited by travellers, in some of the once famous cities of Persia, India, China, and Japan, which more intimate intercourse may soon make known to us.

Although gunpowder was used in cannon about the fourteenth century, it was not until near the middle of the sixteenth century, that the first arm light enough to be carried and handled by a single soldier was introduced upon the battle-field. This became the signal not only for a general change in arms and warfare, but in the whole constitution of civil society. Spears, javelins, and bows and arrows were useless to oppose the musketeer; helmets, breast-plates, and coats-of-mail could not resist the bullet. Hence, personal armor became a useless encumbrance, as the drilled peasant, with his arquebuse, was found to be superior to the mail-clad warrior and his host of spearmen. The supremacy of the Knights could no longer exist, and the defence of states soon passed from their hands to those of the peasant. War now became a science wherein skill and discipline and *preparation* conquered; not mere numbers, artifice, and brute force. Standing armies and well-supplied arsenals became a necessity for every nation aiming at conquest or independence, for none but the experienced could wage war.

It was near the close of the seventeenth century before all the nations of Europe were supplied with firearms which could be handled with facility and aimed from the shoulder. At this period the Dutch, Spanish, French, and English were the most efficient in war; soon Prussia became distinguished in discipline and organization, and France surpassed others in systematizing its military manufactures and improving its weapons. Each nation sought by drill in the field and skill in the workshop to devise and adopt a *special* system of military organization and of war-material. The French, Prussians, Spaniards, and English established arsenals, armories, foundries, and powder-works, many of which have been diligently improved and extended to our day.

At the time of the Revolutionary war, the U. S. had few arms and no Armories or Arsenals. The arms used at first were gathered from citizens; soon after, supplies were obtained by purchase in France. The earliest manufacture of war-material mentioned is that of powder in Virginia in 1776. Springfield (Mass.) was selected by Gen. Washington as a site for a foundry and laboratory in 1777, and supplies were sent from there to Gen. Schuyler's army in Western New York in July of that year. Brass cannon (chiefly howitzers) were cast in Philadelphia in 1777 (some of which are now at Watervliet Arsenal), and an arsenal was established about this year in Carlisle, Pa. Small-arms were manufactured at Springfield Armory prior to 1787. An armory was commenced at Harper's Ferry (Va.) in 1795, and "three or four additional arsenals and magazines" authorized by Congress at the same time, and others in 1808.

During the war of 1812 small-arms were procured from Springfield and Harper's Ferry, and other ordnance stores, by purchase in the country, or manufacture at the Arsenals. After that war, with the policy apparently of having U. S. Arsenals in each State, several more were authorized, so that in 1847 there were two armories and seventeen arsenals in operation. Of the arsenals, *five* were "Arsenals of construction," and the others "Arsenals for repairs and deposit."

In 1838 Congress authorized a new organization of the Ordnance Corps, and in 1842 placed the Armories (previously under civil superintendence) under the charge of its Officers. The advantages of the change were soon apparent in the publication of a regular "System of Construction—with Drawings," and the "Ordnance Manual," descriptive of the material and dimensions for every article of war-ma-

terial, and the adoption of patterns which proved efficient and satisfactory during our next war. The siege and field guns, carriages and mortars, friction-primers for cannon, and harness of U. S. models, used in Mexico *for the first time in war*, differed in important details from other systems. The mortar-firing and siege-equipage were especially satisfactory. The advantage of the U. S. system of small-arms (made chiefly by machinery, and of interchangeable parts) was very great. They were promptly repaired in the field, using spare parts ready fitted. The arms, as well as other articles of equipment in the hands of the troops, were kept in serviceable order by Ordnance Soldiers, who, serving siege-guns in action, also opened shops after each day's halt, and established an active arsenal at the citadel of Mexico during the occupation of the city, where many supplies were manufactured as well as repaired.

In 1860 there were twenty-three Arsenals and Armories, and during the civil war nine of the Northern and Western Arsenals were enlarged and employed as "Arsenals of construction," and the working capacity of the Springfield Armory was extended to complete 1000 muskets per day. In addition, a large number of private workshops—for the manufacture of guns and carriages and stores of all kinds—were kept employed, and twenty-five private armories, under charge of the Inspector of Contract Arms, made muskets, carbines, pistols, and swords, according to gauges verified at the National Armory, so that like parts were interchangeable with armory work. A daily product of 1000 muskets was obtained from those making these arms, in addition to the arms made at Springfield.

The Ordnance Department has devoted much attention to the manufacture of cast-iron cannon and powder for use in large guns, improving greatly the endurance and certainty of cast iron in cannon. The results obtained both in smooth-bore and rifled guns have been so favorable that other nations have either adopted or are experimenting with like methods. Great credit is due to the late Gen. Rodman for the many successes achieved in guns and carriages by him, and his name is now inseparably connected both with the mode of *casting cannon cooled from within*, and with the use of *mammoth-grain powder* for large cannon, first suggested and made by him.

It has been proposed to reduce the number of Arsenals, and concentrate all ordinary operations at three or four, so that all (or nearly all) ordnance manufactures could be conducted at each. Rock Island Arsenal, on the Mississippi, is in course of building on this plan, and is to include an armory, arsenal, powder-works, and foundry. A similar establishment is proposed for California, and one east of the Alleghenies, either in connection with, or in addition to, the Springfield Armory. It is also under consultation to have some supplies heretofore purchased by the Quartermaster's Department manufactured at the Arsenals,—such as wagons, harness, canteens, and infantry valises.

The following table gives a list of all U. S. Arsenals, with date of establishment and present condition:

Name of Arsenal.	Post-office.	Date of building or authorized.	Kind and extent of work.	Present condition.
Springfield Arsenal	Springfield, Mass.	1777	Making ammunition, etc.	Armory in operation
" Armory	" "	1785 (about)	Small-arms	Armory in operation
Carlisle Arsenal	Carlisle, Pa.	1777	Ordnance stores	Broken up.
Harper's Ferry Armory.	Harper's Ferry, Va.	1794	Making small-arms	"
Schuylkill Arsenal	Philadelphia, Pa.	1800	Laboratory	Transferred to quartermaster's department.
Rome "	Rome, N. Y.	1814	Depository	Sold.
Pikesville "	Pikesville, Md.	1808	"	Occupied.
Washington "	Washington, D. C.	1808	Arsenal of construction	In operation.
Watertown "	Watertown, Mass.	1808	" " "	" "
Watervliet "	West Troy, N. Y.	1813	" " "	" "
Bellona "	Richmond, Va.	1815	Foundry and Arsenal	Broken up.
Champlain "	Vergennes, Vt.	1827	Depository	"
Allegheny "	Pittsburgh, Pa.	1814	Arsenal of construction	In operation.
Frankford "	Bridesburg, Pa.	1816	Arsenal of construction and laboratory for metallic cartridges, caps, and primers for cannon	" "
St. Louis "	St. Louis, Mo.	1827	Arsenal of construction	Broken up.
Augusta "	Augusta, Ga.	1826	Depository and arsenal for repairs...	"
Kennebec "	Augusta, Me.	1827	" " "	In operation.
Baton Rouge "	Baton Rouge, La.	1849	" " "	Broken up.
Mount Vernon "	Mount Vernon, Ala.	1830	Depository	"
Apalachicola "	Chattahoochee, Fla.	1832	"	"
Detroit "	Dearbornville, Mich.	1832	"	Occupied.
Fort Monroe "	Old Point Comfort, Va.	1826	Arsenal of construction	In operation.
Fayetteville "	Fayetteville, N. C.	1836	Depository	Broken up.
Little Rock "	Little Rock, Ark.	1837	"	"
San Antonio "	San Antonio, Tex.	1857	Depository and arsenal for repairs...	In operation.
Charleston "	Charleston, S. C.	1836	Depository	Broken up.
Leavenworth "	Fort Leavenworth, Kan.	1858	Depository and arsenal for repairs...	In operation.
New York "	Governor's Island, N. Y. H.	1835	Depository	Occupied.
Liberty "	Liberty, Mo.	1837	"	Broken up.
Columbus "	Columbus, O.	1863	"	Occupied.
Indianapolis "	Indianapolis, Ind.	1863	"	"
Fort Union "	Fort Union, N. M.	1854	Depository and arsenal for repairs...	In operation.
Vancouver "	Fort Vancouver, Washington Ter.	1859	" " "	Occupied.
Rock Island "	Rock Island, Ill.	1862	Arsenal of construction and armory, foundry, and powder-works	Building.
Benicia "	Benicia, Cal.	1852	Arsenal of construction	In operation.

P. V. Hagner, *U. S. Army.*

Ar'senic (symbol As, equivalent, 75), [Lat. *arsen'icum*, from the Gr. ἄρσην, "masculine," "strong," so named on account of its power as a poison], the common name of arsenious acid or white oxide of arsenic, a virulent poison. (See Arsenious Acid.) The name arsenic is limited in scientific language to the metal. Arsenic is found native to a limited extent, but occurs usually in combination with metals or with sulphur, or both. Mispickel or arsenical pyrites ($FeAsS$) is the most abundant arsenical mineral; other minerals containing arsenic are domeykite, Cu_3As_2; algodonite, $Cu_{12}As_2$; whitneyite, $Cu_{18}As_2$; niccolite, $NiAs$; kamacite, $MnAs$; smaltite, $(Co,Fe,Ni)As_2$; skutterudite, $CoAs_3$; cobaltite, $Co.S.As_2$; gersdorffite, $Ni(S.As)_2$; ullmannite, $Ni(S.As.Sb)_2$; leucopyrite, $FeAs_2$; rammelsbergite, $NiAs_2$; lœlingite; glaucodot, $(Co,Fe)(S.As)_2$; paeite, $FeS_2.FeAs_2$; alloclasite; sartorite, $PbS.As_2S_3$; binnite, $3Cu_2S.2As_2S_3$; dufrenoisite, $2PbS.As_2S_3$; proustite, $3Ag_2S.As_2S_3$; tetrahedrite or fahlerz; tennantite; geocronite; polybasite; enargite, $3Cu_2S.As_2S_5$; realgar, AsS; orpiment, As_2S_3; dimorphite, As_4S_3; arsenolite, As_2O_3; mimetite, $3Pb_3As_2O_{12}.PbCl_2$; berzelite; carminite; pharmacolite, $Ca_2H_4As_2O_{10}.5H_2O$; hoernesite, $Mg_3(AsO_4)_2.8H_2O$; roesslerite, $Mg_2H_2'AsO_4)_2.12H_2O$; symplesite, $Fe_3(AsO_4)_2.8H_2O$; erythrite, $CO_3(AsO_4)_2.8H_2O$; annabergite, $Ni_3(AsO_4)_2.8H_2O$; cabrerite; köttigite; chondrarsenite; trichalcite; olevenite; adamite; conichalcite; bayldonite; euchroite; irroconite; erinite; cornwallite; tyrolite; clinoclasite; chalcophyllite; scorodite; pharmacosiderite; chenevixite; arsenosiderite; pitticite; bendantite; lindadserite. The most important arsenical minerals are those in which arsenic is combined with iron, cobalt, and nickel. Arsenic also occurs in small quantities in many other minerals, specially in antimony ores, iron pyrites, etc., hematite iron ores, the soil, mineral waters, etc. Arsenic is in fact one of the most widely diffused elements in nature.

Owing to its occurrence in antimony ores and iron pyrites, it is liable to find its way into the various preparations of antimony, into sulphuric acid, and the various chemical products of which this acid is the basis, as sodic sulphate and carbonate, hydrochloric acid, superphosphates, etc. In the chemical examination of the bodies of persons supposed to have been poisoned the greatest care is necessary to procure reagents entirely free from arsenic.

Metallic arsenic is prepared by sublimation: (1) from arsenical pyrites; (2) from a mixture of arsenious acid and charcoal.

Arsenic is a brittle metal, of a steel-gray color. On the fresh fracture it exhibits a bright metallic lustre, which soon tarnishes. Its specific gravity varies from 5.62 to 5.96. Its atomic weight is 75. Its vapor density is 10.3995 (air = 1) or 150 (hydrogen = 1): this is double the atomic weight. Hence, the atomic volume is anomalous, being only half that of hydrogen. (See ATOMIC VOLUME.) It crystallizes in rhombohedra. It volatilizes at a dull red heat without previous fusion, with a peculiar odor, described as resembling that of garlic. When heated in the open air it burns with a bluish flame.

Arsenic belongs to the group of elements which includes nitrogen, antimony, and phosphorus. It forms two principal series of compounds: (1) those in which it is triatomic, as $As'''H_3$, $As'''Cl_3$, As'''_2O_3, As'''_2S_3; (2) those in which it is pentatomic, as $As^{v}O_5$, $As^{v}S_5$.

(For the detection of arsenic see ARSENIOUS ACID.) With oxygen, arsenic forms two important compounds—arsenious oxide, As_2O_3, and arsenic oxide, As_2O_5, which give rise to arsenious acid, $HAsO_2$, and arsenic acid, H_3AsO_4. With sulphur, arsenic forms three important compounds—realgar, AsS, orpiment, As_2S_3, and As_2S_5. Besides these there is a subsulphide, $As_{12}S$ (?), and a persulphide, AsS_2. Arsenic combines with metals in the same manner as sulphur and phosphorus, which it resembles, especially the latter, in many respects; so much so that it is hardly proper to consider it a metal. Its compound with hydrogen, arsine, AsH_3, is analogous to ammonia, NH_3, and like ammonia is the type of a class of bases, arsines, which correspond to the AMINES (which see).

Metallic arsenic is rarely used in the arts. Lead containing a small proportion of arsenic is used for the manufacture of shot, and iron containing a little arsenic is very fluid when melted, and better adapted for fine castings for which strength is not essential. C. F. CHANDLER.

Ar'senic Ox'ide (symbol As_2O_5), a compound of oxygen and the metal arsenic; in its hydrated state it constitutes arsenic acid. It is found in nature in combination with iron, cobalt, lead, etc., in the minerals symplesite, erythrite, mimetite, etc., mentioned under ARSENIC. It is prepared by heating arsenious oxide with nitric acid. It is deliquescent and very poisonous. It is extensively used in calico-printing, in place of tartaric acid, for developing white patterns on colored grounds in the chloride-of-lime vat. It is also extensively used in the manufacture of aniline red. Combined with metals, it forms an important class of salts, called arseniates, which are analogous to the phosphates.

Arsenious Oxide (or **Anhydride**), As_2O_3, in the hydrated state **Arsenious Acid.**

Occurrence.—It is found native, as the mineral arsenolite, in silky, crystalline crusts on ores of silver, lead, nickel, antimony, etc., in the Hartz Mountains and other localities.

Preparation.—At Reichenstein, in Silesia, arsenious oxide is prepared by roasting arsenical pyrites (mispickel), FeAsS, in a muffle furnace. The vapors pass into a condensing chamber, and are deposited as a powder. This is then twice purified by resublimation from iron pots, being condensed first in powder in a chamber, finally in vitreous masses in the upper part of the subliming vessels. At Ribas, in Catalonia, mispickel is roasted in reverberatory furnaces without muffles, the crude product being subsequently purified, as at Reichenstein. At Andreasberg, in the Hartz, native arsenic is roasted for the silver it contains, the arsenious oxide being obtained as an incidental product. Much arsenious oxide is produced in the roasting of tin and cobalt ores at Altenberg, in Saxony, and of tin ores in Cornwall.

Properties.—Arsenious oxide appears crystallized in one of two different forms, or amorphous: (1) in octahedral crystals, as usually sublimed and condensed on cold surfaces, or as crystallized from its solution in water or hydrochloric acid; (2) in right rhombic crystals, obtained occasionally by sublimation or solution in potash; (3) amorphous, vitreous, or glassy, produced when arsenious oxide is sublimed and condensed on a hot surface, so that before solidifying it passes through a semi-fluid state. It is transparent when first prepared, but gradually becomes opaque and crystalline.

Arsenious oxide usually appears as a very heavy, white, gritty, crystalline powder. It has no decided taste. At 218° C. it volatilizes to a heavy, colorless, odorless vapor, of a specific gravity of 13.85, which condenses to octahedral crystals on cool surfaces. When heated with charcoal, it is reduced to metallic arsenic, with a peculiar odor like that of garlic. In its common octahedral form it is soluble in about 30 parts of cold or 10 parts of boiling water. When thrown into water, a portion floats like wheat flour, while the portion which sinks rolls itself into little round pellets, dry within. It is nearly insoluble in alcohol, absolutely insoluble in ether. It is soluble in hot dilute acids to a greater extent than in water, but it mostly separates on cooling, possessing but little basic power. It dissolves readily in alkalies, forming *arsenites*. It acts as a reducing agent on nitric, manganic, chromic, and hypochloric acids, being changed by them to arsenic acid. It reduces gold from its terchloride. To potassium, carbon, sulphur, phosphorus, and zinc it gives oxygen, with the liberation of metallic arsenic. Distilled with acetates, it yields cacodyl, $As(CH_3)_2$, a compound of a peculiar intolerable odor.

Effect of Arsenious Oxide on the Animal Economy.—Arsenious oxide when taken into the stomach is soon absorbed into the blood, and circulates with that fluid, exhibiting power over certain diseases, especially intermittent fever and skin diseases, as psoriasis, lepra, eczema, etc. It is also classed among the tonics, and is given for nervous disorders, especially those which are periodic. Among the remedies for chorea (St. Vitus's dance) it holds a prominent place. The usual method of administering arsenic is in small doses (from three to five drops) of the *liquor arsenicalis*, largely diluted with water, twice or thrice in the day. It is frequently administered in small granules, which should not contain more than one-tenth of a grain each. Numerous other arsenical preparations are in use in medicine. Externally, arsenious oxide is a powerful caustic, and is considerably used in destroying cancers and malignant growths. Arsenic is sometimes given combined with iodine and mercury (Donovan's solution). Caution is necessary in its use.

The quantity necessary to destroy life varies considerably. Under circumstances favorable for its operation the fatal dose for an adult is from two to three grains. Death from a poisonous dose of arsenic may occur in a few hours, or after the lapse of many days. Arsenic has been used as a slow poison, the symptoms being attributed to inflammation of the bowels from natural causes. In most cases its detection is easy. Arsenic is used by anatomists as an antiseptic, but is dangerous, as it is apt to get into cuts on the hands, and cause disagreeable symptoms. In some countries, especially in Styria, arsenic is taken by the young female peasants to increase their personal attractions. That arsenic can be taken habitually for any length of time would seem an impossibility; and yet such statements are made on unquestionable authority. (See JOHNSTON'S "Chemistry of Common Life.")

The most effective chemical antidote for arsenic is the hydrated sesquioxide of iron, prepared by the rapid precipitation of a solution of a per-salt of iron (as the persulphate or terchloride) by an alkali (as ammonia). The mixture of ferric hydrate with magnesia, obtained by precipitating the iron solution with an excess of calcined magnesia, is still more efficacious. In case of an overdose or of intentional poisoning the following treatment is recommended: Evacuate the stomach by the stomach-pump, using lime-water; administer large draughts of tepid sugar and water, magnesia and water, or lime-water; avoid the use of alkalies, but administer charcoal and hydrated sesquioxide of iron. If the fatal symptoms be averted, let the patient for a long time subsist wholly on farinaceous food, milk, and demulcents.

The Detection of Arsenious Oxide.—Hydrosulphuric acid merely imparts a yellow color to the aqueous solution. If hydrochloric acid be added, a yellow precipitate of tersulphide of arsenic is formed, soluble in sulphide of ammonium, from which it is reprecipitated by acids. The sulphide of arsenic is soluble in carbonate of ammonia, especially on heating. Acids reprecipitate it from this solution. It is readily dissolved by hot nitric acid; also by hydrochloric acid, with potassic chlorate. Argentic nitrate causes no precipitate in the aqueous solution of arsenious acid, but if ammonia be cautiously added, a yellow precipitate of argentic arsenite is produced, readily soluble in an excess of ammonia and in nitric acid. In making this test, add the argentic nitrate, and then (inclining the test-tube) let one or two drops of ammonia run down, so as to form a layer on the surface of the liquid to be tested. Where the two liquids are in contact a bright yellow ring of argentic arsenite will be seen. Cupric sulphate causes no precipitate in the aqueous solution of arsenious acid; but if ammonia be added, as in the last experiment, a yellowish-green cupric arsenite (Scheele's green) is precipitated.

Reinsch's Test.—Metallic copper boiled in a solution containing arsenic, to which hydrochloric acid has been added, becomes coated with a gray incrustation of metallic arsenic, which, if present in considerable quantity, may be detached in scales by long boiling. If the copper, with the incrustation, be removed, dried between pieces of filter-paper, and introduced into a tube closed at one end, the application of heat causes the arsenic to sublime as a shining black ring if much is present, or as a white crystalline ring of arsenious acid if the quantity is small. Metallic zinc precipitates arsenic if the solution be previously acid-

ulated with hydrochloric or sulphuric acid. At the same time arseniuretted hydrogen (AsH_3) is evolved.

Marsh's Test.—This experiment is best conducted in a flask provided with a funnel tube, and an exit tube containing calcic chloride to dry the gas evolved. Into the flask containing granulated zinc and distilled water dilute sulphuric acid is introduced. Hydrogen is liberated, which, passing through the chloride-of-calcium tube, where it is dried, escapes at the extremity of the apparatus. As soon as the air is completely expelled the hydrogen may be ignited. If the solution containing arsenic be now poured into the flask, arseniuretted hydrogen will be evolved, and the color of the flame changed to a livid blue. 1. If a piece of cold porcelain (the cover of a porcelain crucible) be held in the flame, a black deposit of metallic arsenic is produced. This stain disappears when moistened with calcic hypochlorite. 2. If one or two drops of strong nitric acid be poured on an arsenic stain, and then gently evaporated, it is converted into arsenic acid. By adding a drop of argentic nitrate solution, and cautiously neutralizing with ammonia, a brick-red argentic arseniate is produced. An excess of ammonia dissolves the red arseniate. 3. If the exit tube (which should be of hard glass and free from lead) be strongly heated beyond the calcic chloride tube, the arseniuretted hydrogen is decomposed, metallic arsenic being deposited in the form of a shining black mirror on the cold part of the tube. 4. If a short tube be adjusted, by means of a caoutchouc connector, to the extremity of the exit tube, and the gas passed into a solution of argentic nitrate, a black precipitate of metallic silver is produced, while the arsenic passes into solution. On neutralizing the filtered liquid with ammonia, the yellow argentic arsenite is precipitated.

Fleetman's Test.—If a solution containing arsenic be mixed with a large excess of a concentrated solution of potassic hydrate, and boiled with granulated zinc, arseniuretted hydrogen is evolved. A piece of filter-paper, moistened with a solution of argentic nitrate, assumes a purplish-black color if exposed to this gas. This experiment may be conducted in a small flask or large test-tube supplied with a cork, through which passes a small tube drawn to a point.

Dry compounds of arsenic, when heated with sodic carbonate on charcoal in the inner flame of the blowpipe, emit a peculiar garlic odor. Heated with sodic carbonate and a little potassic cyanide in a dry tube, closed at one end, a black mirror of metallic arsenic sublimes.

Arsenites.—Arsenious acid forms with bases a series of salts, which are not very stable, and have been but little studied. "Fowler's Solution" is a solution of equal weights of arsenious oxide and potassic bicarbonate, boiled with water and flavored with spirits of lavender. It contains 64 grains of arsenious oxide in one pint. The sheep-dipping mixtures commonly employed are composed of arsenious acid, soda, sulphur, and soap, which, when used, are dissolved in a large quantity of water, and thus constitute essentially dilute solutions of arsenite of soda. Arsenite of copper, or Scheele's green, is a pigment largely used as a pretty and cheap green paint. The same substance is extensively employed in the manufacture of green paper-hangings for the walls of rooms; and recent inquiries would lead to the belief that rooms covered with paper coated with this green arsenite of copper are detrimental to health, from the readiness with which minute particles of the poisonous pigment are detached from the walls by the slightest friction, are diffused through the room, and ultimately pass into the animal system. It is also said that arsenetted hydrogen, H_3As, a very poisonous gas, is generated in damp weather. Another green pigment is named Schweinfurth's green; it contains arsenious acid, oxide of copper, and acetic acid, and is a double arsenite and acetate of copper. With tartaric acid arsenious oxide forms a salt analogous to tartar emetic. Its formula is $K.AsO.C_4H_4O_6$.

C. F. Chandler.

Arse'nius [Gr. Ἀρσένιος], Saint, was born in Rome about 355 A. D. The emperor Theodosius appointed him in 383 tutor to his son Arcadius. Arsenius retired in 394 to a desert in Egypt, where he lived as an anchorite. Died in 449 A. D.

Ar'sie, a town of Italy, in the province of Belluno, 50 miles N. W. of Venice. Pop. 5317.

Arsin'oë, daughter of Ptolemy I., king of Egypt, was born about 316 B. C. About 300 B. C. she was married to Lysimachus, king of Thrace. She instigated Lysimachus to put to death his son Agathocles (born before her marriage), in order to promote the succession of her own son. By this crime Lysimachus was involved in war with Seleucus, king of Syria, and was killed in 281 B. C. Her sons having been murdered by Ptolemy Ceraunus, she fled to Egypt, and became the wife of her brother, Ptolemy Philadelphus.

Arsinoë, an Egyptian princess, was a daughter of Ptolemy Auletes, and a sister of the famous Cleopatra. Cæsar having conquered Egypt (48 B. C.), took her as a captive to Rome, but soon released her. She was assassinated by Mark Antony in 41 B. C.

Arsinoë, an ancient city of Egypt, capital of a nome, was situated near Lake Mœris, about 50 miles S. S. W. of Cairo. It was originally called Crocodilopolis ("the city of crocodiles") because it had a temple devoted to the worship of those reptiles. Ptolemy Philadelphus gave it the name of Arsinoë in honor of his queen. The site is now occupied by the town of Medinet-el-Faium.—Arsinoë was the name of another city of Egypt, situated at the N. W. extremity of the Red Sea, near the modern Suez. It was an important emporium, connected with the Nile by a canal.

Ar'sis and The'sis [ἄρσις, θέσις], two Greek words, signifying "raising up" and "laying down." This musical term denotes the rising and falling of the hand in beating time. It is also applied to the elevation and depression of the voice, and the accentuation of syllables in the scansion of poetry, *arsis* being the stress of voice given to strongly accented syllables, and *thesis* the lesser stress given to other syllables.

Ar'son [from the Lat. *ardeo, arsum*, to "burn"], the wilful and malicious burning of the house of another. There must be an actual burning—an unexecuted attempt to fire a house does not constitute the offence. If the act be negligent instead of wilful, the crime is not committed, and the wrong-doer is only liable to a civil action. The English law on this subject has been modified in this country. Arson is in some instances divided into degrees, and cases included in it which were not offences at common law. It is made a crime by statute law to set fire to one's own house with intent to injure another—as, for example, to defraud insurers. The punishment of arson is severe, and in some of its degrees capital.

Ars-sur-Moselle, a town of Germany, in Alsace-Lorraine, 5 miles by rail from Metz, has vineyards and iron-works, manufactures of paper, instruments, and iron goods. Pop. in 1871, 5330.

Art [from Fr. *art*, which is from Lat. *ars, artem*], signifies (1), the systematic application of knowledge in producing a desired result; and (2), a systematic collection of principles and rules for attaining a desired end. Under this last head the arts are divided scientifically into (1), those which are intended to produce material results, termed the useful arts (those useful arts in which the effects are produced entirely or mostly by machinery or by mechanical contrivances are termed Mechanic Arts, which see); and (2), those intended to produce æsthetic results, termed the Fine Arts (which see), The application of æsthetic principles or the laws of taste to works which are intended to produce a religious effect is termed religious art; the application of the laws of taste to works of a material nature is termed industrial art. (See Fine Arts.) The word *art* is often used as a collective term for any or all of the fine arts (as the "study of art," a "patron of art"); as relating to the fine arts are also used various derivatives and compounds of the word art (as "artist," "artistic," "art-museum"). (For formative arts, arts of design, etc., see Fine Arts.)

The term "liberal arts" (*artes liberales*) was applied by the Romans to the higher studies, which only freemen were permitted to pursue. They were summed up in the following verse:

"Lingua, Tropus, Ratio, Numerus, Tonus, Angulus, Astra."

The term "servile arts" (*artes serviles*) they applied to trades which were practised only by slaves. They were summed up in the verse:

"Rus, Nemus, Arma, Faber, Vulnera, Lana, Rates."

In modern times, the term "liberal arts" is applied to the collection of studies in philosophy, science, art, and history which compose the academic and collegiate (ante-professional) course of study; hence, to graduate in the arts, bachelor of arts (A. B.), master of arts (A. M.).

G. F. Comfort.

Ar'ta (anc. *Ambra'cia*), a town of Albania, 46 miles S. S. E. of Yánina, on the river Arta, here crossed by a remarkable bridge. It is the seat of a bishop, and has a large cathedral, a citadel, and manufactures of coarse cottons, woollens, and capotes. Here are remains of ancient Hellenic walls. Pop. estimated at 6000. (See Ambracia.)

Arta, Gulf of (the ancient *Si'nus Ambra'cius*), a gulf of the Ionian Sea, in the N. W. of Greece, lies between Acarnania and Albania, and is nearly landlocked. It is about 25 miles long and about 10 miles wide. The naval battle of Actium was fought near this gulf.

Artaba'nus [Gr. Ἀρτάβανος], written also **Ardavan**

or **Ardovan,** king of Parthia, and the last of the dynasty of the Arsacidæ. He began to reign about 216 A. D., and waged war against the Roman emperor Macrinus. He was defeated and taken prisoner by the Persians under Ardshir, who put him to death in 226 A. D.

Artaba'zus [Gr. Ἀρταβάζος], an eminent Persian general, a favorite of Xerxes, commanded a large division of the army which invaded Greece in 480 B. C. He took part in the battle of Platæa (479 B. C.), after which he retreated with his division by forced marches to Byzantium, and thence crossed into Asia.

Artabazus, a Persian general and satrap, revolted against Artaxerxes III. in 356 B. C. Having been defeated in battle, he took refuge at the court of Philip of Macedon. He was pardoned, returned to Persia, and fought for Darius at Arbela. He was satrap of Bactria under Alexander after 330 B. C.

Artapher'nes [Gr. Ἀρταφέρνης], a Persian satrap and a half-brother of King Darius Hystaspis. He was appointed satrap of the western part of Asia Minor in 506 B. C. He used his power to restore Hippias, who had been expelled from Athens. About 498 B. C. he subdued the Ionians, who had revolted against the king of Persia.

Artaphernes, a general, a son of the preceding, was associated with Datis in the command of the Persian army which invaded Greece in 490 B. C., and was defeated at Marathon. He also served in the army of Xerxes in Greece, in 480.

Artaud (Nicolas Louis), a French writer noted as a Greek scholar, was born in Paris in 1794. He became inspector of the Academy of Paris soon after the revolution of 1830. He translated the dramas of Sophocles (3 vols., 1827); the comedies of Aristophanes (6 vols., 1830), and the tragedies of Euripides (1832). He obtained the office of inspector-general. Died in 1861.

Artaud de Montor (Alexis François), Chevalier, born in Paris in 1772. He was for many years secretary of legation at Rome, and became chargé-d'affaires at Florence in 1805. Among his works are "Machiavel, his Genius and Errors" (1833), and a "History of the Sovereign Pontiffs" (8 vols.). Died in 1849.

Artax'ata, the former capital of Armenia, on the Araxes, was destroyed by the Roman general Corbulo, rebuilt by Tiridates, and was captured by the Persians in 370 A. D. It is now a mass of ruins.

Artaxerx'es I., Longimanus [Gr. Ἀρταξέρξης Μακρόχειρ; Pers. *Ardshver Darázdánt*], a king of Persia, was a son of Xerxes I., whom he succeeded in 465 B. C. He was called Longimanus ("long-handed") because his right hand was longer than his left. The Egyptians revolted against him about 460, but they were reduced to subjection about 455 B. C. In 449 the Persians were defeated by the Athenian forces of Cimon, near Salamis, in Cyprus. Artaxerxes died in 425 B. C., and left the throne to his son, Xerxes II.

Artaxerxes II., surnamed Mnemon, because he had a good memory, was the eldest son of Darius II. of Persia. He became king in 405 B. C. His younger brother, Cyrus, who was governor of Asia Minor, revolted and raised a large army, in which were 10,000 Greeks. The king, commanding in person, defeated the army of Cyrus at Cunaxa in 401. Cyrus was killed in this action, which was followed by the famous retreat of the Ten Thousand. (See Ten Thousand, Retreat of.) Agesilaus, the Spartan, invaded the dominions of Artaxerxes, and gained several victories, but this war was ended by the peace of Antalcidas (387 B. C.). He put to death Darius, his eldest son, for a conspiracy. He died in 362 B. C., aged about ninety-four, and was succeeded by his son, Artaxerxes III. (See Plutarch, "Life of Artaxerxes;" Diodorus Siculus; Thirlwall, "History of Greece.")

Artaxerxes III. (or **Ochus**), king of Persia, was a son of the preceding. He began to reign in 361 B. C., and disgraced himself by his cruelty and sensuality. Among the important events of his reign was the subjugation of Egypt, which he effected about 350 B. C. Died in 338 B. C. It is supposed that he was poisoned by his eunuch, Bagoas.

Arte'di (Peter), [Lat. *Pe'trus Arcte'dius*], a Swedish naturalist, born at Anund Feb. 22, 1705. He was educated at Upsal, where he formed an intimate friendship with Linnæus. They co-operated on the principle of a division of labor in the field of natural history, and Artedi chose the department of ichthyology, in addition to physiology and mineralogy, which they both cultivated. He visited England in 1734. Soon after his return he was drowned in a canal at Amsterdam in 1735. He left a Latin work on fishes, which Linnæus published in 1738, and which is highly commended. (See Linnæus, "Life of Artedi," prefixed to the work mentioned above.)

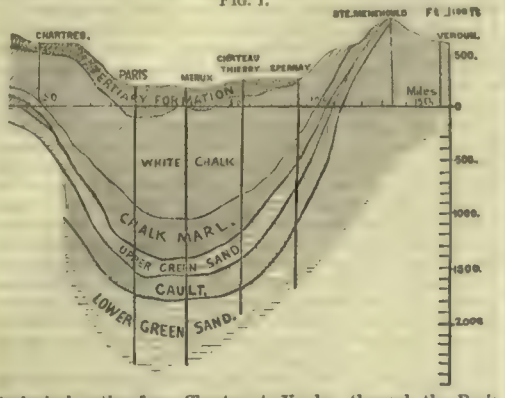
Ar'temis [Ἄρτεμις], the Greek name of the goddess Diana (which see).

Artemis'ia [Gr. Ἀρτεμισία], a martial queen of Halicarnassus, was a tributary or ally of Xerxes I., king of Persia. She commanded in person her fleet, which fought for Xerxes against the Greeks, and she displayed skill and courage at the battle of Salamis (480 B. C.). According to tradition, she jumped from the Leucadian rock into the sea and was drowned, because she was disappointed in love.

Artemisia, an Oriental princess celebrated for her conjugal affection and her grief for the loss of her husband, Mausolus, prince of Caria, who died in 352 B. C. She erected to his memory at Halicarnassus a magnificent mausoleum (so called in honor of Mausolus), which was considered one of the seven wonders of the world. Remains of it still exist. According to tradition, she mingled his ashes with her wine and died of grief. (See J. C. Avenarius, "Dissertatio de Artemisia et Mausoleo," 1714.)

Artemisia, a genus of plants of the order Compositæ, sub-order Tubulifloræ, comprises numerous species of herbs and shrubs, natives of the temperate regions of Asia and Europe. They generally have an aromatic odor, and a warm or acrid and bitter taste. The *Artemisia Absinthium* (or wormwood) grows wild in England and the U. S., is perennial, and has bipinnatifid leaves. Containing a bitter principle and an essential oil, both very strong, it is used in medicine as an anthelmintic or vermifuge. Among the other species which have medicinal properties are the *Artemisia santonica* (Tartarian wormwood or southernwood), a native of Tartary; *Artemisia Indica* (Indian wormwood), which grows on the Himalaya Mountains; *Artemisia arborescens* (tree wormwood), which is a native of the Levant; and *Artemisia vulgaris* (mugwort), which is a native of England. The dried flower-buds of several species of *Artemisia* are sold under the name of wormseed, *semen contra*. The great western plains and arid tablelands of Nevada, Utah, and Colorado are overgrown with the *Artemisia* (*tridentata* and other similar species, popularly called sage brush), which indicates a soil impregnated with alkaline or saline substances.

Ar'tery [Lat. *arte'ria*, plu. *arte'riæ*, from the Gr. ἀήρ, "air" or "spirit," and τηρέω, to "keep" or "preserve," the arteries, until Galen's time, having been supposed to contain air]. Arteries are the vessels which convey the blood passing from the heart to the various parts of the body. The arterial tube is divided into three layers, called the coats of the artery—an external, which is elastic; a middle, which is muscular with elastic layers; and an internal, smooth and lined with fusiform epithelium. The tube is also enveloped in a fibrous sheath. When an artery is completely divided by a sharp instrument, its walls do not collapse, but the orifice contracts, and also retracts into its sheath; a clot then forms and stems the flow till the cut edges of the artery have time to throw out lymph, and heal. All the arteries of the human body (with the exception of the pulmonary) are branches more or less direct of the aorta. Each main trunk divides into two principal divisions—one, the artery of *supply*, which breaks up into branches for the supply of the tissues in the vicinity; and another, the artery of *transmission*, which passes to the parts beyond. These, however, anastomose freely. Thus the femoral artery divides into the *deep* femoral, to supply the thigh, and the *superficial*, to supply the leg below the knee; the common carotid divides into the *external* carotid, to supply the neck, scalp, and face, and the *internal* carotid, to supply the brain. Although arteries have generally in different persons the same distribution of branches, they occasionally vary, and thereby are apt to perplex the anatomist. Wounds of arteries can be detected by observing that the escaping blood is of a bright-red color, and flows in jets or spirts at each pulsation; while blood from a vein is dark, and flows in a steady current. Arterial bleeding is controlled by tying with a thread, by acupressure, by compression, or by the application of styptics, etc.



Arte'sia, a township of Iroquois co., Ill. Pop. 1269.

Arte'sian Wells are holes of small diameter (usually between three and six, and rarely exceeding twelve, inches) sunk into the earth, through which the water of subterranean reservoirs or streams rises near to or above the surface. Their name is derived from the province of Artois in France (ancient *Artesium*), where they have long been used; but they were known to the ancients, by some of whose writers they are occasionally mentioned. They were also used in China at a very early period, not only as sources of water, but also of combustible gas and petroleum. A well at Lillers, Pas-de-Calais, bored in 1126, still flows undiminished.

Artesian wells are most readily obtained where the geological formations possess a moderate inclination or "dip," and are composed of strata of materials impervious to

water (rock or clay), alternating with such as, like sand or gravel, allow it to pass more or less freely. The rain-water falling where such strata approach to or reach the surface will in great part accumulate in the pervious strata, rendering them "water-bearing." Thus are formed sheets of water confined between two inclined, impervious walls of rock or clay, above as well as below, and exerting great pressure at their lower portions. Where water so circumstanced finds or forces for itself natural outlets, we shall have springs: when tapped artificially by means of a bore-hole, we have an artesian well, from whose mouth the water may overflow if its surface-level be below that of the head of pressure as shown in the figure; the principle being

FIG. 1.

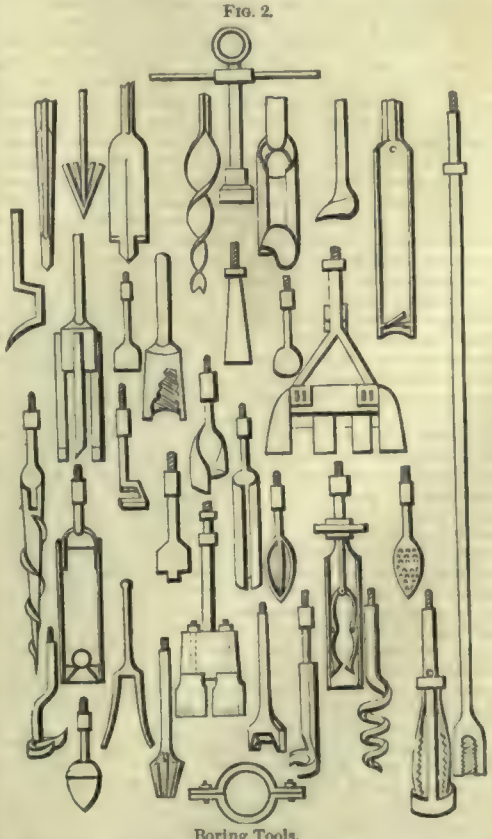
Geological section from Chartres to Verdun through the Paris basin. Horizontal scale, 90 miles to the inch; vertical scale, 1500 feet to the inch.

substantially the same as that upon which artificial fountains are constructed. Even in the absence of properly water-bearing pervious strata, accumulation of water may take place or subterranean streams may exist in crevices and fissures. These occur with especial frequency in limestone beds, whose material is more or less dissolved by water; thus very commonly caves and subterranean channels are formed in such regions, and if the beds be sufficiently inclined, head for the rise of water in artesian bores may thus be furnished.

In regions where unstratified rocks prevail, or where the stratified rocks are much disturbed, the finding of artesian water becomes a matter of great uncertainty, and can in general be expected only at considerable depths and at low surface-levels. In formations possessing but a slight inclination or "dip" the head of water-pressure may be many miles distant, and a difference of level between its locality and that of the well may not be at all apparent to ordinary observation. It is thus obvious that the study of the geological structure and general surface-conformation of a region is primarily needful in determining the probability of success in obtaining artesian water in any given locality. Not only can the practicability, as well as the difficulties to be met, be thus in a great measure foreseen, but it can also be ascertained how far the experience acquired in one bore may serve in other cases, and what allowance must be made for difference of location with reference to the head of pressure, as regards depth and the kind of strata to be penetrated. Sometimes a single well-conducted experiment will thus demonstrate the feasibility of artesian wells over extensive areas.

As a matter of course, artesian water brings up with it such other solid, liquid, or gaseous substances as are present in the contiguous rocks, and are either soluble in it, or, like petroleum, will float on it. And as from the depth from which it is brought it is liable to have come in contact with a great variety of materials, and at a temperature which increases with a certain degree of regularity as we descend (on an average at the rate of one degree Fahrenheit for every 60 to 70 feet), it is very common to find artesian water more or less strongly impregnated with a variety of mineral matters, amongst which common salt is perhaps the most frequent. In this respect artesian wells are quite analogous to natural warm springs.

The manner of sinking a bore for artesian water varies with the depth and with the nature of the material or materials to be penetrated. In the surface-soil stratum or other loose alluvial deposits pipes of wood or iron are very commonly driven down by means of a pile-driver. In the alluvial region of the lower Mississippi "drove" wells obtained in this way are quite common, being formed of gas-pipe one and a half to two inches in diameter, whose lower end is a sharp steel cone, perforated for the passage inward of the water, which is struck at depths varying from 20 to 70 feet, and even more. The same mode of obtaining water quickly and easily has been extensively employed during the building of the Pacific Railroad, the pipes being withdrawn and carried forward as the work progressed. It is but rarely, however, that water thus reached rises above the surface.



When the material is of a more resisting character, and greater depth has to be attained (as is usually the case), the soil-pipe, whether driven in or set into a hole previously bored by means of an earth-auger, serves to prevent the loose earth from falling in, and as a guide to ensure the verticality of the bore, which is of the utmost importance.

The boring tools are of very various shapes, adapted to the different kinds of rock, clay, or sand of various degrees of consolidation. For hard rock the most generally useful tool is a flat chisel; for clay and soft rock, a long, scoop-shaped bit with a slanting cutter, or with a tapering, twisted, spiral band (somewhat like a "gimlet screw") at the lower end; for sand, the same, or, should it be very clean and damp, a bit resembling a common wood auger, with broad spiral flanges.

In the case of soft rock, clay, and sand, the auger-bit is attached to stiff bars of wood or iron connected by screws, and provided with a cross handle at the mouth of the well, whereby they can be revolved by the workmen. The whole is suspended by a rope working over a pulley attached to the top of a tall tripod or other scaffold or derrick, and winding on a windlass or whin; the connection between the head of the auger and the rope being so arranged that the latter is not twisted by turning the former. Thus, whenever by boring the auger has become so full as to threaten clogging, it is readily hoisted out with its contents, and the latter discharged. Whenever the depth of the bore exceeds the height of the derrick, it becomes necessary to unscrew successively the sections of poles or bars as they are drawn up, while a collar attached to the pole at the mouth of the well prevents it from falling back. When working at great depths the operation of discharging the borings thus becomes a very tedious one, consuming far more time than actual boring.

The presence of water in the hole generally facilitates operations materially; it is therefore poured in from above when not naturally present. Sand, especially, can thus be

FIG. 2.

Boring Tools.

discharged more readily and boring continued for longer intervals of time. The auger being drawn up, the "sand-pump" can then be sent down at the end of a rope. The sand-pump is a long tubular bucket of sheet iron, with a

light valve at the bottom opening inward, enabling it to sink down into the semi-fluid mass of water and sand until it is full, the valve closing when the pump is raised. The same implement serves to clear the bore of quicksand, when met with in moderate quantities.

When hard rock has to be penetrated it must be pecked through with chisels, in the same manner that blast-holes are drilled by quarrymen and miners. The bits may then be attached either to stiff poles, as is done in boring soft materials, or, preferably, they may be altogether suspended by a rope. The rapid deterioration of the screw connections by repeated heavy shocks, the liability to deviate from the vertical, and the greater difficulty encountered in withdrawing the boring tool and discharging the borings, have caused the former mode of suspension to be almost altogether superseded, in this country, by rope-boring—a method extensively adopted by the Chinese long since in sinking their numerous deep bores.

When boring in rock by hand the upper end of the rope or pole bearing the drill is attached to a spring pole or bar, vibrated by the workmen, who at the same time give a slight turn to the cross-bar at each stroke, so as to complete the circle in from twenty to thirty strokes, varying with the kind of rock and the diameter of the hole. The lift varies, usually, between ten and twenty inches.

When boring by steam-power the boring-rope is connected with a walking-beam vibrated by the engine, which also works the whin or windlass (the "bull-wheel") when required. To obviate the necessity of too frequently lengthening the rope as the bore deepens, it is attached to the walking-beam by means of a long screw working in a stirrup-shaped nut, by turning which the rope can be let out to the extent of fifteen to eighteen inches.

The drill, also, is not directly attached to the rope's lower end, but first to a long and heavy stem of iron, connecting at its upper end with a long stirrup-shaped piece, which can be made to slide upward into another similar one attached to the rope in the reverse position. This arrangement, expressively called the "jars," serves to facilitate the loosening of the tools when they get fast by the jarring motion that can thus be given. At the Pennsylvania oil-wells the entire length of such a set of tools is about thirty feet; its weight, 800 to 1000 pounds.

A most valuable improvement made of late years in the boring of hard rock is the diamond-pointed drill of Leschot. In this implement diamonds are firmly set into the conical, concave, or annular end of a steel bar, so as to present cutting edges to the rock when turned right-handed. It is usually worked by steam or compressed air, and by its means the hardest granite may be bored at the rate of several inches per minute. It is, of course, equally applicable to the boring of artesian wells in hard rock as to mining and tunnelling operations, in which it is now extensively employed. When an annular bit is used, sample cores of the rock penetrated may be brought to the surface and examined. As in most labor-saving implements, its somewhat considerable prime cost is soon covered by the gain in time and cost of repairing other drilling tools.

It is not often, on the whole, that the sides of an artesian bore are sufficiently solid and impervious to remain unprotected throughout. Such is the case, *e. g.*, in the cretaceous limestone region of the States of Mississippi and Alabama, whose soft, chalk-like rock is commonly bored with the earth-auger, being solid and almost uniform even to the thickness of twelve hundred feet. No tubing save the soil-pipe is here ordinarily required, even in flowing wells. In most cases, however, the use of tubing becomes necessary, either to prevent the walls from "caving," or to exclude undesirable veins of water or quicksand; the latter especially being a frequent and most troublesome source of difficulty. The cheapest and most durable tubing is the wooden, but the great diminution of clear diameter resulting from its employment greatly limits its practical usefulness. Most commonly, wrought-iron tubes (gas-pipes, and for larger diameters tubing made of sheet iron and riveted) are used, although not very durable; more rarely, cast-iron, bronze, or copper ones, the former being rather cumbrous, the latter, though very durable, too easily collapsed or deformed by outside pressure, and rather costly. Yet they should be used at great depths in bores of great cost and importance and difficulty of repair.

The outside diameter of tubes should ordinarily be three-fourths to one inch less than that of the bore-hole, to allow for inequalities of surface inside. It is important, on several accounts, that they should not fit too closely, except for excluding quicksand. The tubes are made in lengths of about six feet, screwing into each other or connected by outside "thimbles" riveted to the lower, and successively attached by screw-rivets to the upper section as the tube is lowered into the well.

If after tubing any portion of a well the boring is to be continued below, it must ordinarily be done with a correspondingly diminished diameter, both of drills and tubing if the latter be required. A deep well thus sometimes contains three or four different successive sets of tubing, and even more, so that, although begun with a clear diameter of eight or nine inches, it may be diminished down to two or three. It may then become necessary to extract all the tubing, and widen the bore by "reaming." Expanding drills are sometimes used to undercut a set of tubing, and thus lower it, but this is a slow process, and somewhat uncertain of success.

The accidents to which the well-borer is liable are very numerous in kind and of very frequent occurrence. The most common one is that the tools get "jammed" in the well, whether in consequence of a deviation of the bore-hole from the vertical, or from the falling in (whether from the sides of the well or from its mouth) of some fragment or boulder, or perhaps a hard fossil, or from the breaking of a joint or the "stripping" of a screw, by which the tools themselves have fallen in.

The first cause mentioned is the most formidable, as it is rarely possible to correct fully a material sidewise deviation of a bore-hole; this accident, therefore, frequently causes the final abandonment even of deep bores. The jamming of the tools by an object fallen from above is also often a very serious matter; hence a double-hinged valve is commonly placed on top of the soil-pipe as a measure of precaution. A large number of most ingenious implements for extracting bodies of various kinds and shapes has been devised, yet not unfrequently a special tool must be constructed to suit a particular case. All possible precautions should be taken to prevent such accidents, as their cure is but too frequently impossible.

Among the most noted of deep-flowing wells is that of Grenelle at Paris. The latter city is situated in the lowest portion of a basin-shaped mass of formations, so that the strata slope towards the city. It was begun in 1833 under the auspices of the government, and, advancing slowly, was completed on Feb. 26, 1841, when, at the depth of 1792 feet, the auger, penetrating a ledge of rock, fell suddenly several yards, evidently into water. In a short time the water rose 112 feet above the surface in an immense volume, bringing up sand and mud. It exerts a pressure equal to a rise of 812 feet above the surface (in pipes), and discharges half a million of gallons per day of very pure water, which is distributed to that part of the city. Since, however, its temperature at the mouth of the well is 82° F., it requires to be cooled for drinking purposes, and is used for warming the hospitals at Grenelle. A large number of other wells have since been sunk in and near Paris, as well as London, which is similarly situated as regards geological structure. Among the most remarkable of the locality is that of Passy, which was sunk with a diameter of two feet to a depth of nearly 2000 in the years from 1855 to 1860, inclusive. It discharges 5,660,000 gallons of water per day; the yield of the Grenelle well having, at the same time, diminished by one-fourth.

Among the noted deep artesian wells of Europe is that of Kissingen in Bavaria, completed in 1850. It is 1878½ feet in depth, the last 138½ feet being sunk in pure rock-salt. Hence the water is strongly salt; its temperature is 66° F., and the discharge is 100 cubic feet per minute; it will rise to the height of 58 feet above the surface. Wells have been sunk to greater depths in Germany since then; the deepest of all, and doubtless the deepest in the world, being that lately sunk at Sperenburg in Prussia, to a depth of 3900 feet.

In the U. S. artesian wells are numerous, especially in New York, Pennsylvania, Virginia, Alabama, and Mississippi. In the latter two States they alone furnish the supply of water without which the fertile prairie regions would suffer severely in summer. It has frequently happened here, as elsewhere, that the discharge from the wells first sunk has been seriously diminished or altogether stopped by the opening of other bores in the same neighborhood or at a lower level. A nine-inch bore made at the foot of the hill on which the city of Columbus, Miss., is situated caused the sudden cessation of the discharge from the numerous wells in the town, while itself emitting a stream copious enough to run a mill. On the partial closing of the orifice the wells above resumed their flow.

The numerous bored wells of Western Pennsylvania, West Virginia, and adjoining parts of Ohio are chiefly remarkable as the source of the world's largest supply of petroleum, which flows or is pumped from them, accompanied by salt water and combustible gas. Their spontaneous flow seems frequently to be caused not so much by water-pressure as by that of the combustible gas, which is sometimes emitted by them in vast volumes, spouting to the height of 60 to 100 feet a mixture of water and petroleum. Disastrous conflagrations have at times resulted

from such inordinate manifestations of energy. These wells rarely exceed 500 feet in depth. At Cleveland, O., as well as at a few other points, the natural gas is used both for lighting and heating purposes by the proprietors.

The oil-region of Pennsylvania, with its numerous wells, has its parallel in North-eastern China, where the wells are said to count by tens of thousands, some of them approaching a depth of 3000 feet. They are not, however, as productive of petroleum as those of the U. S.

A number of wells of moderate depth (not exceeding 500 feet) have also been sunk at the city of New York. The structure of Manhattan Island is exceedingly unfavorable to their success; but good water has been obtained in large quantity, and rising to within twenty feet of the surface.

Among the deepest bored wells in this country are two at St. Louis, Mo. The first was bored by the Messrs. Belcher, sugar-refiners, between 1849 and 1854, 300 feet from the river-bank, and 420 feet above the sea-level, down to 2199 feet, discharging per minute 75 gallons of water at 73.4° F. The other well, at the Insane Asylum, 180 feet above the former, was sunk at the expense of the county, to the depth of 3843.5 feet (the last 40 feet in granite), in the course of 3 years 5½ months from Mar. 31, 1866, and working day and night, excepting Sundays. Diameter of bore, 4½ inches from 1022 feet to bottom. Both wells furnish saline sulphur water; in the second it does not rise to the surface; temperature, 105° F. These wells are remarkable for having been mainly sunk in hard rock—limestone, sandstone, and shale—and almost throughout by steam-power. The same applies to the Louisville artesian well, 2066 feet in depth; its water is likewise strongly mineral.

At Terre Haute, Ind., several wells have been sunk to depths varying from 1600 to 1900 feet. One of these yields only a strong sulphur water; two others also yield petroleum. Water quite similar to that of the Terre Haute wells, and likewise connected with a petroleum-bearing formation, though of much later date, is spouted by the artesian well near Lake Charles in Calcasieu parish, La. The main stream comes from the surface of the great sulphur-bed of that locality, at a depth of 440 feet, at the rate of about sixty-five gallons per minute, and with a rise of twelve feet above the surface.

One of the deepest bores in the U. S. is the well sunk at the State-house, Columbus, O. Its depth is 2775½ feet, but the water struck (which is salt) does not rise above the surface; its temperature at the bottom is 91° F., or that of hot summer weather.

In the vicinity of Chicago artesian water of great purity is readily obtained at a moderate depth and in great abundance, rising to convenient heights above the surface. It is of material importance as furnishing a supply both fit for domestic use and adequate for manufacturing purposes.

Among the artesian wells which have encountered great difficulties in their construction we may mention those sunk at Charleston, S. C., to the depth of 1250 feet, and at New Orleans to that of 630. The strata penetrated here being but little consolidated, and alternating with quicksand layers, the auger had to be closely followed by tubing, which itself was very liable to sidewise displacement and collapse. At New Orleans no satisfactory result was obtained at the depth mentioned; at Charleston, a somewhat saline, yet soft water, of a temperature of 87°, rises ten feet above the surface, at the rate of twenty gallons per minute; it is used for steam-boilers.

The boring of artesian wells is likely to become a matter of capital importance in the arid regions of the West, where both surface and spring water is so frequently not only very scarce, but undrinkable. An expedition under the command of Capt. (now Major-General) Pope was sent out by the U. S. government in 1855 for the purpose of testing the feasibility of sinking artesian wells on the waterless plateau of the Llano Estacado, which forms a formidable obstacle on the most direct route between the South-western States and Mexico. It was shown that water would rise to within an available distance of the surface in bores between 800 and 900 feet in depth.

In California artesian wells are largely used in providing water for irrigation. The same is being done in the Sahara desert of Africa, where such wells have been sunk to the depth of 1200 feet, each one creating around itself an oasis.

Bore-holes are sometimes sunk from the surface into sand or other pervious strata for the discharge of waste water that would otherwise prove a nuisance. These are called absorbent or drain wells.

E. W. Hilgard, *Oxford, Miss.*

Ar'teveld' (or **Artevelde**), **van** (Jacob), a famous Flemish demagogue, born at Ghent, became a rich brewer. By his talents and eloquence he acquired much influence and popularity. The people of Ghent, who had revolted against the count of Flanders, chose Arteveld as their commander. He banished a number of Flemish nobles and knights, and adopted a despotic and arbitrary policy. As an ally of Edward III. of England, he waged war against France. Having formed a design to give the sovereignty of Flanders to the English Black Prince, he provoked a revolt of the Flemings, who killed him July 9, 1345. (See Froissart, "Chronicles;" J. de Winter, "J. van Artevelde," 1846.)

Arteveld, van (Philip), a son of the preceding, was born at Ghent in 1340. He was also a popular favorite, but passed many years of his mature life as a private citizen. When Ghent was besieged by the count of Flanders in 1381, and reduced to a desperate condition, Arteveld was appointed to the chief command. In May, 1382, he defeated the count, and then assumed the title of regent. Charles VI. of France intervened in favor of the count of Flanders with an army, and Arteveld was defeated and killed Nov. 27, 1382. (See Froissart, "Chronicles.")

Art Exhibitions, public exhibitions of the works of living artists, for the purpose of affording pleasure and instruction to the people on the one hand, and on the other of promoting the sale of the works exhibited. They originated before the art-unions, with which they are now usually connected. As in modern times artists depend for patronage on private persons, and as their works, if sold, are usually kept in the obscurity of private houses, the necessity arose that some plan should be adopted for their public exhibition. Among the earliest of such displays was that of the French Academy of Art in 1673. The regular exhibitions of the Royal Academy of London commenced in 1796. Similar exhibitions are held in all civilized countries. The annual exhibition of the National Academy of Design at New York is one of the most important in the U. S. Its exhibitions commenced in 1825.

Arthabas'ka, a county of Canada, in the central part of Quebec, intersected by the Becancour River. Area, about 850 square miles. The county is traversed by the Grand Trunk Railway. Capital, St. Christophe (or Arthabaskaville). Pop. in 1871, 17,611.

Arthabas'kaville, or **St. Christophe,** the capital of Arthabaska co., province of Quebec, Canada, has a convent and an academy of the Nuns of the Congregation of Montreal, and two weekly papers.

Arthritis [from the Gr. ἄρθρον, a "joint"], literally, "inflammation of a joint;" a term inclusive of gout and rheumatism, though properly applicable to inflammations of the joints of whatever character.

Arthro'dia [Gr. ἀρθρωδία, from ἄρθρον, a "joint" or the "socket of a joint"], a connection of bones, in which the head of one is received into a very superficial cavity in another, so as to admit of motion in almost all directions, as in the joint between the humerus and the scapula.

Ar'thur, a thriving town in the N. Riding of Wellington co., Ontario, Canada, on the Toronto Gray and Bruce Railway, 73 miles W. by N. of Toronto. It is the seat of important manufactures. Pop. of census sub-district, 4376.

Ar'thur, Ar'tur, or **Ar'tus,** a semi-fabulous British hero and king of the Silures, is supposed to have flourished about 500 or 550 A. D., after the Romans evacuated the island of Britain. He is celebrated as the hero of the romances of the Round Table, and his exploits were favorite themes of mediæval bards and romancers. According to the popular legends, he defeated the Saxon invaders in several battles, and bravely defended the independence of the Britons, but was finally killed in a battle fought at Camlan against his rebellious nephew Modred. His fame and adventures were magnified and embellished by writers of various nations in the Middle Ages. Some of these affirm that his residence was at Caerleon, on the Usk, in Wales, where he lived in grand state, surrounded by multitudes of knights and ladies—that twelve knights of eminent valor formed the centre of this retinue, and sat with the king at a round table. Another of his capitals was Camelot, identified by tradition with Queen's Camelot in Somersetshire. The name of his wife was Guinivere. (See Turner, "History of the Anglo-Saxons;" Ritson, "Life of King Arthur," 1825; Tennyson, "Idyls of the King." See also Sir Thomas Malory's "Byrth, Life, and Actes of Kyng Arthur," London, 1485; new ed. by Southey, 1817, 2 vols. quarto.) The Arthurian romances were probably thrown into their present form, if not largely invented, by Walter Map. (See Morley's "Writers before Chaucer," *sub voce.*)

Arthur (Timothy Shay), an American writer of tales, was born near Newburg, Orange co., N. Y., in 1809. He became a resident of Philadelphia in 1841, and published many popular tales having an excellent moral tendency. Among his works are "Lights and Shadows of Real Life," "Library for the Household" (12 vols.), and "The Good Time Coming."

Arthur's Seat, a rocky hill which rises in the environs of Edinburgh to the height of 822 feet above the level of the sea, and commands a prospect of great extent and superlative beauty. It is supposed to derive its name from King Arthur. It is formed of several varieties of trap-rock upheaved through the carboniferous strata, and presents on the southern and western sides perpendicular precipices.

Ar'tichoke [supposed to be a corruption of *al-kharciof*, the Arabic name of the plant], (*Cyna'ra scol'ymus*), a perennial herbaceous plant of the natural order Compositæ, is nearly allied to the thistle. It is a native of Southern Europe, and is cultivated for food. The genus is distinguished by the bracts of the involucre being fleshy at the base, and emarginate with a hard point. The part which is eaten is the succulent receptacle of the flower-head, gathered before the flowers expand, and boiled or made into a salad. The Jerusalem artichoke (*Helian'thus tuber-o'sa*) is an entirely different plant, which is sometimes cultivated for its tubers.

Ar'ticle [Lat. *artic'ulus*, literally signifying a "joint" or "single part"], a word used in various senses, usually denoting a distinct part of a systematic work. It may signify a single clause in a contract, treaty, or other written document, a particular, separate charge or item in an account, or a point of faith. In grammar, it is a part of speech, usually the shortest and simplest of all; in mercantile language, it denotes a particular commodity: in journalism, the principal editorials are called *leading articles*.

Articles, in law, a word used to denote various kinds of instruments drawn up under distinct heads or divisions. Instances of the use of the word are a libel in admiralty, where the libellant (or plaintiff) is said to "articulately propound;" "articles of agreement," "articles of impeachment," "articles of partnership," or of peace or of war. "Articles of Confederation" is a phrase employed to designate the compact made between the original thirteen States of the U. S., forming a general government before the present Constitution, and which, having gone into effect Mar. 1, 1781, continued in force until the first Wednesday of Mar., 1789.

Articles, The Six, were imposed on the English nation by Parliament in 1539 during the reign of Henry VIII. They asserted the doctrine of transubstantiation, condemned the marriage of priests, enjoined the continued observance of vows of chastity, and sanctioned private masses and auricular confession. The act imposing these articles was popularly called the "Six-stringed Whip."

Articles of Faith, an expression usually employed to denote the particular points of doctrine which together make up the sum of Christian belief. The various churches of Christendom, not being agreed upon all these points, have for the most part set forth their own exposition of them; and it is to these creeds, symbols, or confessions that the term Articles is most commonly applied. The Articles of the English Church, formerly forty-two in number, are now reduced to thirty-nine, and by the Methodist Church to twenty-five. (See THIRTY-NINE ARTICLES.)

Articles of War, a name applied to an act of Congress approved April 10, 1806, to establish rules for the government of the U. S. army. Separate articles (those now in force, approved in 1864, to supersede the old articles of 1802) establish rules for the government of the navy. Also applied to the code of military law embodied in the Mutiny Act annually passed in the British Parliament. For the enforcement of such Articles of War power is given to the Crown to establish courts-martial to try and punish offences according to the Articles themselves. Another annual Mutiny Act embodies "Articles of War for the Marine Forces," which relates exclusively to the royal marine forces *while employed on shore*. The navy is not controlled by any annual Mutiny Act, but the Articles of War relating to it are contained in an old act of Parliament, the 22d Geo. II., c. 33.

Articula'ta [the plu. neuter of the Latin past part. *articula'tus*, "jointed" or "furnished with joints," from *artic'ulus*, a "joint"], or **Artic'ulated An'imals,** one of the four primary or grand divisions of the animal kingdom according to the system of Cuvier, which is generally adopted by naturalists. The Articulata are characterized by bilateral symmetry and an external skeleton composed of a series of rings or segments. These rings in some cases appear externally as mere transverse folds in a soft skin, but are often covered with a bony or horny substance. They are also characterized by an internal gangliated nervous system, the ganglia being arranged symmetrically along the ventral aspect of the central or median line of the body. Optic nerves and other nerves of special sense proceed from a ganglion in the head, which is sometimes called the brain, but is not much like the brain of vertebrate animals. The Articulata have no proper heart, but instead of it a *dorsal vessel*, a tube carried along the central line of the body near the back. The blood is usually white. They surpass all other animals in muscular performances in proportion to their size. Many of the Articulata have articulated members or legs, symmetrically arranged in pairs. By most recent naturalists they are divided into three classes—Insects, Crustaceans, and Worms. Huxley subordinates the Articulata under the name of Arthropoda, and introduces the divisions Annulosa and Annuloida, to include some classes of animals otherwise placed by Cuvier.

Artific'ial Hori'zon, a horizontal mirror, usually the surface of a basin of mercury, used to determine the altitude of a star or other object when the sensible horizon is ill defined.

Artificial Stone. See CEMENT, by GEN. GILLMORE.

Arti'gas (José), a South American general, born at Montevideo in 1755, became in early life a leader of the Gauchos, a class of outlaws. In 1811 he entered the service of the Junta of Buenos Ayres, for which he fought against the Spaniards or royalists. He defeated the latter in several battles, and became in 1815 master of the Banda Oriental. Aided by the democratic party, of which he was the leader, he conquered Buenos Ayres in 1820, but was removed from power about the end of that year. Died in 1851.

Artil'lery [Fr. *artillerie*, remotely from the Lat. *ars, artis*, "art," "ingenuity," implying that it is the product of skill]. The term *artillery* was in early times used to designate all kinds of missiles employed in warfare, and the machines by which they were propelled. In modern times, however, and especially since the introduction of gunpowder for military purposes, the term is understood to denote cannon of all sizes and varieties, their carriages, projectiles, implements, and equipments, the machines necessary to transport, serve, and manœuvre them, and lastly the troops specially instructed and employed in their service.

Artillery is classified according to the particular service for which it is adapted, and in each class according to its size, weight, or the character or weight of its projectile. Its primary classification is *light* and *heavy*. The former includes field, mountain, prairie, and boat guns, rockets, etc.; the latter comprises siege, garrison, sea-coast, and ship guns. *Field artillery* is subdivided into horse artillery, in which all the artillerymen are mounted on horses, and "mounted batteries," in which the officers, sergeants, and certain other enlisted men only are mounted on horses, the cannoneers marching by the side of the guns, or, for manœuvres on the field of battle or a rapid but prolonged movement elsewhere, mounting upon the ammunition-chests on the carriages. The size of guns is designated either by the diameter of the bore in inches or by the weight of their solid shot in pounds. In England they are often designated by the weight of the guns in hundredweights.

The artillery engines in use by the ancients were chiefly the *ballista* and *catapult* for throwing stones and heavy darts, and the *battering-ram* for effecting breaches or demolishing walls. These engines were rude, bulky, heavy, clumsily constructed, and required many men and much time and labor for their transportation, placing in position, and manœuvring; but, for the period and purpose, they were doubtless of great power and sufficiently effective. The effective range of the ballista and catapult did not exceed 100 or 150 paces, but at this distance they were capable of discharging missiles of 300 pounds weight.

In the Middle Ages the cross-bow came into military use, and gradually supplanted the catapult. It is probable that an engine of similar construction took the place of the ballista. These engines were constructed of tough, fibrous wood, and in some instances of steel. By their introduction greater portability and some increase of range were obtained.

The birth of artillery, as we of to-day understand it, must date from that of gunpowder. Although there is but little doubt that a compound of nitre, charcoal, and sulphur was well known to the Chinese as early as the ninth century as an explosive agent, and had been heard of in Europe about the era of the first Crusade as adapted simply for such a purpose, it does not appear that it was well known in Europe until it was introduced by Roger Bacon in the twelfth century. Its uses for artillery or projectile purposes did not seem to be understood until demonstrated in the early part of the fourteenth century by the Friburg monk Berthold Schwartz, to whom this important attribute was made known by an accident.

The earliest record of the construction of cannon is about

the middle of the fourteenth century. It is alleged that cannon were employed by Edward III. of England, A. D. 1327, in his campaign against the Scots, and also by the French, A. D. 1338–39, and at the siege of Algesiras, A. D. 1342, but contemporaneous mention is obscure, and refers to cannon more as curiosities than as engines of war. The first well-authenticated use of cannon in battle was by Edward III. of England in the battle of Cressy, A. D. 1346. Even on this occasion it would appear that their effect upon the French was due more to astonishment than to any inherent power of the novelty itself. From this date, however, the construction and use of cannon increased with great rapidity. At the very first they were of small calibre, throwing stone or leaden balls of only three or four pounds weight, but before the close of the century they were capable of throwing stone projectiles of forty or fifty pounds for field-guns and of 200 pounds for siege or fortification guns. In fact, their excessive size and weight not only seriously interfered with, but actually prevented, their general use. The earliest cannon were constructed of iron bars joined together longitudinally, and strengthened by exterior hoops of iron. Wood, wound with rope, and sometimes with wire, was also used upon the exterior to strengthen them. One of the most interesting of ancient *monster* cannon still extant is the "Mons Meg," made in

Fig. 1.

1486 at Mons, Brittany, and now in the castle of Edinburgh. An inscription on the carriage states that it was employed at the siege of Norham Castle in 1513. It burst in 1682 in firing a salute. It is made of iron bars hooped together, and its bore is twenty inches in diameter. (Fig. 1.)

Another superb specimen of early cannon—of much later date than the preceding—is the "Tsar Cannon" (or King of Cannon) in the arsenal of the Kremlin, Moscow. It was made early in the seventeenth century under the emperor Theodore. It is of bronze, with a calibre of

Fig. 2.

The Tsar Cannon.

about thirty inches. The carriage upon which it stands is merely an ornamental support. Cast without trunnions, it was probably laid in permanent position for firing. (Fig. 2.)

Still more curious (for they are even *yet*, if we mistake not, *in battery*) are the famous Turkish guns defending the

Fig. 3.

Dardanelles. The engraving shows the interior of the fort of Chanak Kalesi on the Asiatic side. There are said to be 102 guns (it is not stated that *all* are like those shown and described). The diameter of the shot is thirty-six inches, length of guns fifteen feet. They were cast at Bagdad. The gun in the foreground is that which hit the Windsor Castle in the famous passage up the Dardanelles of the British fleet under Admiral Ducktorth in 1807. It will be observed that the wooden carriages form (only) permanent supports, affording no angular motion to the gun, the direction of which is necessarily invariable. (Fig. 3.)

Ancient cannon were in some instances made of *leather*, and as so made were used to some extent by Charles XII. of Sweden, A. D. 1697.

In the very infancy of cannon construction the breech-loading principle suggested itself, and was made use of in a crude manner, but the low state of the mechanic arts forbade the exact mechanism necessary to perfect the idea. About the middle of the fifteenth century cannon began to be cast in iron, and towards the latter portion in various alloys. A. D. 1477, Louis XI. of France caused many cast-iron cannon to be fabricated for use against the cities of Picardy and of Flanders. About this period the projectiles for large cannon, which had hitherto been of stone, were made of cast iron, but to some extent stone balls continued in use for a number of years afterwards. Shells were also introduced at this time, and we have a record of their use by Charles VIII. of France at the siege of Naples, A. D. 1494. Brass cannon were first cast in England by John Owen, 1535, and a few years later in Scotland by order of James IV. During the last half of the sixteenth century mortars for throwing shells were introduced in Germany, and in the first half of the seventeenth century in France. Mortars were at first discharged by igniting the shell before it was introduced, and then igniting the charge in the mortar. The great danger of such a practice caused its abandonment, but not until it had been followed for half a century. Towards the latter part of the seventeenth century a short cannon, called after its inventor (the German Haubits) a *howitzer*, was introduced for the purpose of using large shells by direct fire. In 1799 there was introduced a short cannon of large relative calibre called a *carronade*, named from the Carron Iron-works, where it was first cast. No long guns for firing hollow projectiles at long range by direct fire were known until 1812, when Colonel Bomford of the U. S. ordnance department invented a gun for that purpose, which he improved in 1814, and called a "columbiad." Some years afterwards this invention was introduced into France by General Paixhans, and was generally called in Europe by his name. In 1841 a gun of this character, but of somewhat different model, and called a sea-coast howitzer, was introduced into the U. S. service; and three years later these were followed by columbiads of altered model, increased weight, and greater power. Up to this period all ordnance was smooth-bore, the rifle principle, although suggested very early in the history of cannon, and put into practice in military weapons A. D. 1600, having never been perfected or brought into general use. About 1847–48, soon after the application of the rifle principle to small-arms, experiments commenced to be made with rifled cannon, but ten or more years were consumed before the proper form, number, and twist of the grooves, and form of the elongated projectile, had been sufficiently ascertained to justify any general use of rifled cannon. These varying elements are still the subject of scientific research and experiment, although rifled cannon have now very nearly superseded smooth-bore cannon throughout the world.

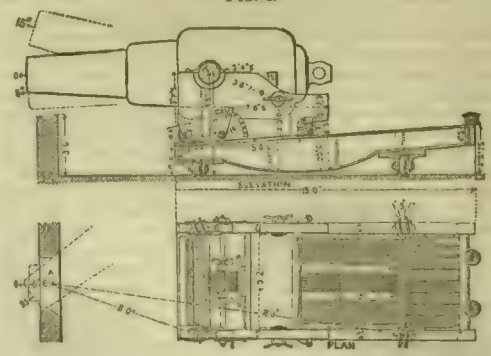
Gunpowder was first used in the form of dust, but its great loss and inconvenience in use, and the discovery of its increased power in a granulated form, led, after some years, to its sole use for cannon in that form.

In gun construction the prime considerations are tenacity, elasticity, and hardness. Cast iron, wrought iron, steel, and (for the smaller ordnance) an alloy of 90 parts copper and 10 parts tin, are found to meet these conditions best. Since 1860 the alloy has gradually fallen into disuse, England, France, and the U. S. being the only nations who use it now, and even these nations use it to a very limited extent.

The present condition of gun construction is mainly experimental. Iron in one form or another is the only material used for heavy artillery, but the particular form in which it is to be used, whether as cast, wrought, or steel, or whether in bars, coils, or ingots, or in combination—as, for instance, steel or wrought iron interior and cast-iron or wire-wrapped exterior—is still undecided, and it is left for experiments which are still in progress or to be made hereafter to decide which is best. In the U. S. cast iron is used for smooth-bore guns, and also for rifle guns, but as its use for the latter has not proved satisfactory, experiments are now being made with wrought iron, and with wire-wrapped and other built-up guns, with fair prospect of success. In England modern gun construction at one period inclined to the use of a steel interior tube, strengthened by an exterior casting of iron, which is the system of Palliser. But the superior excellence of the inventions of Sir William

Armstrong, improved by those of Fraser, have resulted in the exclusive use, in that country at present, of the system of these two inventors. This method of gun construction is, in brief, a steel core (or body of the gun) strengthened by three or more exterior tubes of coiled wrought iron. The system is at present popularly known as the "Woolwich."

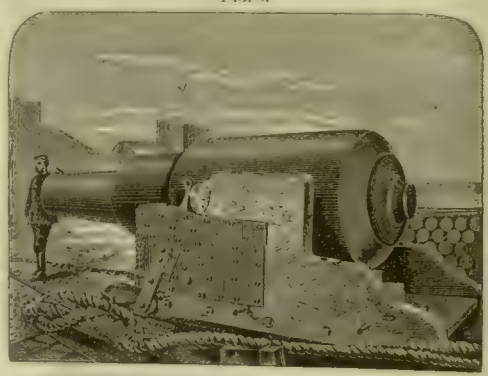
In Germany and Russia, and some other European nations, the Krupp system of heavy forgings of steel ingots is preferred. This last is by far the most expensive, and does not always produce the most durable guns. The question of breech or muzzle loading is still an undecided one. The Germans seem to prefer the first named, while the English, after several years' adoption of the first, have of late abandoned its use and returned to the muzzle-loader. In the U. S. experiments still going on have not yet demonstrated which principle is the best. The advantages of loading at the breech with heavy guns are numerous and great, but the serious mechanical difficulties of perfecting the movable breech attachments have not yet been satisfactorily overcome.



During the half decade (1855–60), and the succeeding decade (1860–70), enormous strides were made in gun construction, and in that of carriages and projectiles, and the manufacture of gunpowder.

The plating of vessels of war with iron, and the increasing thickness of this armor, have led of late years to a very great increase in the size, weight, and calibres of sea-coast and naval cannon, and this in turn has necessitated very radical changes in the material and methods of gun construction. In England the lead in this direction was taken by Sir William Armstrong, who was subsequently followed by Whitworth, Fraser, Palliser, Blakely, and others. In Prussia, Krupp at Essen struck out a new method, which has proved so successful as to cause his guns to be adopted in large numbers by Russia, Austria, Belgium, and Spain, in addition to his own country. In the U. S., Rodman, Dahlgren, and Parrott have made their names famous by successful improvements in heavy gun construction. Each of the above-named inventors has given his name to his invention, and the guns are so recognized throughout the civilized world.

The method of Armstrong is to form the barrel or body of the gun by welding at their ends several wrought-iron tubes, each of which is two or three feet in length, and is formed by winding a square bar of iron around a mandrel and welding the edges. The part of the gun in rear of the trunnions is strengthened first by an enveloping tube composed of a plate of iron bent in a circular form and its edges welded, and secondly by another enveloping tube made, as in the body of the gun, of spiral coils. As at first constructed, the Armstrong guns were all breech-loaders, the movable breech arrangement consisting of a hollow screw, through which the charge was passed into the bore, and a wedge which fitted into a slot cut in the breech of the gun closing the rear end of the bore. This wedge was slipped into its place by a hand, and kept there by a few turns of the screw. The breech-loading principle having proved unsatisfactory in practice, it was abandoned, and all Armstrong guns were subsequently constructed as muzzle-loaders.

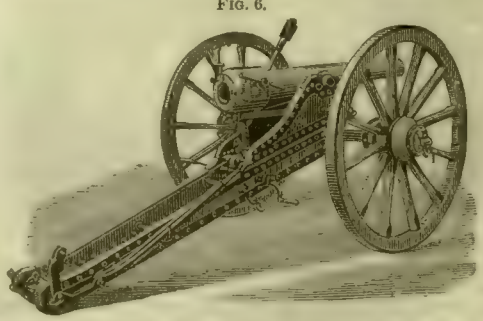


Armstrong's method of construction has been considerably modified by the suggestions of Mr. Fraser, a leading employé in the royal arsenal at Woolwich. These modifications consisted, in brief, in reducing the number of coils, shrinking on the outer coils and trunnion-block together, introducing offsets or shoulders for hooking or securing the different parts to each other, and in using a cheaper iron for the outer coils. These modifications, while they did not improve the strength of Armstrong's original invention, reduced the cost of the gun nearly 50 per cent. As thus reduced the cost of Woolwich guns is about double that of cast-iron guns in the U. S. of equal weight. Early in 1867, Fraser still further modified his method by constructing his guns, up to those of 9-inch calibre or 250-pounders, of four separate parts: 1st, the inner (or A) tube, a solid steel forging, tempered in oil, roughly bored out to a calibre slightly less than the proper one; 2d, an outer (or B) tube, composed of two single and slightly taper coils of wrought iron, united together endways, rough turned and shrunk on to the inner (or A) tube, which is accurately turned down to receive it, the process being easier to *turn down* the inner tube than to bore the outer one; 3d, a breech-coil or jacket, composed of a triple coil, a double coil, and a trunnion-ring made and welded together; and 4th, the cascable. Guns of this character have been constructed of 7-inch (115-pounder), 8-inch (180-pounder), 9-inch (250-pounder), 10-inch (350-pounder), and, more lately (1871), 12-inch (600-pounder). Fig. 4 shows the Woolwich 25-ton (12-inch) gun on its carriage. Still more recently, a gun of 11.6 calibre, of greater weight and throwing a projectile weighing 700 pounds, has been

Fig. 4.

made. This last gun is what is popularly known as the 35-ton gun, or "the Woolwich Infant." (Fig. 5.) In the calibres of the Fraser system above 9-inch one or two additional exterior coils are used. For its size and weight, the 9-inch Fraser gun is probably the most efficient gun in the world.

Fig. 5.



Whitworth's method is to construct the gun of a low steel, the hoops cast hollow, hammered over a steel mandrel, annealed, and forced together (or the gun built up) by hydraulic pressure. The breech-pin, which is made of harder steel than the body of the gun, is screwed into its place. The striking peculiarity of Whitworth's gun is the cross-section of its bore, which is hexagonal.

The Blakely gun is composed of a barrel of low steel, over which is shrunk a tube of less elastic steel, and over all a cast-iron tube or jacket, to which the trunnions are attached. The two steel tubes are cast hollow, hammered over mandrels, and annealed. The projectiles for these guns are on the expanding principle.

The Palliser method is to insert a steel tube in the bore of a cast-iron gun, either from the muzzle, where it is secured by one or more steel screw-washers, or from the breech, in which case the steel tube only extends a short distance beyond the seat of the charge, and is secured in its place by a screw breech-plug. This method affords the opportunity of utilizing smooth-bore guns of older systems by their conversion into rifle guns of considerable power and endurance.

The method of Mr. Francis Krupp of Essen, Prussia, is to fabricate the body of his gun from a solid ingot of low

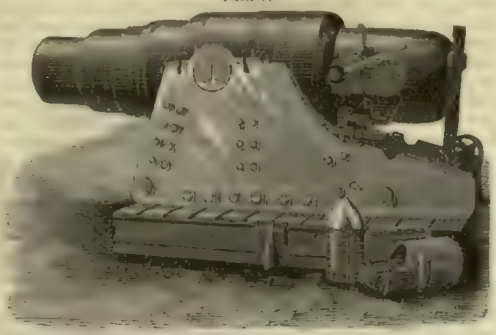


Fig. 6.

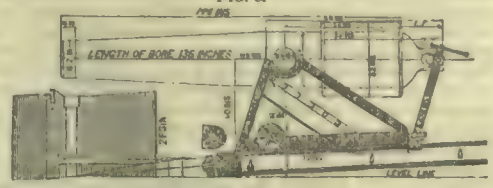
steel worked under heavy steam-hammers. The gun is strengthened by three or more steel tubes, which are



shrunk upon the central tube or mass of the gun, the last ring or tube enclosing the breech being forged in one piece with the trunnions, and made without any weld. The rings are of different lengths, as is usual with built-up guns, and the whole gun is diminished in thickness towards the muzzle, not by tapering, but by being turned with concentric steps of diminished heights. Fig. 6 shows one of Krupp's field-guns on its carriage. Besides several thousand field-guns, Krupp has fabricated nearly 2000 of 6-inch, 7-inch, 8-inch, 9-inch, 11-inch, 12-inch and 14-inch calibre. Of the last-named monsters (of which two have been made), both have successfully stood the proof of nearly 170 pounds of prismatic powder and a 1200-pound projectile. The 14-inch Krupp gun weighs fifty tons. (Fig. 7.) The first of its kind required the continuous labor, night and day, of sixteen months, and, with its carriage and the turn-table (both of steel) on which it is mounted, cost $110,000, gold. Krupp's partiality for steel induces him to make all of his projectiles and gun-carriages of that material.

Fig. 7.

In the Parrott method the body of the piece, or rather the gun itself, is of cast iron, cast hollow, and cooled from the inside (after the plan of Rodman) for the larger calibres, and strengthened about the seat of the charge by an exterior tube of wrought-iron bars spirally coiled and shrunk on. For this purpose this portion of the gun is turned down to a cylindrical form. Besides his field-guns of 3 inches (10-pounder) and 3.62 inches (20-pounder), and his siege-gun of 4.2 (30-pounder), Captain Parrott has constructed sea-coast and ship-guns of 6.4 inches (100-pounder), 8 inches (200-pounder), and 10 inches (300-pounder). His mode of rifling is the increasing or gaining twist. The Parrott gun is serviceable, of considerable endurance, and, when Parrott projectiles are used, of most excellent accuracy. The 10-pounder, 30-pounder, and 100-pounder seem to give better results than the other calibres. Fig. 8 shows the Parrott 200-pounder.

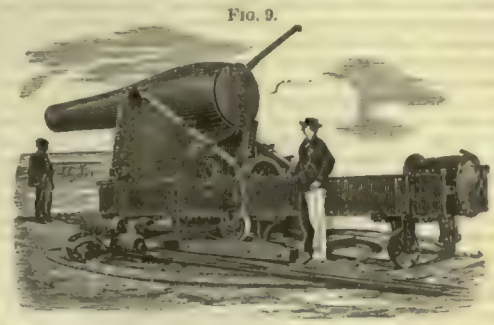


Fig. 8.

The method of Admiral Dahlgren of the U. S. navy has been illustrated only in guns for naval uses. His guns are of cast iron cast solid, and cooled from the exterior; they are of great thickness at the breech and as far forward as the trunnions, and from thence to the muzzle rapidly diminishing in thickness, so that their external configuration is not unlike that of a champagne-bottle. Dahlgren guns are chiefly of 9-inch and 11-inch calibre, and are adapted exclusively for hollow projectiles. A 10-inch Dahlgren gun for firing solid shot has, however, been put in service. The 15-inch and 20-inch naval guns, although they have in great degree the exterior form of the Dahlgren, are cast hollow, cooled from the inside, and have the elliptical bottom of the bore, which are characteristic features of the Rodman plan. The 9-inch, 10-inch, and 11-inch Dahlgren guns have the bottom of bore in the conical form of what is known as "the Gomer chamber."

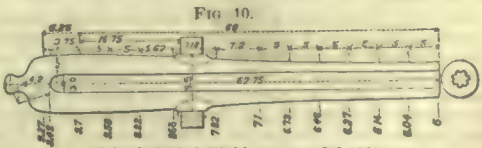
The guns of Gen. Rodman of the U. S. ordnance corps are all of cast iron, and are cast hollow and cooled from the inside, the exterior being meantime kept from rapid cooling by fires built around the gun in the casting-pit. Rodman guns are further distinguished by great thickness of metal at the breech, by graceful curves of their exterior lines, by the absence of all exterior ornamentations, sharp angles, or edges, and of the cascable and swell of the muzzle, and by having the trunnions at the centre of gravity, thus doing away with preponderance and greatly facilitating the service of the gun. Rodman guns are both smooth-bore and rifled. The calibres of the smooth-bore guns are 8 inches, 10 inches, 13 inches, 15 inches, and 20 inches, and of the rifle, 8 inches (corresponding exteriorly to 10-inch s.-b), 10 inches (to 13-inch s.-b.), and 12 inches (to 15-inch s.-b.), three dimensions of carriage thus answering for six guns. All Rodman guns are adapted to the use of solid as well as hollow projectiles. The 15-inch Rodman gun weighs 25 tons, the solid shot 450 pounds, and the powder-charge 100 pounds mammoth powder. The 20-inch Rodman weighs 58 tons, its solid shot 1060 pounds, and its powder-charge 180 pounds mammoth powder. Fig. 9 shows the Rodman 15-inch gun.

Fig. 9.

In the U. S., in 1856, the systems of artillery in use for the land service were as follows:

Field Artillery.—6-pounder and 12-pounder guns and 12, 24, 32-pounder howitzers—six different pieces of ordnance, and seven different kinds of carriages; the 12-pounder howitzer mounting on three different kinds of carriage.

Siege Artillery.—12-pounder, 18-pounder, and 24-pounder guns; 8-inch howitzer; and cochorn, 8-inch and 10-inch mortars—six different pieces of ordnance, and as many different carriages.



Sea-Coast Artillery.—24-pounder, 32-pounder, and 42-pounder guns; 8-inch and 10-inch columbiads; and 10-inch and 12-inch mortars—seven different pieces of ordnance, and as many different carriages.

All of the various carriages were of wood.

The system of artillery for the land service in use in the U. S. in 1873 are as follows:

Field Artillery.—3-inch rifle and 12-pounder smooth-bore—two guns and two carriages. Fig. 10 is the 3-inch rifle, model of 1861, and at present in use.

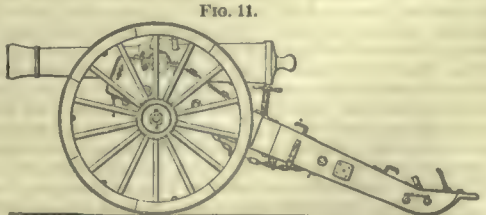


Fig. 10.

3-inch Rifled Field-gun, model 1861.

Fig. 11 shows the 12-pounder smooth-bore on its carriage.

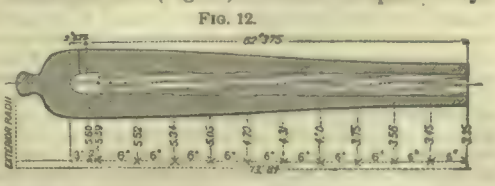

Fig. 11.

12-Pounder, Gun and Carriage.

The 3-inch rifle (Fig. 10) is soon to be superseded by a

Fig. 12.

new 3½-inch (Rodman) rifle, model of 1870, shown in Fig. 12. This is to be mounted on the same carriage as the 12-

pounder smooth-bore (Fig. 11), the weight being about the same.

Siege Artillery.—4½-inch rifle, 8-inch howitzer: 8-inch, 10-inch, and coehorn mortars—five pieces of ordnance and five carriages.

Sea-Coast Artillery.—10-inch, 13-inch, 15-inch, and 20-inch smooth-bore guns; 8-inch, 10-inch, and 12-inch rifle guns; 10-inch, 13-inch, and 15-inch mortars—ten different pieces of ordnance and seven carriages, the 10-inch smooth-bore and 8-inch rifle, the 13-inch smooth-bore and 10-inch rifle, and the 15-inch smooth-bore and 12-inch rifle, having respectively the same exterior dimensions and mounting on the same carriage.

All of the sea-coast ordnance and the mortars of the siege system have wrought-iron carriages.

For two centuries after the invention of cannon no attempts appear to have been made to classify or arrange the various sizes and descriptions, or to systematize the organisation of the material or troops of the artillery. So numerous were the varieties that were brought into the field, and actually used in battle, that great confusion in manœuvre, difficulty in supply of ammunition, and uncertainty as to results ensued. These disadvantages finally became so many and great that reform of some kind was essential. In the first half of the sixteenth century, under Francis I. of France, this confusion was reduced to some sort of system, and about the middle of the same century, under Henry II. of France, greater simplification and more systematic arrangement were introduced. The varieties of guns were reduced to six in all. It was not until more than a century and a half afterwards that any radical and permanent classification and organization was effected. Gustavus Adolphus of Sweden made improvements in the direction of increased *mobility* of field artillery, and the genius of Frederick the Great of Prussia aided materially in the same direction, particularly by the introduction of horse artillery. Napoleon Bonaparte also, in his day, instituted many advantageous changes in the organization, mobility, and use of artillery. Early in the eighteenth century the French general of artillery, De la Vallière, reduced the number of calibres to five, and improved the construction and reduced the number of gun-carriages. Soon after the middle of this century, or about 1765, the French general of artillery, De Gribeauval, effected more extensive and advantageous reforms. He separated the field system from the siege, reduced the charges of powder, and diminished the weight of field artillery; introduced iron axletrees, cartridges, elevating screws, tangent scales, perfect uniformity in carriage construction, and improved the draught of artillery when upon the road by increasing the diameter of the wheels, altering the position of the siege-gun on its carriage, and the manner of attaching the horses to all guns. These reforms were great, and were so excellent as to ensure the permanency of many of them as the basis of the system of the present day.

The improvements in artillery of the nineteenth century have been numerous and important, in fact, during the first two decades of its last half these improvements have been greater than at any period since the discovery of gunpowder. In 1827 the construction and form of gun-carriages were simplified, the models of guns were improved, and the number of calibres still further reduced. In 1850, Louis Napoleon, afterwards emperor of France, simplified the field-artillery system by the invention of a gun-howitzer, a 12-pounder, which took the place of the 8, 9, and 12-pounder guns, and 12, 24, and 32-pounder howitzers of the then existing system. Since the last-named date up to the present the chief changes may be stated in brief as follows: 1st, improvement in the quality of iron for gun-construction, and in the methods of its preparation and use; 2d, increased size and efficiency of heavy guns; 3d, the successful application and general introduction of the rifle principle; 4th, more general use of hollow projectiles, and especially of shells for heavy guns; 5th, the substitution of iron for wood in the construction of gun-carriages.

The greatly increasing size of heavy guns of cast iron involved many mechanical difficulties of construction, and finally exceeded the limits of the possibility of perfect castings. As early as 1844–45, Captain (afterwards General) Rodman, a highly intelligent officer of the U. S. ordnance corps, instituted a series of scientific investigations, followed by experiments, having for their object the removal of this difficulty. These investigations, pursued through several years, resulted in the introduction of Rodman's system of hollow casting and cooling from the interior, which renders perfectly practicable the casting of iron guns of reliable endurance of the largest necessary calibre. Perfect success having attended the fabrication, by this method, of 8-inch and 10-inch guns, Rodman suggested the casting of a 15-inch gun, which was successfully accomplished in 1860, and was followed by the subsequent fabrication of several hundred others. A 20-inch gun was next projected by Rodman, and the first one was successfully cast in 1863. Rifle guns of large calibre have also been cast by the same method, but, whether caused by imperfect form or construction of the projectile, or for other reasons, those of the largest calibre (12 inches) have not possessed sufficient endurance to resist the immense strains to which such guns are subjected. The further fabrication of such cannon has therefore been suspended in the U. S.

Many changes, looking to the substitution of some other explosive compound for gunpowder, have been projected from time to time, but, although about ten years ago gun-cotton promised to afford the advantages sought after, its use, at no time extending beyond Austria, was soon found inexpedient, and was discontinued. Gun-cotton, nitro-glycerine, and its various compounds, dualin, dynamite, lithofracteur, etc., while they are excellent for mining, blasting, or ordinary explosive purposes, are found to be too quick and powerful for use in firearms, either small or great. A wide range of experiment, however, has shown that gunpowder can be greatly improved by greater care in the selection and manipulation of its ingredients, and by increased uniformity in the form and size of its grains. Experiment has further demonstrated that it is essential to vary the size of the grain for different calibres of cannon; that is to say, a large-grained (or slower-burning) gunpowder is more advantageous for the larger cannon, since it gives increased initial velocity with decreased pressure on the walls of the gun. This has resulted in the classification of gunpowder in the U. S. service into five kinds: 1, *rifle powder*, for pistols and carbines; 2, *musket*, for rifled muskets; 3, *mortar*, for field and siege-guns and mortars; 4, *cannon*, for the smaller calibres of sea-coast guns; 5, *mammoth*, for 15-inch and larger guns.

Within the last few years the improvements in the manufacture of mammoth powder have been so marked that with charges of similar weights the initial velocity of a 15-inch projectile has been increased from 1300 or 1400 feet per second, with a pressure of 40,000 to 60,000 pounds per square inch, to 1800 feet per second, with a pressure of less than 30,000 pounds per square inch. As the work done by the impact of a projectile is in direct proportion to the square of its velocity, it is obvious how great are the advantages which have thus been obtained.

The condition of artillery throughout the civilized world is at the present time in a great degree tentative or experimental—probably more so than at any time since gunpowder was discovered. The proper proportion of artillery to other arms, of the various classes and calibres to one another, and of the different kinds or varieties of projectiles most suitable for use, are all at present unsolved problems.

In the organization of armies for the field the proportion of artillery to the other arms has at various periods of the world's history varied between the limits of one gun per 1000 infantry to six per 1000. Too great a proportion of artillery may give confidence to raw and inexperienced troops, but it encumbers an army with an unwieldy train, and thus impairs its mobility. Too small a proportion weakens the army's efficiency for many defensive as well as offensive operations, and renders some military operations exceedingly difficult, if not altogether impracticable. The topographical features of the theatre of war, and the peculiarities of the enemy's organization, exercise a material influence in the problem.

In the war in the Crimea (England, France, Sardinia, and Turkey against Russia) the proportion of artillery was rather less than three guns per 1000 infantry and one per 1000 cavalry. In the Italian campaign (France and Sardinia against Austria) the proportion was rather more, say three and a quarter to three and a half guns per 1000 infantry. In the seven weeks' war (Prussia against Austria, Saxony, and Bavaria) the proportion was about the same, with perhaps a slight excess on the part of Austria. In the Franco-Prussian war of 1870–71 the proportion was three guns per 1000 infantry on the part of the French, and about four per 1000 on the part of the Germans.

In our recent civil war (1861–65) the proportion was fixed at the outset at three guns per 1000 infantry, and two per 1000 cavalry, with the intention of reducing the former to two guns as the infantry became more experienced and staunch. During the last year of the war the proportion was reduced in the armies commanded by General Sherman to about one and a half guns per 1000 infantry and one gun per 1000 cavalry, in order that the mobility of the armies for the extraordinarily long and rapid marches they had to make might be increased. Under the circumstances this proportion was found to be quite sufficient. These circumstances were exceptional and abnormal, and perhaps unlikely to occur again. It is therefore not considered to be advantageous to reduce the proportion

of artillery below two and a half to three pieces per 1000 infantry, unless the topographical features of the theatre of war are mountainous or densely wooded.

The organization of the artillery of the armies of the U. S. during the civil war was designed and executed by the writer. Peculiar circumstances compelled this organization to be somewhat hastily decided upon and adopted. It therefore unavoidably included at the outset a variety of unsuitable calibres, but as soon as better and more uniform material could be fabricated and placed in the hands of the artillery troops this temporary anomaly ceased, and but two calibres of field-guns were kept in the service—the 3-inch rifle and the light 12-pounder smooth-bore, and in the proportion of one of the former to two of the latter. The generally wooded character of the theatre of war neutralized in a great degree the advantages of rifled guns, and rendered this proportion the most desirable. For siege purposes the ordnance used were 4.2-inch and 4.5-inch rifled guns, 8-inch howitzers, and 8-inch and 10-inch mortars. At the siege of Yorktown, where unusual facilities of water-transportation greatly favored their use, 100-pounder and 200-pounder rifle guns and 10-inch and 12-inch sea-coast mortars were put in battery. For guns of position in permanent field-works and fortified intrenched lines, such as the defences of Washington, 24 and 32-pounders of the sea-coast smooth-bore system were extensively employed, these guns having been found on hand at the Washington Arsenal.

The whole number of field-guns which were equipped and took the field with the various armies of the U. S. during the civil war was about 1500, and they were transported or accompanied by 40,000 horses, and served by about 48,000 men.

The number of guns of position in use in the various field-works or intrenched lines during the same war was about 1200, and they were served by about 22,000 men. In the defences of Washington alone the number of implacements for cannon were 1500, and there were actually mounted and in position 807 guns and 98 mortars, which were served by 18,500 men. These defences, thrown up by the engineers under the direction of General Barnard, were the most extensive known in history, exceeding even the famous lines of Torres Vedras designed by Wellington for the defence of the British army in Spain. They were 37 miles in circuit, consisted of 68 separate forts (whose aggregate perimeter was 13 miles) and 93 batteries, the whole connected by 20 miles of rifle-trenches. More than 30 miles of road practicable for artillery were constructed concentric with the interior of this extensive line. The armament of these defences was served by 18,500 skilled artillerymen, for whose organization, instruction, and progress especial care was taken by the writer when chief of artillery. Every foot of the approaches to these works was cleared of obstructions, and was directed in orders to be so carefully scrutinized and studied by the artillerymen of the various forts that the elevation of the guns and the length of fuse for the hollow projectiles were ascertained by actual experiment for every part of them. There were no finer and better instructed troops in the world than the heavy artillery regiments which garrisoned the defences of Washington during the year 1863 and a portion of the years 1862 and 1864.

The personnel of the field artillery of the armies of the U. S. during the great war alluded to was composed in great part of volunteers, but, though raw and uninstructed at first, such was the zeal and intelligence of officers and enlisted men that most of them finally became as well instructed, as rapid in their movements, as accurate in their fire, and as steady in their courage, as veteran regular troops. The horse-artillery portion of the field artillery was, with only three exceptions, composed entirely of batteries of the regular army. They were of course attached to the cavalry, opened and maintained the action for them in regular fields of battle, accompanied that body even on those rapid and sometimes remote "cavalry raids" upon the enemy's communications and completely around his rear which constituted so extraordinary a feature in the late civil war. The services of this body of artillery could not possibly be excelled in brilliancy and *élan*.

The *troops* of the artillery in the regular army of the U. S. are at present (1873) organized in regiments, the details of which are as follows: Five regiments, each consisting of 1 colonel, 1 lieutenant-colonel, 3 majors, 1 adjutant, 1 quartermaster, 1 sergeant-major, 1 quartermaster-sergeant, 2 principal musicians, and 12 batteries. Each battery consists of 1 captain, 2 first lieutenants, 2 second lieutenants, and 150 enlisted men (sergeants, corporals, artificers, musicians, and privates). In time of peace the President is authorized to reduce the battery organization to 1 captain, 1 first lieutenant, 1 second lieutenant, and 60 privates. The law requires that one battery in each regiment *shall be* "mounted"—*i. e.* equipped with guns, horses, etc.—and gives the President discretion to mount as many of the others as the exigency of the public service may seem to him to demand. For the purpose of diffusing throughout the regiment instruction in light artillery the orders of the war department require that each lieutenant shall serve a tour of two years in the mounted battery. When not thus mounted the remaining batteries of artillery serve as heavy or garrison artillery in the sea-coast fortifications.

The personal armament of an artilleryman of the mounted batteries, whether field or siege, is a pistol and sabre for the sergeants, trumpeters, and drivers, and a sabre only for each cannoneer. The personal armament of the artilleryman of the heavy or garrison batteries, which serve in the sea-coast fortifications, is the rifle-musket and other equipment of the infantry soldier.

The organization, as regards matériel, of a mounted battery of the U. S. field artillery, when on a war-footing, is 6 guns, 6 caissons, 1 battery-wagon, 1 travelling forge, and 112 horses; and when on a peace footing it is 6 guns, 6 caissons, and 80 horses, or sometimes 4 guns, 4 caissons, and 60 horses. Guns of different calibres or descriptions are never assembled in the same battery; and in times of war field-batteries are attached to divisions (sometimes to corps d'armée), and not to brigades. The equipment of ammunition of a field-battery for active service in war is 400 rounds per gun, of which 200 rounds are carried with each rifle-gun (3-inch) and its caisson, or 128 rounds with each 12-pound gun (smooth-bore) and its caisson; the remainder being carried in the ordinary army transport-wagon, but accompanying the battery and under the exclusive control of its captain.

The organization of a siege-battery in the U. S. service is 4 guns, 1 battery wagon, 1 travelling forge, and 60 horses. The amount of ammunition which accompanies the siege-battery is 250 rounds per gun, and it is transported in the ordinary army transport-wagon.

William F. Barry, *U. S. Army.*

Artillery, Schools of. Special schools for instruction in artillery have for many years been organized and maintained by the various nations of the civilized world as a component part of their military establishment. As early as A. D. 1515 such a school was organized by the Venetians. A few years later, Charles V. established a school of artillery in Spain, and another in Sicily. Towards the end of the next century (1675) a school for *practical* instruction in artillery was established by Louis XIV. of France at Douai, and a few years later instruction in the *theory* of the science was added to its course. About the same time an artillery school was organized in Saxony, and some years subsequently by the other nations of Germany. In Sweden, Austria, and Russia such schools were in existence before the close of the seventeenth century. About the middle of the eighteenth century the artillery school at Woolwich was established in England.

In some nations the school is a joint one for artillerists and engineers, but this is exceptional, the general rule being to keep the instruction of these two scientific corps separate and distinct. In the U. S. an artillery school for practice was established at Fort Monroe, Va., in 1823, and it continued in existence for about six years, and as a *practical* school solely, when the exigencies of the military service (due chiefly to Indian wars) caused its discontinuance. This school was commanded successively by Col. Fenwick and Lieut.-Col. Eustis. In May, 1858, a school for practical and theoretical instruction was organized at the same place, under the command of Lieut-Col. Harvey Brown, who in less than two years was succeeded by Lieut.-Col. Dimmick. This school languished after the first year and a half of its existence, and was finally brought to an end in 1861 by the great civil war. In Nov., 1867, an artillery school for theoretical as well as practical instruction was again established at Fort Monroe, and has since continued uninterruptedly up to the present date (1873). This school was organized under the command of Brevet Maj.-Gen. Barry, who still remains at the head of its direction.

The general course of instruction at all artillery schools is divided into the *practical* and *theoretical*. The theoretical comprises mathematics, military surveying, as much of physical science as is essential for the artilleryman, military engineering, military history, etc. etc.; and in the practical is included the drill and service of, and target practice with, all kinds of ordnance, the laying out and construction of batteries, and the duties of the artillery laboratory. In some schools of artillery the instruction only of the commissioned officers of that arm is the object, while in others instruction is extended to the non-commissioned officers and other enlisted men. In the artillery school of the U. S. army the instruction is theoretical and practical, and is designed for the benefit of enlisted men of all ranks, as

well as for commissioned officers. This school is commanded by a colonel of artillery, assisted by a lieutenant-colonel (who superintends the theoretical instruction) and a major (who superintends the practical instruction). The scholastic affairs of the institution are supervised by a staff composed of the commandant, the two other field-officers, and the ordnance-officer who commands the arsenal at Fort Monroe. The adjutant of the school is the secretary of the staff. Each of the five regiments of artillery in the army of the U. S. has one foot-battery and its captain stationed at the school. Upon each of these five captains are devolved the duties of instructor. From each regiment of artillery two first lieutenants and two second lieutenants are annually sent to the school for instruction. The course of instruction extends over one year, and is conducted on a similar plan to that at the Military Academy at West Point. There are two examinations in each year for the officers, and one for the enlisted men. The first, during the last week in August, is for the officers, and is in mathematics only; the second, commencing April 1, is for officers and enlisted men, continues about twenty days, and covers the entire ground of the theoretical and practical course of instruction. Those who pass the examination successfully are awarded an engraved certificate, signed by the members of the staff, setting forth that fact.

The practical instruction comprises the drill-service and mechanical manœuvres of, and ample target practice with, every kind of ordnance used in the military service of the U. S.; the laying of platforms; the laying out and construction of field-works or intrenched lines for artillery; the embarkation, disembarkation, and transportation of heavy ordnance, carriages, and artillery machines; the practical use of all known artillery machines; the estimation of distances and their determination by plane-table and portable telemeters; and the duties of the military laboratory as far as they concern the artillerist. The theoretical instruction includes mathematics, military surveying, astronomy, ordnance and gunnery, military history, the preparation and public delivery of written essays on military campaigns or biography, constitutional, international, and military law, and the theory and use of surveying, astronomical, and ballistic instruments and apparatus.

The school term commences on the 1st of May, annually. All reports from the school are made direct to the general of the army. Twenty lieutenants and from thirty to forty non-commissioned officers pass through the school annually.

WILLIAM F. BARRY, *U. S. Army.*

Artiodac'tyla [from the Gr. ἄρτιος, "entire," "even," and δάκτυλος, a "finger" or "toe"], the term applied to an order of hoofed Mammalia having toes in even number, as two or four, and having a subdivided or complex stomach, and a moderate-sized simple cæcum. To this order all those animals belong which are chiefly used for human food, and which have been domesticated from a period before the historical epoch.

Artocarpa'ceæ [from the Gr. ἄρτος, "bread," and καρπός, "fruit"], a natural order of exogenous plants, of which the *Artocar'pus inci'sa*, or bread-fruit, is the type; it is regarded by some botanists as a sub-order of Urticaceæ. This order comprises more than fifty species, nearly all natives of tropical countries. The milky juice of some yields CAOUTCHOUC (which see), and that of the cow tree (*Brosimum*) is a rich and wholesome food, like cow's milk. With these is associated the virulent poisonous upas tree (*Antiaris toxicaria*). The seeds of this order are all innocuous, and those of the *Musanga* of Western Africa are esculent. The fruit is often a *sorosis*, a single succulent fruit formed of the aggregated germens of a whole spike of flowers, as in the case of the bread-fruit.

Artois (anc. *Atreba'tes*), a former province of France, bordering on Flanders, is included in the department of Pas-de-Calais. The capital of Artois was Arras. Artesian wells derive their name from Artois (in Latin *Arte'sia*). Charles X. of France before his accession was styled count of Artois.

Arts, Degrees in. The term arts (in Latin *artes*) or liberal arts (*ar'tes libera'les*), as applied to certain studies, was derived from the ancient Romans; and as early as the ninth century was used in the schools of Paris, which probably received it from Martianus Capella, and on the establishment of universities the term "faculty of arts" denoted instructors in science and philosophy, as distinguished from the faculties of theology, medicine, and law. The number of arts was seven: grammar, logic, rhetoric (the *Trivium*), music, arithmetic, geometry, and astronomy (the *Quadrivium*). The terms master and doctor were applied synonymously to persons teaching by authority from the universities. In process of time the first was restricted to the liberal arts, the other to divinity, law, and medicine. Music, however, had its doctorate, as well as philosophy and letters. When regulations were established to prevent unqualified persons from teaching, and an initiatory discipline was prescribed, these terms were called *gradus*, "steps" or "degrees." The passing of the initiatory stage, first instituted by Gregory IX. (1227–41), conferred the title of bachelor, and an additional course was necessary to obtaining that of master. Later, the doctorate became, in some countries, the third or highest degree. The titles of master and doctor implied the duty of publicly teaching some of the branches included in the "arts"—a custom still retained, to some extent, in the German universities, but in other countries the titles are simply honorary, or at most indicate the passage of certain examinations. The doctorate in medicine, and in some countries that of law, are exceptions to this rule. (See DOCTOR.)

Art-Union [Ger. *Kunst'verein*], an institution for the promotion of a liberal patronage of the fine arts; a society formed to encourage the fine arts by the purchase of pictures with a common fund raised by subscription. The works they purchase are sometimes distributed by lot or lottery. Art-unions originated in France about 1812, and were introduced in 1823 into Germany, where they produced probably greater results than in any other country. The Düsseldorf Art-Union, formed in 1829, has given a powerful impulse to the fine arts, and has promoted the execution of monumental works of art of the highest class. In the course of twenty years it expended on works of art 268,000 thalers. These institutions were introduced into Great Britain in 1834, the first being formed in Edinburgh. The London Art-Union was organized in 1837, and was very successful. The oldest of these societies in the U. S. was the American Art-Union, founded at New York in 1839. It had, in 1849, 18,960 members, and an income of about $96,000. This society was discontinued because the lottery business was illegal in that State. It is usual to give an engraving to each of those who draw blanks in the lottery.

A'rum [Lat. *a'rum*; Gr. ἄρον], a genus of endogenous herbaceous plants of the order ARACEÆ (which see). This genus has a convolute spathe, the spadix naked at the point. In some of its species a stench like that of carrion is produced during flowering, and in some a remarkable degree of heat. The flower of *Arum cordifolium* has a temperature of 121° F. when the air is only 66°. The *Arum maculatum* (wake-robin) is a native of England, has arrow-shaped leaves, often spotted, and a tuberous, poisonous root, which is a drastic cathartic too violent to be taken in a fresh state. A nourishing farina called Portland arrow-root is prepared from the root after the acrid juice is removed. The *Arum Indicum* is cultivated in Bengal for its stems and tubers, which are eatable. The *Arum triphyllum* of Linnæus (which recent botanists call *Arisæma triphyllum*), or Indian turnip, is a native of the U. S. The tubers of this plant have medicinal properties like those of *Arum maculatum*, and yield a pure white starch.

Ar'un, a river of England, in the county of Sussex, enters the English Channel at Little Hampton, after a course of 35 miles. It is connected by a canal with the Wey.

Ar'undel, a small market-town of England, in Sussex, on the Arun, 5 miles from the sea and 50 miles S. S. W. of London. It is on the south side of the South Downs. Here, on the summit of a hill, is a magnificent castle which was built soon after the Norman Conquest, and is the residence of the dukes of Norfolk. Arundel returns one member to Parliament. Pop. in 1871, 2956.

Ar'undel (or **Arunde'lian**) **Mar'bles,** a collection of ancient Greek sculptures purchased in Smyrna and elsewhere, chiefly by Sir William Petty, for Thomas, earl of Arundel. They were sent to England in 1627, and presented in 1667 to the University of Oxford by his grandson, Henry Howard, afterwards duke of Norfolk. They consist principally of fragments of the "Parian Chronicle," supposed to have been executed in the island of Paros about 263 B. C. This Chronicle, inscribed on marble, contained (when perfect) a table of the principal events in Grecian history, from the times of Cecrops (1582 B. C.) to the archonship of Diognetus, 264 B. C. The inscription for the last ninety years is lost.

Arus'pices, or **Harus'pices** [probably from *haru* (= *hira*, "entrails"), and *specio*, to "see" or "examine"], were Roman soothsayers, who foretold future events from the inspection of the entrails of the victims offered at the altars of the gods. Their art, as perhaps that of the augurs, was brought from Etruria.

Ar'va, a county of Hungary, is bounded on the N. and E. by Galicia, on the S. by Liptau, and on the W. by Trencsin and Galicia. Area, 802 square miles. It consists entirely of a high mountain-valley, sterile, but beautiful in its grandeur. The chief article of export is lumber. Pop. in 1869, 82,364.

Arvic'ola [from the Lat. *ar'vum*, a "field," and *co'lo*, to "inhabit"], a genus of small animals of the order Rodentia, allied to the rat and mouse. They are distinguished by the prismatic form and fangless structure of the molar teeth. The *Arvicola agrestis* (field campagnol) and the *Arvicola riparia* (bank campagnol) are natives of England. The U. S. have more than twenty species, called field-mice.

Arvieux, d' (Laurent), Chevalier, a French traveller and Orientalist, born at Marseilles in 1635. He negotiated a treaty with the dey of Tunis in 1668, and was consul at Aleppo from 1679 to 1686. He wrote a "Treatise on the Manners and Customs of the Arabs" (1717). From his papers Labat compiled "Memoirs of Chevalier d'Arvieux, containing his travels in Asia" (6 vols., 1735). His works are commended by Niebuhr. Died in 1702.

Arx (gen. **Ar'cis**), a Latin name given to the citadel of an ancient city. The arx was a fortified eminence or rock, either within the walls or close to the city, and sometimes bore a particular name, as the Cadmea of Thebes, the Acrocorinthus of Corinth, the Acropolis or Cecropia of Athens. The arx of Rome was part of the Capitoline Hill.

A'rya, or **Ar'yan.** *Arya*, a Sanscrit word, signifying "respectable," "honorable," was applied to the Sanscrit-speaking people of India, whose ancestors came across the river Indus from Central Asia probably between 1600 and 2000 years before the Christian era. The three higher castes of the Hindoos are comprehended under the general term of Arya; the lowest of the four principal castes (the Sudras) belonging to the races whom the Aryas had conquered. *Arya* is supposed to have originally signified "agriculturist," at a time when the most respectable portion of the people of that part of Asia were engaged in cultivating the earth, raising herds of cattle, flocks of sheep, etc., whence it came to signify "respectable." The Aryas were of the same race as the ancient Persians, and it is said that even so late as the reign of Darius Hystaspes the Persians could converse with the light-complexioned Hindoos without the aid of an interpreter. Prof. Bopp of Berlin, in his "Comparative Grammar," has shown that many of the languages of Europe are closely related to the Sanscrit; or, to adopt the words of the late Prof. Wilson of Oxford, "He may be considered to have established, beyond reasonable question, a near relationship between the languages of nations separated by the intervention of centuries and the distance of half the globe, by differences of physical formation and social institutions—between the forms of speech current among the dark-complexioned natives of India and the fair-skinned races of ancient and modern Europe; a relationship of which no suspicion existed fifty years ago, and which has been satisfactorily established only within a recent period." (See Preface to the translation of Bopp's "Comparative Grammar," London, 1845.) All those nations whose relationship has been proved "beyond reasonable question" by a careful comparison of their languages, are designated as the Indo-European (or, less correctly, the Indo-Germanic) family of nations. Their ancestors, we have every reason to believe on purely scientific grounds, were originally one people, and therefore Aryan, as a convenient general term to denote the race, has been applied not merely to the ancestors of the modern Hindoos, and to their nearest of kin, the ancient Persians, but to the whole of this extensive family, whose forefathers, there is reason to believe, once inhabited Central Asia, whence they migrated in search of fresh pastures and more room, some going south-eastward to India, some northward or north-westward to Russia, and others westward to Asia Minor, thence to Southern and Central Europe. (See Max Müller's "Science of Language," 1st series; Farrar's "Families of Speech.")

J. Thomas.

Ar'zachel, a Jewish astronomer, who was born in Spain, and lived about 1050–1100. He ascertained the obliquity of the ecliptic, and prepared astronomical tables, called "Toledo Tables."

As (gen. **As'sis**), a Roman weight, also called **Libra,** was nearly equal to the modern pound. It was divided into twelve unciæ, "ounces," and was equal to 10 ounces 18 pennyweights 13$\frac{5}{8}$ grains Troy. *As* was also the name of a brass Roman coin which originally weighed a pound, but in consequence of the increase of the value of metal compared with that of food and other commodities, it was gradually reduced to half an ounce. During the second Punic war the value of the *as* was about two farthings, but its weight and prices in Rome were so variable that its value cannot be accurately fixed. (See Sestertius.)

A'sa Dul'cis (*i. e.* "sweet asa"), a drug highly prized by the ancients as an antispasmodic and diuretic. It was worth its weight in gold, and was obtained from a plant of the genus *Thapsia*, a native of Barbary and Southern Europe.

Asafœtida. See Assafœtida.

Asagræ'a (named in honor of Asa Gray, the botanist), a Mexican plant which has bulbous stems, linear, grass-like leaves, and spikes of whitish flowers. The *Asagræa officinalis*, which is said to be the only species of this genus, produces the cebadilla-seeds from which the poison veratria is prepared.

Asan'der [Gr. Ἀσανδρος], a Macedonian general, a brother of Parmenio, was appointed governor of Lydia by Alexander the Great in 334 B. C. After the death of that king he was satrap of Caria, an ally of Ptolemy, and an enemy of Antigonus, against whom he waged war about 314 B. C.

Asarabac'ca (*As'arum Europæ'um*), an herbaceous plant of the natural order Aristolochiaceæ, having kidney-shaped leaves, is a native of Europe. The roots and leaves are stimulant, purgative, and emetic, and contain a bitter principle or crystalline substance called *asarin*.

As'arum [Gr. ἄσαρον], a genus of herbaceous plants of the natural order Aristolochiaceæ, is distinguished by 12-horned stamens, distinct from each other and from the style, and by a bell-shaped, 3-lobed perianth. The *Asarum Canadense*, a native of North America, called wild ginger, is a stimulant and diaphoretic. Two other species grow in the Atlantic States.

As'ben, called also **A'ir,** a country of Central Africa, situated between about 15° and 20° N. lat., and 6° and 11° E. lon., borders on the Desert of Sahara. It includes a large tract of desert, and some fertile land which produces dates. The climate is hot and dry. Capital, Agades.

Asbes'tos, or **Asbestus** [from the Gr. ἄσβεστος, "indestructible"], a fibrous mineral composed of fine, flexible, and easily separable filaments of a silky lustre. It is a variety of actinolite and tremolite, and consists chiefly of silica, magnesia, and lime, or pyroxene. The fibres of a very silky variety of asbestos are called amianthus. Asbestos may be woven into cloth which is incombustible, and if soiled may be cleansed by fire. The ancients wrapped the bodies of the dead in such cloth, in order that when they were burned on the funeral pyre their ashes might be kept separate. It was also used for the wicks of the lamps in the temples. Mountain cork and mountain leather are varieties of asbestos. It is now employed as a material for roofing, boiler-felting, night-lamp wicks, steam-packing, and paper-stock. Asbestos is abundant in Corsica, Savoy, the Valtelline—the best coming from the last-mentioned region—and the Tyrol.

Asbjörnsen. See Appendix.

As'boline, a nitrogenous substance to be found in soot.

As'both (Alexander Sandor), a Hungarian officer, born Dec. 18, 1811, fought in the revolution of 1848, and in 1851 visited the U. S. He entered the Union army on the breaking out of the war in 1861, distinguished himself in various engagements, and was made a major-general in 1864. He was minister to the Argentine Republic in 1866, and died at Buenos Ayres Jan. 21, 1868, from the effects of wounds received in battle.

As'bury (Francis), born at Handsworth, Staffordshire, England, Aug. 20, 1745, of Methodist parents, was converted at the age of thirteen, became a local preacher at sixteen, an itinerant under Wesley at twenty-two, came to America in 1771 as missionary; in 1772 became Wesley's "general assistant" in America. During the Revolutionary war, though extremely prudent, he was the object of much annoying suspicion from the fact that he had scruples against taking the oath of allegiance. In 1784 he was elected bishop of the new Methodist Episcopal Church, and was consecrated by Bishop Coke. His labors and success in establishing his Church (chiefly in fields where churches were almost unknown) are among the most remarkable of which history bears record. Died in Spottsylvania, Va., Mar. 21, 1816.

As'calon (Ἀσκάλων of the Greeks), called *Ash'kelon* in the Bible, one of the five capital cities of the Philistines, a former seaport of Palestine, 14 miles N. of Gaza, 12 S. by W. of Ashdod or Azotus, and 42 W. S. W. of Jerusalem. It was anciently a place of much importance, and was especially so in the time of the Crusades, when its small and insecure harbor was filled with stones by the sultan Bibars, A. D. 1270. It is now a small village called *Asculan*, and has extensive ruins.

As'caris [Gr. ἀσκαρίς], (plu. **Ascar'ides**), a genus of intestinal parasites, of which the most common is the round-worm, *Ascaris lumbricoides*, found in the intestines of man. Children frequently have them, principally in the small intestines. The body of this worm is round, elastic, with a smooth surface, of a whitish or yellowish color; it

tapers especially towards the anterior extremity, which commences abruptly by three tubercles which surround the mouth. The body is transversely furrowed with numerous fine lines, and marked also with four lines from head to tail. In the female there is usually a constriction of the body at the distance of about one-third of its length from the mouth. Sometimes, especially in young and weakly children, their accumulation may cause serious disturbance; even convulsions may be thus produced. There are no symptoms (apart from the passage of the worms from the bowels) invariably connected with their presence. Itching of the nose, capricious appetite, swelling of the abdomen, and grinding the teeth when asleep, may all occur, but they may also be produced by other causes. *Ascaris vermicularis* is the small white thread-worm or seat-worm, which, although called *ἀσκαρίς* by Hippocrates, is by most recent writers called *Oxyuris vermicularis*. Its length is from two-twelfths to five-twelfths of an inch, the female being larger than the male. The head is blunt, widening on each side; the body tapers (at least in the female) to a point. Seat-worms, by the itching they produce, often distress children very much; they are less freqently met with in adults. (For *treatment* of worms, see ANTHELMINTICS.)

Ascawa'na Lake, a beautiful sheet of water, 2 miles long and 1 mile wide, in Putnam Valley township, Putnam co., N. Y. It is a place of summer resort.

Ascen'sion, an island in the Atlantic Ocean, 800 miles N. W. of St. Helena, belongs to Great Britain. It is 10 miles long and 6 miles wide. It is volcanic and mountainous, one peak rising to the height of 2870 feet. It has a fort in lat. 7° 55′ 55″ S. and lon. 14° 25′ 5″ W. Turtles, vegetables, and birds' eggs are procured here. It was discovered in 1501. Capital, George Town. Pop. about 400.

Ascension, a parish in the S. E. part of Louisiana. Area, 420 square miles. It is intersected by the Mississippi River, and bounded on the N. by the Amite. The surface is an alluvial plain, partly subject to inundation; the soil is fertile, producing sugar, rice, cotton, and maize. Capital, Donaldsonville. Pop. 11,577.

Ascension [from the Lat. *ascen'sio*, an "ascent"]. In astronomy, the right ascension of a star is the arc of the equator intercepted between the first point of Aries and that point of the equator which comes to the meridian at the same instant with the star. Measured always from west to east, the right ascension of a star corresponds or is analogous to the longitude of a place on the earth. The most convenient mode of designating the position of a star is to refer it to the equator, and to a certain fixed point in the equator. The point chosen for this purpose is the vernal equinox or first point of Aries, from which the degrees are reckoned eastward all round the circle. The right ascension and the declination are thus the two co-ordinates by means of which the place of any star is determined. The right ascension is ascertained by a sidereal clock, and is reckoned or expressed in time. For example: if a star come to the meridan five hours after the first point of Aries passes the meridian, then five hours is the star's right ascension in time, which is equivalent to seventy-five degrees, because one hour corresponds to 15° in space. *Ascensional difference* is the difference between the oblique and the right ascension of a celestial object. On account of almost all astronomical elements being now computed from observations of right ascension and declination, instead of oblique ascensions and ascensional differences, this term is at present but little used.

Ascension Day, or **Holy Thursday,** one of the great religious festivals of the Roman Catholic and Episcopal churches, is held on the fortieth day after Easter, to commemorate the ascension of Christ into heaven. Ascension Day has been observed at least since 68 A. D., and perhaps earlier. Saint Augustine believed it to have been instituted either by the apostles themselves or the bishops immediately succeeding them.

Ascet'icism [from the Gr. *ἀσκέω*, to "exercise," to "discipline"], a term applied to a voluntary retirement from the world and the practice of acts tending to mortify the body; so called from the rigid discipline to which the devotee subjects himself, the object of the ascetic being to advance the spiritual interests of himself or others. Asceticism was practised among Jewish and pagan nations long before the time of Christ, especially in India. The Essenes in Judæa and the Therapeutæ in Egypt were bodies of Jewish ascetics. At the present day, asceticism is most prevalent among Brahmans, Booddhists, and Christians of the Armenian, Coptic, Greek, and Roman Catholic churches. Early in the second century zealous members of the Christian Church devoted themselves to lives of poverty, celibacy, and abstinence from all sensual gratification. Some of these remained among men, others dwelt apart as hermits. The union of numbers of hermits into one body was first made by Pachomius, 340 A. D. This was the virtual origin of MONASTICISM (which see).

Ascet'ics [for etymology see preceding article], a name commonly given to those who in the early ages of Christianity devoted themselves to a solitary and contemplative life, practising great austerities, with a view to mortify the flesh and withdraw the mind from worldly objects; also applied to those persons in India and other countries who lead a life of ASCETICISM (which see). The ascetics of India are especially celebrated on account of the severe and even terrible austerities which they practise. One man will stand all day in one position exposed to the rays of a burning sun; another will hold his hands clenched till his fingernails grow through them.

Asch, a town of Austria, in Bohemia, 100 miles W. of Prague. It has factories of linen, calico, paper, hosiery, and leather goods, and many dyeing establishments and breweries. Pop. in 1869, 9405.

Aschaf'fenburg, a town of Bavaria, in the circle of Lower Franconia, on the right bank of the Main, 24 miles by rail E. S. E. of Frankfort. It has a royal castle, a Gothic church, a library of about 22,000 volumes, a hospital, a gymnasium; also manufactures of woollen goods, paper, straw goods, etc. It belonged to the elector of Mentz for many centuries, and was ceded to Bavaria in 1814. A victory of the Prussians over the Austrians was gained here July 14, 1866. Pop. in 1871, 9212.

As'cham (ROGER), an eminent English scholar and writer, born in Yorkshire in 1515. He graduated at St. John's College, Cambridge, in 1534, and distinguished himself as a classical scholar. In 1544 he published a work in defence of archery, entitled "Toxophilus," which is remarkable as a specimen of pure English style. He was appointed in 1548 tutor to the princess Elizabeth, whom he instructed in Greek and Latin, but he resigned that position in 1550. Soon after this event he was sent as secretary of embassy to the court of the emperor Charles V., and passed three years in Germany. Although he was a Protestant, he was appointed Latin secretary to Queen Mary in 1553, and after her death (in 1558) he was retained at court in the double capacity of secretary and tutor to Queen Elizabeth, who again took lessons in Greek and Latin. He remained at her court until his death, Dec. 30, 1588, having by his prudence or good fortune passed through very perilous times without persecution or dishonorable temporizing. His chief work, "The Schole-Master" (1571), contains excellent advice on the subject of learning Latin. (See DR. JOHNSON'S "Life of R. Ascham," prefixed to his works, 1767; GRANT, "De Vita Rogeri Ascham.")

Asch'bach (JOSEPH), a German historian, born at Höchst, near Frankfort-on-the-Main, in 1801. He obtained a chair of history at Bonn about 1842, and in 1853 at Vienna. His most important works are a "History of the Emperor Sigismund" (3 vols., 1838–45); "Allgemeines Kirchenlexicon" (4 vols., 1846–50), and "Roswitha und Conrad Celtes" (1867). He also wrote a "History of the Visigoths" (1827) and a "History of the Omeyyades in Spain" (2 vols., 1829–30).

Asch'ersle'ben, a town of Prussia, in the province of Saxony, is on the river Eine, 18 miles W. S. W. of Magdeburg. It has about seven churches, one synagogue, and a gymnasium, and is surrounded by a strong wall. Here are manufactures of flannel, frieze, linens, pottery, and brandy. Pop. in 1871, 16,734.

As'cians, or **As'cii** [from the Greek *a*, priv., and *σκία*, a "shade" or "shadow"], literally, "without shadow." A term applied to the people of the torrid zone, who have twice in the year the sun perpendicular above their heads, and hence are without shadow.

Ascid'ia, or **Ascid'ians** [from the Gr. *ἀσκίδιον* (dimin. of *ἀσκός*), a "leathern bottle"], a group of molluscoids of the class Tunicata. They have no shell, but are enclosed in an elastic tunic with two orifices, and resemble a bottle or jar. Within the external tunic is a muscular membrane, regarded as corresponding to the mantle of the other Mollusca. The greater part of the cavity of the mantle forms a branchial sac, the folded lining of which constitutes the gills (branchiæ). The movements of numerous cilia around the mouth bring into it a current of sea-water, which passes out at the vent or anal orifice. They have no eyes or other organs of special sense, but they have hearts and a circulation of blood, with the remarkable peculiarity that its direction is sometimes reversed. In their mature state they are fixed by the base to some solid substance, as a rock or seaweed, but the young, resembling tadpoles in form, swim by means of a vibratile tail, which disappears when they settle. The group is divisible into solitary or simple (Ascidiadæ) and compound ascidians (of several families), members of which are connected by a tubular stem, and to some extent

have a common circulation of blood, though each has its own heart, respiratory apparatus, and digestive organs. In other kinds, more strictly called compound ascidians, the tunics of many are united into a mass, and they form systems like zoophytes. The individuals in these systems have always sprung by gemmation from one, and both the solitary and compound ascidians propagate by eggs. "In the dim obscurity of the past," says Darwin, "we can see that the early progenitor of all the Vertebrata must have been an aquatic animal provided with branchiæ, with the two sexes united in the same individual, and with the most important organs of the body (such as the brain and heart) imperfectly developed. This animal seems to have been more like the larvæ of our existing marine ascidians than any other known form." (See "Descent of Man," vol. ii., p. 372.)

Ascid'ium [from the Gr. *ἀσκίδιον* (dimin. of *ἀσκός*), a "small leathern bag or bottle"], a hollow, pitcher-shaped body which occurs on the stems of certain plants, as *Nepenthes* and *Sarracenia*. It usually contains water, and is sometimes furnished with reflexed hairs, which prevent the escape of insects that fall into it. (See NEPENTHES.) *Ascidium* is also a genus of simple tunicaries, which gives name to the family Ascidiadæ and the whole group of ascidians.

Asci'tes [from the Gr. *ἀσκός*, a "skin," a leathern bag for water, alluding to the shape of the patient's abdomen], dropsy of the abdominal cavity, is most frequently an indication of portal obstruction, caused by "cirrhosis" or other disease of the liver, which hinders the return of venous blood to the heart and causes pressure in the veins, leading to transudation of serum into the peritoneal (abdominal) cavity. In other cases it is a symptom of general dropsy; or it may result from cancer or tubercle of the peritoneum; or, in children especially, it may appear as a temporary and quite inexplicable phenomenon, without serious danger or distress. Ascites must be regarded in almost all cases as a very grave symptom of disease, yet there are not a few cases where the immediate danger passes away, and the patient becomes, for the time, comfortable; but such results are temporary and unfrequent. The treatment is palliative. Diuretics may be useful, but hydragogue cathartics are much more effective in relieving the symptom. Tapping may be practised where the dropsy very seriously distends the abdomen. The diagnosis between ascites and ovarian dropsy is sometimes very difficult. The distinctive marks can be appreciated only by the skilled physician.

Asclepiada'ceæ [so named from *Ascle'pias*, one of its genera], a natural order of exogenous plants, which often have twining stems, and almost always have a milky juice. The leaves are entire; the flowers are monopetalous and regular, but peculiar in their structure. The corolla is divided into five lobes; the filaments of the five stamens are usually united so as to form a tube, which is generally furnished with a crown or coronet of hood-shaped appendages. The fruit consists of two follicles, with many seeds terminating in long down or silky fibres. This order comprises about 1000 species, mostly natives of warm climates. Many of them are used in medicine, and others are cultivated for their beautiful flowers, as the *Stephan'otis floribun'da* and the *Hoya carnosa*, a hothouse climber, to each flower of which a drop of honey is always suspended. The type of the order is the *Asclepias*, several species of which are natives of the U. S. Among the medicinal plants of this order are *Calot'ropis gigante'a*, or mudar, *Tyloph'ora asthmat'ica* of India, and *Vincetoxicum officinale*. Useful fibres are obtained from the stems of several species of *Calotropis*, from *Orthanthera viminea*, and *Ho'ya viridiflo'ra*.

Asclepi'adæ [Gr. Ἀσκληπιάδαι]. This term was first applied, among the ancient Greeks, to those who were reputed to be the descendants of Æsculapius, the god of medicine; afterwards, to those who were trained in his temples (Asclepions) in the science and art of healing. Aristotle, though not a physician, was one of the family of the Asclepiadæ. Young men designed for the medical vocation, if sons of physicians, began their studies before their twentieth year; others, after a preparatory education lasting from the seventeenth to the twentieth year; in both, the special medical training probably did not end before their twenty-fifth year. Much secresy and exclusiveness were observed in their initiation: and after the first ordeal of preparation had been passed, at the commencement of the ceremonies of illumination, the HIPPOCRATIC OATH (which see) was administered to the candidate. At the close of the period of training came the ceremony of coronation, by which the young Asclepiadæ were fully introduced into the profession of medicine. (See WATSON, "Medical Profession in Ancient Times," New York, 1856.)

Asclepiade'an, or Ascle'piad [from Asclepiades, a poet who invented this metre], the name of a metre in ancient poetry consisting of four feet, a spondee, a choriamb, and two dactyls (or, according to some, two choriambs and an iambus). The first ode of Horace furnishes an example:

"Mæcēnās ātāvīs ēdītĕ rēgĭbŭs."

Asclepi'ades [Gr. Ἀσκληπιάδης], a celebrated Greek physician, born at Prusa, in Bithynia, flourished about 100–80 B. C. He practised at Rome, where he founded a school, and was very popular with the Romans on account of his pleasant and simple remedies. His maxim was, that a physician ought to cure his patients safely, speedily, and agreeably. He relied much on diet, bathing, and exercise or gestation. He wrote several works, of which only small fragments are extant. (See GUMPERT, "Asclepiadis Bithyni Fragmenta," 1798; BIANCHINI, "La Medicina d'Asclepiade," 1769.)

Ascle'pias [named, on account of its medicinal virtues, from Ἀσκληπιός, the Greek name of Æsculapius, the god of medicine], a genus of perennial herbaceous plants, the type of the order Asclepiadaceæ, mostly natives of the U. S. The corolla is wheel-shaped and reflexed, the crown or coronet is fleshy, and each of its hooded appendages has an incurved horn. The *Asclepias Cornuti* (milk-weed or silk-weed), formerly called *Asclepias Syriaca*, is an American plant, abounding in an acrid milky juice, which contains caoutchouc. The seed-vessels are filled with a silky down, which is sometimes used for stuffing pillows. The fibre of the stem is said to be valuable for ropes. The *Asclepias tuberosa*, sometimes called pleurisy-root, has handsome flowers. Its root is used as an expectorant and diaphoretic. Many other species of *Asclepias* grow in the U. S.

As'coli di Satria'no, an episcopal city of Italy, in the province of Foggia, 25 miles by rail S. E. of Foggia, on the eastern slope of the Apennines. Near it, Pyrrhus, in 279 B. C., won a great victory over the Romans, and in 1246 A. D. an imperial army crushed the Apulian insurgents led by Cardinal Rainer. Pop. in 1861, 5869.

As'coli-Pice'no, a province of Central Italy, is bounded on the N. by Macerata, on the E. by the Adriatic Sea, on the S. by Teramo, and on the W. by Perugia. Area, 808 square miles. The province consists chiefly of mountain-ridges running parallel to each other, the portion on the coast being of superior beauty. Chief town, Ascoli-Piceno. Pop. in 1871, 203,009.

Ascoli-Piceno (anc. *Asculum Picenum*), an old episcopal city of Central Italy, in the province of the same name, is situated on a hill and on the river Tronto, 53 miles S. of Ancona. It commands a fine view of the Apennines, a few miles distant. It is well built, and has a cathedral, a museum, a theatre, a library, and many private palaces. It was annexed to the Papal States in 1426. A battle was fought here between Tancred of Sicily and the emperor Henry VI. of Germany, in which the latter was defeated (1190). Pop. in 1871, 22,937.

Asco'nius Pedia'nus (QUINTUS), a Roman critic and commentator, was born probably at Padua, and lived about 50 A. D. He taught at Rome, and is said to have been the master of Quintilian. Among his works were valuable commentaries on Cicero's "Orations." Poggio Bracciolini found in 1416 at St. Gall commentaries on seven orations—viz., "In Verrem," "In Divinationem," "Pro Cornelio," "In Toga Candida," "In Pisonem." "Pro Scauro," and "Pro Milone." He wrote a Life of Sallust, which is not extant. He died, aged eighty-five, in the reign of Domitian.

Ascut'ney Moun'tain, an isolated mass of granite in Windsor co., Vt., 3300 feet above the level of the sea. Its summit affords an extensive and beautiful view of the valley of the Connecticut River.

Asel'li [Lat. *Asel'lius*], (GASPARO), an Italian anatomist and physician, born at Cremona about 1580. He became professor of anatomy at Pavía, and acquired distinction by the important discovery of the lacteal vessels in 1622. He wrote on this subject a treatise entitled "De Lactibus sive Lacteis Venis" (1627). Died in 1626.

Asfeld, d' (CLAUDE FRANÇOIS BIDAL), MARQUIS, an able French general, born in 1667. He served with distinction in Spain, and commanded the French cavalry at Almanza in 1707. He was second in command under Villars in Italy in 1733, was commander-in-chief in Germany in 1734, and became a marshal of France in that year. Died Mar. 7, 1743.

As'gill (Sir CHARLES), a British general, born in 1762. He served against the U. S., and having been captured at Yorktown, was selected by lot from the prisoners to be hung in retaliation for the death of an American officer, but he was saved by the intercession of the French court. Died in 1823.

Ash (*Frax'inus*), an important genus of trees belonging to the family Oleaceæ, distinguished by imperfect flowers, sometimes destitute of corolla, and leaves unequally pinnate. The fruit is a *samara*, a winged pericarp. It comprises about fifty species, mostly natives of Europe and North America, and valuable for timber, for fuel, and shade trees. The *Fraxinus excelsior*, the common ash of England, is a beautiful ornamental tree, and the timber is much esteemed by carpenters, joiners, coachmakers, and wheelwrights. It grows to the height of 100 feet or more. Cultivation has produced several varieties of it, among which is the weeping ash, the branches of which droop nearly to the ground. The *Fraxinus Ornus*, or flowering ash, a native of Southern Europe, has more perfect flowers than the other species. A saccharine substance called manna is obtained from it by making incisions in the bark, and sometimes exudes spontaneously. Among the noblest trees of the genus is the *Fraxinus Americana*, or white ash, which is abundant in the Northern and Middle U. S. It leaflets are petiolate, ovate, or lance-oblong, entire, acuminate, and in autumn are changed to a dark brown or purple tint. The timber is tough, and valuable for the same purposes as the *Fraxinus excelsior*. In the forests of the U. S. occur also the *Fraxinus pubescens* (black or red ash) and *Fraxinus quadrangulata* (blue ash), and others. The black ash (*Fraxinus sambucifolia*) is used in basket-making. The mountain ash, conspicuous for its clusters of red berries, is a species of *Pyrus*, having no affinity with the genus *Fraxinus*.

Ash, a township of Monroe co., Mich. Pop. 1451.

Ash (Joseph P.), an American officer, born in Pennsylvania. On the outbreak of the civil war he entered the army as a lieutenant of volunteers, was appointed a second lieutenant in the Fifth U. S. Cavalry April 30, 1861, and a captain Sept., 1863. In the action near Warrenton, Va., he was wounded in six places before leaving the field; on recruiting service during convalescence. In the campaign of 1864 of the Army of the Potomac, while endeavoring to rally a wavering division of troops at the action of Tod's Tavern, he was killed May 8, 1864. (Brevet major and lieutenant-colonel U. S. A. for conspicuous gallantry.)

G. C. Simmons, *Clerk Board of Eng'rs.*

Ashan'tee, written also **Asiente,** an extensive kingdom of Western Africa, on the Gold Coast, Upper Guinea, is between lat. 5° and 9° 30′ N., and between lon. 0° 55′ E. and 4° 7′ W. It is bounded on the N. by the Kong Mountains, on the E. by Dahomey, on the S. by the Atlantic, and on the W. by Liberia. Area, about 75,000 square miles. It is generally mountainous, well watered and fertile, and covered with dense forests, which are almost impenetrable. The staple products are maize, rice, sugar, yams, tobacco, cocoanuts, gums, and dyewoods. Gold is said to be abundant here, and the chief articles of export are gold-dust, palm oil, and slaves. The people are warlike and fierce, and human sacrifices are common. They have some skill in the manufacture of sword-blades, cotton cloths, and golden ornaments. The government is a despotism. Capital, Coomassie (or Kumassi). The British, who have a fort on the coast at Cape Coast Castle, were involved in a war with the Ashantees, which began in 1807 and continued until 1825. The Dutch also had a colony on the coast until 1871, when they ceded it to the British.

In 1873 a war arose between the Ashantees and the British, because the British refused to pay the annual tribute to the king of Ashantee which the Dutch had formerly paid him. The Ashantees first attacked the Fantis, living under British protection, entirely defeated them, and subsequently succeeded in driving all the natives friendly to the British into the two forts Elmina and Cape Coast Castle. The British troops under Sir Garnet Wolseley then invaded Ashantee, and as it soon became evident that no treaty could be made and confided in, on account of the treacherousness of the Ashantees, the British pushed forward directly towards Coomassie; and after some fighting they took the capital and burned it. The king of Ashantee agreed to pay an indemnity to the British, and the war ceased.

Ash'away, a post-village of Hopkinton township, Washington co., R. I., has a national bank and important manufactures.

Ash'borough, a post-village, capital of Randolph co., N. C., is 78 miles N. W. of Fayetteville and 5 miles S. W. of Deep River. Pop. of village, 182; of township, 1172.

Ash'bourne, or **Ashburn,** a market-town of England, in Derbyshire, near the river Dove, 12 miles N. W. of Derby. It is on the S. slope of a high hill, and has a large church, built about 1240; also manufactures of cotton goods and lace. Pop. in 1871, 4945.

Ash'burnham, a post-village and township of Worcester co., Mass., 55 miles N. W. of Boston. It has one national bank, three churches, and manufactures of chairs, lumber, wooden ware, matches, and cotton goods. Ashburnham Dépôt is at the junction of the Cheshire and the Vermont and Massachusetts R. Rs. Pop. of township, 2172.

Ashburnham, a large village of Peterborough co., province of Ontario, Canada, on the Otonabee River, opposite Peterborough. It has extensive lumber-mills and considerable trade in grain.

Ashburnham, Earls of, and Viscounts St. Asaph (1730, in the peerage of Great Britain), barons of Ashburnham (1689, in the English peerage), a noble family of England.—Bertram Ashburnham, the fourth earl, was born Nov. 23, 1797, and succeeded his father in 1830.

Ash'burton (Alexander **Baring**), Lord, an English diplomatist, born in 1774, was a son of Sir Francis Baring, an eminent merchant. He was employed in his youth in mercantile affairs in the U. S., and married a daughter of Senator William Bingham of Pennsylvania. In 1810 he became the head of the firm of Baring Brothers & Co. of London, and in 1812 was chosen to represent Taunton in Parliament, in which he acted with the Liberal party until 1831, when he became a supporter of Sir Robert Peel and a moderate Conservative. He was returned to Parliament for North Essex in 1832, and was created Baron Ashburton in 1835. In 1842 he was sent as a special ambassador to the U. S. to settle a dispute which had long been pending in relation to the north-eastern boundary. He was selected for this mission because he was acquainted with the American people and institutions, and was inclined to a pacific policy. Lord Ashburton and Mr. Webster negotiated this important treaty, which was signed at Washington in Aug., 1842, and was called the Ashburton Treaty. Died in May, 1848. He left a son, William Bingham Baring, who inherited the title.

Ash'by, a post-village and township of Middlesex co., Mass. It has manufactures of lumber, tubs, etc. Pop. 994.

Ashby, a township of Rockingham co., Va. Pop. 2268.

Ashby, a township of Shenandoah co., Va. Pop. 2645.

Ashby (Turner), a Confederate general, born in Fauquier co., Va., about 1824. He was appointed a brigadier-general in 1862, and was greatly distinguished as a cavalry commander. During Banks's pursuit of Jackson in the Shenandoah Valley, Gen. Ashby was in command of cavalry covering the rear of Jackson's army, and in an engagement near Harrisonburg, June 5, 1862, he was shot through the body and killed. His loss was severely felt by the Confederates, he being one of their ablest and bravest cavalry leaders. G. C. Simmons, *Clerk Board of Eng'rs.*

Ashby-de-la-Zouche, a market-town of England, in Leicestershire, 20 miles by rail N. W. of Leicester. It has a ruined castle in which Mary queen of Scots was once confined, and an ancient church in which was the burying-place of the Hastings family. Here are iron smelting-works and manufactures of hats and hosiery. Coal-mines and salt-springs occur in the vicinity. Pop. in 1871, 9153.

Ash'dod, or **Azo'tus** (modern *Asdood* or *Esdûd*), an ancient city of the Philistines, in Palestine, about 3 miles from the Mediterranean and 12 miles N. E. of Ascalon. It was an important city and stronghold of the Philistines, who, after defeating the people of Israel in the time of Samuel, captured their ark and carried it to the temple of Dagon in Ashdod. It was dismantled by Uzziah, besieged by Psammetichus, and destroyed by the Maccabees. It is called *Azotus* in the New Testament (Acts viii. 40). Near its site is a village of mud houses, called *Asdood* or *Esdûd*, on the sea 21 miles S. of Jaffa.

Ashe, a county which forms the north-western extremity of North Carolina. Area, 325 square miles. It is drained by New River. This county is a mountainous tract between the Blue Ridge on the S. E. and Stone Mountain on the W. The soil in some parts is productive. Cattle, sheep, and grain are extensively raised. Excellent ores of copper abound. Capital, Jefferson. Pop. 9573.

Ashe (John), a general and patriot of the Revolution, born in England in 1721, emigrated to North Carolina in 1727. He took an active part in the political movements which preceded the Revolution, and served as a brigadier-general during the war. Died, a prisoner of war, Oct. 24, 1781.

Ashe (Samuel), a brother of John, mentioned above, was born in 1725. He became chief-justice of North Carolina in 1777, and governor of that State 1795–98. Died Feb. 3, 1813.

Ash'e, Ashi, or **As'ser** (Rab or Rav), a celebrated Jewish rabbi of Babylon, was born in 353 A. D. He was eminent for his learning and genius, and was the reputed author or compiler of the "Babylonian Talmud," a vast collection of traditions and legal documents, which was

regarded among the Jews as the highest authority on legal questions. Died in 427 A. D.

Ash'er, a tribe of ancient Israelites, descended from Asher, eighth son of Jacob by the handmaid Zilpah. They were assigned a portion of land in the N. W. of Palestine, but never dispossessed the Canaanites and Phœnicians who dwelt there. The tribe furnished but one noteworthy person, the prophetess Anna, who lived during the infancy of Christ (Luke ii. 36–38). The territorial boundaries and the history of this tribe are very obscure.

Ash'erville, a post-township of Mitchell co., Kan. Pop. 144.

Ash'es, the solid or earthy residuum left after the combustion of wood, coal, or other organic substances. The most important ingredient of the ashes of land-plants is potash, or a salt of potash with a portion of lime and silica. The potash is extracted from ashes by a process called lixiviation—leaching. By dissolving the salt contained in the ashes the water is converted into ley, which is afterwards evaporated by boiling. The insoluble part of the ashes remaining after lixiviation is called leached ashes, which is composed of carbonate of lime, phosphate of lime, oxide of iron, etc. The ashes of marine plants, and those that grow near the sea, contain soda instead of potash, with a small portion of iodine. The soda is also separated from the insoluble mass by lixiviation. Wood ashes are extensively used in the manufacture of soap, and are useful as manure. The salts obtained from them by lixiviation are called potash and pearl-ash, which latter is a carbonate of potassa. Bone ashes consist mostly of phosphate of lime, which is a valuable manure. (See Potash, Soda, and also Agricultural Chemistry, by Prof. S. W. Johnson, A. M.)

Ashes, Volcanic, pulverulent lava, thrown out by volcanoes, consisting of minute fragments of various minerals, as mica, felspar, magnetic iron ore, augite, olivine, etc.

Asheville, the capital of Buncombe co., N. C., is 1 mile E. of French Broad River, 255 miles W. of Raleigh, and is an important centre of trade. It has one female college, three academies, a foundry, machine-shops, three furniture-factories, six churches, and three weekly newspapers. Pop. 1400; of township, 2593. R. M. Furman, Ed. "Citizen."

Ash'field, a post-township of Franklin co., Mass. It has an academy, an insurance company, and a public library. It is a place of summer resort. Pop. 1180.

Ash'ford, a post-village and township of Windham co., Conn., 30 miles E. N. E. of Hartford. P. of township, 1241.

Ashford, a post-village and township of Cattaraugus co., N. Y., 35 miles S. E. of Buffalo. P. of township, 1801.

Ashford, a post-township of Fond du Lac co., Wis. Pop. 1799.

Ash Grove, a post-township of Iroquois co., Ill. Pop. 1146.

Ash'grove, a township of Shelby co., Ill. Pop. 1499.

Ash Hills, a township of Butler co., Mo. Pop. 491.

Ash'ippun, a post-township of Dodge co., Wis. Pop. 1623.

Ashkelon, or **Askelon.** See Ascalon.

Ash'kum, a post-township of Iroquois co., Ill. Pop. 1315.

Ash'land, a county of the N. E. central part of Ohio. Area, 390 square miles. It is drained by the Lake Fork and Black Fork, which unite to form the Mohican River. The surface is mostly undulating; the soil is very fertile, and adapted to wheat, grass, or fruit. Grain, wool, and live-stock are largely raised. The county is intersected by the Atlantic and Great Western and the Pittsburgh Fort Wayne and Chicago R. Rs. Capital, Ashland. Pop. 21,933.

Ashland, a county in the N. W. of Wisconsin. Area, 2150 square miles. It is bounded on the N. by Lake Superior, and includes a group of islands called the "Twelve Apostles," in that lake. It is drained by the head-streams of the Chippewa River. The surface is uneven or hilly, and partly covered by extensive forests. Great quantities of pine lumber are exported. Among the resources of this county is iron ore, which abounds in a ridge called the Iron Mountains. Capital, La Pointe. Pop. 221.

Ashland, a post-village, the capital of Clay co., Ala., 75 miles N. E. of Montgomery. It has one weekly newspaper, two schools, and abundant water-power. Pop. of the township, 1499. J. B. Stedham, Ed. "Times."

Ashland, a township of Lawrence co., Ark. Pop. 147.

Ashland, a township of Morgan co., Ind. Pop. 969.

Ashland, a post-village of Boyd co., Ky., on the Ohio River, 13 miles below Catlettsburg, and on the Lexington and Big Sandy R. R., running 20 miles into the interior to the celebrated coal-mines. It has two of the largest blast pig-iron furnaces on the Ohio River, and also one of the largest and most complete rolling-mills in the country. Iron ore, pig iron, and coal are shipped from this point. It has one national bank and one weekly paper. Pop. 1459.
F. R. French, Ed. "Ashland Journal."

Ashland, the residence of Henry Clay, the eminent orator and statesman, is situated in Fayette co., Ky., about 2 miles S. E. of Lexington. The estate of Ashland contained about 600 acres, of which 200 were appropriated to a beautiful park.

Ashland, a post-township of Middlesex co., Mass., at the junction of the Boston and Albany and Hopkinton R. Rs., 24 miles S. W. of Boston. It has one weekly paper. The chief business is the manufacture of boots and shoes, boxes and lasts, emery, and grain-grinding. Pop. 2186.
George P. Mayhew, Ed. "Advertiser."

Ashland, a post-twp. of Newaygo co., Mich. P. 770.

Ashland, a post-township of Dodge co., Minn. P. 611.

Ashland, a post-village, capital of Benton co., Miss., on the Tennessee line. It has one weekly paper.
Henry S. Falconer, Ed. "Argus."

Ashland, a post-village of Saunders co., Neb., is on Salt Creek, about 3 miles from its entrance into the Platte River, and on the Burlington and Missouri River R. R., 24 miles N. E. of Lincoln. Superior magnesian limestone is found here. It has two weekly newspapers and a national bank. Pop. 653.

Ashland, a post-township of Grafton co., N. H. It has important manufactures of paper, card-board, flannel, gloves, etc. It is on the Boston Concord and Montreal R. R. Pop. 885.

Ashland, a township of Chemung co., N. Y. Pop. 1016.

Ashland, a post-village and township of Greene co., N. Y. The township contains six churches, and has beautiful scenery, being partly occupied by spurs of the Catskill Mountains. Pop. 992.

Ashland, a handsome post-village with paved streets, capital of Ashland co., O., is on the Atlantic and Great Western Railway, 85 miles N. N. E. from Columbus and 65 S. W. from Cleveland. It has eight churches, two newspapers, two banks (one national); one mutual fire insurance company, chartered in 1851; two foundries, two machine-shops, a clover-thrasher-and-huller manufactory; an adjustable boot- and shoe-pattern factory, which sends goods to all parts of Europe; excellent schools, and three grain-elevators. Pop. 2601.
L. J. Sprengle, Ed. "Ashland Times."

Ashland, a post-village of Jackson co., Or.

Ashland, a township of Clarion co., Pa. Pop. 758.

Ashland, an important town in the Mahanoy Valley, the centre of the anthracite coal-fields of Schuylkill co., Pa., on the line of the Philadelphia and Reading R. R., 97 miles from Philadelphia, within 2 miles of the Lehigh Valley R. R., and 13 miles from Pottsville, the county-seat. Ashland is the second town in the county in point of population and business. It has one national and two State banks, two large machine-shops, foundries, etc. It is surrounded by a number of the largest coal operations in the region. It has one newspaper. Pop. 5714.
J. Irvin Steel, Pub. "Ashland Advocate."

Ashland, or **Ashland City,** a post-village, the capital of Cheatham co., Tenn., on the Cumberland River, 20 miles below Nashville. Pop. 121.

Ashland, a post-village of Hanover co., Va., on the Richmond and Fredericksburg R. R., 17 miles N. of Richmond. In May, 1864, General Sheridan, in the course of a raid, destroyed a dépôt here. It is the seat of Randolph-Macon College. Pop. of Ashland township, 3942.

Ash'lar, or **Ashler,** a building-stone squared and hewn; dressed stones used for facing work when it is worked in regular beds and joints. Tooled ashlars are slabs marked with parallel flutings or grooves. Other varieties are called polished ashlar and rustic ashlar, the latter of which has an uneven surface.

Ash'ley, a small river of South Carolina, rises in Colleton county, and, flowing south-eastward, unites with the Cooper River at Charleston.

Ashley, a county of Arkansas, bordering on Louisiana. Area, 870 square miles. It is bounded on the N. W. by the Saline, on the S. W. by the Washita River, and is intersected by Bayou Bartholomew, which is navigable. Coal, copper, and lead have been found. The surface is gently rolling, and the soil sandy but fertile. Corn and cotton are the chief crops. Capital, Hamburg. Pop. 8042.

Ashley, a township of Independence co., Ark. Pop. 702.

Ashley, a township of Pulaski co., Ark. Pop. 2110.

Ashley, a post-village of Washington co., Ill., on the Central R. R. where it is crossed by the St. Louis and Southeastern R. R., 60 miles E. S. E. of St. Louis. Pop. 1030.

Ashley, a post-township of Pike co., Miss. Pop. 1222.

Ashley, a post-village of Oxford township, Delaware co., O., on the Cleveland Columbus and Cincinnati R. R., 10 miles N. by E. of Delaware. Pop. 454.

Ashley (James M.), born in Pennsylvania Nov. 14, 1824, removed to Ohio in 1849, was a member of Congress from 1860 until 1868, when he became governor of Montana Territory.

Ashley, Lord. See Shaftesbury.

Ash'mole (Elias), F. R. S., born at Lichfield, England, May 23, 1617, was educated at Oxford, and served as gentleman of ordnance under King Charles I. in the civil wars. In 1646 he turned his attention to the study of judicial astrology and Rosicrucianism, and Oct. 16 of that year became a brother of the Free and Accepted Masons. He was Windsor Herald (1660–75), and married as his third wife a daughter of Sir William Dugdale, Garter principal king of arms. In 1659 the younger John Tradescant gave him his collection of curiosities, which Ashmole presented in 1683 to Oxford University. It was the basis of the present Ashmolean Museum. He wrote "Theatrum Chymicum" (1652), "The Way to Blisse" (1658), "History of the Order of the Garter" (1672), "History of Berkshire" (3 vols. folio, 1715), and a whimsical "Diary." Died May 18, 1692. "He was," says Anthony Wood, "the greatest virtuoso and curioso that ever was known in England. . . . He did worthily deserve the title of *Mercurio-philus Anglicus.*"

Ash'more, a post-village and township of Coles co., Ill., on the Indianapolis and St. Louis R. R., 94 miles E. S. E. of Springfield. Pop. of township, 2088.

Ash'mun (George) was born at Bradford, Mass., Dec. 25, 1804, graduated at Yale in 1823, became a lawyer at Springfield, Mass., in 1828, was a Whig member of Congress (1845–51), president of the Chicago Republican convention of 1860, and was distinguished as a patriotic and able man. Died July 17, 1870.

Ashmun (Jehudi), an American noted as a promoter of colonization in Liberia, was born in Champlain, N. Y., in 1794, graduated at Bowdoin College in 1816. He went to Liberia in 1822 as an agent of the Colonization Society, and rendered important service to the colony. He died in Boston Aug. 25, 1828.

Ashmun (John Hooker), an American jurist, born at Blandford, Mass., July 3, 1800. He graduated at Harvard in 1818, and became professor of law there in 1829. He acquired a high reputation as a jurist, but died prematurely Apr. 1, 1833.

Ashtabu'la, a county which forms the north-eastern extremity of Ohio. Area, 700 square miles. It is drained by the Grand and Ashtabula rivers. The surface is level; the soil contains much clay, and is adapted to grazing. Great quantities of grain, wool, fruit, and other crops are raised. It is intersected by the Lake Shore and Michigan Southern, the Ashtabula Youngstown and Pittsburgh, and the Franklin Division of the Lake Shore R. Rs. Capital, Jefferson. Pop. 32,517.

Ashtabula, the chief town of Ashtabula co., O., on the Lake Shore R. R., 58 miles from Cleveland, and the terminus of the Ashtabula Youngstown and Pittsburgh and the Franklin division of the Lake Shore R. Rs. Its harbor, one of the best on Lake Erie, admits vessels of the largest class, and it is becoming a port of considerable commercial importance, receiving iron ore in transit from Lake Superior to Youngstown and Pittsburgh, and is a point for the shipment of coal on the lake. It has two national and one other bank, two newspapers, and a population which has greatly increased since the last census. Pop. 1999; of Ashtabula township, 3394. Ed. "Telegraph."

Ashtaroth. See Ashtoreth.

Ash'ton, a post-township of Lee co., Ill. Pop. 1007.

Ashton, a township of Monona co., Ia. Pop. 106.

Ash'ton-in-Ma'kerfield, a town of England, in South Lancashire. The inhabitants are mostly employed in cotton-factories and in collieries. Pop. in 1871, 7463.

Ashton-under-Lyne, a town of England, in the S. E. part of Lancashire, on the Tame, 6½ miles by rail E. S. E. of Manchester. It is a great seat of the cotton manufacture, and is remarkable for the rapidity of its growth. It returns one member to Parliament. It has a church built in the time of Henry V., a theatre, a mechanics' institute, etc. Many of the inhabitants are employed in calico-printing, bleaching, dyeing, and the manufacture of machines. Pop. in 1811, 22,689; in 1861, 34,836; in 1871, 37,420.

Ash'toreth, or **Ash'taroth,** a Syrian goddess, worshipped by the ancient Israelites and other nations of Western Asia. She was called the Queen of Heaven, and appears to have been a personification of the moon. She is commonly identified with Astarte (which see). Her chief temples were at Tyre and Sidon.

Ash'ville, a post-village, the capital of St. Clair co., Ala., 115 miles N. of Montgomery. Pop. of township, 992.

Ashville (North Carolina). See Asheville.

Ash Wednesday [Lat. *Di'es Cin'erum;* literally, "day of ashes"], the first day in Lent, so called because in ancient times it was the custom for penitents to appear in the church covered with sackcloth and ashes.

A'sia, the largest of the great divisions of the globe. In extent of surface it is superior to America in about the proportion of 8 to 6, and it exceeds Europe and Africa taken together; while in the antiquity of its history and civilization, in the greatness of its population, and in the variety of its productions, it surpasses all the other great divisions of the globe. It was in Asia that the human race had its origin, and from it the arts and civilization were diffused over the other regions of the earth. It likewise has peculiar claims to the interest of Christians, as containing the principal scenes of the events recorded in sacred history. The name *Asia* was originally applied to a small district of Lydia, watered by the Cayster; it was afterwards extended to the whole peninsula now known as Asia Minor, and lastly to the entire continent east of the Mediterranean and Ægean seas. The ancient geographers usually included Egypt within the limits of Asia.

The area of Asia has been variously estimated. According to a very high authority,* it may be stated at 16,216,600 square miles. According to Behm and Wagner ("Bevölkerung der Erde," Gotha, 1872), it has, including the islands, 16,924,000 square miles. It is bounded on the N. by the Arctic Ocean, on the E. by the North Pacific, on the S. by the Indian Ocean, on the S. W. by the Red Sea, which separates it from Africa, and on the W. by Europe, the Black Sea, the Mediterranean, and the Grecian Archipelago. Its greatest length, from the Dardanelles to Behring's Strait, is about 10,000 miles, and its greatest breadth, from Cape Sievero Vostotchnoi Nos in Siberia, lat. 77° 30′ N., to Cape Buro, at the S. extremity of the Malay Peninsula, about 5100 miles. Its maritime coast-line may be reckoned, in round numbers, at 35,600 miles. Asia is separated from Europe by an imaginary line, the course of which is variously traced by different geographers; part of it, however, is formed by the Ural Mountains; it is joined to Africa by a narrow neck of land called the Isthmus of Suez, which is, however, crossed by the celebrated Isthmus Canal, thus virtually isolating Africa. On the E. it is separated from America by Behring's Strait, which is only 60 miles in width. The coasts of Asia are very irregular, being deeply indented on all sides by immense bays and gulfs. Among these are the Persian Gulf, Arabian Sea, Bay of Bengal, and Gulf of Siam on the S. coast, and the Gulf of Tonquin, Yellow Sea, Sea of Japan, Gulf of Tartary, Sea of Okhotsk, and Gulf of Anadir on the E. coast. The indentations on the N. are not of the same extent, but are equally if not more numerous, the Gulf of Obi being the largest. Asia has several large peninsulas, situated on the southern and eastern coasts; among them are Arabia, India, Malacca, Cochin China, Corea, Kamtchatka, and Anadir. The principal islands are also situated on the southern and eastern coasts; among them are Ceylon, Java, Borneo, Sumatra, the Laccadives, Maldives, the Chagos Archipelago, the Andaman and Nicobar islands, the Mergui Archipelago, Celebes, the Sunda and Banda islands, the Moluccas, Sooloo Islands, Philippines, the islands of Hainan, Formosa, Chusan, Hong Kong, the Japanese empire (including the great islands of Kioosioo, Sikokf, Niphon, Yesso, and Sagalien), and the Kuriles. On the N. are Kotelnoi, Fadievskoi, New Siberia, Livkoy, and Nova Zembla. Owing to its vast extent of surface, extending from N. to S. through more than 76 parallels, and from E. to W. through more than 165 meridians, Asia includes every variety of soil, climate, and production. The conflicting accounts given of the physical structure of a large part of the interior render it almost impossible to give a perfectly accurate and intelligible view of its general conformation. Its mean level above the sea does not exceed about 1150 feet, while a third part of it has a mean elevation of not more than 255 feet. The whole tract lying N. of the Altai and N. W. of the Thian-Shan Mountains is one prodigious plain or lowland, a third larger than Europe, with very little elevation. The southern portion, lying along the Indian Ocean, is also, comparatively speaking, but little elevated, as is likewise a

*See the "Treatise on Physical Geography," by Professor Guyot, in Johnson's "Family Atlas of the World."

great part of the interior, where the height above the sea does not exceed about 1000 feet, though formerly supposed to be double that height. It is now believed also that the elevations of several of the other plateaux of Central Asia have been overestimated. But although a large portion of Asia rises but little above the sea-level, there are extensive tracts having a great elevation; and on the other hand, a considerable part of the continent is actually below the sea-level: as, for example, that portion of country lying around the Caspian Sea and Lake Aral, the whole of which region is a vast cavity of about 55,000 square miles in extent.

Political Divisions.—The area and population of the several divisions were estimated in 1872, by Behm and Wagner, as follows:

Names of Countries.	Square Miles.	Population.
Russian territory	5,944,600	10,730,000
Caspian Sea	178,800	
Aral Sea	26,000	
Turkey in Asia	672,500	16,463,000
Arabia	926,000	4,000,000
Persia	636,000	5,000,000
Afghanistan, with Herat	251,200	4,000,000
Beloochistan	106,700	2,000,000
Kafiristan	20,000	300,000
Khiva	54,200	1,500,000
Bokhara	76,300	2,500,000
Khokan	30,000	800,000
Turkomania	144,200	770,000
Other territory of Turkistan	134,500	2,000,000
Chinese empire	3,742,000	446,500,000
Japan	149,400	34,785,321
Hindostan and British Burmah	1,558,747	206,225,580
Ceylon	24,705	2,405,287
Farther India:		
Burmah	190,500	4,000,000
Siam	309,000	6,298,000
Anam	198,000	9,000,000
French Cochin China	21,700	1,204,287
Straits Settlements	1,084	306,775
Malay Peninsula	31,700	209,000
East India Islands:		
Sunda Islands and Moluccas	678,500	25,000,000
Philippine and Sooloo islands	114,100	7,450,000
Other islands	6,800	170,000
Total	16,924,000	794,000,000

Mountains, Face of the Country, etc.—More than two-thirds of the surface of Asia consists of mountain-ranges and plateaux, connected with each other by branches, and controlling the plains by other branches. The largest plateau is the Mongolian in Eastern Asia, so called because it is exclusively inhabited by the Mongolian race. It is almost double the size of Europe, and has the form of a trapezium with rounded sides and angles, having its shortest side in the W. and the longest in the N., and has an average height of 9000 feet. It is surrounded by mountain-chains on all sides. In the S. are the Himalaya Mountains, having many peaks with an elevation of more than 20,000 feet, among which Mount Everest, 29,000 feet high, is said to be the highest peak known. Connected with this by the range of the Hindu-Kush is the plateau of Persia, having in the E. an average height of 6000 feet, in the W. of 4000 feet, and in the centre of 2000 feet. It is surrounded by numerous mountain-chains, which have an average elevation of 10,000 to 12,000 feet. W. of this, and connected with it by Mount Ararat (16,000 feet), is the plateau of Asia Minor, which is also connected with the Caucasus by branches of the Armenian highland. Other important ranges and highlands are, in the S., the plateau of Syria and Arabia, the plateau of Hindostan, the ranges of Farther India; in the E., the range of Corea; in the N., the East Siberian range (with the Aldan and Stanowoi Mountains), the ranges of Kamtchatka; in the W., the Ural and Caucasian mountains. The plains situated between the different ranges may be divided into six separate parts: the plain of Siberia, containing 4,250,000 square miles; the Caspian plain, with the largest inland seas on the globe, containing 1,000,000 square miles, of which over one-fourth lies below the level of the sea; the Chinese plain, which is among the most fertile and best cultivated parts of the globe, contains 200,000 square miles; and the plains of Farther India, Hindostan, and Mesopotamia. Very few active volcanoes are found on the continent of Asia, though the islands abound in them. Only one active volcano is found in Western Asia—Mount Demavend, 70 miles S. of the Caspian Sea. Formerly the plateaux of Persia and of Asia Minor were the scenes of great volcanic action, which is now, however, limited to very few places. In the Thian-Shan Mountains in Central Asia two active volcanoes occur, which form the centre of a great volcanic region. Although numerous fire-springs and fire-hills occur in China, no mountains are known to have emitted lava. Not less than nine active volcanoes exist in Kamtchatka. Earthquakes are of frequent occurrence and of a violent character in Asia Minor, the Persian mountains, Cabul, South-eastern Tartary, and in Northern Hindostan.

It has not yet been definitely settled whether Asia or Africa contains a larger extent of desert or steppes. In Asia the great marshy plain of Siberia extends southward to Turkistan, which, in the neighborhood of the Caspian and Aral seas, assumes the character of a sandy and salt desert. The greater part of Asia Minor, Arabia, and Persia, half of Mesopotamia, a large part of Manchooria, and the entire Mongolia, all form deserts or steppes, with the exception of the borders of springs or the shores of rivers, the majority of which flow into saline lakes or swamps. The cause of this vast amount of desert is without doubt the general absence of forests on the continent. This very probably was not always the case, but large tracts of what in all probability was formerly cultivated land, have been transformed by the systematic destruction of the forests in the course of several thousand years into deserts or steppes.

Rivers and Lakes.—A very remarkable peculiarity of the river-systems of Asia is its double rivers—*i. e.* two streams rising together, flowing in almost parallel directions throughout their whole course, and uniting before entering the sea. Among these twin rivers are the Sihon and Gihon, flowing into Lake Aral; the Euphrates and Tigris, uniting at Koona, and emptying into the Persian Gulf; the Ganges and the Brahmapootra; the Yang-tse-Kiang and Hoang-Ho, in China, rising near each other, first separating and again approaching each other, the one falling into the Yellow Sea, the other into the Gulf of Pecheliee; and the Yenisei and Lena, which empty into the Arctic Ocean. Among the other rivers of Asia are, in the northern part of the continent, the Obi (or Oby), the Irtish, the Indigbirka, and the Kolyma; in Eastern Asia, the Amoor, the Hoang-Kiang, and the Sang-Koi (or Tonquin); in Southern Asia, the Indus, and its confluents, the Attock, Jhylum, Chenaub, Sutlej; the Irrawaddy, the Martaban, the Menam, and the Camboja, and the Amoo and Syr-Darya in Central Asia. The basins of some of these rivers are of vast extent. That of the Obi is 1,250,000 English square miles, being the largest in the world, with the exception of that of the Amazon. The basin of the Yenisei is 1,041,000 square miles; that of the Lena, 787,000 square miles; while those of the Amoor, Yang-tse-Kiang, and Hoang-Ho are all above 500,000 square miles. The Yang-tse-Kiang is the longest river, being about 3300 miles long. The Yenisei comes next, with 3200 miles, while the length of the other principal rivers varies from 1500 to 3000 miles.

A large number of lakes, which form a semicircle, commencing with the Dead Sea, run first in a N. E. and then in an E. direction along the highlands of Central Asia to the centre of the continent. Among these lakes are the highest, as Lake Baikal; as well as the lowest lakes known, such as the Dead Sea, the Caspian Sea, and Lake Aral. Besides these, the most prominent are Lake Balkash, Lake Tengrinoor, etc.

Minerals.—Asia is peculiarly rich in the precious gems, and although it is generally considered to abound less in metals than the other continents, it ought perhaps to be referred, at least in part, to the fact of this continent having been first settled by civilized nations, who early explored and exhausted a large part of its mineral wealth. Diamonds are found in the Ural Mountains, Borneo, Ceylon, as well as in various other places. Rock-crystals, amethysts, rubies, turquoises, carnelians, agates, onyxes, beryls, topazes, and various other gems are found in various places. Gold is most abundant in Siberia, in the Altaï chain, called the Gold Mountains, in Japan, Borneo, the Chinese province of Yunnan, and the mountains of the Indo-Chinese peninsula. It is also found in less abundance in many of the other countries. Silver is found in China, Asiatic Russia, Anam, Japan, and Turkey. Mercury abounds in China, Thibet, Japan, India, and Ceylon. Tin is met with in Burmah, China, the islands of the Indian Archipelago, and Farther India; copper and iron in Japan, in Siberia, in Thibet, Hindostan, Anam, Persia, and Turkey; which countries also contain lead in greater or less abundance, as well as in Siam, Georgia, and Armenia. Coal has been found in Siberia, Northern China, Bengal, and some of the islands of the Indian Archipelago, and probably exists in many unexplored localities. Salt (very often rock-salt) abounds in all parts of the continent, and few extensive districts are altogether destitute of salt lakes or springs.

Climate.—Asia, extending as it does from the polar circle to the neighborhood of the equator, must necessarily exhibit a great variety of temperature in its different regions. In the western and south-western parts—excepting Southern Arabia, which is within the tropics—the climate is generally temperate, but in the south-eastern the heat is often extreme; while throughout the northern half of the continent excessive cold predominates. The variations of

climate are increased by local influences, especially by the great height of its table-lands and mountains, its compact form, and the great extension of the land towards the Pole. The greatest heat experienced in Asia occurs in Beloochistan, where it is said that the thermometer sometimes reaches 130° F. in the shade. The remarkable variety of climate for which Asia is distinguished is not manifested by its larger regions alone, but it is equally exhibited within the limits of its different countries down to their provinces and districts. Thus, while at Peking, which is in the same latitude as Naples (40° N.), the mean annual temperature is 55° F., at Naples it is 62° F., and the temperature in summer is 77° higher than that of Naples, while its winter temperature of 28° F. is the same as that of Copenhagen in lat. 56° N. The violent winds called typhoons occur in South-eastern Asia, their sphere of action diminishing as we go westward. They blow at all seasons, though but rarely between May and December. The monsoons extend into Asia from the Indian Ocean, as far as lat. 36° N. They include China, all Hindostan, and part of Thibet. Their direction is from the S. W. in summer and from the N. E. in winter, the change being accompanied by heavy storms. South of the equator the monsoons blow from the S. E. and N. W. during the same periods.

Vegetation.—We find all classes of plants represented here, from the luxuriant vegetation in the S. to the mosses in the extreme N. The vegetation of the steppes and deserts is poor. Among the plants peculiar to Asia are certain palms, fig trees, precious woods, tea, cinnamon, pepper, ginger, nutmeg, and other spices, the camphor tree and soap tree. Coffee, cotton, rice, sugar, indigo, tobacco, the mulberry, and the vine are also grown extensively. The tea-plant is extensively grown throughout Assam, China, Cochin China, and Japan. In general, the botany of Eastern Asia resembles that of Eastern North America, most genera and many species being common to the two regions; but Eastern Asia has this peculiarity, that many genera and orders elsewhere exclusively tropical have here their representative northern species. This fact renders the botany of China and Japan peculiarly rich and interesting. The banian, peepul, teak, and poon are important Indian trees.

Zoology.—The animal life of Asia is distinguished by the same great variety as the plants and the climate, while the greatest variety is found in the S. E. Here we find the elephant, the rhinoceros, the Bengal tiger, the panther, the boar, the crocodile, the python, besides many species of poisonous snakes, monkeys, parrots, etc. On the southern slopes of the Himalaya Mountains large herds of wild goats, sheep, horses, asses, mules, and cattle roam about. In China the beasts of prey have been mostly superseded by domestic animals. The steppes and deserts of Mongolia abound in camels, buffaloes, horses, asses, mules, antelopes, goats, etc., as well as tigers, leopards, and smaller carnivorous animals. In Persia, Asia Minor, and Arabia we find, as the chief beast of prey, the lion instead of the tiger. Domestic animals are found almost exclusively in the mountains, while the camel is the most important animal of this region. In Arabia the animal life and other characteristic features of Africa predominate.

Population, Races of Men, Languages, and Religion.—The population of Asia was estimated by Behm and Wagner in 1872 at 794,000,000—*i. e.* nearly two-thirds of the entire population of the earth's surface, while the area only constitutes one-third of the area of the earth.

Among the Christian churches in Asia, the Greek Church is the strongest in the Russian and Turkish territory, and is rapidly spreading in Central Asia and China. Other Oriental churches in Turkey, Persia, and India are the Armenians, Nestorians, and Jacobites. Catholicism chiefly prevails in East India and the Archipelago, while Protestantism has its strongest hold in India. The total number of Roman Catholics in Asia is estimated at 4,166,000, Protestants at 409,000, and other Christian churches at 8,324,000. Numerous descendants of Christians are thought by many to be spread throughout Asia. Thus, numerous native Christians were recently found to exist in Japan, where they had retained their faith for more than two centuries. Buddhism, Brahmanism, and the other religions of India, China, and Japan are supposed to have over 600,000,000 believers, while Mohammedanism has about 50,000,000. The number of Jews is estimated at 350,000.

Prof. Fr. Müller (*Linguistische Ethnographie*, in Behm's "Jahrbuch," 1868) divides the languages of Asia into four families: (1) The Northern Asiatic, comprising the Yukagirian, the Koryakian, Tchukchi, the language of Kamtchatka and of the Kooriles, Yenisei and Koltish, and also the languages of the Esquimaux, found also in North America. (2) The Southern Asiatic languages, comprising the Dravidian languages and the Singhalese. (3) The languages of Central Asia, which are divided into four large families: 1, the Ural-Altaic languages, comprising the Samoyede group, the Finnish, the Tartaric, the Mongolian, and the Tungusian group; 2, Japanese; 3, the language of Corea; 4, the monosyllabic languages, comprising the language of Thibet, the Himalaya languages, Burmese, Siamese, the languages of Anam, the languages of the Shan, Miaotse, Lolo, and other tribes, and the Chinese. (4) Some groups of the Caucasian family, comprising the languages of the Caucasus, the northern group of the Semitic languages; among these Chaldee, Syrian, Hebrew, etc., and the Indian and Iranian groups of the Indo-European languages.

History.—The ancient history of Asia may be divided into four great epochs, corresponding with the existence of the four world-empires—the Assyrian or Babylonian, the Medo-Persian, the Grecian, and the Roman, which last may be considered as extending to the period of the Mohammedan conquest, in A. D. 638. Christianity was introduced and established at the time of the highest power of the Roman empire.

The next division of Asiatic history, after the Roman, is that which comprehends what are usually termed the Middle Ages, extending from the beginning of the seventh to the end of the fifteenth century, when Vasco da Gama discovered a passage to India by the Cape of Good Hope. Not quite a century after Mohammed had fled from Mecca in 622, his religion, destined to exercise so great an influence in the East, had spread from the Red Sea to the Caspian, and from Tartary and India as far W. as the Atlantic. In 1037, Persia was conquered by Togrul Beg, and India, Tartary, Syria, and Egypt by his successors. Having taken Jerusalem, their cruelty to the Christian pilgrims called forth the Crusades. The dominion of the Saracens about the middle of the thirteenth century ultimately extended, under the sway of Kublai Khan, over the whole of Western Asia. The Crusades had contributed, in a more remarkable degree than formerly, to direct the mind of Europe towards Asia, and the result was the establishment of permanent commercial relations between them. About 1250 two Venetian noblemen, Nicolo and Maffio Polo, visited Asia as merchants, taking with them Nicolo's son, Marco, who afterwards became the most celebrated Asiatic traveller of the Middle Ages. He resided twenty-four years at the Tartar court, by which he was frequently employed as an ambassador, and during this time he traversed most of China, a considerable part of India, Java, Ceylon, and perhaps several other countries, making also a few voyages along the S. coast of Asia. He likewise collected much information concerning places which he never visited; and his correct description of countries formerly unknown to Europeans must be considered as having laid the foundation of modern Asiatic geography. Several other travellers also published notices of Asia, but their relations in general are full of fables; so that the partial knowledge of China and of portions of Northern and Central Asia, gleaned principally from the travels of Polo, with the discovery, by Rubruquis, that the Caspian is an inland sea, must be regarded as all the geographical knowledge that the Middle Ages had, in addition to that possessed by the ancients. The doubling of the Cape of Good Hope by Vasco da Gama in 1498 opened a new channel of intercourse with the East, and ultimately led to a more accurate and more extensive knowledge of its geography. From the end of the fifteenth century to the present time the history of Asia has gradually risen in importance, and the progress of its geography been much advanced. Within a few years after the arrival of Da Gama on the Indian coast the Portuguese had acquired a complete knowledge of the whole coast from Cape Comorin to the Bay of Cambay. At the death of their famous naval commander and hero, Albuquerque, in 1515, their colonies were established at various points on the Asiatic coast, and extended from the Cape of Good Hope to the empire of Japan, a distance of at least 12,000 miles. In 1600 a new and formidable enemy arose to the Portuguese in the Dutch, who by 1640 had subdued all the Eastern islands and seas, with the exception of some British settlements on the coast of Sumatra. During the protracted contest between the Dutch and Portuguese, the northern part of Asia, not previously known either to ancients or moderns, suddenly emerged from obscurity. Russia, having thrown off the Tartar yoke in 1461, proceeded to enlarge her dominion by the conquest of Kasan in 1552, and Astrakhan in 1555. In 1578 the Cossacks, having crossed the Ural range, entered Siberia, the discovery and survey of which were pursued so vigorously that in 1644 the mouth of the Amoor was reached, and in 1648 the separation of Asia from America by an open sea was proved. Somewhat later a complete geographical view of the vast empire of China and part of Central Asia was obtained from the Jesuits, who, having risen to high favor at Pekin, actually published a map of that country under the

authority and at the expense of the Chinese government. The attention of the British had long been directed to Asia, and the discovery of the passage by sea gave them a new impulse. For many years following that event frequent voyages of discovery were made by British navigators, and several embassies and other journeys were performed by British subjects on land. But the formation, in 1600, of the East India Company, which ultimately established British authority in the East, has done more than any other event to extend our geographical knowledge in that quarter. At first the new information obtained was scanty, but from 1740, during the wars with the French in the Deccan, and more especially from 1757, after the conquest of Bengal, it rapidly increased.

The recent history of Asia has been under the controlling influence of Russia and England, both of which have, in the course of the last two centuries, and since the beginning of the nineteenth century, more rapidly than at any previous time, extended their boundaries, and are now indisputably the two great powers of Asia. Wherever they are allied they can dictate to the remainder of the Asiatic states; but as they are rivals for the ascendency, they jealously watch, and often try to check, each other's progress, especially in Central Asia, where the southern frontier of the Russian and the northern of the British are now separated by a comparatively small tract of land. Quite recently, France has gained a firm footing in Farther India, and the Netherlands are making great efforts to extend their rule over the islands of the Indian Archipelago. One of the most remarkable events in the recent history of the native states of Asia is the opening of Japan to a friendly intercourse with the civilized countries of Europe and America. Japan already is by far the most progressive among the native Asiatic states, and is likely to exercise a considerable influence upon the destinies of Eastern Asia. In China a powerful anti-foreign party desperately opposes the adoption of a similar policy, but there also the combined influence of the commerce, science, and religion of the Christian countries is smoothing the way for the beginning of a new era. Persia also has found it necessary to enter upon a reformatory career, and the journey of the shah to all the European courts—an event entirely unprecedented in the history of the country—has made a powerful impression upon the minds of the people. The advantages which Russia and England derive from the construction of railroads and telegraphs begin to be appreciated by all the native states. Considerable progress in this direction has already been made in Japan, and Persia in 1872 concluded a contract with Baron Reuter of London, which, if executed, would cover the whole country with a network of railroads. The connection of British India with Europe by railroad has for some time engaged the attention of engineers, and when, in 1873, Lesseps, the originator of the Suez Canal, came forward with a new scheme, great hopes of its speedy execution were entertained in scientific and commercial circles. The exploration of the interior of Asia has been very active since the beginning of the nineteenth century, and the unknown territory is at length confined within very small limits.

A. J. Schem.

Asi'ago, a town of Italy, in the province of Vicenza, 23 miles N. of Vicenza, is in a district called "Seven Communes." It has manufactures of straw hats and turned woodwork. Pop. 5140.

A'sia Mi'nor, the ancient name of a peninsula forming the western extremity of Asia, now called Anatolia (which see). It was bounded on the N. by the Euxine (*Pon'tus Euxi'nus*) and Propontis, on the S. by the Mediterranean, and on the W. by the Ægean Sea (*Ægæ'um Ma're*). The principal divisions were Bithynia, Cappadocia, Cilicia, Galatia, Ionia, Lycaonia, Lydia, Lycia, Mysia, Pamphylia, Phrygia, Pontus, and Paphlagonia, which will be noticed under their own heads. The Mount Taurus range extends through the southern part, and Anti-Taurus through the northern. The principal rivers are the Halys (Kizil-Irmak), which rises in the eastern part and enters the Euxine; the Sangarius (Sakareeyah), which also flows into the Euxine; and the Meander, which enters the Ægean Sea. Here flourished many famous and powerful kingdoms of antiquity, and here many conquerors in successive generations contended for supremacy. "We are now," says Malte-Brun, "to tread upon a soil rich in interesting and splendid recollections, with an existing population completely debased by ignorance and slavery. The glory of twenty different nations which once flourished in Western Asia has been extinguished; flocks wander over the tombs of Achilles and Hector; and the thrones of Mithridates and Antiochus have disappeared, as well as the palaces of Priam and Crœsus. The merchants of Smyrna do not inquire whether Homer was born within their walls; the fine sky of Ionia no longer inspires either painters or poets; the same obscurity covers with its shades the banks of the Jordan and the Euphrates. . . . The wandering Arabian comes, indifferent and unmoved, to rest the poles of his tent against the shattered columns of Palmyra. . . . If, however, European arts and civilization were, by some new arrangement of Providence, to revisit this ancient cradle of the human race, we should still find there the charming coast of Ionia, with its picturesque islands; the fertile shores of the Euxine, shaded by inexhaustible forests; and in the distance the numerous chains of Mount Taurus, crowned with upland plains, representing on a small scale the vast plateaux of Central Asia."

William Jacobs.

Asiat'ic Soci'eties, societies formed for the promotion of the knowledge of the language, literature, and history of the Asiatic nations. The first society of this kind was established by the Dutch at Batavia in 1780. The next was the Royal Asiatic Society of Bengal, founded at Calcutta by Sir W. Jones in 1784. Among those of more recent date are the Société Asiatique, founded at Paris in 1822; the Royal Asiatic Society of Great Britain and Ireland, 1823; the Asiatic Society of Ceylon, 1845; the German Oriental Society in 1845; the Asiatic Society of China, established in 1847; and the American Oriental Society in 1842.

Asimago'my, a lake in Canada (Ontario), is about 12 miles long and from 2 to 4 miles wide. It discharges itself into the eastern extremity of Lake Superior by a stream about 36 miles long.

As'kew (Anne), a gentlewoman of high distinction in the reign of Henry VIII., and an intimate court-friend of his queen, Catharine Parr. She was the daughter of Sir William Askew of Kelsey, Lincolnshire. Falling a victim to the craft of Gardiner, she was attainted of heresy as a "fanatical Anabaptist," after an examination by Christopher Dare and Sir Martin Bowes, lord mayor of London. In the Tower she was tortured by the rack, Wriothesley, the lord chancellor, and Rich, inflicting this inhumanity with their own hands. Finally, being unable to walk to Smithfield, she was carried there in a chair, and her body chained to the stake, at which she was burnt in 1546.

As'mannshau'sen, a village of Germany, in Nassau, on the right bank of the Rhine, 2 miles N. W. of Rüdesheim. The red wine of Asmannshausen is highly esteemed, having a rare aromatic flavor and uncommon strength. It retains its fine qualities only about four years.

Asmode'us, or **Asmo'di,** a demon or evil genius, who, according to the apocryphal book of Tobit, killed the seven husbands of Sara. In the "Talmud" he is called the prince of demons. He is the same with Abaddon and Apollyon.

As'monæ'ans, or **Asmoneans,** a family of Jewish princes, partially identical with the Maccabees. The name was derived from Asmonæus, who lived about 300 B. C. His great-grandson, Mattathias, was a distinguished patriot and leader of a revolt against the king of Syria. He had several sons, who ruled over Judea and were called Maccabees (which see).

Asô'kă, Açoka, or **Ashoka,** an ancient king of Maghada, in India, was a grandson of Chandragupta (or Sandracottus). He reigned about 250 B. C., was converted to Buddhism, and erected a great number of monasteries. His dominion extended over the greater part of Hindostan.

Asp, or **As'pic** [Lat. *as'pis*; Gr. ἀσπίς], a species of venomous serpent mentioned by ancient writers. Some of these describe its bite as inevitably fatal, and as producing speedy death without pain. Modern naturalists identify it with the *Naja haje*, a species of hooded viper which is found in Egypt, and is from three to five feet in length. When it is irritated it dilates its neck. The figure of the *Naja haje* occurs on the sculptured monuments of the ancient Egyptians. The jugglers of modern Egypt cause it to dance to their music, and throw it into a cataleptic state. The name of asp is also applied to the *Vi'pera as'pis*, common in many parts of Europe, and frequent in Sweden and the neighboring countries. It is much dreaded on account of its bite.

Aspar'agus [Gr. ἀσπάραγος], a genus of plants of the order Liliaceæ, natives of Southern Europe and Africa. Its species are partly shrubs and partly herbaceous. They have a 6-parted perianth, six stamens, one style, and the fruit is a berry. The most important species is *Asparagus officinalis*, the common asparagus of gardens, which is a native of Europe, and is generally cultivated in Europe and the U.S. It was used as food by the ancient Romans. It grows to the height of four feet, and thrives best in a rich and deep soil. This plant is raised from the seed, and should not be used until about three years have elapsed after the planting of the seed. The perennial roots con-

tinue for many years to send up every spring a crop of tender shoots, which, after having attained the height of a few inches, are cut a little below the surface of the ground. A peculiar principle called *asparagine*, $C_4H_8N_2O_3$, is obtained from these shoots, and also from the root of the marshmallow.

Aspar'tic Ac'id ($C_4H_7NO_4$), an acid obtained by the decomposition of asparagine, or by the action of heat upon ammonic malate, maleate, etc.

Aspa'sia [Gr. Ἀσπασία], a celebrated woman of ancient Greece, remarkable for her genius, beauty, and political influence, was born at Miletus, in Asia Minor. She became in her youth a resident of Athens and the mistress of Pericles. Her house was a celebrated resort for the most eminent Athenians, including Socrates, who professed to be her disciple. She had a high reputation for talent, and a report obtained currency that she composed part of the great funeral oration which Pericles pronounced over the Athenians who fell in battle about 430 B. C. Having been accused of impiety by Hermippus, a comic poet, she was defended by Pericles and acquitted. After the death of Pericles she was married to Lysicles. There is extant an antique bust inscribed with the name of Aspasia. (See Burigny, "Vie d'Aspasie;" Plutarch, "Life of Pericles.")

Aspasia the Younger, an Ionian lady whose original name was Milto. She became the favorite mistress of Cyrus the Younger, who changed her name to Aspasia. She was distinguished for beauty and intellect. She was taken captive by King Artaxerxes at the battle in which Cyrus was killed, 401 B. C., and was consecrated by him as a priestess of Anaitis.

Aspa'siolite, a greenish mineral from Kragerö, Norway. It is a hydrated silicate of alumina and magnesia, and is a variety of fahlunite.

As'pe, a town of Spain, in the province of Alicante, 15 miles W. of Alicante. Here are numerous flour-mills, about twenty oil-mills, several soap-factories, and distilleries of brandy. Pop. 6700.

As'pect [Lat. *aspec'tus*], look, appearance, countenance. In astrology, the position of one planet with respect to another. Aspect is defined by Kepler as "the angle formed by the rays proceeding from two planets, and meeting at the earth." The ancients reckoned five aspects—namely, conjunction, indicated by the symbol ☌; opposition, by ☍; trine, by △; quartile, by □; and sextile, by ⚹. Planets in conjunction have the same longitude; in opposition the difference of their longitude is 180°; the aspect is trine when they are 120° apart, quartile when they are 90° apart, and sextile when they are 60° apart.

As'pen, a village of Uintah co., Wy., near the S. W. corner of the Territory, and on the Union Pacific R. R., 29 miles E. of Wahsatch. Coal is mined in the vicinity. The station is 7463 feet above the sea.

As'pen, or Tremulous Poplar (*Pop'ulus trem'ula*), a tree of the natural order Salicaceæ, is a native of Europe and Western Asia. It is remarkable for the mobility of its leaves, which, having long petioles laterally compressed, are caused to flutter by the gentlest breath of air. The wood is soft and light, is used to make trays and pails, and is valuable timber for the interior of houses. The name of aspen is also applied to the *Populus tremuloides* and *grandidentata*, natives of the U. S., resembling the European aspen in the proverbial quivering of their leaves.

Aspergil'lum, a remarkable genus of tubicular bivalve molluska, characterized by the soldering of both valves to the inner surface of the calcareous sheath. The shell has the form of an elongated cone, the larger end of which expands into a disk, which is pierced by many small tubular holes. Hence it derives its popular name of "watering-pot." The animals of this genus are borers, which live in sand. They are chiefly found in the Indian and South Pacific oceans. Others have been found fossil in Europe.

As'pern, or Gross Aspern, a village of Austria, on the left bank of the Danube, 5 miles E. N. E. of Vienna. Aspern, with the adjacent village of Essling, was the scene of a great battle between Napoleon and the Austrian archduke Charles after the French army had taken Vienna. The French crossed the river by a bridge which they constructed at the island of Lobau, and began the attack on the 21st of May, 1809. After half of the French had crossed the river, the Austrians assumed the offensive. Both of the villages were taken and retaken, and the day closed without a decisive result. The fight was renewed on the 22d, when, after great slaughter, Napoleon retreated to the right bank of the river, having lost about 7000 killed and 30,000 wounded and prisoners. The Austrians lost about 20,500 killed and wounded.

As'phalt [Gr. ἄσφαλτος; Lat. *asphal'tum*] is a solid bituminous substance, often called **Mineral Pitch** or **Native Pitch.** (See Bitumen, by Gen. Q. A. Gillmore, U. S. Army.)

Asphal'tic Coal, a name given to certain coal-like substances which are found filling irregular cavities and fissures, generally of the older rocks. They have been often classed as coals, but differ in composition and geological position from all true coals. They are not stratified, but fill fissures into which they have evidently flowed when in a fluid or plastic state. They are, in fact, ancient asphalts, which have become more compact and drier—*i. e.* containing less oil and gas—in the lapse of ages. These asphaltic coals are found in carboniferous rocks in New Brunswick and West Virginia, and in Devonian strata in Ohio and Kentucky.

As'phodel (*Asphod'elus*), a genus of herbaceous plants of the order Liliaceæ and sub-order Asphodeleæ, nearly related to the asparagus and onion. They are natives of Barbary, Sicily, Greece, and other parts of the Levant. Several species are cultivated in gardens for the beauty of their flowers, as the *Asphodel luteus* (yellow asphodel). The *Asphodel ramosus* is said to be the flower which Homer describes as growing in the meadows of Elysium. It is now abundant in Apulia. The ancients imagined that the manes of their friends fed on its roots, and they planted it near their tombs.

Asphyx'ia [from the Gr. *a*, priv., and σφύξις, the "pulse"], originally meaning cessation of the motion of the heart, has by usage come to signify arrest of breathing (properly *apnœa*) by suffocation or strangulation. It occurs in drowning, by water excluding air from the lungs; in hanging or choking, by the compression of the windpipe, preventing the entrance of air; in the presence of certain gases, as chlorine or pure carbonic acid, by spasmodic closure of the glottis or entrance to the windpipe. It has been proved by careful observations that after death by asphyxia the left cavities of the heart are empty, and the right distended with blood. This is owing to the fact that venous blood, not renewed by exposure to the oxygen of the air, will not circulate through the lungs, thus being forced to accumulate in the right or venous side of the heart. The mode of treatment of asphyxia must depend on its cause. (See Drowning.) In partial strangulation, abstraction of blood in moderate amount may unload the heart and promote the movement of the blood, after the cause of obstruction has been removed. For asphyxia from irrespirable gases the first necessity is a supply of pure air. When the heart has almost or quite ceased to beat for a few moments, life is sometimes restored by artificial Respiration (which see), or by application of galvanic electricity to the chest.

Asphyx'iants [from *asphyx'ia*, "suffocation"], chemical compounds enclosed in bombs or other projectiles, and designed to suffocate or poison the enemy, especially in naval warfare, where men are confined between the decks of a ship. These barbarous inventions are discountenanced in honorable warfare.

Aspidich'thys [Gr. ἀσπίς, a "shield," and ἰχθύς, a "fish"], a genus of fossil fishes, described by Dr. Newberry, from the Devonian rocks of Ohio, allied to *Pterichthys*, but very much larger. The middle dorsal plate of the carapace is a foot wide and a foot and a half long, more than an inch thick at the centre, and its external surface is studded with smooth enamel tubercles as large as split peas.

As'pinwall (called **Colon** by the natives), a seaport of Central America, is situated on the N. side of the Isthmus of Panama, and on Navy Bay, 48 miles by rail from Panama, on the Pacific Ocean; lat. 9° 21′ N., lon. 79° 54′ W. It was founded in 1852 by the Panama R. R. Company, and is the northern terminus of the Panama R. R., which was opened in 1855. It has a good harbor, which is deep enough for large ships, and has several large hotels. Aspinwall was formerly a great thoroughfare of the travel between California and the Atlantic States. Steamers ply frequently between this place and New York, which is about 2000 miles distant. Pop. in 1869, 4000.

Aspinwall, a post-township of Nehama co., Neb. Coal is found here. Pop. 572.

Aspinwall (William), M. D., born in Brookline, Mass., May 23, 1743, graduated at Harvard in 1764, and subsequently took his medical degree in Philadelphia, became a surgeon in the Revolutionary army, and after the war was a prominent Jeffersonian politician in Massachusetts. He practised medicine with great success, and was distinguished for the practice of "inoculation" and his early adoption of vaccination. Died April 16, 1823.

Aspinwall (William H.). See Appendix.

As'pirate [from the Lat. *as'per*, "rough"] denotes in pronunciation a rough breathing, similar to the sound of the letter *h*. It occurs with various degrees of intensity,

being sometimes almost as strong as the German *ch*, at others so slight as to be scarcely perceptible. In Greek grammar it is commonly called *spiritus asper* ("rough breathing"), and is marked thus (῾), in contradistinction to the *spiritus lenis* ("smooth breathing"), represented thus (᾽). Οἱ Ἕλληνες would be represented in English letters thus: *Hoi Hellēnes*.

As'pirator [from the Latin verb *aspi'ro, aspira'tum*, to "breathe," or "breathe on or into," from *ad*, "to," and *spiro*, to "breathe"], an apparatus used by chemists to draw air or other gases through bottles or other vessels. It is a tight vessel filled with water, having a tube with a stopcock connected with the upper end, and another tube with a stopcock connected with the lower end. The former tube is attached to the vessel through which the gas is to be drawn; the stopcocks are both opened, and the weight of the water issuing from the lower tube acts as a suction, and draws in the gas.

As'pis, or **Clu'pea,** an ancient and important fortified city of the Carthaginians, on the Mediterranean, about 50 miles E. of Carthage, was founded about 310 B. C. It was the place where Regulus landed in the first Punic war, and was a distinguished episcopal see from 411 to 646 A. D. It was the last spot on which the African Christians made a stand against the Saracens. Remarkable ruins are to be seen there.

Aspromon'te, a mountain at the south-western extremity of Italy, 16 miles E. N. E. of Reggio, 6300 feet high. Here Garibaldi and the greater part of his army were taken prisoners in Aug., 1862.

Aspropot'amo (*i. e.* "white river"), the ancient *Achelous*, the largest river in the kingdom of Greece, rises in Albania. It flows in a S. S. W. direction, and after a course of about 100 miles enters the Mediterranean (or Ionian) Sea nearly 15 miles W. of Missolonghi.

Ass, or **Don'key,** a quadruped of the genus *Asinus* and family Equidæ. It is characterized by long ears, a black cross over the shoulder, and short hairs on the upper part of the tail. It is remarkable for its patience, stolidity, and power of endurance, and has been the domesticated drudge of man from time immemorial. The ass is probably a native of Central Asia, as it is now found wild in that region. Vast numbers of the wild-ass (which the Romans called *onager*) roam over the great Asiatic deserts and steppes, feeding on saline herbage. They also inhabit Persia, Asia Minor, and Syria. An interesting notice of this animal is given in the thirty-ninth chapter of Job. The wild-ass is a high-spirited animal of extraordinary speed, and is one of the principal objects of the chase in Persia, where its flesh is highly esteemed as food. This animal (supposed to be the *Equus hemionus* of Pallas) surpasses the horse in swiftness of foot. There appears to be some doubt whether the domesticated ass is descended from this wild animal, so much superior in speed and other qualities. In Oriental countries the custom of riding on the back of the tame ass is very common; and the Old Testament informs us that it was thus used by patriarchs and kings in the earliest times. The asses which are raised in Syria and other parts of the East are a better breed than those of Europe. The animal is not much employed in the U. S., except for the propagation of mules, which are the hybrid progeny of the ass and mare. Being very sure-footed and able to live on scanty fare, the ass is well adapted for service as a beast of burden in rocky and mountainous regions. Its milk is recommended as a diet for dyspeptic and consumptive patients. The proverbial stupidity of the ass seems rather due to its patience and endurance than to any particular want of intelligence.

The Ass.

Assafœt'ida, or **Asafœtida** [from *asa*, an Oriental word said to signify "gum," and the Lat. *fœ'tidus*, "fetid"], a gum-resin or the concrete juice of the root of *Narthex assafœtida* (the *Ferula assafœtida* of Linnæus). It is a native of Persia and Afghanistân, has a peculiar and disagreeable odor, and is extensively used in medicine as an antispasmodic. It is considered an efficacious remedy for hysteria, nervous diseases, and spasmodic pectoral affections. In many parts of Asia it is used as a condiment.

Assai, a beverage which is commonly used on the Amazon, and is prepared from the fruit of *Euterpe oleracea* and other species of palm nearly related to the cabbage-palm. The fruit is nearly equal in size to a sloe, and consists of a hard seed enclosed in a thin covering of firm pulp. The assai, a thick creamy liquid of a purplish color, is composed of this pulp and water.

Assal', a salt lake of Eastern Africa, 25 miles S. W. of Tajura, is about 760 feet below the level of the sea. It is 8 miles long and 4 miles wide, and has an area of 20 square miles. The shores are covered with crusts of salt about a foot thick. Large quantities of salt are carried hence by caravans to Abyssinia.

As'sam, a province or district of Farther India, borders on China, forming part of the valley of the Brahmapootra. It is included between lat. 25° 45′ and 28° 15′ N., and between lon. 90° 35′ and 96° 50′ E. The area is 21,805 square miles. It is well watered by numerous rivers, has a fertile soil, but a large part of it is swampy and subject to inundation. The staple products of the soil are rice, tea, cotton, opium, and mustard. Gold, silver, and precious stones are found here. The rainy season lasts about six months, from April to October, during which time the whole country is inundated. The large and dense forests of Assam are infested by great numbers of elephants, tigers, leopards, rhinoceroses, buffaloes, etc. Assam was ceded to the British by Burmah in 1826. The religion of the Assamese is Brahmanism. Pop. 710,000.

Assas'sin [for etymology see below], one who attacks and kills by treachery or surprise a person who is unprepared for defence. The word was originally the name of a fanatical sect or order, the disciples, it is said, of Alo-ed-Deen (Aloaddin), commonly called Sheikh-el-Jebel, or the

"Old Man of the Mountain." The first founder of the order is said to have been Hassan-ben-Sabah, who flourished in Persia about 1080 A. D. According to some writers, they were called Assassins from their immoderate use of hasheesh (or hashish), an intoxicating drug obtained from Indian hemp. Hassan-ben-Sabah and his followers gained possession of several fortified castles in the mountainous parts of Persia, and intimidated princes and governors by a series of secret murders. The order consisted of members of several degrees, the lowest of which were *Fedavies* or *Fedais* (*i. e.* the "devoted"), who were not initiated into the secret doctrines and mysteries, but with blind obedience executed the bloody orders of the prince or Old Man of the Mountain, who was their absolute ruler. They mustered about 50,000 fighting men in the time of the Crusades, and sometimes came into collision with the crusaders. Hassan-ben-Sabah died about 1125. One of his successors was assassinated about 1163 by his brother-in-law, because he extended to the whole order an exemption from the commands of the Koran, which exemption had before been the exclusive privilege of the initiated. Alo-ed-Deen (Aloaddîn), the famous chief of the Assassins, is supposed to have been born about 1210. According to some authorities, this order was suppressed or dispersed by the sultan Bibars. (See Von Hammer (Hammer-Purgstall), "Geschichte der Assassinen," 1818; Weil, "Die Assassinen" in Sybel's "Histor. Zeitschrift," 1863.)

Assault' [from the Lat. *ad*, "upon," and *salio, saltum*, to "leap"], in law, an attempt or offer with force and violence to do a corporeal hurt to another, as by striking at him with or without a weapon. It is often coupled with the word "battery," which means the act of carrying the assault into effect. Every battery includes an assault, but the converse is not true. In order to constitute an assault there must be a present ability to carry the threat into effect. Thus, if the hand of a person at rest were raised against another at such a distance that no blow could be inflicted, there would be no assault, while if there were a weapon in the hand there might be. Assaults are either simple or with intent to commit some other criminal act, as to kill, rob, or ravish. Assaults of this class are frequently punished with severity by statute law, and are themselves declared to be felonies, though the principal offence is not committed. A simple assault is a mere misdemeanor. There are many instances in which an assault is justifiable, as in self-defence, and in arrest by officers, and in the punishment of children and apprentices. Even in these cases undue force must not be used, and if that which is reasonable under all the circumstances be exceeded, the party resorting to the force will be a wrong-doer.

Assault, in military language, is a sudden and vigorous attack of a fortified post or camp, or an effort to carry by open force a breach which has been made in a fortress. In the regular routine of sieges (as they *were* formalized, for recent changes in the art of fortification and in the character of firearms have rendered the old rules somewhat inapplicable) the "assault" is one of the last scenes of the drama called a "siege." In the regular siege the assault (if, instead of gaining the breach by covered "approaches," it is decided to resort to it) is delivered after the outworks are captured, and one or more "breaches" formed (by "breaching batteries") in the body of the place. It is usually performed by picked troops or volunteers (sometimes called a "forlorn hope"), who, at a concerted signal (upon which the besiegers' artillery ceases to fire), issue from the contiguous parallels or places of arms, descend into the ditch, and advance rapidly and without much order, but without firing, upon the breach. "Firing parties" are stationed in neighboring parallels to keep down the fire of the besieged, and "supports" are close at hand to follow up the assaulting party, if successful in effecting an entrance.

Under Louis XIV. commandants of besieged places were forbidden to capitulate before receiving *three* assaults. Under Napoleon it was declared dishonorable and punishable with death to capitulate before receiving at least one assault. According to Vauban and the "schools," the open assault is a "useless massacre," which, if successful, results only in the demoralization of the troops, the sacking of the place, and the destruction of resources valuable to the besiegers. Nevertheless, it is sometimes compulsory, as in the case of the assault of Constantine (1837) by the French, with a loss of 500 out of 1750. In Spain the English army delivered terrible assaults, as those at Badajos (1812) and St. Sebastien (1813); the loss at the former (which failed, the place being entered by *escalade*) cost 3700 men, and the latter (successful) 2000, killed and wounded. The bloody assault by which the siege of Sebastopol was terminated Sept. 8, 1855, was necessitated by the fact that the "approaches" could be pushed forward no farther. This so-called siege differed from an ordinary siege in this, that "the difficulty was to *conquer the Russian army* upon a ground prepared beforehand, quite as much as to surmount the material obstacle presented by the fortifications" (*Niel*). The allied loss in this assault (killed and wounded) was nearly 10,000; that of the Russians, 11,700 men; thus terminating a siege of eleven months' duration, and which cost the besiegers 150,000 and the Russians 84,000 men.

The protracted duration and fearful losses at this siege, though it cannot be taken as strictly typical of the changed character of modern siege warfare, are not without their confirmatory bearing upon the *dictum* of Col. Brialmont, one of the most accomplished and authoritative of European engineers (*Études sur la défense des États*), that "the advantage is no longer on the side of the besiegers, and that in *great places*, where materials, provisions, and men are never lacking, the superiority is incontestably acquired for the defence." And he adds: "Conclusion most encouraging to small states, and to those which limit their ambition to the worthy aim of preserving intact and developing their independence, their wealth, and their liberties."

J. G. Barnard, *U. S. Army.*

Assay', or **Assay'ing** [from the Fr. *assayer*, to "try"]. This term, which is applied to metals or metallic compounds, is sometimes employed as synonymous with analysis, but more generally restricted to the process of ascertaining the proportion of gold or silver in an alloy, or of pure metal in a metallic ore. Silver plate and manufactured articles of gold and silver generally contain an alloy of copper or other metal. (See Alloy.) In Great Britain, each article, before it is sold, is assayed at Goldsmiths' Hall, so as to determine the proportion of precious metal in its composition. The process of assaying gold and silver depends on the principle that those metals cannot be converted into oxides by union with the oxygen of the air, while the baser metals with which they are alloyed can be oxidized if raised to a high temperature. The apparatus employed in this process consists of a *cupel*, a small shallow vessel made of bone-ash, and a *muffle*. The latter is made of fire-clay, is about eight inches long, three or four inches in diameter, and is shaped like a railway tunnel (that is, having a flat bottom and an arched top); it is open at one end and closed at the other, and has several apertures in its sides for air to pass through. Weighed fragments of mixed silver and lead are placed on cupels, which, introduced into a muffle, are exposed to the heat of a furnace until the metals are melted. The oxygen of the air unites with the lead, forming an oxide, which is partly volatilized, and partly absorbed by the porous cupel. At the end of this process of *cupellation* there remains a globule of pure silver, which by its diminished weight shows how much alloy was contained in the sample. During the assay of silver by the foregoing process, called the *dry method*, a small loss of silver occurs. For this reason the *humid* process has been adopted in the mints of France, of the U. S., and of other nations. This method consists in dissolving the compound or impure silver in nitric acid of density 1.25, and adding a solution of common salt (NaCl), which causes the precipitation of the chloride of silver (AgCl) in white flocculi. The solution of salt is made of a definite strength, and is poured out of a graduated vessel until all precipitation of pure silver ceases. The assay of gold ores or impure gold is performed in a manner similar to that of silver. If gold alloyed with copper is to be assayed, some silver must be added to the alloy. The alloy of the three metals, gold, silver, and copper, may be assayed by cupellation, by which the copper is oxidized and the gold and silver remain combined. These may be separated by a process called *parting*, which, however, is only practicable when the alloy contains three parts of silver to one of gold. The parting or quartation consists in acting on the alloy by hot nitric acid, which dissolves the silver, forming the soluble nitrate of silver, and leaves the gold in a solid and separate state. As no ore of gold or artificial alloy contains so much silver as three to one, it is necessary to incorporate an additional quantity of silver with it. This is done by wrapping the proper quantities of gold and silver in lead-foil, and heating them on a cupel. The metallic button which is the result of this cupellation is hammered on an anvil, and rolled into a thin plate or ribbon, which is coiled up and called a *cornet*. This is exposed in a glass vessel to the action of nitric acid, which, dissolving the silver, leaves a brown, spongy mass of gold. It is then heated in a crucible, annealed, and weighed. As jewelry and other articles cannot be assayed either by the dry or humid method without injuring their form, their purity is ascertained by the use of the *touchstone*, with which a streak is drawn on the surface of the gold. Black basalt is one of the minerals used as a touchstone. (For special methods of assay, see the respective metals.)

William Jacobs.

Asseman'ni (Giuseppe Simone), bishop of Tyre *in partibus*, a learned Maronite, born at Tripoli, in Syria, in

1687. He was sent in 1715 by the pope to Syria and Egypt to collect manuscripts, and was keeper of the Vatican Library (1738–68). He published a valuable work on Syrian literature, entitled "Bibliotheca Orientalis Clementino Vaticana" (4 vols., 1719–28). Died Jan. 14, 1768.—His nephew, Stefano Evodio, an Orientalist, born at Tripoli in 1707, was educated at Rome. He was archbishop of Apamea *in partibus*. He succeeded his uncle, Giuseppe Simone, as keeper of the Vatican Library, in 1768. He published several catalogues of Oriental manuscripts. Died in 1782.

Assem'bly, in politics, a convention or body of men associated for civil or legislative business, and possessing more or less political power. In some of the U. S. the term is applied to the lower branch of the legislature, and the other house is called the senate. At the beginning of the French Revolution, the members of the *Tiers Etat* (Third Estate), who had been chosen to represent the common people in the States-General, assumed (Jan. 17, 1789) the title of *Assemblée Nationale*, and, having been joined by the more liberal members of the nobility and clergy, proceeded to frame a new constitution. The court denied their authority, and made a not very vigorous effort to dissolve the Assembly, but failed, and finally yielded to the popular current. This body, which was termed the Constituent Assembly, formed a constitution which was accepted by the king, and, having ordered the election of a legislative assembly, dissolved itself Sept. 30, 1791. The Legislative Assembly, from which all members of the Constituent Assembly were expressly excluded, met Oct., 1791, and continued to undermine or defy the royal authority, which was abolished Aug. 10, 1792. Having convoked a *National Convention*, the Assembly closed its labors and existence Sept. 21, 1792. The formation of the second French republic (Feb., 1848) was followed by the election of a National Assembly, which met in May of that year, and, having formed a constitution, transferred its power to the Legislative Assembly. This body was dissolved or abolished by the *coup-d'état* of Dec. 2, 1851. The third republic was proclaimed Sept. 4, 1870, but, on account of the presence of German armies in France, the election of deputies was postponed until the armistice, which began just after the capture of Paris, Jan. 30, 1871. The National Assembly met at Bordeaux in Feb., and elected Adolphe Thiers as *chef du pouvoir exécutif* ("chief of the executive power").

Assembly, General. See General Assembly.

As'sen, capital of the Dutch province of Drenthe, 16 miles S. of Groningen, is connected with the Zuyder-Zee by the Drenthe Canal. In the neighborhood are tumuli mentioned by Tacitus. Pop in 1867, 6443.

Asses'sor [Lat. *asses'sor*, from *assid'eo*, *asses'sum*, to "sit beside," to "assist"] is applied in England to a person, usually a lawyer or jurist, who is appointed to advise the judge and direct his decisions. In several inferior courts assessors are appointed by statute. The burgesses of every borough are required to elect annually two assessors, who assist the mayor in revising the burgess lists and in presiding at the municipal elections. In some of the U. S. an assessor is a person elected by the people to assess or appraise all taxable property, in order that the owner of the same may pay a tax proportioned to its value. This valuation or appraisement is called assessment. The assessed value is usually less than the real, or less than the price for which it could be purchased.

As'seteague Island, off the E. coast of Northampton co., Va., to which it belongs, has a brick lighthouse, 129 feet high, standing 2 miles from the S. W. extremity of the island and showing a fixed light of the first order, 150 feet above the sea, in lat. 37° 54′ 37″ N., lon. 75° 21′ 04″ W.

As'sets [from the Fr. *assez*, "enough"], in law, denotes the property in the possession of an heir or under control of an executor, administrator, or trustee, applicable to the payment of debts and charges against the estate which they represent. It is mainly applied to the case of heirs, executors, and administrators. Assets are either real or personal. Real estate is assets in the hands of an heir; personal property, in like manner, in those of an executor or administrator. If the real estate is devised to an executor, he takes it as trustee. Assets are also distinguished into legal and equitable, the first being under the control of a court of law, and the second administered by a court of equity; and the two courts are not governed by the same rules. In the U. S. this last distinction is by reason of statute law of little consequence, as all the estate of a deceased person becomes a fund for the liquidation of his debts, according to a prescribed statutory order. The distinction between real and personal assets is still of importance, as it is a general rule that real estate is not to be taken for the payment of debts until the personal property is exhausted. A testator may by a sufficiently clear direction in his will avoid the effect of this rule, and make his real estate the primary fund for the payment of his debts.

Assh'ur, or **Ash'ur,** an ancient and populous city, capital of Assyria, on the Tigris, 10 miles below Calah, and 60 miles S. of Nineveh. Its site is marked by extensive ruins at Kileh Sherghat. Here is a large square mound or platform two and a half miles in circumference, about 100 feet above the level of the plain, and composed in part of sun-dried bricks. Cuneiform inscriptions of great interest have been found here.—A son of Shem was also called Asshur, from whom the name of the city was derived.

Assien'to (or, preferably, **Asiento**), a word applied to treaties which the government of Spain made with several foreign nations for the purpose of supplying her colonies with negro slaves. The first of the assientos was made with the Flemings, in the reign of the emperor Charles V. The Genoese obtained the contract in 1580. The privilege was transferred to the Portuguese in 1696, and to the French in 1701. The English acquired it by the treaty of Utrecht, 1713, but resigned or sold it to Spain about 1750, since which no such contract has been made.

Assignat, paper money issued by the French government in 1790, and at subsequent periods of the revolutionary régime. It was based on the security of the national domains, which consisted of the confiscated estates of the Church and wealthy *émigrés*. The total amount of assignats issued was 45,578,000,000 francs. The public credit having been ruined by the reign of terror and anarchy, the value of the assignats declined lower and lower. In June, 1793, one franc in silver was worth three francs in paper. The government, in order to check their depreciation, passed a law to fix the maximum prices of commodities, the effect of which law was very injurious to trade. In Mar., 1796, one franc in gold was equivalent to three hundred francs in paper. In July of that year the assignats were recalled, and replaced by the *mandats*.

Assign'ment [from the Lat. *assigno*, to "appoint"], in law, the act of making over to another one's estate or interest. The person making the assignment is an *assignor;* the recipient is an *assignee*. The word is mainly used in reference to transfers of leases, incorporeal rights, such as copyrights and patents, and rights of action. Such transfers are to some extent by statute law required to be in writing. It is a rule of *common law* that a thing in action is not assignable, though this doctrine is not followed in a court of *equity*, an assignment being regarded in that court as in the nature of a declaration of trust, so that the assignor becomes a trustee for the assignee. There are some exceptions to this rule, as in the case of mere personal causes of action and cases where public policy intervenes. Such an assignee simply takes the rights of his assignor, and holds subject to any defences which the debtor could urge against his creditor. There is a class of things in action not subject to this infirmity, such as bills of exchange, promissory notes, checks upon banks, and public securities payable to order or bearer. He who purchases these in good faith and before maturity, for a valuable consideration, may shut out for the most part the defences which might have been urged against the payee. Such paper is termed negotiable. In this way the distinction between that which is negotiable and that which is assignable becomes of great practical consequence. It is a frequent practice on taking an assignment of a claim to obtain a statement from the debtor that he has no defence to it. He would then be precluded from setting up any that he might have on the doctrine of estoppel.

The word "assignment" is also used to indicate the act of setting apart dower for a widow in the real estate of her husband. It is also employed in case of bankruptcy or insolvency, to indicate the act of transfer of a failing debtor's property to a person called an assignee, who is substantially a trustee for the benefit of the creditors. A failing debtor by the laws of some States is permitted to make a voluntary and even preferential transfer to an assignee acting in the same general manner, though such laws are substantially superseded for the time being when there is a U. S. bankrupt law in operation. T. W. Dwight.

Assi'si [Lat. *Assis'ium*], a town of Italy, province of Perugia, is built on a steep hill, 13 miles S. E. of Perugia. It is surrounded by a wall flanked with towers, and has a cathedral built in the eleventh century, and many monasteries. It is the native place of Saint Francis, and in its churches and convents are remarkable paintings by Cimabue and Giotto. Here is a large and beautiful Gothic structure called Convento Sacro, which is adorned with fine paintings. Among the remains of the ancient Assisium is a beautiful portico of the temple of Minerva. Pop. 3333.

Assis'tance [from the Lat. *ad*, "near," and *sisto*, to "stand"], **Writ of,** a direction by the court of chancery to the sheriff to put a party in whose favor a decree has been

rendered in possession of land to which the decree has declared him to be entitled.

Assize [from the Lat. *assideo*, to "sit near"], the name of an ancient English court; a writ to recover the possession of a freehold. The word is used in the plural to denote the stated sittings of the judges of the superior courts in England in the various counties, by virtue of several commissions, to try civil and criminal cases.

Asso'ciated Press, an association of newspapers in the U. S. for the collection of news. Its principal centre is at New York, but there are subordinate centres, as at Cincinnati, Chicago, and Washington, to which items of news are transmitted, to be there condensed and distributed to the various journals. Besides this, there are rival associations which perform a similar work. In Europe the Baron Reuter has almost a monopoly of this kind of business, but American journals have always opposed the establishment of his system on this continent.

Asso'ciate Pres'bytery, in Scotland, dating from 1733, founded in opposition to aristocratic dictation in the settlement of ministers. In 1747 a split occurred on the question of the "Burgess Oath," resulting in the formation of the ASSOCIATE SYNOD and the GENERAL ASSOCIATE SYNOD. In 1820 this schism was healed, only a few ministers, belonging to the GENERAL ASSOCIATE SYNOD, protesting against the union. (See UNITED ORIGINAL SECEDERS and UNITED SECESSION CHURCH.)

ASSOCIATE REFORMED SYNOD OF NEW YORK, composed of two presbyteries which refused to join the UNITED PRESBYTERIAN CHURCH, formed in 1858 by bringing together the Associate and Associate Reformed churches. In 1860 they reported 16 ministers, 14 churches, and 1631 members; in 1867 they reported only 11 ministers.

ASSOCIATE REFORMED SYNOD OF THE SOUTH, a small Presbyterian body which in 1860 reported 68 ministers, in 1867, 65, and in 1872, 67.

ASSOCIATE SYNOD OF NORTH AMERICA, like the Associate Reformed Synod of N. Y., persons who declined the union of the Associate and Associate Reformed churches in 1858. In 1860 they reported 11 ministers, 32 churches, and 778 members, chiefly in Indiana, Illinois, and Iowa; in 1867, they reported 14 ministers, 40 churches, and 1221 members.

Associa'tion [from the Lat. *ad*, "to," "together," and *so'cius*, a "companion"], a union of persons; a company; a society formed for the transaction of some business for mutual advantage; a company formed for the advancement of science or literature.

Associa'tion, British, the title of an annual reunion of the most eminent scientific men of Great Britain, who meet at different places, and report the progress and new discoveries made in their respective departments of science. The American Association for the Advancement of Science was formed in 1847.

Association of Ideas (otherwise called **Mental Association,** or simply **Association, Suggestion, Connèction of Ideas, Train of Thought, Succession of Thoughts**), etc., a principle or law in mental philosophy exercising an important influence upon the operations of the mind. "When a traveller visits the ruins of Athens or of Rome, the plain of Pharsalia or of Marathon, the sight of these places awakens the memory of the men and of the deeds which have made them glorious." The names of the great recall their achievements. A portrait revives similar memories, and calls up emotions which might have seemed dormant for ever.

> "It may be a sound,
> A tone of music, summer's eve, or spring,
> A flower, the wind, the ocean, which shall wound,
> Striking the electric chain."—*Byron.*

These facts rest upon the reciprocal power of thought to evoke thought. Under this power arises what is called the association of *ideas*, but its law is the law of intellectual gravitation—its sphere is the universe of mind. It is wider than "ideas," and extends to all our mental modifications. Our cognitions, emotions, and active powers, all come under the law of association. Our feelings, our willings, and our efforts are as completely held in groups by internal bonds as our ideas are.

Association may connect ideas by a simple link or by a multitude of links. The idea of the civil war of England prompts the question, "What is the value of a Roman denarius?" There are no two thoughts so remote as to have no link. Association has, therefore, infinite possibilities.

The laws of association have been variously enumerated. Some of the most obvious and important are—

1. Simultaneity and succession, synchronism and chronology. Thus, Cæsar and Pompey, Luther and Leo, Charles I. and Charles II.; Aristotle back to Plato, Descartes on to Spinoza.

2. Contiguity and remoteness between ourselves and the things, or between the things themselves: New York and Brooklyn, ourselves and our antipodes. We think of Mercury as nearest the sun, and that suggests Neptune as the farthest off.

3. Resemblance and contrast to the eye in works of art, which recall the original to the mind: metaphor; punning rests on the association of sounds that resemble with things that differ. Night recalls day, sickness recalls health, war recalls peace.

4. The logical relations involve association of ideas, though not all association of ideas is logical: cause and effect, workmen and work, father and child, the universe and God, object and means, analogy, premiss and conclusion, part and whole. The relations of physical, mechanical, and cosmical order are of the same kind, and hence association is the mother of invention and discovery.

5. The association of the verbal sign with the thing signified, which is the essence of language and the necessary preliminary to reasoning. Two or more of these causes may co-operate in particular cases, or the thing may in one aspect give rise to one association, in another aspect to another. Aristotle reduces the principle of association to three parts: Proximity in time and contiguity in place as one; resemblance, contrast. Hume says: "There appear to be only three principles of connection among ideas—namely, resemblance, contiguity in time or place, and cause or effect. A picture naturally leads our thoughts to the original (resemblance); the mention of one apartment introduces an inquiry concerning the others (contiguity); we think of a wound and the pain which follows it (cause and effect)." Augustine reduces the principle to one: What is once together is afterwards together. Hobbes says: "The cause of the coherence or consequence of one conception to another is their first coherence or consequence at that time when they are produced by sense." Cardaillac (1830) in substance repeats Hobbes when he says that simultaneity is the common condition of all the other connections: nothing can be linked now that has not been linked before. Hamilton in the same way reduces the laws to two, simultaneity and affinity; and these two laws, he asserts, are only modifications of one law, redintegration, or totality: "Those thoughts suggest each other which had previously constituted parts of the same entire or total act of cognition." This is ending where Augustine began. Hamilton maintains that a third thought may be associated with a first through a second which "does not rise into consciousness," "suggestions passing through one or more ideas which do not themselves rise into consciousness." This false theory in metaphysics he illustrates by an example drawn from a false theory in physics—to wit, that billiard-balls in a row, intermediate between the first one, which is struck, and the last one, which flies off, remain motionless. Hamilton's whole position and argument are marked by the crudity and self-contradiction which often mar his lectures. The true theory in such cases is, that the acts of consciousness are too rapid to mark themselves deeply and distinctly enough in memory to be carried on by it to the end of the process. Reflection usually with very little difficulty articulates all the parts. When Hamilton reflectively associated Ben Lomond with the Prussian system of education, he simply did slowly what he had done before rapidly. The human mind is subtler than light, far beyond the degree in which light is subtler than lead. Consciousness is the essential condition of an idea. Memory, as objectively separated in time from consciousness, is not essential to it. Both can be born together, and both die together. A precedence in the order of thought must not be confounded with a precedence objectively in time. Alexander Bain reduces the primary attributes of intellect to three, of which the third is retentiveness, the facts connected with which may, with few exceptions, "be comprehended under the principle called the law of contiguity or contiguous adhesion. The principle of contiguity has been described under various names—as Hamilton's law of 'redintegration,' the 'association of ideas.' The principle may be stated thus: Actions, sensations, and states of feeling, occurring together or in close succession, tend to grow together or cohere in such a way that when any one of them is afterwards presented to the mind, the others are apt to be brought up in idea." Bain further discusses agreement, law of similarity, compound association, constructive association.

Not all ideas once integrant are necessarily redintegrated. The strength of the impression which they originally made, their duration in fellowship, the time which has elapsed since we had them, the cogency of their connection, are all determining forces. But in advance of all this the tendencies of the law of association in the particular individual are determined by the native constitution of his mind and by the circumstances of his whole training, mental and moral. These tendencies carried out make the poet or the math-

ematician, the sensualist or the sage. An illegitimate association of ideas may mar a whole life, may work out crime and ruin. One and the same thing may be to two persons a deadly or a reviving savor. The same flag calls forth the fiercest assaults and the most vigorous defence. The same strain of music awakens joy, sadness, hope, or despair. The poem of Wordsworth on the "Power of Sound" is but an exquisite painting of one class of illustrations of the power of association. There are national tendencies under this law as well as individual. Governments and societies are built for ages on the ideas associated with a single central idea embodied in a word. It is the association of ideas which makes the mightiest and holiest bond of our life—the tie of the home, the native land, the Christian communion. It makes the heart of the Swiss sicken and die for the little rocky mountain-nook which is associated with the "Ranz-des-Vaches." The principle of the association of ideas is therefore not only of profound interest in psychology, but has great importance in morals. Like every power of man, it comes under the law of moral responsibility. Association is in certain respects involuntary, and habit can in any case carry it beyond the proper control of the will. But the will can largely determine what shall be the original links of association, and bear an important part in determining whether we shall follow up or repress a particular class of associated ideas. The association of a profane or ludicrous idea with a sacred name or fact may make that name or fact through a whole lifetime the means of recalling blasphemy or mockery.

The attempts to account for the association of ideas are of course affected by the general features of the different systems. The effort to give them in whole or in part an organic mechanical relation has been made by Descartes, Hartley, Bonnet, and a number of later writers, who relate them to brain-fibre and the nerve. Locke says: "They seem to be but traces of motion in the animal spirit." Kant ("Anthropologie") truly says: "It is in vain to look for a physiologic solution of them." This wonderful power of the human mind is part of the perfection which it owes to the Great Being who is its author. The thinker who makes ideas and their associations physical things, is as extravagant as the idealist who converts the solid earth into a mere relation between the mind that thinks of itself and the mind itself thus thought of. The materialist and the absolute idealist are the antipodes of the one world of extravagance in thought. The later psychologists, Herbart, Benecke, and others, have made clearer the twofold character in the association of ideas: First, where the associated elements are homogeneous, and produce what Herbart calls perfect fusion; second, where the elements are heterogeneous, and result in complication or imperfect fusion. This distinction is regarded as of great value for the entire soul-life, but especially with reference to the points at which the approaches of soul to the physiological processes are closest.

A well-regulated association of ideas on our own part, and a delicate perception of what is likely to be the association in the minds of others with particular words or things, are essential to the charm of conversation and of social intercourse. Without both of these a good and intelligent man may be a bore and a nuisance. One of the characteristic differences between logic and wit is, that logic keeps the association of ideas under the control of reason, while wit uses it for combinations which triumph over reason and carry it away a delighted captive. The active imagination is the result of this force of the association of ideas. The imagination no more creates its own primary elements than the painter creates the matter of his colors or his canvas. The imagination selects and combines what the law of association furnishes. Its most daring so-called "creations" are capable of an easy analysis, which shows that they are shaped under this law. The memory is largely dependent upon association. (See MEMORY and MNEMOTECHNICS.) Various uses have been made of the principle of association in philosophy. Hume employs it to explain the idea of causality; Reid and others to account for the force of habit. But though the association of ideas can become the subject of culture, it is, as we have seen, primary and innate.

The association of ideas has been observed by thinkers from an early period. Aristotle speaks of it in his "Treatise of Reminiscence" very briefly, but in a manner worthy of his wonderful acuteness. It is to Locke, however, in the latest edition of his "Human Understanding," we owe the first discussion of the subject with a fulness at all commensurate with its importance; and no system worthy of the name, since Locke, has failed to devote a large space to it. C. P. KRAUTH.

Asso'net, a village of Freetown township, Bristol co., Mass., on a branch of the Old Colony and Newport R. R., 10 miles N. E. of Fall River.

Assolant (JEAN BAPTISTE ALFRED), a French author, born in 1827, who commenced active life as a teacher of history in Poitiers. He travelled over the American continent. Returning to France, he published in the "Revue des Deux Mondes" several novels founded upon his American adventures, and published later various romances. His best known works are "Butterfly," "Acacia," and "Une Fantaisie Americaine." He has been also a very popular journalistic writer.

Assouçy, d' (CHARLES COYPEAU), a French burlesque poet, born in 1604, who styled himself "The emperor of burlesque," and who was called by others "Scarron's ape." He wrote many humorous poems, among them "Ovide en belle Humeur" and "Ravissement de Proserpine," in which the humor was dull, and their author provoked the satire of Boileau, who wrote of him

> "Le plus mauvais plaisants eut des approbateurs
> Et jusq' a d'Assouçy, tout trouva des lecteurs."

Died in 1679.

Assump'sit [Lat. "he has undertaken"], an agreement not under seal, either express or implied; a common-law action to obtain damages for the violation of such an agreement. It is usually divided into common or *indebitatus assumpsit*, brought in general upon an implied promise; and special assumpsit, which is founded on an express promise.

Assump'tion, a parish in the S. E. of Louisiana, area 320 square miles. It is bounded on the W. by Grand River, and intersected by the navigable bayou La Fourche. The surface is nearly level; the soil is fertile and adapted to the sugar-cane. Sugar, molasses, rice, and corn are the chief crops. Capital, Assumption. Pop. 13,234.

Assumption [Sp. *Asuncion*], a city of South America, the capital of Paraguay, is situated on the left (E.) bank of the river Paraguay, 645 miles N. of Buenos Ayres; lat. 25° 16′ 29″ S., lon. 57° 42′ 42″ W. It was founded by the Spaniards in 1536. It has a cathedral, five churches, a government palace, a college, a public library, etc. Hides, tobacco, timber, and *yerba maté* (or Paraguay tea) are shipped here by the river. The houses are mostly built of brick, one story high. Pop. about 48,000.

Assumption, a post-village and township of Christian co., Ill., on the Illinois Central R. R., 23 miles S. of Decatur. It has a weekly paper, two flouring-mills, and a number of stores. Pop. 590; of township, 1246.
JOHN P. MARNEL, PUB. "ASSUMPTION PRESS."

Assumption, a post-village, the capital of Assumption parish, La., 40 miles S. of Baton Rouge.

Assump'tion of the Vir'gin, a festival of the Greek and Roman churches in commemoration of the resurrection and miraculous ascent of the Virgin Mary to heaven. It is held on the 15th of August. Protestant Christians unanimously reject the tradition of these events. The full tradition of the Assumption is given in Saint Alphonso Liguori's "Glory of Mary."

Assump'tion of Mo'ses, a pseudepigraphical or apocryphal book containing a pretended account of the death of Moses and of the assumption of his soul to heaven. Some suppose that Saint Jude alludes, in his reference to the contest between the archangel Michael and the devil, to the statements made in this book; but it is not certain that it existed in apostolic times.

Asswan, as-swân′, **Assouan,** or **Essuan** (anc. *Syene*), a town of Upper Egypt, on the right bank of the Nile, near the border of Nubia, 115 miles S. of Thebes; lat. 24° 5′ N., lon. 33° E. It is two and a half miles below the First Cataract, and is remarkable for its picturesque situation and ancient monuments. Here are quarries of syenite, a variety of granite which derives its name from Syene. From these quarries came the red obelisks that adorned various temples of Egypt. Here are also ruins of a large Saracen or Arabian town, among which are found many Cufic inscriptions. Here, according to some authorities, the poet Juvenal died in exile about 125 A. D., but others deny the truth of the statement. Pop. 4000.

As'sye, or **As'saye,** a village of the Nizam's dominions, in Hindostan, 24 miles N. of Jaulna, was the scene of the duke of Wellington's first great victory. On the 23d of Sept., 1803, with a force of 2000 British and 2500 natives, he utterly defeated the Mahrattas, numbering from 30,000 to 50,000 men, partly officered by the French. Wellington, then Gen. Wellesley, captured 98 cannon, and lost 1560 killed and wounded.

Assyr'ia [Gr. *Ἀσσυρία*], the Latin name of an ancient and powerful kingdom (called also **Asshur** and **Assura**) of Western Asia, was bounded on the N. by Armenia, on the E. by Media, on the S. by Babylonia, and on the W. by Mesopotamia, or the river Euphrates. Assyria proper appears to have coincided very nearly with the modern Kurdistan, but the dominions of the most powerful

Assyrian monarchs had a much greater extent. According to George Rawlinson, "The site of the second or great Assyrian monarchy was the upper portion of the Mesopotamian valley. The cities which successively formed its capitals lay, all of them, upon the middle Tigris, and the heart of the country was a district on either side of that river enclosed between the 35th and 37th parallels of latitude. By degrees these limits were enlarged, and the term Assyria came to be used in a loose and vague way of a vast and ill-defined tract extending on all sides from this central region." The high mountain-chain of Zagros formed the natural eastern boundary of this region, which was also bounded on the N. by a snowy mountain-range called Mons Niphates. The surface was mostly a plain diversified with several ridges or ranges of limestone hills. The soil of the plains and valleys was exceedingly productive, so that the fertility of Assyria was a favorite theme of ancient writers. It is probable that this fertility was promoted by artificial irrigation, for Herodotus states that but little rain fell in Assyria. The country on the eastern side of the Tigris was well watered by rivers—namely, the Greater Zab, the Adhem, the Lesser Zab, and the Dialas or Diyâleh. The word *Assyria* is probably derived from Asshur (or Ashur), which was the name of a son of Shem and of the chief god worshipped by the Assyrians.

History.—The early history of Assyria is involved in obscurity. According to the book of Genesis (chap. x.), Nineveh, the capital of this kingdom, was founded by Nimrod, the son of Cush, or by Asshur, a son of Shem. This ambiguity arises from the fact that in the Hebrew text Asshur means sometimes Assyria, and sometimes a son of Shem. The cuneiform inscriptions indicate that the most ancient capital was the city of Asshur, on the Tigris, about 60 miles S. of Nineveh. The Assyrians belonged to the Semitic family of nations. Their features, sculptured on monuments recently discovered along the Tigris, present a striking resemblance to those of the Jews and Arabs. They were remarkably warlike, and, according to the prophet Isaiah, were "a fierce people." Their pride, treachery, and violence are also denounced by several Hebrew prophets.

In relation to the history and chronology of Assyria we have only three original authorities—Herodotus, Ctesias, and Berosus. According to Herodotus, who is confirmed to some extent by Berosus, the empire commenced about 1270 B. C., and endured about 650 years, but Ctesias gives it a duration of more than 1300 years. "The cuneiform monuments," says George Rawlinson, "while they generally confirm Herodotus, contradict Ctesias perpetually." It is probable that several kings reigned over Assyria before the empire was founded, as an empire implies the previous and gradual growth of a nation. Among the early kings whose names are found on bricks at Kileh-Sherghat is Bellush, who is supposed to have reigned about 1350–1330 B. C. His great-grandson, Shalmaneser I. (1290–70), is chiefly known in history as the founder of Calah, the second capital of Assyria. He was succeeded about 1270 B. C. by his son, Tiglathi-nin, called the conqueror of Babylon, who is the first king of whom extensive conquests are recorded. Passing over several kings of whom nothing is known but their names, we come to Tiglath-pileser I., a powerful monarch who reigned about 1150. His conquests are recorded on a terra-cotta cylinder which is now in the British Museum, and is perhaps the earliest Assyrian historical document that has been discovered. In his reign Assyria was probably the most powerful kingdom in the world, except Egypt. Among the other Assyrian conquerors was Asshur-danni-pal (the Sardanapalus I. of the Greeks), who, according to Rawlinson, began to reign in 884 B. C., and extended the boundaries of Assyria by conquests. He compelled Tyre and Sidon to pay tribute to him, and reigned about twenty-five years, during which Assyria made rapid progress in wealth and art. He excelled all his predecessors in the grandeur of his public buildings, and erected a great palace at Calah (Nimrood), which is the most magnificent Assyrian edifice that has been discovered, except the palace of Sennacherib at Nineveh. This palace of Asshur-danni-pal, which was 360 feet long, was adorned with sculptures, many of which are now in the British Museum. He was succeeded by his son, Shalmaneser II., who defeated Ben-hadad, king of Damascus, and his successor, Hazael. The events of his long reign are recorded on an obelisk of black basalt (about seven feet high) which was discovered by Mr. Layard at Nimrood in excellent preservation. The statement of Ctesias, that Ninus founded the Assyrian empire, and that his wife Semiramis conquered Ethiopia and invaded India, is generally considered fabulous, but among the Assyrian monuments occurs the name of Sammuramit, the wife of Iva-lush (810–781 B. C.). Recent explorers of history have substituted this Sammuramit, "a very prosaic and commonplace princess," for the famous and heroic Semiramis of the Greek legends, which appear to have had a very slight basis of fact.

The second book of Kings states that Pul, king of Assyria, invaded Palestine, and received tribute from Menahem, king of Israel, about 750 B. C., but the name of Pul does not occur in the native inscription. The Hebrew sacred history also mentions Tiglath-pileser II., who began to reign about 745 B. C., and waged war with success against the kings of Syria, Israel, and Tyre (2 Kings xv. 29). By his victories over these and other nations he re-established the power of Assyria in the region between the desert and the Mediterranean. He was succeeded by Shalmaneser, who subdued Hoshea, king of Israel, and reigned about six years. The next king was Sargon, who usurped the throne about 721 B. C., and was victorious in expeditions against many nations or tribes. He defeated the army of Egypt, and dethroned Merodach-baladan, king of Babylon, which he annexed to his own empire. He was succeeded about 704 B. C. by his son, Sennacherib, who was the most celebrated of all the Assyrian kings, and was distinguished for his pride, ambition, and warlike enterprise. His long reign was signalized by many victorious expeditions. He defeated the Egyptians near Ekron, subdued the Philistines, and invaded the dominions of Hezekiah, king of Judah, from whom he took many fenced cities, and carried away about 200,000 Jews into captivity. Having forced Hezekiah to pay tribute to him, he returned to Nineveh, his capital, where he built a magnificent palace, which surpassed in size and splendor all earlier edifices, and was adorned with excellent sculptures. This palace was partly exhumed by Mr. Layard, who excavated on its ground floor sixty-eight chambers, and a hall 180 feet long. In a second expedition against the king of Judah and his ally, the king of Egypt, he failed disastrously (see 2 Kings xviii. and xix.), his army being destroyed by a miracle in the night at Pelusium. "The total destruction of the empire in consequence of this blow," says Rawlinson, "is an exaggeration of Josephus. Sennacherib did not die till 680 B. C., seventeen years after his misfortune. . . . He wisely turned his sword against other enemies, and was rewarded by important successes upon all his other frontiers." Sennacherib was assassinated by two of his sons, and was succeeded by another son, Esar-haddon, who reigned thirteen years, and held his court alternately at Nineveh and Babylon. Among his exploits was the conquest of Egypt. He died about 667 B. C., and left the throne to his son, Asshur-bani-pal (or Sardanapalus), who was eminent as a warrior, builder, and patron of art. He extended the limits of the empire in almost every direction, and built a grand palace at Nineveh (Koyunjik). This palace was remarkable for the beauty of the bas-reliefs and other ornaments. The sculptures of this reign are much superior to the earlier in spirit and freedom from conventionality. The empire declined rapidly after the death of Asshur-bani-pal, who was succeeded by his son, Saracus, a weak and effeminate prince. In his reign occurred a great inroad of Scythians, who ravaged Assyria and other civilized countries, about 630 B. C. Soon after this event, Cyaxares the Mede formed a league with Nabopolassar, governor of Babylon, against Saracus. These allies took and destroyed Nineveh in 625 (or, as some say, 606 B. C.), and Assyria then became a province of Media.

Language and Religion.—From the mounds of Mesopotamia have been exhumed a large mass and variety of documents in the Assyrian language, in cuneiform characters. These documents confirm the previous opinion of the learned that the language was Semitic. They were inscribed on slabs of stone, with which the walls of palaces were panelled, on obelisks of stone, on clay tablets, and on cylinders (or, more strictly, hexagonal prisms) of fine terra-cotta, two or three feet long, which the Assyrian kings deposited at the corners of temples. These so-called cylinders were covered closely with small inscriptions, which, says G. Rawlinson, "it often requires a good magnifying-glass to decipher." The materials which they used most extensively for records and literary documents were stone and plastic clay, the latter of which, being afterwards baked, has resisted the ravages of time as well as stone. The number of characters was very great—about 300, all wedge-shaped, but with a great variety in the form of the wedge. (See CUNEIFORM INSCRIPTIONS.) "The Assyrian characters," says George Rawlinson, "correspond not to letters, according to our notion of letters, but to syllables." A grammar of the Assyrian language has been published by Ménant, and a dictionary by Norris (London, 1869).

The religion of the Assyrians was a gross polytheism, and nearly identical with that of the Chaldeans or Babylonians. The principal objects of their worship were Asshur, Anu, Bel, Iva, Beltis, Nisroch, Nebo, Nin, Shamas, and Sin. At the head of the Assyrian Pantheon stood Asshur, a thoroughly national deity, whom they styled the "Great Lord," the "King of all the Gods." The tutelage

of Asshur over Assyria is strongly marked by the identity of his name with that of the country, which in the original is complete.

Architecture, etc.—The artistic genius and multifarious ingenuity of the Assyrians, and their highly civilized condition, are abundantly proved by the remains of art which have been exhumed near the Tigris by M. Botta and Mr. Layard. As architects, as sculptors, as designers and engravers, it is evident that they equalled or surpassed all other Asiatic nations. Ancient Hebrew and Greek traditions concur in representing the Assyrians as renowned in early ages for skill in architecture. They lavished great

Portal or Doorway of the Palace of Khorsábád. (Bas-relief.)

labor and ornament on royal palaces, compared with which their temples were rather insignificant. The Assyrian palace, constructed mainly of sun-dried bricks, uniformly stood on an artificial platform, which was commonly composed of bricks. It contained a great number of rectangular chambers and several grand halls, richly ornamented with sculptures, which are designed with excellent taste and display an artistic genius of a high order. These halls are lined or panelled with slabs of marble or other stone, which are profusely adorned with bas-reliefs and covered with historical inscriptions. "Of all the Assyrian works of art,"

Winged Bull with a human head, from Nimrood; now in the British Museum. (Bas-relief.)

Colossal Lion from the Great Mound at Nimrood. Length, 12 feet; height, 7 feet 8 inches. (Bas-relief.)

says Rawlinson, "which have come down to us, by far the most important are the bas-reliefs. They used the bas-relief for almost every purpose to which mimetic art is applicable." These represent battles, sieges, naval operations, hunting-scenes, processions, and scenes of ordinary life. The use of the column appears to have been rare in Assyrian palaces, where it sometimes occurs in interior doorways. The accompanying illustrations may serve to give the reader an idea of the general style of the Assyrian sculptures, discovered by Mr. Layard, M. Botta, and others.

"The imperial palace of Sennacherib," says Mr. Fergusson, "is, of all the buildings of antiquity, surpassed in magnitude only by the great palace-temple of Karnac; and when we consider the vastness of the mound on which it was raised, and the richness of the ornaments with which it was adorned, it is by no means clear that it was not as great, or at least as expensive, a work as the great palace-temple at Thebes." (*Handbook of Architecture*, vol. i.) Among the remarkable remains of Assyrian art now in the British Museum are the winged and human-headed lions, twelve feet high, and winged bulls of similar dimensions. (See NINEVEH.) (See also LAYARD'S "Nineveh and Babylon," 1853; LAYARD'S "Nineveh and its Remains," 2 vols., 1849; G. RAWLINSON, "The Five Great Monarchies of the Ancient Eastern World," 4 vols., 1862–67; BONOMI, "Nineveh and its Palaces," 1857; GUMPACH, "Abriss der Assyr. Babyl. Geschichte," 1859; NIEBUHR, "Geschichte Assurs und Babels seit Phul," 1857.) WILLIAM JACOBS.

Assyr'ia, a post-township of Barry co., Mich. P. 1175.

Ast (GEORG ANTON FRIEDRICH), an eminent German philologist and critic, born at Gotha in 1776. He was appointed professor of classical literature at Landshut in 1805, and obtained the same chair in the University of Munich in 1826. He wrote, besides other works, a "Manual of Æsthetics" (1805) and "The Life and Writings of Plato" (1816). He also published a good edition of the works of Plato, with a Latin version and a commentary (11 vols., 1819–32). Died Dec. 30, 1841.

As'tacus [a Latin word signifying "lobster"], a genus of crustaceans, including the cray-fishes of Europe and the Pacific States of the U. S.

Astar'te [Gr. Ἀστάρτη], or **Ash'taroth,** the chief goddess worshipped by the Phœnicians, Syrians, and Carthaginians. She is considered by some as the original of the Greek Aphrodite (Venus). Others identify her with Cybele, and others again with Juno. As Baal was the god of the sun, so Astarte was the goddess of the moon. She is variously represented, but more usually with four wings (the two uppermost of which are intended to symbolize the horns of the moon), wearing a pointed cap, and holding a dove in her hand; as shown in the accompanying illustration, taken from an image of Astarte found in Etruria. The Syrians built to her a famous temple at Hierapolis. Her chief temples, besides that at Hierapolis, were at Tyre and Sidon. (See Appendix (Essay 1.) to book iii. in vol. ii. of RAWLINSON'S "Herodotus.")

Astarte.

Astar'te, a genus of bivalve mollusks, the type of the

family Cyprinidæ, nearly related to the Veneridæ. Fossils of some 200 extinct species are widely distributed over the world. Some of them are found in the lias formation. Fifteen or twenty species of *Astarte* now exist in the deep sea in various parts of the world.

Astat'ic [Lat. *astaticus;* from the Gr. *a*, priv., and ἵστημι, to "stand"], a term applied to the magnetic needle when it is withdrawn from the action of the earth's magnetism, and has no longer the *statical* position in which it is *in equilibrio* with the influence of this force. A needle is rendered astatic by placing the axis about which it is movable in the direction in which terrestrial magnetism acts, because it cannot then receive any motion from the force, and will rest in any position. This effect is more usually produced by neutralizing the action of the earth by means of an equal and opposite magnetic action; that is, by placing the needle vertically above or below a second magnetic needle, the N. pole of which is in juxtaposition with the S. pole of the first needle.

As'ter [from the Gr. ἀστήρ, a "star"], a genus of plants of the natural order Compositæ, which Lindley proposes to call Asteraceæ. This genus comprises a great number of species, generally herbaceous, mostly natives of the U. S. Many of them are cultivated in the gardens of Europe for the beauty of the flowers, which bloom from July to November. The ray-florets, which are never of the same color as the disk, are purple, blue, violet, white, etc. Among the remarkable American species are *Aster Novæ Angliæ*, *Aster puniceus*, *Aster cyaneus*, and *Aster spectabilis*. The China aster (*Aster Chinensis; Callistephus Chinensis*) is a favorite garden flower in England and the U. S. Many varieties are cultivated, and present a great diversity of colors. They prefer a rich soil, and continue to bloom until the end of autumn.

Asteracan'thus ["star spine"], a genus of fossil sharks, of which only the dorsal defensive spines are known. These are found in the mesozoic rocks of England, and were named by Agassiz from the stellate tubercles with which they are ornamented.

Aste'rius, or **As'ter,** a Father of the Church, supposed to have been born at Antioch about 340 A. D. Little is known of his life except that he was bishop of Amasea, in Pontus. Some of his homilies are extant.

As'teroids [Gr. ἀστεροειδής, "resembling a star," from ἀστήρ, a "star," and εἶδος, "form," "resemblance"], the name given to members of the zone of small planets travelling between the orbits of Mars and Jupiter. They are so called because they are not readily distinguishable from the fixed stars save by the experienced observer. The discovery of the first known members of this group of celestial bodies forms one of the most interesting chapters in the history of astronomy. It had long been noticed that a large gap separates the orbit of Mars from that of Jupiter. Not, indeed, that the actual distance between these orbits is even so great as that which separates the orbits of Jupiter and Saturn, but the orderly increase observable in the planetary distances as we proceed outward from the sun is obviously marred by the sudden increase which marks the interval between the orbits of Mars and Jupiter, as compared with that between the orbits of the earth and Mars. This circumstance led Kepler, and afterwards Titius, to express the opinion that an undetected planet revolves between Mars and Jupiter. The discovery of the planet Uranus, whose mean distance corresponds exactly with Bode's law (see Bode), led this eminent astronomer to recommend that search should be made for such a planet. Accordingly, for the first time in the history of astronomy, an empirical law—a law whose cause is even now not recognized—led astronomers to commence a systematic survey of the heavens. Through the exertions of Baron de Zach an association of twenty-four astronomers was formed. These observers divided the zodiac among them, and soon after the beginning of the present century the search for the new planet was fairly commenced. But the discovery did not fall to the lot of any of those who had undertaken the search. As in the case of the planet Uranus, an apparent accident brought the first discovered member of the family of asteroids under the notice of an astronomer who richly merited such a success, though actually engaged on work of another character. Piazzi, then at work on his great catalogue, was carefully surveying the constellation Taurus, when his attention was attracted by an apparent change of place in a small star which he had observed on the first day of the present century. By Jan. 3, 1801, he had convinced himself of the star's change of place. He communicated his discovery to Oriani and Bode, and continued his own observations until Feb. 11, when his labors were interrupted by dangerous illness. When his letters reached Oriani and Bode the planet had already approached too near to conjunction with the sun to be discernible. There seemed great risk that after all the planet would escape astronomers, since it would not be discernible before Sept., 1801, and the observations of Piazzi were deemed insufficient for the calculation of the planet's place after so long an interval. But Gauss, the eminent mathematician, came to the rescue, and after a careful study of all the observations made by Piazzi, he formed an ephemeris of the planet's path for several months in advance. At length, after an arduous search, De Zach redetected the planet on Dec. 31, 1801, Olbers (independently) discovering it on the following evening. After one year of doubt and difficulty, astronomers had succeeded in achieving a well-earned triumph for their science. It was found that the new planet travels at a mean distance of 2.767 from the sun, the earth's distance being unity, while Bode's law had indicated for it a distance of 2.8. It therefore fulfilled even more closely than was to have been expected this empirical law. It was called Ceres by Piazzi. But while astronomers were congratulating themselves on this new proof of the existence of law and harmony within the solar system, a fresh discovery threatened to throw all into disorder again. While searching for Ceres, Olbers had noticed with special care the arrangement of the small stars which lay near its assigned geocentric path. On Mar. 28, 1802, while examining a part of the constellation Virgo, he noticed a small star in a part of the heavens which had thus been rendered familiar to him, the star occupying a place where he felt sure no star had been visible while his search for Ceres had been in progress. In two hours he had recognized the planetary motion of this body. By April 28, Gauss had assigned to the newly-discovered planet, which received the name of Pallas, an orbit having a mean distance very little less than that of the planet Ceres. Thus there were now two planets where only one had been wanted to supply the gap in the planetary scheme. Olbers was led to expect that others would be found; and a search being instituted for the purpose of testing this view, Harding of the Lilienthal Observatory discovered, on Sept. 1, 1804, the planet Juno. Subsequently, on Mar. 29, 1807, exactly five years after his discovery of Pallas, and in the same region of the heavens, Olbers discovered Vesta.

No further addition was made to the family of asteroids until Dec. 8, 1845, when Astræa was discovered at Driessen by a German observer named Hencke. But from the discovery of Hebe, on July 1, 1847, not a year has passed without adding one or more asteroids to the list of known planets. In some years the progress of discovery has gone on more rapidly than in others. Thus, in 1861 *ten* asteroids were discovered; in 1868, *twelve;* while in each of the years 1863 and 1869 only *two* were discovered. But at present there seems to be no reason to expect that a year will ever pass without adding to the list. The following table presents all the asteroids discovered up to the date of writing, with the name of the discoverer and the date of discovery:

No.	Name.	Date of Discovery.	Discoverer.
1	Ceres	1801, January 1	Piazzi.
2	Pallas	1802, March 28	Olbers.
3	Juno	1804, September 1	Harding.
4	Vesta	1807, March 29	Olbers.
5	Astræa	1845, December 8	Hencke.
6	Hebe	1847, July 1	Hencke.
7	Iris	August 13	Hind.
8	Flora	October 18	Hind.
9	Metis	1848, April 25	Graham.
10	Hygeia	1849, April 12	De Gasparis.
11	Parthenope	1850, May 11	De Gasparis.
12	Victoria	September 13	Hind.
13	Egeria	November 2	De Gasparis.
14	Irene	1851, May 19	Hind.
15	Eunomia	July 29	De Gasparis.
16	Psyche	1852, March 17	De Gasparis.
17	Thetis	April 17	Luther.
18	Melpomene	June 24	Hind.
19	Fortuna	August 22	Hind.
20	Massalia	September 19	De Gasparis.
21	Lutetia	November 15	Goldschmidt.
22	Calliope	November 16	Hind.
23	Thalia	December 15	Hind.
24	Themis	1853, April 5	De Gasparis.
25	Phocea	April 6	Chacornac.
26	Proserpina	May 5	Luther.
27	Euterpe	November 8	Hind.
28	Bellona	1854, March 1	Luther.
29	Amphitrite	March 1	Marth.
30	Urania	July 22	Hind.
31	Euphrosyne	September 1	Ferguson, U. S.
32	Pomona	October 28	Goldschmidt.
33	Polyhymnia	October 28	Chacornac.
34	Circe	1855, April 6	Chacornac.
35	Leucothea	April 19	Luther.
36	Atalanta	October 5	Goldschmidt.
37	Fides	October 5	Luther.
38	Leda	1856, January 12	Chacornac.
39	Lætitia	February 8	Chacornac.
40	Harmonia	March 31	Goldschmidt.

No.	Name	Date of Discovery.	Discoverer.
41	Daphne	May 22	Goldschmidt.
42	Isis	May 23	Pogson.
43	Ariadne	1857, April 15	Pogson.
44	Nysa	May 27	Goldschmidt.
45	Eugenia	June 27	Goldschmidt.
46	Hestia	August 16	Pogson.
47	Aglaia	September 15	Luther.
48	Doris	September 19	Goldschmidt.
49	Pales	September 19	Goldschmidt.
50	Virginia	October 4	Ferguson, U. S.
51	Nemausa	1858, January 22	Laurent.
52	Europa	February 6	Goldschmidt.
53	Calypso	April 4	Luther.
54	Alexandra	September 10	Goldschmidt.
55	Pandora	September 10	Searle, U. S.
56	Melete	1857, September 9	Goldschmidt.
57	Mnemosyne	1859, September 22	Luther.
58	Concordia	1860, March 24	Luther.
59	Elpis	September 12	Chacornac.
60	Erato	September 14	Forster & Lesser.
61	Echo	September 15	Ferguson, U. S.
62	Danaë	September 19	Goldschmidt.
63	Ausonia	1861, February 10	De Gasparis.
64	Angelina	March 4	Tempel.
65	Cybele	March 8	Tempel.
66	Maia	April 9	Tuttle, U. S.
67	Asia	April 17	Pogson.
68	Leto	April 29	Luther.
69	Hesperia	April 29	Schiaparelli.
70	Panopea	May 5	Goldschmidt.
71	Niobe	August 13	Luther.
72	Feronia	May 29	Peters, U. S.
73	Clytie	1862, April 7	Tuttle, U. S.

133	Cyrene	August 16	Watson, U. S.
134	Sophrosyne	September 27	Luther.
135	Hertha	1874, February 18	Peters, U. S.

A new planet was also discovered by Watson July 29, 1873, but subsequent observations were prevented by cloudy weather, and it has not therefore been included in the above list.

The most remarkable characteristic of the asteroids besides their smallness is the relatively wide range of eccentricity and inclination among their orbits; so that in this last respect they may be said to be intermediate between the planets and comets. Their distances vary between two hundred and more than three hundred millions of miles. The eccentricity of Polyhymnia is no less than .339119, so that its greatest distance is more than twice its least. The inclination of Pallas is 34° 13′, so that the excursions of this planet above and below the ecliptic exceed, when taken together, the mean distance of the planet from the sun. Leverrier has shown, by means of calculations founded on the secular motion of the perihelion of Mars, that the combined mass of all the asteroids (discovered and undiscovered) cannot greatly, if at all, exceed one-fourth of the mass of our earth, and in all probability is much less than this. REVISED BY J. C. WATSON.

Asterol'epis [from the Gr. ἀστήρ, a "star," and λεπίς, a "scale," alluding to the marks on the dermal plates of the head], a genus of fossil ganoid fishes, described by Hugh Miller, from the Scotch old red sandstone. It is believed to have sometimes attained a length of twenty feet.

Asthma, az'ma [Gr. ἆσθμα, a "gasping for breath"], a term somewhat vaguely used to designate diseases characterized by difficulty of breathing, occurring in paroxysms; thus, spasm of the glottis is sometimes called "thymic asthma;" autumnal catarrh is known as "hay asthma;" the dyspnœa (difficult breathing) of Bright's disease has been, with questionable propriety, called "uræmic asthma;" and similar symptoms arising from heart or lung disease have also been mistaken for true asthma, which, however, may be associated with these various diseases. True asthma, according to Niemeyer, includes only those cases where the point of the irritation producing the attack is either at the origin of the vagus nerve or in some remote part of its course. This does not exclude cases of reflex asthma, such, for example, as may occur in uterine disease. Others state that irritability and hyperæmia of the bronchial mucous membrane are essential elements of the disease; and the readiness with which powdered ipecac., the exhalations from feathers, etc., will excite paroxysms, would appear to confirm this view. It is rare to find structural changes of any organ in cases of simple asthma. The trained diagnostician alone can discriminate between asthma and dyspnœa from other chest diseases. True or nervous asthma consists in a paroxysmal spasm of longer or shorter duration, attacking the muscular elements of the bronchial tubes, diminishing temporarily their calibre, and thereby obstructing respiration. Notwithstanding the great distress which may accompany the attack, the immediate danger is not great. The smoking of saltpetre-paper or of stramonium-leaves, the administration of opiates, coffee, belladonna, conium, cannabis, chloral, vapor of chloroform, etc., may or may not relieve the paroxysm. Iodide of potassium benefits many cases, permanently or temporarily. Quinia, Fowler's solution, iron, and other tonics are often useful. A nutritious diet, with careful regulation of the bowels, is important. The compressed air-bath is recommended as affording great relief during the paroxysm.

As'ti (anc. *As'ta Pompe'ia*), a city of Italy, in the province of Alessandria, is on the river Tanaro, and on the Turin and Genoa Railway, 36 miles by rail E. S. E. of Turin. It is a bishop's see, has a fine Gothic cathedral, a royal college, a theological seminary, a printing-office established in 1479, and many elegant mansions. Here are several manufactories of silk stuffs. This is the native place of the poet Alfieri. Asta Pompeia was a town of great antiquity. In the Middle Ages it was the capital of a republic, which existed from 1098 to 1155. Its light white and sparkling wine is in very great demand. Pop. in 1871, 31,033.

Astig'matism [from the Gr. α, priv., and στίγμα, a "mark" or "spot"] is the term applied to a peculiar defect in the eye which consists in its refracting the rays of light differently in different planes. The defect may be detected by looking at a small pinhole in a card held up against any bright object, and moved to different distances from the eye. To an ordinary eye the image of the hole remains circular at all distances, but to an eye having the peculiar defect in question the image of the hole, as the card is moved away from the eye, becomes elongated, and at a certain distance passes into a straight line. This imperfection may be corrected by means of a cylindrical or spherico-cylindrical lens.

Astol'phus, or **Astul'phus** [Fr. *Astolphe;* Ger. *Aistulf*], king of the Lombards, obtained the throne in 749 or 750 A. D. Having seized Ravenna about 752, he threatened Rome. The pope then applied for help to Pepin, king of the Franks, who defeated Astolphus in 754, and forced him to cede Ravenna and the Pentapolis to the pope. This is said to have been the origin of the temporal power of the popes. Died in 756 A. D.

As'ton, a township of Delaware co., Pa. Pop. 1845.

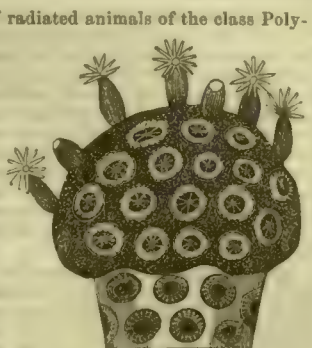
As'tor (John Jacob), born at Waldorf, near Heidelberg, in Germany, July 17, 1763, emigrated to the U. S. in 1783, and invested his capital in furs, which he took to London and sold with much profit. He next settled at New York, and engaged extensively in the fur-trade. He exported furs to Europe in his own vessels, which returned with cargoes of foreign commodities, and thus rapidly amassed a fortune. In 1811 he founded Astoria on the western coast of North America, near the mouth of the Columbia, as a dépôt for the fur-trade, for the promotion of which he sent two expeditions to the Pacific Ocean. He was remarkable for his sagacity and diligence in business. He purchased in New York a large amount of real estate, the value of which increased enormously. At his death (Mar. 29, 1848) his fortune was estimated at $20,000,000. He left $400,000 to found a public library in New York. (See Astor Library.)

Astor'ga, d' (Emanuele), Baron, an eminent musical composer, born in Sicily Dec. 11, 1681. He passed some years at the court of the emperor Leopold I., by whom he was patronized. After the death of Leopold (1705) he travelled in many countries of Europe. His chief work is a "Stabat Mater," which is much admired. He also produced "Daphne," an opera, and cantatas, one of which is called "Quando Penso." Died Aug. 21, 1736.

Astoria, a post-village and township of Fulton co., Ill., on the Rockford Rock Island and St. Louis R. R., 50 miles N. W. of Springfield. Pop. 2118.

Astoria, a post-village of Queens co., N. Y., on the East River, opposite New York City, now a part of Long Island City (which see). Pop. 5204.

Astoria, a post-village and port of entry, capital of Clatsop co., Or., on the S. bank of the Columbia River, 9 miles from its mouth. It was once an important dépôt of the fur-trade, having been founded by John Jacob Astor in 1811. Pop. 639.



Astor Library, of New York City, one of the largest in the U. S., was founded by John Jacob Astor, who bequeathed $400,000 for that purpose. His will directed that the government of the library should be vested in eleven trustees—namely, Washington Irving, William B. Astor, Daniel Lord, Jr.; James G. King, Joseph G. Cogswell, Fitz-Greene Halleck, Henry Brevoort, Jr., Samuel B. Ruggles, Samuel Ward, Jr., the mayor of New York, and the chancellor of the State. The library, erected on La Fayette place, was opened in 1854, before which J. G. Cogswell had been appointed superintendent. William B. Astor, a son of the founder, added to his father's bequest a sum nearly equal. The library has about 150,000 volumes.

Astrâbâd', or **Asterâbâd,** a town in the northern part of Persia, capital of a province of its own name, is on a small river which enters the south-eastern part of the Caspian Sea, from which it is about 20 miles distant. It is near the N. foot of the Elbrooz Mountains. The situation is unhealthy in summer, but the appearance of it is rendered attractive by extensive gardens. The greater part of the town is in ruins. Here are some manufactures of silk and cotton stuffs. Pop. estimated at 10,000.

Astrachan. See Astrakhan.

Astræ'a [Gr. Ἀστραία], goddess of justice, a personage of classic mythology, was said to be a daughter of Jupiter and Themis. At the termination of the Golden Age, when violence began to prevail in the world, she ascended to heaven, being the last of the goddesses to leave the earth.—Astræa is also the name of an asteroid discovered by Hencke in 1845. Its mean distance from the sun is 2.577 times that of the earth. It completes a revolution in 1511 days.

Astræa, a genus of radiated animals of the class Polypes, order Madreporaria. They live in the sea, and form calcareous skeletons (star-corals), which are characterized by sessile, star-shaped, lamellate cells, crowded on the upper surface. The polyps are often an inch in diameter. They form large, hemispherical masses of coral.

Astræa Viridis.

As'tragal [Lat. *astrag'alus;* Gr. ἀστράγαλος], a convex moulding, which was first introduced at the base of the capital of the Ionic order, and has since been applied in other positions. It is also called a collarino.

As'tragalus, in anatomy, the first or uppermost bone of the tarsus, which forms with the leg-bones the hinge of the ankle-joint. Its lower surface is concave, and rests on the os calcis, or heel-bone, with which it is connected by a strong ligament.

Astrag'alus, a genus of herbaceous and shrubby plants of the natural order Leguminosæ, sub-order Papilionaceæ. The leaves are pinnate, with an odd leaflet, and the pod is two-celled. It comprises numerous species, mostly natives of the temperate and cold parts of the eastern hemisphere. Several species of *Astragalus* growing in Persia and Asia Minor yield gum-tragacanth. The *Astragalus Bæticus* is cultivated in Hungary and Germany for its seeds, which are used as a substitute for coffee. Numerous species of *Astragalus* are found in the U. S., especially westward.

Astrakhan', a government in the south-eastern part of European Russia, is bounded on the N. by Samara, on the E. by Orenburg and the Caspian Sea, on the S. by Caucasia, and on the W. by the country of the Don Cossacks and Saratov. It is intersected by the Volga, which divides it into two nearly equal parts. Area, 85,012 square miles. The surface is nearly level, and the soil mostly sterile and saline. A large part of it is occupied by salt marshes and saline lakes. The fisheries of the Volga in this government are very valuable, many sturgeon being caught in it. Pop. in 1867, 573,954.

Astrakhan, or **Astrachan,** a city of Russia, capital of the above government, is situated on an island of the river Volga, 40 miles from its entrance into the Caspian Sea. It has crooked and dirty streets, and houses mostly built of wood. It contains a cathedral, about thirty-five churches, fifteen mosques, an archiepiscopal palace, a botanic garden, an Indian temple, and a gymnasium. Immense quantities of fish are exported hence. The other articles of export are leather, furs, linen, and woollen goods. This place is the seat of Greek and Armenian archbishoprics. It has an extensive trade, and manufactures of silk and cotton. Steamboats ply between this place and the ports of the Caspian Sea. Pop. in 1867, 47,839.

As'tralite, a variety of glass resembling aventurine, containing crystals of a cuprous compound, which exhibits a dichroitic iridescence of dark-red and greenish-blue. It is made by fusing and cooling slowly a mixture of 80 parts of silica, 120 of litharge, 72 of carbonate of soda, 18 of borax glass, 24 of scale oxide of copper, and 1 of scale oxide of iron.

As'tral Spir'its, spirits which the ancient Persians and other Orientals supposed to animate the stars. This opinion or superstition was adopted by some of the Greeks and Jews. The demonologists of the Middle Ages conceived them as fallen angels or souls of departed men.

Astrin'gent [Lat. *astrin'gens,* active part of *astrin'go,* to "bind," to "contract"], an agent which produces a persistent contraction in organic tissues, and thus checks discharges from the body, such as excessive purging or diarrhœa and hæmorrhages. Astringents are of two classes, vegetable and mineral. Of the former, tannic and gallic acids are the prevailing active principles; and these may be obtained and used in the pure state. The most common vegetable astringents are galls, oak-bark, logwood, blackberry root, rhatany, catechu, and kino. Of mineral astringents, the most important are acetate of lead, sulphate and chloride of iron, nitrate of silver, alum, carbonate of lime, and the mineral acids, sulphuric, nitric, and hydrochloric.

Astroca'ryum, a genus of palms, comprises about sixteen known species, natives of tropical America, and remarkable for the sharp spines with which the stem and almost every part is armed. They have pinnated leaves. The murumuru palm (*Astrocaryum Murumuru*), a small tree about ten feet high, grows on the Amazon, and bears a fruit about one inch long, which is esculent and highly esteemed. Another edible fruit is produced by the tucuma palm (*Astrocaryum Tucuma*), which grows near the Amazon to the height of thirty to forty feet. The *Astroca'ryum vulga're,* called tucum palm, is more lofty than the tree last noticed. It is cultivated by the natives, who obtain from the epidermis of its unopened leaves a fine and strong fibre of which they make cordage, nets, etc.

As'trolabe [Gr. ἀστρόλαβος, from ἄστρον, a "star," and λαμβάνω, to "take"], a name given by the Greeks to a circular instrument used to make astronomical observations, which is now superseded by better instruments. The ancient astrolabe consisted of two or more circles having a common centre, and so inclined to each other as to enable the astronomer to observe in the planes of different circles of the sphere at the same time.

Astrol'ogy [from the Gr. ἄστρον, a "star," and λόγος, a "discourse," also "science"], literally, the "science of the stars." This term was originally synonymous with astronomy, but was subsequently applied to a spurious science

which professed to explain the events of human life by the influence of the stars or planets. Astrology, which is a very ancient form of superstition, may be defined as the study of horoscopes, and an attempt to predict the fortunes of men by the positions and aspects of the stars. Judicial* astrology is supposed to have originated in Chaldæa. The Jews, after their captivity in Babylon, were much addicted to it, and the same delusion has prevailed among all the nations of Europe. In ancient Rome, during the empire, astrologers were a numerous and influential class. In the Middle Ages, astronomy proper was chiefly studied as subsidiary to astrology, which was considered as the more important of the two sciences. The relation between astrology and astronomy was like that between alchemy and chemistry. The Copernican system contributed greatly to bring astrology into discredit. The fundamental conception of astrology seems to have been drawn from the actual influence of the sun upon the earth in affecting health, fertility, and temperature. Connected with these facts was the worship of the heavenly bodies as divinities. The notion of Aristotle, set forth in the twelfth book of the "Metaphysics," that the heavenly bodies were "ensouled," and that each moved in its orbit by a conscious volition, gave currency to similar ideas among the students of the Peripatetic system. The power of these heavenly beings was supposed to *flow out* from their dwelling-places, and affect beings on the earth for good or evil. Astrological predictions are founded on the relative positions and aspects of the sun, moon, and planets at the moment of birth, and on certain arbitrary influences supposed to belong to each of these bodies. To facilitate the determination of the aspects, the whole heaven, visible and invisible, is divided into twelve equal parts by the horizon, the meridian, and four other circles passing through the N. and S. points of the horizon and the points of the equator (or prime vertical) which are at the distance of thirty and sixty degrees from the meridian. These equal spaces are called the twelve houses of the heavens, and the circles by which they are circumscribed are called circles of position. The circles of position are supposed to remain fixed, so that a celestial body is carried through each of the twelve houses in the course of a day by the diurnal rotation. The first house is contained between the eastern horizon and the next circle of position going to the eastward. The beginning of the first house, or the point of the ecliptic just rising, is called the horoscope. The first house is the house of life; the second, of riches; the third, of brothers; the fourth, of parents; the fifth, of children; the sixth, of health; the seventh, of marriage; the eighth, of death; the ninth, of religion; the tenth, of dignities; the eleventh, of friends; and the twelfth, of enemies. Each of the houses has one of the heavenly bodies as its peculiar lord. They have different powers, the first being the most powerful. The next object is to consider the aspects or configurations of the influential bodies. The ancients reckoned five aspects. (See Aspects.) The quartile and opposition were considered malignant or adverse, the trine and sextile as benignant or propitious, and the conjunction was an indifferent aspect. The influences ascribed to the planets were as arbitrary as those ascribed to the aspects. Saturn, being at the greatest distance from the sun, was supposed to be of a cold nature; Jupiter, Venus, and the Moon, temperate and benignant; Saturn and Mars were the most dangerous. The influence of the sun and Mercury varied according to circumstances.

Revised by M. B. Anderson.

Astron'omy [from the Gr. ἄστρον, a "star," and νόμος, a "rule" or "regulation"], the science which treats of the constitution, motions, and appearances of the heavenly bodies. Its scope includes the whole visible universe outside our atmosphere. Its principal divisions are—1, Descriptive or Physical Astronomy, which, as its name implies, includes the simple description of celestial phenomena and laws, and is to the heavenly bodies what physical geography is to the earth; 2, Theoretical Astronomy, which comprises the investigation of the celestial motions; 3, Practical Astronomy, which teaches the art of using astronomical instruments, and, by their means, of determining positions on the earth and in the heavens.

The material universe, as revealed by the telescope, is formed of a vast collection of stars and nebulæ, to the number of which no definite limit can be set, scattered through an immeasurable and inconceivable extent of space. Of the stars, about 5000 are usually visible to the naked eye, but very keen observers can detect as many as 8000. The number visible is greatly increased when a small telescope is pointed at the heavens, and continues to increase with every increase in the power of the instrument, rising, in the case of the most powerful telescopes, to forty or fifty millions, or six to eight thousand for every one visible to the naked eye. Even then there is no evidence that the smallest stars are seen, but every reason to believe that larger instruments would show millions more in every direction. The telescopic stars are for the most part scattered at random, except that they are many times thicker in some regions than in others. But great numbers of clusters are known in which great telescopes show a whole firmament of stars in a spot hardly visible to the naked eye.

The first inquiry which suggests itself in considering the stellar universe is, Can we form any estimate of its magnitude or of the scale on which it is constructed? The most difficult and refined investigations of recent times have been devoted to this question, but with only partial success. Until near the middle of the present century the distances even of the nearest stars eluded measurement, and even now there are not a dozen of which the parallax is known with anything like certainty. But these are sufficient to enable us to form a sort of judgment, at least, of the scale on which the universe is constructed. It is roughly estimated that the stars of the first magnitude have, on the average, an annual parallax of two-tenths of a second, and are therefore at an average distance of about a million times that of the earth from the sun. This distance may be most conveniently expressed by saying that light, moving around the earth eight times in a second, would require fifteen years to traverse it. Now, supposing that, on a general average, the more distant stars are of the same real magnitude with the nearer ones, but look smaller owing to their distance, we may conclude that the smallest stars visible to the naked eye are ten times as far as the nearest ones; and, allowing for their range of real magnitude, we may conclude with considerable probability that they lie at distances which light traverses in from fifty to two hundred years. In other words, if we conceive two spheres described around our sun as a centre, the smaller with a radius over which light would pass in fifty years (in round numbers, three hundred million of millions of miles), and another with a radius four times as great, it is probable that a large portion of the stars of the sixth magnitude will be included between these two spheres. Applying the same reasoning to the telescopic stars, we may conclude that the smallest stars visible in the most powerful telescopes are at distances which light would traverse in from five to fifty thousand years. Of what is beyond we know nothing as yet.

Of the form and boundaries of this agglomeration of stars which forms the visible universe nothing certain is known, but it is certain that there is a great tendency to aggregation near the plane of the Milky Way. The latter is well known to consist of vast aggregations of telescopic stars, too small to be separately visible to the naked eye. This fact was first clearly shown by Herschel, and led him to his celebrated theory that all the visible stars form a comparatively thin stratum, near the centre of which our sun is placed. That the densest portions of the universe are spread out into such a stratum or plate there can be no doubt, but of the limits of the thinner portions, composed of stars scattered outside of this stratum, nothing positive can be asserted.

Nothing indicating either growth or decay has been actually observed in the stellar universe. There is no established instance either of a known star disappearing from the heavens, or of a really new one coming into view. The supposed cases of the latter kind are now found to be due to extraordinary variability; a small star, perhaps invisible to the naked eye, suddenly bursting forth into brilliancy, and after a time subsiding to its former magnitude. Several instances of this kind are on record, the last as late as 1866, when a star of the second or third magnitude suddenly appeared in the Northern Crown. An examination of Argelander's great star-catalogue showed that it was formerly a telescopic star of the ninth magnitude. After a few days it gradually returned to this magnitude, and has not since shown any kind of disturbance.

A large number of stars—probably one out of every forty or fifty—are of variable brilliancy. Usually, the variations are so slight as to be discovered only by the careful watching of the trained observer, but in a few cases they are so striking as to be plain to any one who will observe. The star η Argus, in the southern hemisphere, varies in an extraordinary and irregular manner. Mira Ceti, usually hardly visible to the naked eye, rises nearly to the second magnitude once in every ten or eleven months, and after a week or two fades away again. Generally, the variations take place in a regular period, so that the times of greatest and least brilliancy admit of tolerably exact prediction.

The stars are found to be moving among themselves in a way that must ultimately lead to an entire change of their distribution, and perhaps to their entire separation. The

Judicial is often applied to astrology in the sense of pronouncing judgment (or sentence) upon a man's character or destiny, in contradistinction to simple astrology, signifying merely the knowledge of the stars or heavenly bodies.

velocity of motion is usually from twenty to fifty miles per second, but in one instance it probably exceeds 200 miles per second. So far as observation can show, the rule is that each star moves forward independently in a straight line with a uniform velocity. From the few estimates of the masses of the stars which have been made, there is no reason to believe that their motions can be appreciably affected by their mutual gravitation. The combined attraction of all the stars visible with the most powerful telescope, supposing their masses to be correctly judged by those of the stars which have been weighed, would never stop, and would hardly turn aside, the star Arcturus in its course of sixty or eighty miles per second, nor Groombialze 1830 in its course of 200 miles per second. There is, in fact, no certain evidence that the stellar universe is held together by any bond of attraction whatever, as our solar system is. Mädler's view, that Alcyone is the central sun of the universe, is a piece of groundless speculation which has never received the assent of astronomers qualified to judge it. The stellar motions take place in every possible direction, and without regard to any known law, except that, as a general rule, stars in the same region of space move nearly in the same direction.

Besides stars, we have nebulæ as component parts of the telescopic universe. They are cloud-like patches of light scattered all over the heavens, but less numerous in the Milky Way than at a distance from it. Two of them, situated in the northern hemisphere, the great nebulæ of Orion and of Andromeda, are clearly visible to the naked eye. Before the discovery of spectral analysis it was not possible to draw the line between nebulæ and clusters of stars, because large numbers of objects which look like nebulæ through small telescopes are found, with large ones, to be clusters of stars, and every increase in the power of the instrument was found to change objects from the former to the latter class. It was therefore doubtful whether all nebulæ were not really clusters of stars too small or too distant to be resolved with the telescope. But, as soon as the spectroscope was turned upon such of these objects as could give a visible spectrum, it was found that many of them were not solid bodies at all, but masses of incandescent gas, generally hydrogen or nitrogen. To this class belongs the nebula of Orion, which is therefore a true nebula. On the other hand, the nebula of Andromeda gives a continuous spectrum, showing that the luminous matter is in the solid or liquid state, and probably consists of an agglomeration of stars, though no telescope has yet resolved it.

We have no data whatever for forming a judgment of the distance of the nebulæ, as we have in the case of the fixed stars. A favorite theory is, that the forty or fifty millions of stars separately visible through the largest telescopes, the greater number of which, as we have said, are spread out in a thin, widely extended stratum, form a system to which our sun belongs, and that many of the resolvable nebulæ are similar systems situated far outside of our own. In favor of this view is to be said that our Milky Way, viewed from a point 500 times the distance of the most remote star in it, would have the appearance of a nebula, and would give a continuous spectrum, although no telescope we possess would resolve it. It is therefore possible that many of the more distant resolvable nebulæ may be such systems. But the greater number of visible clusters cannot compare with our Milky Way in the number of their stars, as they only comprise a few hundreds or thousands. We can really draw no line of demarcation between the agglomerations of stars within our own system and the most distant cluster, the whole range from one extreme to the other being filled with known objects. We must therefore regard the views in question as forming a very grand but yet unproven hypothesis.

Our description of the stellar universe may be summed up by saying that it is composed of an unknown host of stars, certainly more than 50,000,000, mostly scattered in irregular aggregations forming the Milky Way, while many are aggregated in yet closer clusters, some of which are situated within the Milky Way and some without it, and of a number of enormous masses of incandescent gases situated at unknown distances. Our sun is simply one of these 50,000,000 of stars, without, so far as we know, any mark to distinguish him among his fellows. He is probably rather smaller than the average: removed to 1,000,000 times his present distance, which is probably the average distance of the stars of the first magnitude, he would shine only as a star of the third or fourth magnitude. He is, indeed, accompanied by a number of non-luminous planets, while, with one possible exception, no such companions are seen to the stars; but this does not disprove their existence, because every planet of our system would disappear from view in our most powerful telescopes at a distance far less than that of the nearest star.

The physical constitution of the sun and stars is a subject which has greatly occupied investigators in recent times, without leading them to an entirely certain and complete conclusion. The theory of Wilson and Herschel, that the sun is a dark, cool body, surrounded by a stratum of luminous clouds floating in an atmosphere, has been one of the best known, but it is completely disproved by the modern discoveries of the conservation of force and the equivalence of heat and force. The enormous volumes of heat sent off by the sun can be supplied only by a continuous expenditure of force, and any theory which accounts for the solar light and heat must show whence that force comes. We know that our sun has been radiating light and heat in quantities as great as at present for thousands, or even millions, of years, while the sun of Herschel would cool off very quickly, and then cease to give either light or heat. In one respect, however, the theory in question is now universally agreed to: the "photosphere"—that is, the shining surface of the solar sphere—is composed of cloud-like matter, apparently floating in some kind of fluid, the whole being at an extremely high temperature. The spots are known to be dark depressions in the photosphere, as to the cause of which investigators are not yet agreed. Of the interior of this enormous globe we can see nothing, but there is good reason for holding that it is mostly formed of materials similar to those which compose the crust of the earth, heated to so high a temperature as to be completely vaporized and reduced to a state of *dissociation*, or one in which chemical union of different elements is no longer possible. At the same time, the pressure to which this vaporous interior is subjected by the weight of its outer layers is so great that it is compressed into the smallest possible space, so that the mean density of the sun is not much less than that of water.

On the outside, this mass is continually cooling off by radiation, and hence condensing to the solid or liquid state. The matter thus condensed forms the photosphere, which seems to be in a state of continual change.

Immediately above the photosphere lies a comparatively shallow, but extremely complex, incandescent atmosphere, the absorption of which causes the dark lines in the solar spectrum. This atmosphere consists of hydrogen gas, mixed with the vapors of many of the metals, especially magnesium, calcium, sodium, and iron; the metallic vapors, except that of magnesium, mostly lying so near the base that they are not visible, even with a spectroscope, except just at the beginning and end of a total eclipse. This atmosphere shines with a red light, and was frequently seen during total eclipses of the sun, but its existence and nature were first clearly brought to light by Mr. J. N. Lockyer's spectroscope. This gentleman termed it the chromosphere. It is agitated by storms of fire, the fury of which exceeds anything ever pictured by the wildest imagination of the poet, the velocity of the wind sometimes rising to 100 miles per second, and masses of fiery vapor many times the size of our earth shooting up to the height of 20,000, 50,000, or even 80,000, miles. These masses constitute the red "protuberances" always visible during total eclipses of the sun, the nature of which was a complete mystery until the spectroscope was turned upon them by Janssen in India during the great eclipse of 1868. They are now the subjects of daily observation by spectroscopists.

Outside the chromosphere lies an appendage the nature of which is still involved in mystery, as it can be studied only during the rare moments afforded by total eclipses of the sun. It is seen in the glow of light which then surrounds the whole sun, extending to a height greater than the semi-diameter of that body, and is known as the solar corona. Its spectrum consists principally of a single green line, not identified with that of any terrestrial substance, but Janssen also recognized some of the lines of hydrogen during the eclipse of Dec., 1871. (See SPECTRUM ANALYSIS.)

One of the most difficult questions respecting the sun is, Whence come the floods of heat which he is continually radiating into space? Why did he not cool off hundreds of thousands of years ago? Why does he not now grow cooler from year to year? Only in recent years have serious attempts been made to answer these questions, because only then was it recognized that heat was a form of force which could not be expended without being continually renewed. The theory now most generally received is that of *contraction*. It is supposed that as the sun cools off he contracts in volume; and it is found, by calculation, that a very small contraction will develop an enormous amount of heat in a mass so immense as that of the sun, so long as it does not condense to the solid or liquid state. Thus, the supply of heat may be kept up for a million of years to come, but it must give out some time, unless renewed from some unseen source, and our system will then be involved in darkness and death.

By the motion of the spots it is found that the sun rotates on his axis in about twenty-five days, this being the period at the equator. But as we approach the poles the rate becomes slower and the period longer, approaching twenty-six days at a distance of 45°. Beyond this point very few spots are to be seen, and the law of rotation is not completely known. The liquid or gaseous character of the sun's surface is conclusively proved by the variation in the rate of rotation.

The sun is accompanied by a retinue of eight major planets, of which our earth is one, and by a large group of minor planets. The major planets may themselves be divided into two groups of four each, the four inner and smaller ones being Mercury, Venus, the Earth, and Mars, and the four outer and larger ones being Jupiter, Saturn, Uranus, and Neptune. The smallest of the outer group (Uranus) has more than ten times the mass of the largest of the inner group (the Earth), and is more than fifty times its size. Between the two groups is a wide gap in which the minor planets are found. The principal numerical elements of each planet are given in a table appended to the present article; the principal of the remaining peculiarities are given in the following condensed description:

Mercury, the nearest to the sun, and the smallest of the major planets, shines with a light exceeding that of any of the fixed stars, with the possible exception of Sirius. Owing to its proximity to the sun, it can be seen by the naked eye only when near its greatest elongation, which occurs about once in four months on each side of the sun. The same circumstance, together with its intense brilliancy, has prevented the certain discovery of any peculiarities of physical constitution. This planet is quite often seen to pass between us and the sun, the transits usually occurring at intervals of three, seven, ten, or thirteen years. From a careful discussion of all the transits hitherto observed, Leverrier concluded that the motion of its perihelion is 36″ per century greater than the motion calculated from the attraction of all the known planets, and was hence led to the hypothesis that a group of small plants circulated between Mercury and the sun. But the most careful search by the best observers has uniformly failed to show any trace of such bodies, and there are strong reasons for disbelieving in their existence. No satisfactory explanation of Leverrier's result has ever been given.

Venus, the second planet from the sun, is at times, next to the sun and moon, the most brilliant object in the heavens. When east of the sun it is seen in the west, after sunset, as the evening star, and when west of him it rises before him as the morning star. It gives strong evidence of being surrounded by an atmosphere more dense than that of the earth. Several astronomers have announced the existence of mountains twenty miles high on this planet, but the evidence is too weak to be relied on. Twice in every 120 years Venus passes between us and the sun. (For an account of this very rare phenomenon, see PARALLAX, SOLAR.)

The Earth is the first planet accompanied by a moon. Its equator is inclined to the ecliptic, or the plane in which it moves round the sun, at an angle which in 1850 amounted to 23° 27′ 31″, and which is now diminishing at the rate of about 47″ per century, to increase again in the course of ages, as it fluctuates between comparatively narrow limits. The earth's axis at the same time changes its direction very slowly in the heavens, describing a complete circle around the pole of the ecliptic in about 26,000 years, the time varying somewhat in consequence of the motion of the ecliptic itself. The change of seasons is due to the inclination of these two planes, the earth's northern hemisphere being turned towards the sun from Mar. 21 till Sept. 21, and its southern hemisphere being so turned during the remainder of the year. About these two dates the plane of the earth's equator passes through the sun, and day and night are consequently equal all over the globe, whence the term *equinox*. The civil year has always been measured by the interval between the returns of the earth to the same equinox, because this return brings round the change of the seasons. (See CALENDAR.)

The Moon, being the nearest of the heavenly bodies, is that one with the physical peculiarities of which we are best acquainted. She has the appearance of a perfectly arid desert, on which the most careful scrutiny has failed to reveal a trace of air, water, or life. Her surface is broken up by great inequalities, but they are entirely different in character from those on the surface of the earth. Instead of undulating hill and valley, with chains of mountains, we find saucer-shaped depressions, generally of considerable regularity, with flat bottoms, and mounds or hillocks, great and small, scattered over nearly the entire surface. Large regions are comparatively smooth, and, from their dark color, were supposed by the first users of the telescope to be seas. Several maps of her visible hemisphere have been prepared, on which many of the features are named after the great astronomers or philosophers of ancient and modern times. The moon's revolution on her axis coincides exactly with her mean motion around the earth, and consequently she always presents the same face to us. Her farther hemisphere is for ever hid from view, but there is not the slightest reason to believe that it differs in any respect from the one we see. The size of the moon is such that her dark shadow, cast by the sun, is about 240,000 miles in length, narrowing down to a point at this distance. Whenever the earth is in the line of this shadow we have an eclipse of the sun. (See ECLIPSE and ACCELERATION.)

Mars, the fourth planet from the sun, and the last of the inner group, has always been scrutinized by astronomers with the greatest interest, owing to the variegated character of its surface, and its seeming resemblance to the earth. The whole disk is clearly divided into light and dark portions, which have been supposed to be seas and continents. The supposed seas present a dull greenish hue, while the continents are reddish and give rise to the characteristic color of the planet. Near each pole a brilliant white patch is seen, which is attributed to arctic snows and ice. The conclusion that the markings are due to land, water, snow, and ice are to be received with caution.

Outside of Mars we have the group of minor planets, or asteroids, of which 133 are now known, and of which from five to ten have been discovered annually for some years past. The total number probably amounts to several hundred. As a general rule, their orbits are much more eccentric and much more inclined to the ecliptic than those of the major planets. Nothing is known of their physical constitution, their small size preventing any peculiarities of form or structure from being seen. Their diameters are supposed to range from thirty or forty miles to 300 or 400. These estimates are founded not on measurement, but on the apparent brilliancy of the bodies, and are therefore very uncertain. Most readers are acquainted with the celebrated hypothesis of Olbers, that these bodies are the fragments of a planet which was shattered by some unknown force. Recent researches have rendered this hypothesis very improbable, and it has almost ceased to be a subject of discussion among astronomers.

Jupiter, the next planet in order, is the largest of the system, so that, notwithstanding its great distance, it is brighter than any other star or planet except Venus. Its appearance through the telescope is quite peculiar, a dark band or belt being always visible on each side of its equator, and sometimes another near each pole. When closely scrutinized these belts are found to be of irregular shape and ragged, cloud-like formation. They are subject to occasional changes in color and appearance, and within a year or two have been of a rosy hue, which never seems to have been seen before. It is doubtful whether the solid body of Jupiter is visible at all; in fact, it is not certain that it has any solid body. It has been supposed that the belts are clouds floating in the Jovian atmosphere, but all such analogies between the surfaces of the planets and that of our own globe are little better than pure speculation. Jupiter is accompanied by four satellites, which were discovered by Galileo when he first pointed his telescope at the planet. They are about as bright as the smallest stars visible to the naked eye, and could therefore be seen without a telescope if they were not overpowered by the brilliancy of the planet. Indeed, it is claimed that they actually have been seen by unusually good eyes; and some of these claims are too strongly supported to be lightly set aside. Most of the satellites pass through the shadow of the planet, and suffer a consequent eclipse in every revolution. These eclipses, being visible at the same time all over the globe, furnish one of the easiest methods of roughly determining the longitude, but very little accuracy can be thus attained. By these eclipses the progressive motion of light was first determined by Roemer. (See ABERRATION.)

Saturn, the sixth planet from the sun, with his rings and satellites, is perhaps the most striking telescopic object in the heavens. He has belts like Jupiter, but much fainter. His rings are very broad and thin, their edges being turned towards the planet. Nothing like these rings has been seen anywhere else in our system, nor even in the heavens, and the question, What keeps them from falling upon the planet? is one which has occupied several generations of mathematicians and astronomers, without being definitely solved. The corpuscular or cloud theory is that now most generally admitted. This theory is that the rings are not solid or liquid masses at all, but only a vast swarm—or rather two or three vast swarms—of very minute satellites, too small to be seen separately, but so numerous that they present the appearance of a continuous body. Just within the inner bright ring is a faint dusky ring, first discovered by Bond at Cambridge, which this theory explains very

easily by supposing the swarm of satellites to be here so thin that they are scarcely visible, and permit light to pass freely between them. Saturn is accompanied by eight satellites, twice as many as are known to surround any other planet, but none of them present any characters of especial interest.

Uranus was discovered by Sir William Herschel in 1781. It had frequently been observed before that time, but was not known to be a planet. It is accompanied by four satellites, two of which were discovered by Herschel.

Neptune was discovered in 1846 by one of the most remarkable achievements in the history of astronomy, its position in the heavens having been calculated by Leverrier and Adams before its existence was known. (See NEPTUNE, DISCOVERY OF.) It is attended by one satellite. Both Uranus and Neptune are too far off both from the earth and the sun to admit of any peculiarities being seen upon their disks, but the spectroscope shows them both to be surrounded by atmospheres of great density and remarkable constitution, in which carbonic acid is perhaps the principal ingredient.

Besides the planets which we have described, quite a number of comets are known to be members of the solar system, and a great number of others are suspected to be such, even though their time of revolution is so great that they have never been recorded as seen but once. The general rule is that a comet comes into view suddenly and unexpectedly, falling nearly towards the sun as if dropped from an infinite distance. It whirls around the sun in a parabolic orbit, and flies off into space nearly in the direction from which it came. If astronomers have an opportunity of observing it carefully for several months, they can tell whether it is or is not flying so fast that the attraction of the sun will never bring it back again. It is thus definitely ascertained that the great comet of 1858 will return, in consequence of the sun's attraction, in about 1950 years, probably between the years 3800 and 3820, after flying off into space to the distance of fifteen thousand million miles.

The physical constitution of comets is still one of the enigmas of astronomy. Large comets are generally found to consist of three distinct formations: (1) a small bright, but ill-defined nucleus; (2) a round mass of hazy, nebulous, or foggy matter surrounding this nucleus, and indeed seeming to rise from it; and (3) a tail of extremely rare matter, but of enormous length, extending off from the comet in a direction opposed to the sun, growing wider and fainter as it extends, until it gradually becomes invisible. But the smaller telescopic comets often exhibit neither nucleus nor tail, but consist only of an irregular, ill-defined, nebulous mass, perhaps brighter at one point. As the comet approaches the sun the tail develops enormously, and frequently shows itself when none was visible at a distance. It is now generally considered that the tail of a comet is not a permanent appendage, but a stream of finely divided matter continually driven off from the comet into space by some repulsive force residing in the sun, the nature of which is not yet understood. It may be compared to the steam rising from a boiling pot, or to smoke from a chimney. If this view be correct—and it can hardly be disputed—all the comets are continually evaporating into space, and must in time be entirely dissipated.

This theory of the constant dissipation of comets has recently received a striking confirmation in the ascertained coincidence of meteor-streams with the orbits of comets, and in the disappearance of Biela's comet from the heavens. It has long been known that we have either a meteoric shower or an unusual number of meteors every year on the nights of Aug. 9 and Nov. 14, and they are now found to be produced by the earth's atmosphere meeting a swarm of very minute particles which move in the respective orbits of two comets. The particles are supposed to be the fragments or dust of the comets which have become separated in the course of ages. (See METEORS.)

The foregoing is the briefest possible description of the material universe as revealed by the telescope, and may be considered as an epitome of descriptive astronomy. Of *practical astronomy* we can say no more than that it teaches the construction and use of such instruments as the telescope, the transit instrument, the meridian circle, and the zenith telescope, and the calculation of the observations made with them. The usefulness of practical astronomy, and the perfection it has attained, may be judged from this consideration: take an astronomer blindfolded to any part of the globe, give him the instruments we have mentioned, a chronometer regulated to Greenwich or Washington time, and the necessary tables, and if the weather be clear, so that he can see the stars, he can in the course of twenty-four hours tell where he is in latitude and longitude within a hundred yards.

For *theoretical astronomy*, though scientifically the most important branch of the subject, we can do no more than give the reader a general idea of what it has been and is. This science has existed in a rude state from the earliest ages of which we have any written record; indeed, astronomy has very properly been called the most ancient of the sciences. Its progress may be conveniently divided into three eras.

The first era is that of the ancient system, in which the earth was considered as the centre of the universe, and all the heavenly bodies were believed to revolve about it in the course of twenty-four hours. Far from the truth as this system was, the ancients discovered the rotundity of the earth, and the difference of local time or of the hour of the day between places of different longitudes, knew the causes and laws of eclipses, and constructed tables which gave the motions of the sun, moon, and planets with considerable accuracy. The annual motion of the earth round the sun produces an *apparent* annual revolution of the sun among the stars, and this apparent revolution was perfectly understood in the earliest historical times. The annual course of the sun was mapped out on the heavens, and divided into twelve signs, known as "signs of the zodiac." The year was known to consist of 365¼ days, and the connection of the seasons with the position of the sun in the zodiac was fully understood and described. The great body of ancient knowledge on these subjects has been preserved in the "Almagest" of Ptolemy, a work which remained an authority in astronomy for nearly 1600 years.

The second era was that of Copernicus and Kepler, in which the sun was assigned to its true place as the centre of the solar system; the earth was classified as one of the planets moving around it; and all the orbits of these bodies were found to be ellipses having the sun in one focus. A comparatively simple geometrical system was thus introduced, which did away with the complicated epicycles of Ptolemy, and at the same time represented the apparent motions with much more accuracy. Indeed, if the orbits had really been perfect ellipses, hardly any further advance in accuracy would have been made possible, even by the discovery of gravitation.

The third era is that of gravitation, in which all the heavenly bodies are considered as flying through space with perfect freedom, but each gravitating towards all the others. The sun, being 700 times as heavy as all the planets, keeps them moving in orbits around him by his own gravitation, while the motion of each planet is affected with small irregularities caused by the attraction of all the others. By this theory the courses of all the planets, and of the moon and many of the satellites, are predicted with an astonishing degree of accuracy. The first thing which gravitation settles is the motion of the earth itself on its axis. The daily revolution around its axis seems to take place with perfect regularity, but the axis itself is subject to several very slow motions, which make its direction decidedly different in the course of ages. These motions cannot well be described without a globe, but as the whole earth and the instruments with which observations are made partake of them, they change all observed positions of the heavenly bodies, and these changes must be carefully allowed for in all calculations.

The Copernican system and the theory of gravitation have reduced theoretical astronomy almost to branches of pure mathematics—mechanics, geometry, and trigonometry. The system is quite simple in its original conceptions, but very complex when we descend to minute details. A number of imaginary planes are conceived of as passing through the earth or sun, and extending out into infinity in every direction. The positions of the heavenly bodies are defined by their distances from these planes, and the angles which the line drawn from the sun or the earth to the body makes with different lines drawn in the planes. The most common mode of defining position is by giving three data: (1) the distance of the heavenly body from some point, either the centre of the earth or the centre of the sun, in a straight line; (2) the angle which this straight line makes with one of the planes in question; (3) a perpendicular being dropped from the body on the plane, the angle which the line to the point of intersection makes with some fixed line in the plane. When the distances are reckoned from the earth, it is usual to take the plane of the equator as that of reference; when from the sun, the ecliptic is usually selected. Both these planes are constantly changing their position in consequence of the attraction of the moon and planets on the earth, and this change has always to be calculated and allowed for. This operation makes the subject a very intricate one, which can be fully developed only in works devoted especially to the subject.

The following table gives the numerical details of the different elements pertaining to each major planet of the solar system. We shall explain such of the columns and numbers as need explanation. The "apparent semi-diameter" is half the angle which the diameter of the planet

subtends when seen from some usual or mean distance from the earth. In the case of the four inner planets this distance is that of the earth from the sun, while in the case of the four outer ones it is the mean distance of the planet itself from the sun. The actual distance of many of the planets from us varying very much at different times, their apparent magnitudes vary in a corresponding manner.

The "mass" of the planet signifies not its size, but its weight compared with the weight of the sun. The masses of Mercury and Mars are still uncertain: the former by perhaps a fourth, or even a third, of its entire amount, and the latter by a tenth.

Dividing the mass of the planet by its solid contents, we have its specific gravity or "density," which we give as compared with the density of the earth. The column of densities shows a remarkable difference between the materials of the inner and those of the outer planets, the lightest of the former (Mars) being nearly three times as heavy, in proportion to its size, as the heaviest of the latter. In fact, a piece of the planet Saturn would float in water, which is hardly true of a single solid constituent of our globe.

Among the "diurnal revolutions" of the planets on their axis we give those of Venus and Mercury, as some astronomers have thought they observed them, but that of Mercury is entitled to no reliance at all, and that of Venus to very little.

The "mean distance" of the earth from the sun is the astronomical unit or measuring-rod, with which all distances in the universe farther than the moon are ordinarily measured. We give the mean distances of the several planets, first in terms of this unit, which are very exact, and then in miles, which are still somewhat uncertain, because the distance of the sun from the earth in miles is not yet known with entire certainty. The most complete determination of this element yet made gives a distance of 92,380,000 miles, and this is probably within 300,000 miles of the truth; but all we can say with reasonable certainty is, that the distance is between 92,000,000 and 93,000,000. Calling the uncertainty half a million for the earth, it will be proportional to their distance in the case of the other planets, and therefore nearly 5,000,000 in the case of Saturn, and 15,000,000 in the case of Neptune.

The "periodic time," or time of making one revolution around the sun, is given in days for the inner group, and in Julian years—that is, years of 365¼ days each—for the outer group.

TABLE OF THE PLANETARY ELEMENTS FOR 1850.

Planet.	Apparent Semi Dia.	Diameter in miles.	Mass (☉ = 1).	Density (earth = 1).	Diurnal Revolution.	Mean distance from ☉		Periodic time (days).	Eccentricity	Long. of Perihelion.	Inclination of Orbit.	Long. of Node.

S. NEWCOMB, *U. S. Naval Observatory.*

Astroph'yllite, a variety of mica found at Brevig in Norway.

Astruc (JEAN), an eminent French medical writer, born at Sauve, in Languedoc, Mar. 19, 1684. He was appointed professor of anatomy at Toulouse in 1710, and of medicine at Montpellier in 1716. Having removed to Paris in 1728, he became consulting physician to the king, and in 1731 professor of medicine at the Royal College. He had a high reputation as a professor. He published, besides other works, "De Morbis Venereis" ("On Venereal Diseases," 1736), which displays much erudition. Died May 5, 1766. (See LORRY, "Vie d'Astruc.")

Astu'ria, a former kingdom in the N. of Spain, bounded on the N. by the Bay of Biscay, and on the S. by the Cantabrian Mountains. The Asturians made a long and brave resistance to the Goths and Vandals who invaded Spain about 500 A. D., but were finally subdued. Asturia was the only part of Spain that was not conquered by the Moors. The famous Pelayo, who became king of Asturia in 719 A. D., defeated the Moors in battle. (See ASTURIAS.)

Astu'rias, an ancient division of Spain, now the province of Oviedo, has an area of 4094 square miles. It is bounded on the N. by the Bay of Biscay, on the E. by Santander, on the S. by Leon, and on the W. by Galicia. The surface is mountainous, and abounds in wild and picturesque scenery. Along the southern border extends a chain of mountains, the summit of which, called Peña de Peñaranda, is about 11,000 feet high. It has extensive forests of oak, chestnut, beech, and fir. Among the mineral resources are copper, iron, lead, cobalt, antimony, marble, coal, and zinc. The eldest sons of the kings of Spain formerly took the title of prince of Asturias. The eldest son of the ex-queen Isabella still has the title. The chief town is Oviedo. Pop. in 1867, 588,031. (See ASTURIA.)

Asty'ages [Gr. Ἀστυάγης], king of Media, was a son of Cyaxares I., and reigned from 593 to 569 B. C. He had a daughter, Mandane, who was married to Cambyses, a noble Persian, and bore a son who was Cyrus the Great. He was succeeded by Cyaxares II., the last king of Media (569–536 B. C.).

Asuay', or **Assuay,** a department of Ecuador. It is bounded on the N. E. by the United States of Colombia, on the S. by Peru, and on the W. by Peru and the departments of Quito and Guayaquil. Area, about 28,800 square miles. The western part is traversed by several chains of the Andes, and partly occupied by the desert of Paramo or Asuay. In the middle and eastern parts are extensive and fertile plains. It is watered by the Napo, Pequena, and other rivers, which flow south-eastward into the Amazon, besides the Amazon and Putumayo, which flow along its boundary. The chief town is Cuenca. Pop. 243,459, mostly aborigines.

Asy'lum [Gr. ἄσυλον, from α, neg., and συλάω, to "rob," to "carry off," because, originally, it was a place of refuge against violent and lawless men], a sanctuary and place of refuge and security for criminals and others; any place of retreat and security. In ancient Greece the temples, altars, and sacred places were appointed as asylums for criminals and persecuted persons, and it was considered a sacrilege to kill or remove by force those who had taken refuge in them. They were, however, sometimes surrounded and watched until they died of starvation. Among the ancient Jews cities of refuge were appointed for the benefit of persons who had accidentally committed manslaughter. Romulus is said to have attracted men from other states to Rome by offering an asylum to criminals, debtors, or outlaws. Asylums became so numerous under the Roman empire that they were considered nuisances by honest people, and were nearly all abolished by Tiberius. In the reign of Constantine the Great all Christian churches were asylums. The privilege was afterwards extended to convents, and was much abused by criminals in the Middle Ages. Several popes, in order to prevent this abuse, excluded murderers and some other classes of offenders from the privilege of sanctuary, which was abolished in England by acts passed in 1534 and 1697. In modern usage, the term asylum is applied to charitable institutions for the relief of the blind, insane, orphans, etc.

Asylum, a post-township of Bradford co., Pa. Pop. 1155.

As'ymptote [Gr. ἀσύμπτωτος, from α, neg., and συμπίπτω (composed of σύν, "together," and πίπτω, to "fall"), to "coincide," to "fall together"], a right line or curve which approaches nearer and nearer to some other line, but would never meet it though infinitely extended.

At'abek, a title of honor given to viziers or ministers of state by Persian sultans of the Seljook dynasty. The atabeks were the governors of several provinces, exercising almost royal power.

Ataca'ma, a province of Bolivia, of which it is the most south-western part, is bounded on the W. by the Pacific Ocean, on the N. by Peru, on the E. by the department of Potosi and the Argentine Republic, and on the S. by Chili. The Andes extend along the eastern border. It is about 290 miles long and 150 miles wide, and has an area of 70,181 square miles. The greater part of it is a desert, rendered uninhabitable by the want of rain. Gold, silver, and copper are found here. The volcano of Atacama, 18,000 feet high, is in the northern part. The desert of Atacama was a favorite burial-place of the aborigines of Peru, because in it bodies are preserved from decay by the saltness of the soil. Capital, San Pedro de Atacama. Pop. in 1858, 5273.

Atacama, a province of Chili, is bounded on the N. by Bolivia, on the E. by the Argentine Republic, on the S. by the province of Coquimbo, and on the W. by the Pacific Ocean. Area, 41,121 square miles. The country is for the most part mountainous and sterile, and produces only along the banks of a few rivers some vegetables and a few fruits. It contains, however, rich copper-mines. The climate is dry and warm; most of the springs contain salt water, and the largest river, the Rio Salado, is almost always without water in its lower course! Capital, Copiapo. Pop. in 1869, 82,328.

Atac'amite, an ore of copper, abundant in the desert of Atacama (whence its name), and occurring also as a crust on the lavas of Vesuvius and Etna. It may be defined as a hydrated oxychloride of copper, or a combination of protoxide of copper with chloride of copper. It is a rich ore, containing 55 or 60 per cent. of copper. The natural varieties of atacamite are crystallized, massive, and pulverulent or granular. The primary form of its crystals is a rhombic prism. The greenish incrustation which is formed on antique bronze weapons, utensils, etc., and which is called *æruge nobilis*, is composed of this salt.

Atahuall'pa, or **Ataba'lipa,** the last inca of Peru, was a son of Huayna Capac, who died in 1529. By his will he divided his dominions between his two sons, Huascar and Atahuallpa, who obtained the kingdom of Quito. These brothers reigned in peace about five years, after which Huascar sent an envoy to Atahuallpa, and required him to render homage for the kingdom of Quito. That inca, who was ambitious and warlike, refused to pay homage, and, having invaded Peru with an army, defeated Huascar and took him prisoner in 1532. He spared the life of Huascar, but deprived him of his throne and liberty. In the same year Peru was invaded by Pizarro and a small army of Spaniards. The inca, with an unarmed retinue, approached the camp of Pizarro, in Nov., 1532, for a friendly interview, during which a Spanish priest informed the inca that the pope had given Peru to the king of Spain. As he rejected with indignation the authority of the pope, the treacherous Spaniards seized him and massacred his attendants. The captive inca offered to ransom himself by a quantity of gold which would fill the room in which he was confined as high as he could reach. The Spaniards accepted the gold, but refused him liberty. Pizarro accused Atahuallpa of plotting against him, and ordered him to be tried by a court-martial, which condemned him to be burned alive. After he had consented to be baptized his sentence was commuted to strangulation, and he was executed Aug. 29, 1533. According to Prescott, "he showed singular penetration and quickness of perception." (See PRESCOTT, "Conquest of Peru," vol. i.)

Atalan'ta [Gr. Ἀταλάντη], a mythical personage, was, according to ancient Greek legends, the most swift-footed of mortals, and was renowned for martial courage. She took part in the Argonautic expedition and the Calydonian hunt. Having many suitors, she offered to marry any man who should defeat her in a foot-race, with the condition that if he lost he must be put to death. Milanion, who had received from Venus three golden apples, became the successful competitor by dropping them one by one before Atalanta, who could not resist the temptation to stop and pick them up.

Atasco'sa, a county in the S. part of Texas. Area, 1097 square miles. It is intersected by Atascosa Creek, and also drained by several other creeks. This county is two-thirds prairie, and stock-raising is carried on. The soil is good and easily cultivated. Corn is the chief crop. Lignite is found. Capital, Pleasanton. Pop. 2915.

At'aulf, Adaulf, or **Adolf** [Lat. *Ataul'phus*], king of the Visigoths, and a brother-in-law of Alaric I., whom he succeeded in 411 A. D. He had aided Alaric in the capture of Rome in 410, and had captured Placidia, a sister of the emperor Honorius, whom he married. In 412 he retired from Italy into Gaul, where he defeated Jovinus, took Bordeaux (*Burdigala*), and conquered Aquitania. He was assassinated by one of his own officers in 415 A. D.

At'avism [from the Lat. *at'avus*, a "great-grandfather" or "ancestor"] is a word of recent introduction, with two modifications of meaning: 1. In natural history atavism is the reappearance in animals or plants of traits belonging to their remote progenitors which their immediate parents did not present. *Reversion* is a term nearly synonymous, used (by Darwin and others) to indicate not only the occasional or individual appearance of such remotely-descended traits, but the actual returning to them of a variety or species. Domesticated breeds of animals allowed to run wild become, after a time, nearly (seldom exactly) like their wild ancestors. This is a familiar fact with horses, cattle, hogs, and pigeons. The wild horses on the great North American prairies and on the pampas of South America, though all derived from those imported to the Western continent by Europeans, are nearly of one size, shape, and color; and the same is true of the wild herds of cattle of the South American pampas and llanos. Domestic hogs running wild assume, in a few generations, a moderate size, slender figure, and (in some places at least) a nearly black color, with head and tusks approaching those of the wild boar of Europe. Darwin mentions the fact that in all the breeds of domestic pigeons there appear occasionally birds of a slaty-blue color, with bars and other marks characteristic of the ancestral rock-pigeon (*Columba livia*). He also considers the occasional appearance of stripes upon a horse or mule as indicating ancestral identity between the now distinct species of the equine genus. This opinion may be accepted as probable by some of those who are not ready to adopt the whole Darwinian theory. 2. In human pathology atavism is a reversion (similar to the above) to morbid traits existing in ancestors, but not in immediate parents. This may be briefly illustrated by an example (from "Lectures on Practice of Medicine," by Sir T. Watson): A deaf-mute man married a woman whose hearing was perfect, and had two children by her—one a deaf-mute son, who died childless; the other, a *hearing* daughter, who married a *hearing* man, and gave birth to two *deaf-mute* daughters and a *hearing* son. This son married a woman also with good hearing, and had by her a deaf-mute son. One of the daughters married a deaf-mute, and bore a hearing son. Gout, consumption, insanity, and other diseases sometimes thus disappear for one, two, or more generations in a family, and yet return in a manner evidently due to hereditary (though interrupted or latent) transmission.

Atba'ra (*Astab'oras*), a river of North-eastern Africa, rises in Abyssinia, near Lake Dembea (or Tsana), and flows north-westward. After receiving several tributaries from the mountains, it traverses the desert of Southern Nubia, and enters the Nile in lat. 17° 37′ N., and about 25 miles S. of Berber. It is the last tributary that the Nile receives, and is one of the principal causes of the inundation of Egypt. Its length is estimated at 550 miles. In the dry season, October to June, it contains no water except standing pools. According to Sir Samuel W. Baker, "its dry bed was filled in one night with a mighty stream. To-day (June 24) a magnificent stream, some 500 yards in width, and from fifteen to twenty feet in depth, flowed through the dreary desert." (*The Nile Tributaries of Abyssinia*, 1868.) The same traveller states that "the grand rush of water pouring down the Blue Nile and the Atbara into the parent channel inundates Lower Egypt, and is the cause of its extreme fertility." Crocodiles and hippopotami abound in this river, on the borders of which are great numbers of elephants, rhinoceroses, giraffes, lions, etc.

Atchafalay'a Bay'ou, in Louisiana, is an outlet of Red River, from whence it issues near the mouth of the latter at the N. extremity of Point Coupée parish. It flows nearly southward through Chetimaches Lake, and enters Atchafalaya Bay, a part of the Gulf of Mexico. The whole length is estimated at 225 miles. It is navigable for steamers. At the entrance to the bay is South-west Reef, with an iron lighthouse 50 feet high.

Atch'ison, a county in N. E. Kansas. Area, 424 square miles. It is bounded on the E. by the Missouri River, which separates it from the State of Missouri, and is intersected by Sauterelle River or Grasshopper Creek. The surface is pleasantly diversified; the soil is very fertile. Wheat, corn, oats, dairy products, potatoes, and hay are largely raised. The streams are bordered with forest trees. Coal is found. The county is traversed by the central branch of the Union Pacific, and by several other railroads. Capital, Atchison. Pop. 15,507.

Atchison, a county which forms the N. W. extremity of Missouri, bordering on Iowa. Area, 700 square miles. It is bounded on the W. by the Missouri River, and intersected by the Nishnabatona and Tarkeo Rivers. Large quantities of corn, wool, and dairy products are raised. It is traversed by the St. Joseph and Council Bluffs R. R. Capital, Rockport. Pop. 8440.

Atchison, the capital of Atchison co., Kan., is beautifully situated on the W. bank of the Missouri River, at the extreme western point of the "Great Bend." It is the western terminus of the Missouri Pacific, Chicago Rock Island and Pacific, and Hannibal and St. Joseph R. Rs. It is the northern terminus of the Atchison Topeka and Santa Fé R. R., the eastern terminus of the central branch of the Union Pacific R. R., the southern terminus of the Atchison and Nebraska R. R., and the western terminus of the Burlington and Missouri R. R. The Kansas City St. Joseph and Council Bluffs R. R. also runs through the place. It is therefore the centre of a great system of railroads, and one of the principal commercial towns in the State. It

has 3 daily, 3 weekly, and 3 monthly papers; 2 national and 2 private banks; 4 public school buildings, one of which cost $50,000; St. Benedict's College, and 3 private schools and academies; 8 fine church buildings, including a large Catholic cathedral; a foundry, and 2 large furniture manufactories. Pop. 7054.

J. A. MARTIN, ED. "DAILY CHAMPION."

Atchison, a township of Nodaway co., Mo. P. 1219.

Atchison (DAVID R.), an American politician, born in Fayette co., Ky., Aug. 11, 1807, emigrated to Missouri in 1830. He was elected a Senator of the U. S. in 1843 by the Democrats, and was re-elected for a term of six years ending Mar., 1855. He advocated the repeal of the Missouri Compromise, and was a leader of the Democratic party of Missouri in its conflicts with the Free-State party of Kansas.

A'te [Gr. Ἄτη], a goddess in classic mythology, supposed to avenge crimes, and also to stir up mischief. According to Homer, she was a daughter of Jupiter, who, for her mischief-making character, banished her from Olympus.

At'eles [from the Gr. ἀτελής, "imperfect"], a genus of South American monkeys, characterized by the absence or

Ateles.

a rudimentary condition of the thumb of the anterior hands. They have long, prehensile tails. The genus comprises the marimonda (*Ateles Beelzebub*), which is very numerous on the Orinoco, besides a dozen other species.

Ateliers Nationaux, ăt-le-ā' nă'se-o'nō', or "National Workshops," the name of establishments organized in Paris by the republican government in 1848 for the benefit of operatives and mechanics who lacked employment. These men entertained an idea that the government was bound to find them employment. The number of workingmen who depended on the government for subsistence was about 100,000. The experiment failed, and when the ateliers nationaux were closed a bloody sedition broke out in Paris, June, 1848.

Atella'næ, Fab'ulæ, also called **Ludi Osci,** rustic comedies which were performed in ancient Rome, and derived their name from Atella, a town of Campania. The actors of these plays spoke the Oscan dialect, and amused the people with decent drollery. The *Maccus* and *Bucco* of the Fabulæ Atellanæ are said to be the origin of the modern Harlequin and Pulcinello.

A Tem'po (literally, "to time"), a musical term, used to denote that after some short relaxation in the time the performer must return "to the [proper] time," or original degree of movement.

A Tem'po Gius'to ("to the correct time"), in music, a direction to the performer, after a recitative, to keep the measure true and correct, which during the recitative had been altered to suit the action and passion of the scene.

Ates'sa, an Italian town in the province of Abruzzo Citeriore, 14 miles W. of Vasto d'Ammone. It has a fine church and numerous convents, a hospital, and three *monti de pietà*. Pop. in 1861, 10,729.

Ath, or **Aath,** a fortified town of Belgium, province of Hainaut, on the river Dender, and on the railway from Brussels to Lille, 20 miles by rail E. by S. of Tournay. It has an arsenal, a college, a town-hall, an orphan asylum, and a remarkable church; also manufactures of calico, lace, gloves, cutlery, etc. Pop. in 1866, 8260.

Athabas'ca, or **Athapes'co,** a river and lake of the N. W. provinces of British North America. The lake is about lat. 59° N., and between lon. 106° and 112° W. It extends E. and W. about 230 miles, and has an average width of 20 miles. The river rises in the Rocky Mountains, flows north-eastward, and enters the lake near its western extremity. The water of this lake is discharged through Slave River, and eventually passes into the Mackenzie River.

Athali'ah, a queen of Judah, was a daughter of Ahab, king of Israel, and Jezebel. She was married to Jehoram, king of Judah, whom she survived, and became a notorious idolater. After the death of her son Ahaziah, about 884 B. C., she usurped the royal power and murdered all the males of the royal family except Joash. In 878 B. C. she was killed by the partisans of Joash. Her story is the subject of one of Racine's most celebrated tragedies. (See 2 Kings viii. and xi.)

Athana'sian Creed [Lat. *Sym'bolum Athanasia'num*], so called because it was supposed to have been written by Athanasius (died 373). But this is a mistake. It did not appear in Greek till the eleventh or twelfth century, and was then evidently a translation. In the West it was commented upon by Venantius Fortunatus in 570. And it contains extracts from Augustine's "Trinity" (415 A. D.), and from the "Commonitorium" of Vincentius Lirinensis (434 A. D.); so that it was probably written not far from 450 A. D., and apparently in Gaul.

The Athanasian Creed is the sharpest and most rigid of the three catholic symbols. It sometimes takes as its title the words *Quicunque vult*, with which in its Latin version it commences. The entire passage of which those words are a part is in English as follows: "Whosoever will be saved, before all things it is necessary that he hold the catholic faith; which faith except every one do keep whole and undefiled, without doubt he shall perish everlastingly." Then follows a minute and precise exposition of the Trinity, and an equally exact statement of the doctrine of the incarnation; after which this clause occurs: "This is the catholic faith; which except a man believe faithfully he cannot be saved." The common inference would be that unless a man held the doctrine precisely as it is taught in the creed he cannot be saved. On account of these "damnatory clauses," as they are sometimes called, many Christians, while substantially accepting the doctrines of the creed, disapprove of its being used in the churches. Though still retained in the church-service in England, it is omitted from the Book of Common Prayer used by the Episcopal churches in the U. S. REVISED BY R. D. HITCHCOCK.

Athana'sius [Gr. Ἀθανάσιος], SAINT, a celebrated Greek Father of the Church, was born at Alexandria about 296 A. D. His education was directed by Alexander, arch-

bishop of Alexandria. After he had been ordained as a deacon he was appointed a member of the general Council of Nice (325), in which he distinguished himself by his eloquence, learning, and zeal against Arianism. In 328 A. D. he was elected archbishop of Alexandria by the clergy and the people. He refused to comply with the will of the emperor Constantine the Great, by restoring to communion Arius, who had recanted or renounced some doctrines which the Council of Nice condemned. He was summoned to appear at the Council of Tyre, in 335 A. D., to answer several charges, and was there deposed. The emperor Constantine banished him to Treves, but the emperor Constantius, on the death of Constantine, restored him (338) to his see. In 339 about ninety Arian bishops assembled at the Council of Antioch, condemned Athanasius, and, their decision being approved by the emperor, he was suspended, and retired to Rome. He recovered his office in 346. The Arians prevailed in the Council of Arles (353) and the Council of Milan, which, under the influence of the emperor Constantius, condemned Athanasius in 355 A. D. He was again driven out of Alexandria, and took refuge in the solitudes of Upper Egypt, where he passed six years, and wrote several doctrinal works. On the accession of Julian the Apostate (361 A. D.) he returned to Alexandria, but he was exiled in 362. In 367 he was restored by Jovian; in 367 he was once more exiled by the Arian emperor Valens, but after a few months (368) he was allowed to return, and now continued in peaceable possession of his office until his death, in 373 A. D. Athanasius was the most eminent and influential leader of the orthodox party (who were sometimes called Athanasians), and was distinguished for his fortitude under persecution, and other virtues which qualified him to be a pillar of the militant Church in stormy and perilous times. He left numerous polemical and religious works, written in Greek in a simple, nervous, and perspicuous style. Among them are a "Discourse on the Incarnation," "Five Books against Arius," "Epistles to Serapio," an "Oration against the Gentiles," and an "Apology for his own Flight." An edition of his works was published at Paris in 3 vols. folio, 1628. (See SOCRATES, "Historia Ecclesiastica;" SOZOMEN, "Historia Ecclesiastica;" MÖHLER, "Athanasius der Grosse," 1827; VOIGT, "Lehre des Athanasius," 1861.) REVISED BY A. J. SCHEM.

A'theism [Lat. *atheis'mus;* from the Gr. *a*, neg., and *θεός*, a "god"], the denial of the existence of God, or the doctrine that there is no God. Atheism may be either speculative or practical; the former consists in denying the existence of God; the latter in living as if there were no God. Speculative atheism is, strictly speaking, impossible, for the denial of the Divine existence necessarily affirms it. For if one deny God's being, his denial is worthless unless it rests upon some reason; but this reason must be absolute, or it can be no sufficient warrant for his denial, and this will only be to adduce absolute reason to declare that the Absolute Reason cannot be, which is the very absurdity of all absurdities. To suppose the existence of some nature of things whose chain of invincible necessity stretches above and around the Deity, is to suppose what, if it have any meaning, must itself be invested with the being and the attributes of the Godhead. Strictly speaking, the belief in a God would seem to imply a belief in his personality—that is, in his existence as a *conscious* being. But, according to its modern acceptation, atheism is understood to deny not merely the existence of a personal Deity, but also the presence in the universe (apart from *individual* intelligences) of any Principle of intelligence, beauty, or goodness. (See PANTHEISM.) Perhaps the most remarkable phase of systematic atheism is that which is set forth in the writings of Epicurus and his followers; for although that philosopher nominally acknowledged the existence of gods, he doubtless did so (as Cicero suggests) merely to avoid the popular odium which by a denial of their existence he was certain to incur. In his system of philosophy there is no all-pervading Intelligence, as in that of Anaxagoras—no principle of order, no law except the law of chance. All possible forms of existence had been tried in the fortuitous concourse of the primitive atoms, and those beings only which had at last attained, by repeated accidental trials, a certain regularity and completeness of parts, possessed any permanent existence. Among many of the ancient nations in very early times to deny the gods was much the same as to deny all religious and moral obligations; hence the name *atheos* (*ἄθεος*), or "atheist"—that is, "without God" or "denying the gods"—became a term of the greatest reproach; at length those who had political ends to serve came to use it, not very unfrequently, as a convenient method of exciting popular odium against an opponent; and it has been repeatedly applied to worthy and virtuous men, both in ancient and modern times.

REVISED BY J. H. SEELYE.

Ath'elard of Bath, an English natural philosopher of the twelfth century who travelled in the East and published numerous works, some original and some translated from the Arabic. A few of these works have been printed, and others exist in MS.

Ath'elstan, or **Æthelstan,** an able Anglo-Saxon king of England, born about 895 A. D., was the natural son of Edward the Elder, and a grandson of Alfred the Great. He began to reign in 925, and was the first actual sovereign of all England. On the death of Sigtric, king of Northumbria, Athelstan annexed that country. A league was formed against him by the Welsh, Scots, and Picts, whom he defeated in a great battle at Brunenburg, 937 A. D. He reigned over nearly all the island, except Scotland and Wales. He promoted learning and civilization, and was reputed one of the wisest of the Anglo-Saxon kings. He died without issue Oct. 27, 940, and was succeeded by his brother Edmund. (See FREEMAN, "Norman Conquest," vol. i.; HUME, "History of England.")

Athe'na [Gr. *Ἀθήνη* or *Ἀθηνᾶ*], sometimes called **Pallas Athena,** the goddess of wisdom, and one of the principal divinities of the Greek mythology. According to an ancient legend, she was the daughter of Jupiter, from whose head she issued in full armor. She was the favorite national divinity of the Athenians, whose capital was named in her honor. She presided over the sciences, inventions, arts of peace, laws, etc., and was supposed to have invented every kind of art or work proper to women. *Athena* corresponds to the Roman MINERVA (which see).

Athenæ'um [Gr. *Ἀθήναιον*], a general name for the temples of Athena; a temple at Athens, dedicated to Athena, in which poets and orators assembled to recite their works and to instruct the young. Also, a school which was founded at Rome on the Capitoline Hill by the emperor Hadrian, and long continued to be an important institution. In the reign of Theodosius II. it had ten professors of grammar, three of oratory, five of dialectics, one of philosophy, and two of jurisprudence. The name was given to it in honor of Athens, the great seat of ancient learning. In modern times the term is applied to literary institutions, public reading-rooms, etc.

Athenæ'us, an eminent Greek *littérateur* and antiquary, born at Naucratis, in Egypt, lived about 200 A. D. The events of his life are mostly unknown. He resided for some years at Rome, and appears to have been a great reader, and an epicure in his habits. He wrote, in the form of a dialogue, a very interesting work called *Δειπνοσοφισταί* ("The Banquet of the Learned"), which is extant. It is an account of an imaginary banquet given by a noble Roman to a number of eminent men, and contains a rich fund of anecdotes, criticisms, and extracts from the works of about seven hundred poets and historians, some of whose works are lost. Although it does not indicate much literary ability, it is considered extremely valuable as a *mélange* of literary, social, and domestic gossip. A good edition of this work was published by W. Dindorf, Leipsic, 3 vols., 1827. An English translation of it may be found in Bohn's "Classical Library," London, 1854. (See FABRICIUS, "Bibliotheca Græca;" "Edinburgh Review," vol. iii., 1803.)

Athenag'oras [Gr. *Ἀθηναγόρας*], a Greek philosopher and Christian writer, born at Athens, flourished about 170. Philip Sidetes (about 400 A. D.) makes him the first principal of the catechetical school at Alexandria (161–180 A. D.). He wrote an elaborate treatise on the "Resurrection," also an "Apology," addressed, some say, to Marcus Antoninus and Lucius Verus, about 166 A. D.; others, to Marcus Aurelius and his son Commodus, about 177 A. D. The best recent edition of his works is that by Otto, 1857.

Athe'nion [Gr. *Ἀθηνίων*], an eminent Greek encaustic painter, born at Maronea, in Thrace, was a pupil of Glaucion. He lived about 320 B. C., and died prematurely. Among his works was "Ulysses detecting Achilles disguised as a Female."

Ath'ens [Gr. *Ἀθῆναι*; Lat. *Athe'næ;* Turk. *Seti'nes*], an ancient and celebrated Hellenic city and republic, unrivalled in art and literature, immortal in the records of genius and glory. No state, ancient or modern, has produced in proportion to its extent and population so many authors, orators, artists, and statesmen of the first order, or has contributed so largely to the education and improvement of humanity. Athens is situated about 5 miles N. E. of the Saronic Gulf, in the plain of Attica, which is enclosed by mountains on every side except the south, and forms a grand natural amphitheatre; lat. 37° 56′ N., lon. 23° 38′ E. The plain is bounded on the N. W. by Mount Parnes, on the N. E. by Mount Pentelicus (now often called Mendeli), on the S. E. by Mount Hymettus, on the S. W. by the sea, and on the W. by Mount Ægaleos. About 1 mile N. E. of the city rose Mount Lycabettus, an isolated conical peak, which forms a prominent and beautiful feature in the land-

scape, and is now called the "Hill of Saint George." Within the city walls were four hills—namely, the Acropolis; the Areopagus, or Mars' Hill; the Pnyx, on which political assemblies were held; and the Museum. The Acropolis, or citadel, an isolated, rocky hill, rises abruptly nearly 300 feet above the plain, near the centre of the space enclosed by the walls of Themistocles. It has a flat top about 1100 feet long and 450 feet wide, inaccessible on all sides except the W., where the ascent is also steep. The city stands on a bed of hard limestone, partly covered by a thin, light, and rather sterile soil. It has a delightful climate, and an atmosphere of almost matchless purity and transparency. Mr. Stanley speaks of "the transparent clearness, the brilliant coloring of an Athenian sky; of the flood of fire with which the marble columns, the mountains, and the seas are all bathed and penetrated by the illumination of an Athenian sunset." The same traveller notices "the *violet* hue which Hymettus assumes in the evening sky, in contrast to the glowing furnace of the rock of Lycabettus and the rosy pyramid of Penteliens." Hence, Athens has been called the "City of the Violet Crown." Among the physical features of the environs of Athens are two rivulets, the Cephissus and the Ilissus, both of which are nearly exhausted and waterless in summer. The walls of Athens in its most prosperous state enclosed not only the city proper (τὸ Ἄστυ), but also a long, narrow suburb extending to the harbor of Piræus, which was four and a half miles S. W. of the Acropolis, and was connected with it by two long walls, 550 feet apart. The Piræus was a rocky peninsula enclosing several good harbors, and defended by a citadel and fortress, called Munychia, built on a high rock. This was sometimes termed the Acropolis of the Piræus.

History.—According to an ancient legend, Athens was founded by Cecrops, and was originally called Cecropia. In the reign of Erechtheus the name was changed to *Athenæ*, in consequence of the prominence which was given to the worship of Athena (Minerva). Theseus, the national hero of Attica, is said to have united into one political body the twelve independent *demi* or communities into which Cecrops had divided Attica, and to have made Athens the capital of the new state. Homer in the "Iliad" mentions Athens and its temple of Athena. The last king of Athens was Codrus, who sacrificed himself for his country, in compliance with the advice of an oracle, about 1068 B. C. The state then became a republic or oligarchy, ruled by an archon or archons, the first of whom was Medon, a son of Codrus. An important event in the history of the Athenians was the institution of the Olympic Games (which see), celebrated once in four years at Olympia, in Elis. The first Olympiad began in 776 B. C., the era to which all subsequent events were referred by the ancient Greek historians. The term of office of the archons was reduced to one year about 684 B. C., before which date the archon ruled the state for ten years. (See Archon.) Among the powerful and conservative elements in the Athenian constitution was the council or court of the Areopagus (which see), the origin of which was very ancient. The great legislator and statesman who laid the stable foundations of the glory and prosperity of Athens was Solon, who became archon in 594 B. C., at a time when many of the poor were reduced to slavery and violent party dissensions tended to civil war. He reformed the constitution, abolished slavery for debt, improved the condition of the poor and the common people, and divided the population into four classes, according to their property. The fourth or lowest class were not eligible to office, but they were exempt from taxation, and could vote for archons and other officers. He also enlarged the jurisdiction and authority of the court of the Areopagus, which tended to counteract the excesses of the democratic element which he infused into the constitution. Pisistratus usurped the chief power in 560 B. C., ruled as a mild and liberal tyrant for many years, and left his power to his sons Hippias and Hipparchus. The first effort to embellish the city during the historical period appears to have been made by Pisistratus and his sons. They erected many temples and other public buildings, and commenced the temple of Jupiter Olympius, which was the largest temple in Greece, but it remained unfinished about seven hundred years. The state was liberated from the mild tyranny of the Pisistratidæ by Harmodius and Aristogi'ton, who killed Hipparchus in 514. Hippias was expelled in 510 B. C. Soon after Clisthenes made some liberal reforms in the constitution, which he rendered essentially democratic. He divided the people of Attica into ten tribes (which were subdivided into δῆμοι, townships or parishes), instead of the four ancient Ionic tribes (φυλαί). It is important to observe that the *demi* assigned to each tribe were in no case all adjacent to each other; and "the tribe as a whole," says Mr. Grote, "did not correspond with any continuous portion of the territory, nor could it have any peculiar local interest separate from the entire community." This arrangement was adopted as a precaution against factious movements arising out of local feuds. About 500 B. C. the Greek colonies of Ionia revolted against the king of Persia, and were aided by the Athenians. Provoked by this affront, Darius resolved to subjugate Greece, and to punish the Athenians in an especial manner, for which purpose he sent a large army in 490 B. C. Among the ten generals who commanded the Athenian army were three illustrious men—Aristides, Miltiades, and Themistocles. The armies met on the plain of Marathon, where Miltiades gained a decisive victory which was one of the most momentous events of universal history. The Spartans did not arrive in time to take part in this battle. The sagacious Themistocles, foreseeing that this was only the beginning and not the end of the war, persuaded the Athenians to build a large fleet. Having spent several years in diligent preparation for another invasion of Greece, Xerxes (called the Great) crossed the Hellespont with an immense army in 480 B. C. The Persians forced the pass of Thermopylæ, defended by a small band of Spartans, for whose epitaph Simonides wrote two famous lines which may be thus translated:

"Go tell the Spartans, friendly passer-by,
That we obeyed their orders, and here lie."

The Athenians in this crisis consulted the oracle of Delphi, and received at first an alarming or sinister response, to which was finally added this emphatic prediction: "But this assurance I will give you firm as adamant: when everything else in the land of Cecrops shall be taken, Jupiter grants to Athens that the wooden wall alone shall remain unconquered to defend you." Concluding that the wooden wall signified the fleet, the Athenians removed their women and children to Ægina and Salamis, and evacuated Athens, which was taken and burned by the Persians. The Greeks were reduced to a desperate extremity, but in one day the great naval battle of Salamis (480 B. C.) made an immense change in their situation, and restored them to security and triumph. This event was followed by the rapid development of the maritime power of Athens. Themistocles fortified the Piræus, and surrounded Athens with massive walls sixty stadia in circumference. The courage and public spirit of the Athenians in the conflict with the Persians raised their reputation and influence so high that when many of the Greek states formed a league for mutual defence, they gave to Athens the hegemony or chief control of the confederacy. Soon after the battle of Salamis the Athenians began to rebuild their capital and to erect those masterpieces of architecture which have excited the admiration of all succeeding ages. The most brilliant period in Athenian art was the age of Pericles, who became the most powerful statesman of Athens about 469 B. C. During his long and able administration Æschylus, Sophocles, Euripides, Socrates, and Phidias flourished. He made Athens the most splendid city of Greece, and erected, on the Acropolis, the Parthenon, Erechtheum, and Propylæa. It was here that Art achieved her greatest triumphs. "In order to form a proper idea of the Acropolis, we must imagine the summit of the rock stripped of everything except temples and statues, the whole forming one vast composition of architecture, sculpture, and painting, the dazzling whiteness of the marble relieved by brilliant colors, and glittering in the transparent clearness of the Athenian atmosphere." (*Smith's Dictionary of Greek and Roman Geography.*) In 431 B. C. a long war broke out between the Athenians and the Spartans, who were the aggressors. This was called the Peloponnesian war, which continued about twenty-seven years, and was disastrous to the Athenians. During this period, Thucydides, Nicias, and Alcibiades were prominent public men of Athens. Nicias conducted a large fleet and army against Syracuse (an ally of Sparta) in 413 B. C. But the expedition proved a disastrous failure. Nearly all of his men were killed or captured. In 404 B. C. the war ended with the capture of Athens by the Spartan general Lysander, who abolished the democracy, and established the rule of the Thirty Tyrants. Thrasybulus, aided by a body of exiles, expelled these tyrants within one year after their accession to power. Athens had lost her political and military supremacy, but she still surpassed all other states in art and literature, and was illustrated by the genius of Plato and Demosthenes. The latter began his public career about 354 B. C., when the liberty of Athens was menaced by Philip of Macedon. He became the leader of the party that opposed Philip, whom he assailed in his celebrated "Philippics," the eternal monuments of his political foresight, wisdom, and magnanimity. The army of Philip gained a decisive victory over the Athenians and Thebans at Chæronea, in 338 B. C. Athens and the other Greek states then became subject to Macedon. In 146 B. C., Greece was reduced to a Roman province. Athens under the Roman power continued to enjoy much prosperity, and was the centre of Grecian philosophy, literature, and art. The great monu-

ments of the age of Pericles still remained in their original beauty and perfection. The Athenian schools of eloquence and philosophy attracted great numbers of students from Rome and all parts of the civilized world. Here Cicero, Virgil, and Horace received part of their education. It is difficult to determine the population of ancient Athens, which, according to Xenophon, was the most populous city of Greece. He states that it contained more than 10,000 houses. Leake estimates the population at 192,000, including the Piræus. The private houses were small and poor compared with the public edifices. The climate was so genial that the Athenians passed nearly all their time in the open air.

Monuments and Antiquities.—At the W. end of the Acropolis stood the Propylæa, one of the masterpieces of Athenian art, constructed of Pentelic marble, and finished in 432 B. C. The central part of this building (called Propylæa because it formed a vestibule to the gates by which the Acropolis was entered) consisted of two Doric hexastyle porticoes, covered with a roof of white marble. Of these porticoes the western faced the city and the eastern the interior of the Acropolis; the latter, owing to the rise of the ground, being higher than the former. They were divided into two parts by a wall pierced by five gates or doors, which were the only public entrance into the Acropolis. Considerable remains of the Propylæa are still visible. Passing through the Propylæa, we come to the Parthenon, or temple of Athena Parthenos, regarded as the most perfect specimen of architecture ever executed. It was designed by Callicrates and Ictinus, was built in the Doric order of white Pentelic marble, and was completed in 438 B. C. The dimensions were 228 feet long, 101 feet wide, and 66 feet high to the top of the pediment. It consisted of a cella, surrounded by a peristyle of forty-six columns, which were six feet two inches in diameter and thirty-four feet high. Within the peristyle at either end there was an interior range of six columns five and a half feet in diameter. In technical language this temple was a peripteral octastyle, so called because it had eight columns at each front. "Such," says Leake, "was the simple structure of this magnificent building, which, by its united excellencies of materials, design, and decorations, was the most perfect ever executed. Its dimensions were sufficiently great to give an appearance of grandeur and sublimity; and this impression was not disturbed by any obtrusive subdivision of parts. . . . There was nothing to divert the spectator's contemplation from the simplicity and majesty of mass and outline which form the first and most remarkable object of admiration in a Greek temple." The whole building was adorned within and without with exquisite pieces of sculpture, the grandest of which was a colossal statue of Athena, executed by Phidias and formed of ivory and gold. This statue stood in the largest apartment of the cella. The Parthenon remained almost entire, except the roof, until 1687, when Athens was besieged by the Venetians. A quantity of powder which the Turks had placed in the cella exploded, and reduced the centre of the Parthenon to a heap of ruins. The columns of the two fronts escaped, and are still standing, with part of the walls. The Erechtheum (Ἐρέχθειον), standing on the Acropolis, was a beautiful temple of the Ionic order, and the most revered of all the sanctuaries of Athens, being connected with the origin of the Athenian religion. It was completed about 393 B. C., and adorned with three porticoes and columns, many of which are now standing. Among the finest edifices of Athens was the Theseium (Θησεῖον), or temple of Theseus, which was built of Pentelic marble about 465 B. C. Its architecture was of the Doric order, and it was surrounded by a peristyle of thirty-four columns. The Theseium is the best preserved of all the monuments of ancient Athens. The temple itself is nearly perfect, but the sculptures have received much injury. The site of the Olympeum, or temple of Jupiter Olympius, is indicated by sixteen gigantic Corinthian columns of marble standing S. E. of the Acropolis. This exceeded all other temples of Greece in magnitude, being 354 feet long and 171 wide. It consisted of a cella surrounded by a peristyle, which had ten columns in front and twenty on each side. The peristyle, being double in the sides and having a triple range at either end, consisted of 120 columns six and a half feet in diameter and above sixty feet high. Among the interesting places in the suburbs of Athens were the Academy—in which Plato taught, and which long continued to be a sanctuary of philosophy—and the Lyceum, over which Aristotle presided. Towards the end of the sixth century of the Christian era Athens began to decline. In 1204 it became the capital of a duchy which during the fourteenth century belonged to Naples. In 1394 the Florentine Nerio Acciajuoli became duke of Athens, and his family held this position until 1456, in which year it was taken by the Turks. During the time of the Turkish rule Athens declined more and more, and had a population of only 6000 or 8000. The ancient monuments were falling to ruin, and the city itself presented a true picture of the demoralization of the whole nation. The Greek war of independence was the cause of great destruction to the city, so that when in 1830 Attica was incorporated with Greece, the city was nothing more or less than a heap of ruins. But when in 1834 it became the capital of the new kingdom of Greece, it rapidly changed, and was greatly improved. A royal palace, 300 feet in length and 280 feet wide, was completed in 1843 near Mount Lycabettus. Among the finest modern buildings are the university, the cathedral, the mint, the theatre, and the chamber of representatives. The university, founded in 1836, has about forty professors, and a library of nearly 90,000 volumes. It is said to be well organized and flourishing. Athens has also several gymnasia, and a system of graded free schools. Since the liberation of Greece from the Turkish yoke the Hellenic people have been animated by an ardent desire to regenerate their country by the promotion of education. Athens has a good harbor, the ancient Piræus, now called Drâko. Pop. in 1870, 48,107. Pop. of the Piræus, in 1870, 11,049. (See Leake, "Topography of Athens," 1841; Stuart and Revett, "Antiquities of Athens," 4 vols., 1762–1816; Grote, "History of Greece;" Wordsworth, "Athens and Attica," 1836; Mure, "Journal of a Tour in Greece," 1842; K. O. Müller, article *Attica* in Ersch and Gruber's "Encyklopädie;" Breton, "Athen," 1868; Welcker, "Tagebuch einer griechischen Reise," 1865.) Revised by R. D. Hitchcock.

Ath'ens, a county in the S. E. part of Ohio. Area, 430 square miles. It is bounded on the S. E. by the Ohio River, and drained by the Hockhocking. The surface is hilly; the soil is fertile. Grain, wool, and tobacco are extensively raised. Salt is made from salt-wells. A bed of coal underlies the whole county and is extensively worked. Iron is found in this county, which is intersected by the Marietta and Cincinnati R. R. Capital, Athens. Pop. 23,768.

Athens, a township of Dallas co., Ala. Pop. 3565.

Athens, a post-village, capital of Limestone co., Ala., is on the Nashville and Decatur R. R., 27 miles W. N. W. from Huntsville. On Sept. 23, 1864, the Confederate general Forrest, with a large body of cavalry, invested the town, held by Colonel Campbell, of the One Hundred and Tenth U. S. Colored Troops, and 600 men, and demanded its surrender, which was finally made just as reinforcements were on their way. The place was again occupied by U. S. forces, and again attacked by the Confederate general Buford Oct. 2–3, 1864, but this time the place was firmly held by Colonel Slade, of the Seventy-third Indiana, and Buford repulsed. Athens has two weekly newspapers. Pop. 887; of Athens township, 2618.

Athens, a city of Clarke co., Ga., on the Oconee River, the north-western terminus of the eastern branch of the Georgia R. R., which connects it with Augusta, 114 miles distant, and the southern terminus of the North-eastern R. R., now being constructed to Rabun Gap, which will connect with the West at Knoxville, Tenn. It is the seat of the University of Georgia, the State College of Agriculture, the Lucy Cobb Institute, several other schools of a high grade, and a number of common schools. It has 10 churches, 2 banks, 1 insurance company, 2 cotton-factories, 1 foundry, 1 street railway, 1 gas company, 4 fire companies, and 4 newspapers and periodicals. In the contiguous country are four or five cotton-mills and other manufactories. Pop. 4251.

J. H. Christy, Ed. "Southern Watchman."

Athens, a township of Ringgold co., Ia. Pop. 502.

Athens, a post-village of Menard co., Ill. Pop. 351.

Athens, a post-township of Somerset co., Me. It is the seat of an academy, and has manufactures of lumber, etc. Pop. 1540.

Athens, a post-township of Calhoun co., Mich. Pop. 1294.

Athens, a township of Gentry co., Mo. Pop. 2211.

Athens, a post-village of Greene co., N. Y., on the W. bank of the Hudson River, 29 miles below Albany and opposite the city of Hudson. It is the southern terminus of a branch of the Central R. R. Lime, limestone, bricks, and ice are extensively produced. Pop. 1793; of Athens township, 2942.

Athens, a post-village, capital of Athens co., O., is on the Hockhocking River, and on the Marietta and Cincinnati R. R., 41 miles W. S. W. of Marietta. It is the south-eastern terminus of the Columbus and Hocking Valley R. R., which connects it with Columbus, 76 miles distant. Here is the Ohio University, founded in 1804; also a national bank, two weekly papers, and a State lunatic asylum. Pop. 1696; of township, 3277. Ed. "Messenger."

Athens, a township of Harrison co., O. Pop. 1232.

Athens (borough and township), Bradford co., Pa., embraces the junction of the North Branch of the Susquehanna with the Chemung (once called Tioga) River. Athens was early known as "Tioga" or "Tioga Point," and was the most important trading post in the region. The canal once used along the Susquehanna and Chemung is now abandoned from Elmira to Pittston, and its bank is occupied by the Lehigh Valley R. R. Company, lessee of the Pennsylvania and New York Canal and R. R. Company. The Ithaca and Athens R. R., and also the Southern Central R. R. (to Owego and Auburn, N. Y.), unite with the Lehigh Valley R. R. at Sayers, in Athens township. The borough is 15 miles N. of Towanda, the county-seat, and 4 miles S. from Waverley—Athens township including the S. part of Waverley village, which is mostly in N. Y. There is a post-office at Athens borough, and one at Orcutt's Creek, in the N. W. part of the township; a national bank and two weekly papers in the borough, and a savings bank in South Waverley (the N. end of the township); two bridges over the Chemung, two over the Susquehanna, and several mills, factories, etc. Athens has the oldest academy in the section, and had Nathanael P. Tallmadge among its early tutors. Joshua R. Giddings was born at Queen Esther's Flats, below the borough, during the migration of his parents from Connecticut to the Western Reserve. "Spanish Hill," S. W. of Waverley, had a fortification on its summit, the origin of which is unknown. The region is one of historical interest and physical beauty. Pop. in 1870, borough, 965; township, 2256; total, 3221.

ED. OF "GLEANER."

Athens, a township of Crawford co., Pa. Pop. 1317.

Athens, a post-village, capital of McMinn co., Tenn., on the East Tennessee Virginia and Georgia R. R., 55 miles S. W. of Knoxville. It has one weekly newspaper, and is the seat of East Tennessee Wesleyan University. Pop. 974.

Athens, a post-village, capital of Henderson co., Tex., 178 miles N. of Houston, and 180 miles N. E. of Austin City. Pop. 545.

Athens, a post-township of Windham co., Vt. P. 295.

Ath'erine (*Atheri'na*), a genus of fishes of the family

Atherine, or European Sand-Smelt.

Atherinidæ, related to the mullet. They have more than twice as many vertebræ as the mullet, are about six inches long, and have a broad silvery band along each flank. The genus comprises many species which abound in the Mediterranean. The *Atherina presbyter* is sold in England under the name of *smelt*. Those of the U. S. coast are called "silversides" and "sand-smelts." They are mostly small fishes.

Atherosperma'ceæ [from *Atherosperma*, the name of one of the genera], the name of a natural order of incomplete aromatic exogenous shrubs found in New Holland and South America, remarkable for having their flowers in a cup-shaped involucre, and the peculiar anthers of Lauraceæ.

Ath'erton (CHARLES GORDON), an American politician, born at Amherst, N. H., July 4, 1804. He graduated at Harvard in 1822. He was a member of Congress 1837–43. He procured in 1838 the passage of a resolution that all petitions or papers relating to slavery should be laid on the table without being debated, printed, or referred. In 1843 and '53 he was elected to the Senate of the U. S. Died Nov. 15, 1853.

Atherton (CHARLES HUMPHREY), born at Amherst, N. H., Aug. 14, 1773, graduated at Harvard in 1794, became a lawyer, and was an enthusiastic Federalist. He was a member of Congress from New Hampshire (1815–17). Died at Amherst, N. H., Jan. 8, 1853.

Atherton (HUMPHREY), a native of England who emigrated to Massachusetts about 1636. He became a major-general, and was employed in negotiations with the Indians. Died Sept. 17, 1661.

Ath'lete, plu. **Ath'letes,** or **Athle'tæ** [Gr. ἀθλητής, plu. ἀθληταί], a term applied by the ancient Greeks to a person who contended for a prize in public games as a wrestler, pugilist, or runner; a man who competed for honor or other rewards in contests of physical strength or agility. The arena in which the athletæ contended was at the great national festivals, the Olympic, Isthmian, Pythian, and Nemean games. The victor in these games was treated with extraordinary honor. He entered his native city through a breach made in the wall for that purpose, and his statue was erected in a public place. Plato and other eminent philosophers took part in athletic contests. At Rome the athletæ formed a college or corporation.

Athlone (*Athluan, i. e.* "ford of the moon"), a market-town of Ireland, on both sides of the river Shannon, about 67 miles W. of Dublin, is chiefly in the county of Westmeath and partly in Roscommon. It is on the railway from Dublin to Galway, and about two miles S. of Lough Ree. The Shannon is navigable for steamers above this town. Athlone Castle, built in the reign of King John, has been converted into an important military position. P. 6617.

Ath'ol, a thriving manufacturing village of Worcester co., Mass., in a township of the same name. It is at the junction of the Vermont and Massachusetts and the Springfield Athol and North-eastern R. Rs. It contains three post-offices, two weekly papers, one national and one savings bank, and five churches. Cottons, woollens, lumber, wooden ware, castings, and many other goods are manufactured. P. 3517. R. W. WATERMAN, PUB. AND ED. "CHRONICLE."

Ath'ole, DUKES OF, and marquesses of Tullibardine (1703), and of Athole (1676); earls of Tullibardine (1606), of Athole (1629), and of Strathtay and Strathardle (1703); viscounts of Balquhidar (1676), of Glenalmond and Glenlyon (1703); Barons Murray (1604); Barons Balquhidder (1606); Barons Balvenie and Gask (1676, in Scotland); Barons Strange of Knocklyn (1628, in England); Barons Percy (1722, in Great Britain); Barons Murray of Stanley (1786, in Great Britain); Earls Strange (1786, in Great Britain); Lords Glenlyon (1821, in the United Kingdom). —JOHN JAMES HUGH HENRY STEWART-MURRAY, the seventh duke, was born Aug. 6, 1840, and succeeded his father in 1864. The dukedom takes its name from Athole, a district in Perthshire, Scotland.

Athor, Athyr, or **Het-her,** an Egyptian goddess, the daughter of Ra, supposed to correspond to the Aphrodite of the Greeks. The cow was regarded as her symbol.

A'thos, Mount (called *Hagion Oros* (Ἅγιον Ὄρος) by the modern Greeks, and *Monte Santo* by the Italians; both names signifying "holy mountain"), a celebrated mountain of Greece, at the extremity of the peninsula of Chalcidice (which extends into the Ægean), 80 miles S. E. of Salonica. It rises abruptly to the height of 6350 feet above the sea. Xerxes, king of Persia, cut a canal through the narrow isthmus which connects the peninsula with the mainland, to avoid the dangerous navigation around the promontory. In the Middle Ages, Mount Athos was occupied by numerous monasteries (whence the modern Greek and Italian names), and was a celebrated seat of learning. Here were preserved the remains of famous libraries which furnished to scholars many valuable Greek manuscripts. A number of monks, estimated at 6000, still reside on this mountain, which abounds in beautiful scenery. Recently, the Russians have gained considerable influence among the monks. The Russians formerly submitted to all the regulations of the Greek monks. Of late, however, they have increased so much that the Russian monks now have a majority in two monasteries. (See GASS, "Zur Geschichte der Athosklöster," 1865.)

Atitlan', a lake and volcano of Central America, 80 miles N. W. of Guatemala. The lake is 24 miles long, 10 miles wide, and nearly 2000 feet deep. The volcano is 12,500 feet high, in lat. 14° 30′ 38″ N., lon. 91° 12′ 47″ W. The town of Santiago de Atitlan is on the S. side of the lake.

Atkarsk', a town of Russia, in the government of Saratov, 50 miles N. W. of Saratov. Pop. in 1867, 8311.

At'kins, a township of Coosa co., Ala. Pop. 543.

At'kinson, a post-township of Henry co., Ill. P. 1132.

Atkinson, a post-township of Piscataquis co., Me. Pop. 810.

Atkinson, a township of Worcester co., Md. Pop. 1312.

Atkinson, a post-township of Rockingham co., N. H. It has an academy. Atkinson Dépôt is a station on the Boston and Maine R. R., 37 miles N. of Boston. Pop. of township, 488.

Atkinson (ARCHIBALD), born in Isle of Wight co., Va., Sept. 13, 1792, studied law at William and Mary College, served as an officer in the war of 1812, held prominent State offices, and was a member of Congress from Virginia (1843–48). Died Jan. 10, 1872.

Atkinson (Theodore), born at Newcastle in 1697, became chief-justice of New Hampshire in 1754. Died in 1779.

Atlan'ta, the seat of justice of Fulton county, and the present capital of Georgia. It is the great railroad centre of the Southern States. It owes its existence as a city to these great channels of overland transportation, which converge at the site on which it has sprung up and grown with astonishing rapidity. In 1843, where Atlanta now stands was an unbroken forest, but it in a few years afterwards became the terminal point of several important and extensive railroads, to wit: the Georgia R. R., 171 miles in length, from the city of Augusta, and, by means of the South Carolina and Hamburg R. R., connecting Atlanta with Charleston; the Macon and Western R. R., 101 miles in length, from Macon, thus connecting it, by means of the Georgia Central, with Savannah; the Atlanta and West Point R. R., 86 miles in length, connecting it by other routes with Montgomery and Mobile, Ala., and New Orleans; the Western and Atlantic R. R., 138 miles in length, connecting it, at Dalton and Chattanooga, by other routes, with Knoxville, Greenville, and other points in East Tennessee, Nashville in Middle Tennessee, and Louisville in Kentucky, and Memphis in West Tennessee; the Air Line R. R., connecting it with Richmond, Va., and with several intervening towns and cities of note and distinction. From the same common terminal point there is now being constructed the Georgia Great Western R. R., which when completed will bring it in connection with the inexhaustible coal-fields of Alabama.

Atlanta has sometimes been called the "Gate City." The first corporate name given to it was "Marthasville," in honor of the daughter of Hon. Wilson Lumpkin, ex-governor of the State. It was not until 1845 that the Georgia and Western and Atlantic R. Rs. were completed to this place. It was about this time that the first settlements were made. In 1847 a charter was granted for the municipal government of the new town under the new name of "the city of Atlanta." The population was then about 2500. The new name was suggested by J. Edgar Thomson, the then chief engineer of the Georgia R. R., but now at the head of the Pennsylvania R. R. The idea of the name occurred to him from the geographical position of the place. It is immediately on the dividing ridge separating the waters of the Gulf from those of the South Atlantic slope. The elevation of Atlanta is 1100 feet above the level of the ocean, its latitude a little S. of 34° N. It is on a high ridge, hence its climate is comparatively mild and delightful at all seasons, the thermometer seldom rising in summer above 90° or falling below 15° in winter. Its atmosphere is dry, pure, and healthy. These facts have doubtless contributed greatly to its growth, thrift, and prosperity. When the other connecting roads were completed it became the centre of an immense interior trade. In 1850 its population had more than doubled in three years, and in 1859 it was estimated at over 17,000.

During the late war Atlanta was the theatre of many important events. This was the objective point of Gen. Sherman in his famous campaign of 1864. After many sanguinary conflicts in his progress from Dalton (from the 7th of May to the last of August), he finally succeeded in reaching his goal and taking possession of the city on Sept. 2. This he held until Nov. 15, when he set out upon his grand "march to the sea." Before starting on this movement he compelled all the inhabitants to leave, and by general conflagration left the city in ruins. But after the war was over new life and energy animated the place. As early as the fall of 1865, Atlanta, Phœnix-like, was "rising from her ashes." In 1867 her population was thought to be quite as large as it was in 1859. In 1868, by the new constitution, made in pursuance of the requirements of the reconstruction acts of Congress, it was established as the future capital of the State. Since then it has continued to grow and prosper with its former wonderful rapidity. In 1870, according to the Federal census of that year, its entire population, white and black, was 22,789. Its population is now (1873) estimated at over 30,000. Its real estate is now valued at nearly $9,000,000. Several magnificent churches have recently been erected which would be ornaments to any city in the Union, while the Kimball House as a hotel, in size and dimensions, in interior arrangements, as well as grandeur of external structure, stands without a rival in the Southern country. It has three national banks, three daily, five weekly, and four monthly periodicals. Space will not allow details as to the various and numerous mechanical and manufacturing enterprises which now distinguish the energy and spirit of the place, such as workshops, factories, foundries, and furnaces of all sorts. One, however, of these should not be omitted; that is, the Schofield Rolling-Mill, with its nail-factory, etc. This mill turns out all kinds of railroad and merchant iron. It gives employment to several hundred operatives, and is said to consume forty tons of coal per day, and produces 400 tons of pig iron per month.

Atlanta is no less distinguished for its educational than its industrial enterprises. The Oglethorpe University has been removed from near Milledgeville to this place; besides this, it has the North Georgia Female College, the Atlanta Medical College, the Atlanta University (colored), Moore's Southern Business University, Eastman's Business College, English and German select school, Orphans' Free School, Storr's School (colored), and one of the best general systems of public schools to be found in any of the States. Atlanta is also now a port of delivery; the last Congress made a liberal appropriation for the erection of a custom-house here, and at no distant day it may be expected that this great centre of domestic trade will likewise become noted as an emporium of foreign commerce throughout that extensive region of country over which its network of railroad connections gives it such wonderful facilities for distribution.

Alex. H. Stephens, Ed. "Atlanta Constitution."

Atlanta, a post-village and township of Logan co., Ill., on the St. Louis Alton and Chicago R. R., 39 miles N. N. E. from Springfield. There are two steam flouring mills, one carriage and wagon factory, five churches, two hotels, one newspaper, and one of the largest and best school buildings in Central Illinois. Pop. of township, 2339.

A. W. Briggs, Ed. "Argus."

Atlan'tes [for etymology see below], in architecture, are statues of figures of the male human form used instead of columns by the ancient Greeks and Romans. The latter called them Telamones. *Atlantes* is merely the Latin plural form of *Atlas*, whose shoulders are said to have supported the heavens. Similar female figures are called *Caryatides*.

Atlan'tic, a county in the S. S. E. of New Jersey, bordering on the Atlantic Ocean. Area, 620 square miles. It is bounded on the N. E. by Little Egg Harbor River, and intersected by Great Egg Harbor River. The surface is level; the soil is sandy, and near the sea is marshy. Dairy and garden products are extensively raised. The Camden and Atlantic R. R. passes through this county. Capital, May's Landing. Pop. 14,093.

Atlantic, a post-village of Cass co., Ia., on the East Nishnabatona River, and on the Chicago Rock Island and Pacific R. R., 79 miles W. by S. from Des Moines. It has a national bank and two weekly newspapers. Pop. 1200.

Atlantic, a township of Monmouth co., N. J. Pop. 1713.

Atlantic, a township of Accomack co., Va. Pop. 4111.

Atlan'tic Cit'y, a fashionable watering-place of Atlantic co., N. J., on the Atlantic Ocean, 60 miles S. E. of Philadelphia, with which it is connected by the Camden and Atlantic R. R. This road was opened in July, 1854, since which time many large hotels have been erected here. Pop. 1043.

Atlantic City, a post-village of Sweetwater co., Wy., 4 miles N. E. of South Pass City, is on Rock Creek. It has rich placer gold-mines and an aqueduct several miles long.

Atlan'tic O'cean [Lat. *Atlan'ticus Oce'anus*; Gr. Ἀτλαντικὴ θάλασσα or Ἀτλαντικὸν πέλαγος; Ger. *Atlan'tisches Meer*] is that part of the ocean which separates America from Europe and Africa, and extends from the Arctic Circle to the Antarctic Circle. Its extreme breadth is about 5000 miles, and its area about half that of the Pacific. The part N. of the equator is called the North Atlantic, and that on the S. side of that line the South Atlantic. The following bodies of water are parts of the Atlantic: the Bay of Biscay, the German Ocean, the Irish Sea, the Baltic, Hudson's Bay, the Gulf of Mexico, the Caribbean Sea, and the Gulf of Guinea. Its chief affluents are the Amazon, La Plata, Orinoco, Mississippi, and St. Lawrence in America; the Niger, Senegal, and Congo in Africa; and the Rhine, Loire, and Tagus in Europe. The portion of America which is drained into the Atlantic is vastly greater than that which belongs to the basin of the Pacific. The greatest depth of the Atlantic yet discovered is about five miles. The main feature of the Atlantic basin seems to be a deep valley, which, with an average depth of 20,000 feet or more, extends along and parallel to the coasts of America. The so-called telegraphic plateau between Newfoundland and Ireland has an average depth of 12,000 feet. This is a remarkable ridge about 400 miles wide and 1640 miles long. (See Deep-sea Soundings.) The chief currents of the Atlantic are the Equatorial Current and the Gulf Stream. The former moves from the Bay of Benin westward along both sides of the equator with a mean velocity of about thirty nautical miles a day, but in some places the velocity is much greater. Its breadth varies from 200 to 400 miles. Near Cape St. Roque it divides into two branches, one of which, called the Brazil Current, runs southward, and the

other, called the Guiana Current, flows north-westward to the Caribbean Sea. The Gulf Stream originates in the Gulf of Mexico, passes between Florida and Cuba, and flows along the coast of the U. S. with a velocity of about eighty miles a day, gradually expanding in volume. As it proceeds northward its velocity and temperature both decrease. Its mean breadth is about 350 miles. Reaching the latitude of New York, it gradually turns to the E., and crosses the Atlantic to the Azores, where it divides. The northern branch flows to the British Isles, and the other, turning southward, is swept back by the force of the North Equatorial Current to the Gulf of Mexico. Thus is formed near the middle of the North Atlantic a great whirlpool or eddy, which accumulates a mass of matted seaweed (*Fucus natans*). It is maintained by some that this weed has its origin at or near the place where it is found in such abundance, while others think that it is brought here by the action of the wind and water. This part of the sea, which is called *Mar de Sargasso*, is said to be 260,000 square miles in extent. The water of the Gulf Stream is sometimes twenty degrees warmer than that of the adjacent ocean. On issuing from the Gulf of Mexico it is of a dark-blue color. This stream contributes greatly to temper the climate of England and Ireland. Sailing-vessels from the U. S. to Europe take advantage of the Gulf Stream, and often make the voyage in twenty-three days; the voyage in the other direction is not often performed in less than thirty days, and the average duration is about forty days. The voyage from New York to Europe is favored by the prevalence of S. W. winds, as well as by the Gulf Stream. In the intertropical regions of the Atlantic the trade-winds prevail with great regularity, blowing nearly westward. (See Ocean.)

REVISED BY A. J. SCHEM.

Atlantic Telegraph. See Telegraph, by Prof. Edward C. Pickering, B. S., M. N. A. S.

Atlan'ticville, a post-village of Southampton township, Suffolk co., N. Y., near the S. shore of Long Island. Pop. 179.

Atlan'tides [Gr. Ἀτλαντίδες], in classic mythology, the daughters of Atlas. They were also called Hesperides, Pleiades, and Hyades. (See Hesperides.)

Atlan'tis, the name of a large island which, according to an ancient tradition that was credited by the Greek geographers, was situated in the Atlantic Ocean W. of Africa. One of the earliest writers who mentions Atlantis is Plato, who states that an Egyptian priest gave Solon a description of it. Plato gives a beautiful picture of this island, to which he adds a fabulous history. Nine thousand years before the time of Plato, Atlantis was (so the legend ran) populous and powerful, and conquered the western part of Europe and Africa. An earthquake afterwards caused it to sink in the ocean. (See Rudbeck, "Atlantica," 4 vols., 1675–98; Bailly, "Lettres sur l'Atlan de Platon;" and Carli, "Lettres Américaines.")

At'las [Gr. Ἄτλας], a mythical personage, said to be a son of Japetus and Clymene, and a brother of Prometheus. He was represented by the ancient Greek legends as a leader of the Titans in the war against Jupiter, for which offence he was condemned to support the vault of heaven on his head or shoulders. According to some writers who have rationalized the myth, he was a king who acquired great skill in astronomy.

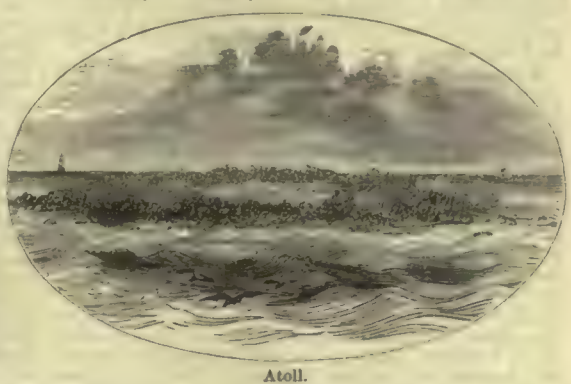
Atlas, in anatomy, the first cervical vertebra, the piece of the vertebral column nearest to the skull. It forms, with the occipital bone, the joint on which the head moves in bowing. It turns on the pivot of the second cervical vertebra, the "axis," when we look from side to side.

Atlas [so called because some early collections of maps had prefixed a picture of Atlas upholding the sphere], a volume containing a collection of maps, usually including more or less descriptive letter-press. The name was probably first applied as the proper title of such a book by Gerard Mercator (1512–94) to his "Atlas," published in the year of his death. Among the best atlases are the works of Sticler (in German, French, Swedish, Finnish, Italian, etc.), of Menke, Spruner, Berghaus, Sydow, and others, illustrating not only geography proper, but history, ethnography, geology, astronomy, botany, and other sciences; and the works of A. K. Johnston, Black, and numerous others in Great Britain. Among the oldest American atlases are those of Matthew Carey and Burr's "Atlas of New York," both valuable and well executed for the times. The number of American atlases in later years is very great, the most complete and widely-known being "Johnson's Family Atlas of the World," containing a very thorough treatise upon physical geography by Prof. Arnold Guyot, Ph. D., LL.D.

Atlas, a post-township of Pike co., Ill. Pop. 1584.

Atlas, a post-township of Genesee co., Mich. P. 1501.

Atlas Mountains, a mountain system of Africa, mostly in Morocco and Algeria, extends from Cape Gher on the Atlantic to Cape Bon on the Mediterranean. It is a congeries of mountains, sometimes isolated and sometimes connected, with many irregular branches. The system is divided into the Greater and the Lesser Atlas, the latter of which is nearer to the Mediterranean. The highest point of the system is in Morocco, and is estimated at 13,000 feet above the sea. Mount Miltsin rises to 11,400 feet. The mineral resources have not been explored completely, but numerous metals are found.



At'lee (Washington L.), M. D., an eminent physician and surgeon, was born at Lancaster, Pa., Feb. 22, 1808, graduated as M. D. at Jefferson Medical College in 1829, practised at Mount Joy and Lancaster, and was professor of medical chemistry at the Jefferson College, Philadelphia, 1844–52. He has published more than eighty medical and scientific monographs, etc., but is especially distinguished for his great number of successful operations in ovariotomy.

Atmosphere [from the Gr. ἀτμός, "vapor," and σφαῖρα, a "sphere"], the aëriform fluid envelope which surrounds the earth or any celestial body. That of the earth is the only one with which we are familiar. It is composed of air (a mixture of 77 parts by weight of nitrogen and 21 of oxygen), with variable proportions of carbonic acid, aqueous vapor, and ammonia, the latter in exceedingly small amounts. (For its physical properties see Acoustics, by Prof. O. N. Rood, A. M., and Pneumatics; see also Climate, Storms, and Winds, by Prof. Arnold Guyot, Ph. D., LL.D.)

Atmospheric Engine. See Hot-Air Engine.

Atmospheric Railway. See Pneumatic Railway.

Atoll', or **Atoln,** a name which the natives of the

Atoll.

Maldive Islands give to a peculiar kind of island that occurs in the Indian Ocean and parts of the Pacific. It is a low circular reef of coral, enclosing a lagoon, which in many instances, but not all, communicates with the ocean by a narrow inlet, or by more than one. (See article on Coral Islands, by Prof. Arnold Guyot, Ph. D., LL.D.)

At'om [Lat. *at'omus;* Gr. ἄτομος, "that which cannot be cut," "indivisible," from α, priv., and τέμνω, to "cut," to "divide"], a minute, indivisible particle of matter. According to one theory of speculative philosophy, matter is infinitely divisible. On the other hand, many modern chemists maintain that all matter consists of ultimate, indivisible, and indestructible particles. They believe that all the atoms of each element have the same weight and form, but the atoms of different elements have unequal weights. Many scientific men suppose that all atoms are spherical. The tendency of recent scientific research has been to prove that the chemical atom and physical atom are not identical. (See Atomic Weights and Chemistry.)

Atomicity. See Chemistry.

Atomic Theory. See Chemistry.

Atom'ic Vol'ume of a gas is the space occupied by a quantity of it proportional to its atomic weight. It is ascertained that 1 equivalent or 16 grains of oxygen at 60° F., and at a barometric pressure of 30 inches, occupy 46.6 cubic inches; 1 equivalent or 1 grain of hydrogen occupies 46.7 cubic inches; and 1 equivalent or 35.5 grains of chlorine occupy 46.2 cubic inches: consequently the atomic volume of hydrogen, chlorine, and oxygen is the same. Other gases exhibit a similar relation, and an attempt has lately been made to carry out an analogous relation in regard to liquids and solids.

Atom'ic Weights, or **Chem'ical Equi'valents,** the proportions by weight in which chemical elements unite. One element must be selected as the starting-point of the

series, and an arbitrary value affixed to it, and thereafter all the other elements can have their values awarded to them according to the proportional amounts in which they combine. It can be demonstrated that a given amount of one element is equivalent to, and serves the same purpose in combining with, a second element as a greater or less amount of a third substance. Hydrogen is by some writers taken as 1, and all the other elements are represented by a quantity which is the minimum amount in which they unite with 1 of hydrogen. By others oxygen is regarded as the starting-point of the series, and is called 100, whilst the other elements have a proportional number attached. (For a table of the atomic weights, see CHEMISTRY.)

Atomiza'tion. In practical medicine this is the very minute subdivision of liquids for inhalation or application to the throat. It was first introduced in France by Sales-Girons. It is effected by forcing a fine jet of liquid against either a solid body or a strong current of air, so as to convert it into diffused spray. Bergson, for instance, applied to this use the tubes used as *odorators* to spread perfumed liquids through the air. Two glass tubes with minute orifices are fixed at right angles to each other, so that the end of the upright tube is near and opposite to the centre of the orifice of the horizontal tube. The upright tube being placed in the liquid to be atomized, air is forcibly blown through the horizontal one. The current of air passing over the outlet of the upright tube rarefies the air in the latter, causing a rise of the liquid through it, and its very minute subdivision (atomization, nebulization, pulverization) as it escapes. Siegle has applied steam-power, generated by the heat of a spirit-lamp, to the propulsion of vapor for atomization. Richardson's *hand-ball* spray-producer is a simpler apparatus, constructed essentially upon the same principle. One of its uses is, by the rapid evaporation of ether or rhigolene, to produce a great degree of cold for local *anæsthesia* (*i. e.* to annul sensibility in a part for a surgical operation).

Atonement. I. THE WORD.—1. The etymology and usage of the *English* word. (1) Supposed to be derived from "at-one-ment," and its earlier signification, "reconciliation;" (2) at present universally used in the sense of "satisfaction for an offence," "expiation." (*Webster* and *Worcester*.) 2. In the authorized English version the word occurs only once in the New Testament (Rom. v. 11), and there represents καταλλαγή, "reconciliation." In the Old Testament it occurs frequently, translating כָּפַר, to "cover with sacrificial blood," and hence to "expiate," to "appease," to "purge away." 3. The biblical equivalents of the word in the Old Testament, כִּפֻּרִים, "expiation." In the New Testament: (1) As it respects God, ἱλάσκεσθαι, to "propitiate" (1 John ii. 2 and iv. 10); (2) as it respects sin, to "expiate" (Heb. ii. 11); (3) as it respects the sinner, ἀγοράζειν, to "redeem" (by blood, Rev. v. 9), and λυτροῦν, to "ransom by substitution" (1 Pet. i. 18; 1 Tim. ii. 6).

II. THE DOCTRINE. 1. *Patristic.*—The biblical view above presented has always prevailed in the Church as the basis of religious experience. It was, however, but imperfectly discriminated as a logical conception by the early teachers. From an exaggerated conception of the independence and power of the kingdom of Satan, many of the Fathers, as Irenæus, Origen, and even Augustine and Jerome, etc., founded on such texts as Col. ii. 15 and Heb. ii. 14 the notion that Christ by his sufferings rendered satisfaction to Satan, who had acquired rights of conquest over the human race.

2. *The Anselmic.*—The doctrine which was from the beginning the living principle of the devotional writings of all Church teachers and of all liturgies and hymns, and which since his time has been taught in the authorized creeds of all sections of the Church, was first systematically unfolded by Anselm, archbishop of Canterbury (1093–1109), in his tract, "Cur Deus Homo." He teaches that the essential moral perfection of the divine nature, which is immutable, necessarily demands the punishment of sin—that sin is an intrinsic and infinite evil. The law is consequently unrelaxable, and the penalty must be executed upon the sinner unless a substitute (1) personally free of all legal demands and (2) of sufficient dignity is willing to be punished in his stead. This condition is answered only by a Person at once divine and human—*i. e.* a divine Person who has assumed a human nature. Christ made atonement for the sins of men by vicariously suffering the legal penalty of death to which they were condemned, and thus expiated the guilt of sin and propitiated the justice of God.

(1) This was in substance taught from the beginning. Athanasius (d. 373), "Contra Arianos," i. 60, etc.: "Laden with guilt, the world was condemned of law, but the Logos assumed the condemnation, and suffering in the flesh gave salvation to all." Augustine (d. 430), "De. Pec. Mer.," i. 56; Gregory the Great (d. 604), "Mor. in Job." 17: 46.

(2) The same doctrine is taught in the standards of the Roman and the orthodox Greek churches, "Conc. Trent.," sess. 6, ch. 7: "Jesus Christ, who when we were enemies merited justification for us by his most sacred passion on the tree, and satisfied God the Father for us." "Cat. Rom.," ii. 5, 63; "Orthodox Conf. of Apos. East. Church," by Petrus Mogilas (A. D. 1642); Winer, p. 85.

(3) The same doctrine is taught in the confessions, liturgies, and hymns of every branch of the Lutheran and Reformed churches: "Formula Concordiæ" (Lutheran); Hase, "Libri Symbolici," p. 684; "Heidelberg Cat.," Ques. 60; "Second Helvetic Conf.," ch. 15; "Gallic Conf.," art. 18; "Belgic Conf.," art. 22; "Westminster Conf.," ch. 8, § 5; "Liturgy and Articles of the Church of England," art. 28, art. 31: "The offering of Christ, once made, is that perfect redemption, propitiation, and satisfaction for all the sins of the whole world, both original and actual."

3. Abelard (d. 1142) first systematically developed what has since been known as the "*moral influence* theory of the atonement." He regards the love of God as the sole principle determining him in his provision of redemption for sinners. All that God's nature or will requires of a sinner as prerequisite to forgiveness and happiness is repentance and reformation. As rebellious men are obstinately indisposed to this repentance, and are afraid to trust his favor, God by his alliance with human nature in Christ, and by his surrender of him to death, makes such an exhibition of his love for man as awakens man's love for and trust in him, and so disposes man to repentance. This view is essentially the doctrine of the Socinians of the fifteenth century (Racovian Cat.) and of modern Unitarians, and of such Trinitarians as Maurice, Jowett, and Bushnell.

4. The "governmental theory of the atonement" was first propounded by Hugo Grotius (d. 1645) in his work against the Socinians, "Defensio Fidei Catholicæ de Satisfactione Christi." He taught that the moral law under which men are held, including precept and penalty, is a positive product of the divine will. The right of waiving or relaxing its demands is therefore an element of God's prerogative as moral sovereign. But since this gratuitous remission of the penalty in case of some sinners would weaken the motives restraining the subjects of the divine government in general from disobedience, by affording an example of impunity, the BENEVOLENCE of God requires that he should make such an *example* of suffering in Christ as will indubitively exhibit his determination not to allow sin to pass in any case without signal marks of his displeasure. This doctrine has never been accepted by any historical Church as an adequate rationale of the atonement, nor has it been embodied in any creed, but it has been frequently adopted by several schools of theologians —*e. g.* the supernaturalists of the last age in Germany, as Stäudlin, Flatt, and Storr, and in America Jonathan Edwards, Jr., Smalley, Maxey, Dwight, Emmons, and Park.

5. The "mystical theory," which, existing in various forms, may be generally stated thus: That the reconciliation effected by Christ is brought about by the mysterious union of God and man accomplished by the incarnation, and not by his sacrificial death. This was held by the Platonizing Fathers, by followers of Scotus Erigena during the Middle Ages, by Osiander and Schwenkfeld at the Reformation, and by the school of Schleiermacher among modern German theologians. (See PROF. ED. PARKS'S "Atonement;" DR. SHEDD'S "Hist. of Christ. Doctrine;" RITSCHL'S "Hist. of Doc. of Reconcil.;" SCHAFF'S "Hist. Chr. Ch.;" WATSON'S "Institutes;" WINER'S "Comp. of Docs. of Christendom;" OUTRAM, "De Sac.;" HASE, "Libri Symbol.;" NIEMEYER, "Collec. Conf.") A. A. HODGE.

Atra'to, a river of South America, in U. S. of Colombia, rises near the Cordillera, flows northward through Choco, and after a course of about 300 miles enters the Gulf of Darien by several mouths. It is navigable for small vessels about 140 miles, and traverses a region rich in gold. In 1857 the government of the U. S. sent an expedition to explore a route for a ship-canal from the Atrato to the Pacific. It is stated that the rainy season continues all the year in the valley of this river. In 1870–72 the explorations under the direction of Capt. Selfridge, U. S. navy, have been resumed, and all the routes between Panama and the Atrato examined, with results far from realizing the hopes entertained of a favorable route.

A'treus [Gr. Ἀτρεύς], an ancient and celebrated king of Mycenæ, was called a son of Pelops. He was the father of the famous *Atridæ*—*i. e.* Agamemnon and Menelaus. The story of Atreus and his family was embellished by the ancient fabulists and tragic poets with many wild legends, involving horrible crimes and calamities.

Atri'des [Gr. Ἀτρείδης], plural **Atri'dæ** [Ἀτρεῖδαι], a

patronymic from *Atreus*, signifies a son or descendant of Atreus. The name in the singular is more usually applied to Agamemnon, but the plural is used to designate the two brothers, Agamemnon and Menelaus.

A'trium, a Latin word signifying a court, a hall. In Roman architecture the atrium was an entrance hall or central apartment, which was the principal part of a private house. In this room the family lived and took their meals. Here stood the Lares and Penates, and here the female servants were employed in weaving and other labors. The atrium was also used as a waiting-room for clients and other visitors. In ecclesiastical architecture the term denotes an open space before a church, forming part of the narthex or ante-temple.

At'ropine, or **Atro'pia,** a peculiar alkaline principle obtained from the *Atropa Belladonna*, is very poisonous. It exists in all parts of the plant. A very minute portion of it has the power to dilate the pupil of the eye. Atropine is composed of carbon, 70.98; oxygen, 16.36; hydrogen, 7.83; and nitrogen, 4.83.

A'trypa [from the Gr. *a*, priv., and *τρύπη*, a "foramen," *i. e.* "without a foramen:" an objectionable name, since it is not true of these shells], a genus of fossil brachiopod shells which closely resemble the *Terebratula*. It had a perforation for the passage of the peduncle, by which the animal attached itself to foreign bodies. Many species of it have been described, the most of which are Silurian, many Devonian, but all palæozoic.

Attach'ment [Fr. *attachement*], the apprehension of a person or seizure of a thing by virtue of a writ or order issued by a court or judge under authority of law. The word is sometimes used to denote the process itself. In respect to property, the term is usually applied to seizure on *mesne* process. Attachment was originally one of the common-law means of obtaining an appearance in an action by the defendant. In some of the States a plaintiff can at the commencement of any action to recover money attach the property of the defendant as a security for the payment of the judgment expected to be recovered; and in case of recovery the property is to be applied in satisfaction of the judgment. But the more usual rule is that there can be no seizure of property, except in specified cases, till the rights of the parties have been settled by judgment of the court. The exceptions are chiefly in cases where the defendant is a non-resident or a fraudulent debtor, or is attempting to conceal or remove his property for the purpose of defrauding or delaying his creditors. An attachment is said to be foreign where a creditor attaches property in the hands of a third person belonging to his debtor, or a debt due from a third person to such debtor. The name is said to arise from the fact that the proceeding is often resorted to for the purpose of collecting a debt against a non-resident. In some of the Eastern States this proceeding is called "trustee process;" in other States it is generally known as "garnishment," meaning a warning. Foreign attachment was derived from local customs in London and other cities, and formed no part of the general law of England.

2. *Against the Person.*—This is issued against officers of the court for any misconduct or neglect of duty, and against any one who has been guilty of contempt of court. The object of the attachment is to bring the guilty party actually before the court. He has then an opportunity to show cause why he should not be found guilty, or, in legal language, to "purge himself of the contempt." If he cannot do this, he is subject to such punishment as the law permits and the court may award. T. W. Dwight.

Attain'der [Old Fr. *attaindre*, to "stain"], in law, is the extinction of civil rights as the consequence of a judicial sentence of death for a capital crime. From this moment the criminal was deemed to be legally dead, incapable of bringing an action except to reverse the attainder, or of appearing in court as a witness. Its two most important consequences are forfeiture and corruption of blood. The effect of forfeiture upon the offender's land was such that it related back to the time of the commission of the offence, and avoided intermediate sales, even to purchasers in good faith. The consequence of corruption of blood was that the person attainted was incapable of inheriting himself or of transmitting an estate by inheritance to another. Thus, if a grandfather owned land, and a son were attainted, his descendant could not inherit from the grandfather, even though the son were dead when the land passed from the grandfather. This harsh rule is now modified in England by statute. Forfeiture, except in cases of treason and murder, does not extend in the case of estates of land beyond the natural life of the offender. By the U. S. Constitution no attainder of treason shall work corruption of blood or forfeiture, except during the life of the person attainted. In case of rebellion the U. S. might regard the rebels either as belligerents or traitors. In the former aspect of the case they would not be bound by the restriction just referred to, but might, under the rules of public law applicable to a state of war, confiscate their property. If, however, they were treated as subjects and as guilty of treason, the restriction of the Constitution would become operative.

Attakapas, at-tuk'a-paw, a large and fertile district in the southern part of Louisiana, comprising, according to old maps, several parishes. It produces large quantities of sugar and molasses. Though often used in conversation, the name has no legal existence, and is not employed in the census.

Atta'la, a county of the central part of Mississippi. Area, 630 square miles. It is bounded on the W. by the Big Black River, and intersected by the Yukanookluna (or Yockanockany) Creek. The surface is undulating or nearly level; a part of the soil is fertile. Cattle, grain, tobacco, cotton, wool, and potatoes are the chief crops. Capital, Kosciusko. Pop. 14,776.

Atta'lea, a genus of palms of numerous species, natives of tropical South America. They generally have lofty, cylindrical, and smooth stems, but some are stemless. Their large pinnate leaves are used for thatching, mats, etc. The fruit is a nut enclosed in a dry fibrous husk. The *Attalea compta* bears an eatable fruit about as large as a goose egg. The leaf-stalks of *Attalea funifera*, which grows in the maritime parts of Brazil, and is there called piassaba, yield a fibre much used to make cordage which is very strong and durable in salt water.

At'talus I., king of Pergamus, was born 269 B. C. He succeeded his cousin, Eumenes I., in 241 B. C., defeated the Gauls who had occupied Galatia, and became an ally of the Romans in a war against Philip of Macedon. He was reputed a wise ruler and able general. Died in 197.

Attalus II., surnamed Philadelphus, born about 220 B. C., was the second son of Attalus I. He succeeded his brother, Eumenes II., in 159 B. C., was a constant ally of the Romans, and patronized arts and sciences. Died in 138.

Attalus (Flavius Priscus), a Roman emperor, born probably in Ionia, was converted from paganism to Arianism. He was prefect of Rome when that city was captured by Alaric in 409 A. D., and was proclaimed emperor by that conqueror in the same year. He was deposed by Alaric in 410, and banished by Honorius in 416 A. D.

At'taman, or **Het'man,** the title of the chiefs of the Cossacks, formerly elected by the people. (See Cossacks.) After the revolt of Mazeppa the office was suppressed by the czar of Russia until 1750. Catharine II. abolished the office among the Cossacks of the Ukraine; among those of the Don it still exists, but its prerogatives have been greatly reduced. The heir-apparent of the Russian crown is principal attaman of the Cossacks, but there are numerous subordinate chiefs having the same title.

At'tar of Ro'ses [from the Arab. *itr*, "perfume"], the oil or essence of *Rosa centifolia* and its varieties, *Rosa damascena* and *Rosa moschata*. It is prepared by distillation of the petals in Persia, India, and other Eastern countries, whence it is exported in small vials. It is very costly, and is often adulterated: 100,000 roses, from 10,000 bushes, are said to yield but 180 grains of attar. It is often called *otto* of roses. That of Adrianople is called the best.

At'terbury (Francis), an eminent English prelate, writer, and politician, born at Middleton-Keynes, in Buckinghamshire, Mar. 6, 1662. He entered Christ Church, Oxford, in 1680, graduated in 1687, and became lecturer in St. Bride's Church, London, in 1691. Having gained distinction as a pulpit orator, he was appointed a chaplain to the king. He was the author of a witty but superficial "Examination of Dr. Bentley's Dissertations on the Epistles of Phalaris," which appeared under the name of "Charles Boyle" in 1698. He was a Jacobite in politics, and a zealous defender of High Church doctrines. He was appointed chaplain to Queen Anne in 1702, dean of Carlisle in 1704, and bishop of Rochester in 1713. His turbulent and imperious temper several times involved him in difficulties, and his hopes of promotion were blasted by the death of Queen Anne in 1714. He was a friend of Pope, Swift, and Bolingbroke. In Aug., 1722, he was committed to the Tower on a charge of treason as an accomplice in plots for the restoration of the Stuarts. He was convicted by the House of Lords in May, 1723, and was condemned to perpetual banishment. He became a resident of Paris, where he died Feb. 15, 1732. Four volumes of his sermons were published in 1740. His reputation as a writer is founded on his sermons and letters, which have great literary merits. (See his "Epistolary Correspondence," 4 vols., 1783, edited by J. Nichols: Thomas Stackhouse, "Memoirs of the Life of Francis Atterbury," 1727.)

At'tic [Lat. *At'ticus*; Gr. Ἀττικός], pertaining to Attica or to its capital, Athens; marked by such qualities as were

characteristic of the Athenians. An Attic style designates that which is pure, classical, and elegant. Attic base is the base of a column used in the Ionic and Corinthian, and sometimes in the Doric, orders. Attic wit and Attic salt signify a poignant and delicate wit especially characteristic of the Athenians.

Attic, a term in architecture applied to a low story rising above the cornice that terminates the main elevation of a building; a sky-lighted room next to the roof of a private dwelling-house.

At'tica [Gr. 'Αττική], a state of ancient Greece, bounded on the N. by Bœotia, on the E. by the Ægean Sea, on the S. W. by the Saronicus Sinus, and on the W. by Megaris. It occupied a triangular peninsula, at the S. E. extremity of which is the promontory of Sunium. A range of hills called Mount Cithæron extends along the northern border. The surface is diversified by limestone hills and plains, the soil of which is light and unproductive. About 10 miles N. E. of Athens rises Mount Pentelicus, which has an altitude of 3884 feet, and contains inexhaustible quarries of white marble of a superior quality. Among the prominent physical features of the country are Mount Hymettus, about 3500 feet high, and Mount Laurium, whose silver-mines have recently attracted again great attention. The principal streams are the Cephissus and Ilissus, which flow southwestward into the Saronic Gulf. The climate is dry and extremely pleasant. The chief productions are wheat, olives, figs, and grapes. Rich silver-mines were worked at Laurium. Attica was very advantageously situated for commerce, and was at one time the greatest maritime power of the world. The people of Attica, who belonged to the Ionic division of the Hellenic race, planted colonies in various distant lands. The region which they colonized on the western coast of Asia Minor was called Ionia. The capital of Attica was Athens (Athenæ), and the inhabitants of Attica were citizens of Athens, possessing the right to assemble in the capital, and take part in the legislative and judicial proceedings. The ancient population is estimated at 500,000, the majority of whom were slaves. Modern Attica is deficient in forest trees, and presents an arid and rather desolate aspect, except in spring. (For the history of Attica, see Athens.) Attica and Bœotia form a department of the modern kingdom of Greece, comprising Megaris and the islands of Egina and Salamis. It has an area of 2481 square miles. The soil is less fertile than it was in ancient times, and is not well cultivated, but it still produces olives, grapes, and some wheat. Pop. in 1870, 136,804.

Attica, a city of Fountain co., Ind., on the Wabash River and Canal, and the Toledo Wabash and Western R. R., 21 miles W. S. W. of Lafayette. It is also the northern terminus of the Indiana North and South R. R. It has a national bank, waterworks, a fine public school building, three wagon, carriage, and plough factories, and a weekly newspaper. Pop. 2273.

B. F. Hegler, Ed. of "Ledger."

Attica, a township of Lapeer co., Mich. Pop. 1620.

Attica, a post-village of Wyoming co., N. Y., is on Tonawanda Creek and on the Attica branch of the Erie R. R., 31 miles E. of Buffalo. It has several churches, two banking offices, and a weekly paper. Pop. 1333; of Attica township, 2546. C. F. Meloy, Ed. of "News."

Attica, a post-village of Venice township, Seneca co., O. Pop. 370.

At'ticus (Titus Pomponius), an accomplished Roman of the equestrian order, born in 109 B. C. During the war between Sulla and Marius he remained neutral, and passed many years (88–66) in Athens, to which city he rendered important services. He was an intimate friend of Cicero. Having returned to Rome in 65 B. C., he declined to take part in political affairs, and distinguished himself by his moderation, generosity, and mediatorial spirit. He was on friendly terms with the leaders of both parties that divided the Romans. He wrote, besides other books, an epitome of Roman history called "Annales," but all his works are lost. His daughter was the wife of M. Vipsanius Agrippa, the eminent statesman. Died in 32 B. C. (See Corn. Nepos, "Life of Atticus:" Hüllemann, "Diatribe in T. Pomponium Atticum," 1838.)

At'tila [Gr. 'Αττίλας; in Ger. *Et'zel* or *At'zel;* in Hung. *Ethele*], a famous barbaric conqueror and king of the Huns, was a son of Mundzuc (or Mundzuccus). He succeeded his uncle Roas as king of the Huns in 434 A. D., his subjects being nomadic hordes who occupied Pannonia and Sarmatia. He extended his dominion by conquest over Germany and Scythia, and obtained the surname of the Scourge of God. The Vandals, Ostrogoths, and Gepidæ fought under his banner. In 447 A. D. he invaded the Roman empire of the East, and defeated the armies of Theodosius II., who obtained peace by the payment of an annual tribute after the Huns had devastated Thrace and Macedonia. Marcian, who succeeded Theodosius II. in 450 A. D., refused to pay tribute to Attila, saying, "I have gold for my friends and iron for my enemies." In 451 A. D. Attila invaded Gaul with an army estimated at 700,000 men, and besieged Orleans (*Aurelianum*), which was relieved by the approach of a Roman army commanded by Aëtius. Attila retired to Champagne, and awaited the enemy on the Catalaunian plain, near the site now occupied by Châlons-sur-Marne. Here he was defeated in a great battle by the combined armies of Aëtius and Theodoric, king of the Visigoths, in June, 451 A. D. It is stated that 250,000 men or more were killed in this battle. Attila then retreated into Germany. In 452 he led an army into Northern Italy, which he ravaged, and threatened Rome. The emperor Valentinian III., unable to defend his capital, invoked the mediation of Pope Leo I., who had an interview with Attila, and persuaded him to grant the Romans a truce. Attila retired from Italy, and died in Pannonia in 453 A. D., on the night after his marriage with Ildico. He was buried by night, and the prisoners who dug his grave were killed, in order that the place of his burial might be kept secret. He had two sons, named Ellac and Dengezic. His actions form the principal subject of the "Niebelungen-Lied." (See Jornandes, "De Rebus Geticis;" Gibbon, "Decline and Fall of the Roman Empire," chaps. xxxiv. and xxxv.; Wm. Herbert's epic poem entitled "Attila," 1828; Callimachus Experiens, "De Gestis Attilæ," 1541; Fessler, "Attila, König der Hunnen," 1794; Amédée Thierry, "Attila dans les Gaules," 1852.)

At'tleborough, a township of Bristol co., Mass., 30 miles by railroad S. S. W. of Boston. It has one national bank, one savings bank, two public libraries, one loan and fund association, a newspaper, nine churches, two hotels, and two high schools. Its villages are connected by telegraph and railway. Here are extensive manufactures of jewelry, calicoes, clocks, buttons, braids, etc. Pop. 6769.

Ed. of "Chronicle."

Attor'ney [Old Fr. *attorner*, to "prepare," to "direct"], one who acts for or on behalf of another. Attorneys are of two kinds—in fact and at law. An attorney in fact is an agent, though the term is commonly applied to one who is authorized to act for another by a writing called a power of attorney. An attorney at law is one who is authorized by law to act in the place of another in the management or conduct of law proceedings. In England the term is employed to denote a class of legal practitioners whose duties are preliminary to those of the barrister, who conducts the cause in court. An attorney is admitted there after a prescribed term of study, on passing an examination directed by the court. Barristers come to the bar through the action of voluntary societies of lawyers which have existed for several centuries. In the U. S. the same person is in general admitted both as counsellor (answering to barrister) and attorney, and examined in the same manner and under the same authority as to his qualifications to perform both classes of duties. An attorney is an officer of the court, and liable to be punished for a breach of duty, and in aggravated cases to have his name stricken from the roll, and thus lose his right to practice. His duties to his client require the exercise of reasonable care. He is responsible for negligence or wilful default whereby his client sustains loss; for example, for the disclosure by him of confidential communications. He is entitled to compensation, and has a lien upon his client's papers or securities in his possession, and upon any judgment obtained through his exertions.

Attorney-General is an officer under the English government whose duty it is to prosecute for the king in criminal matters, and to manage civil actions or proceedings where his revenue or other property is concerned, as well as to enforce public rights. An illustration is a proceeding for the establishment of charitable foundations by a court of justice, and the correction of abuses in their management. The U. S. and the respective States have a public officer of the same name, with similar duties. Statute law affords a more complete definition of them.

Attorney, Power of. See Power of Attorney, by Prof. T. W. Dwight, LL.D.

Attrac'tion [Lat. *attractio*, from *ad*, "to," and *traho*, to "draw"], the tendency of bodies to approach each other and unite; the force which brings bodies together and resists their separation. The principal kinds of attraction are—the attraction of gravitation (see Gravitation); capillary attraction; chemical attraction (see Affinity); the attraction of cohesion, which unites the particles of a body, and operates only between two portions of matter that are in contact; and magnetic attraction (see Magnetism). These attractions are divisible into two classes—1, those which

act at sensible and measurable distances, as gravitation and magnetic attraction; and 2, those which extend only to extremely small or insensible distances, as chemical attraction and the attraction of cohesion.

Attraction of Mountains. In 1774, Maskelyne made an experiment on the mountain Schehallion, in Perthshire, to ascertain the attraction of mountains. This and subsequent experiments have established the fact that mountains are capable of producing sensible deflections of the plumb-lines of astronomical instruments.

At'tribute [from the Lat. *attribuo* (composed of *at* for *ad*, "to," and *trib'uo*, *tribu'tum*, to "give"), to "give to," to "assign"] denotes, primarily, any quality or power which is by universal consent attributed to a being. Hence, we speak of the "attributes of God," and in a similar manner of those of some particular man or of the human race. In logic, it signifies the opposite of *substance*, and the same as *predicate*.

Attribute, in the fine arts, is a symbol used to distinguish and characterize certain figures. Thus, the trident is the attribute of Neptune; the caduceus, that of Mercury; the owl, that of Minerva. Attributes are either essential or conventional. Essential attributes have some real relation or resemblance to the object or idea to be represented.

At'tucks (Crispus), the leader of the mob in Boston which attacked the British troops Mar. 5, 1770, was a mulatto or half-breed Indian. He was killed in this affray, which was called "the Boston Massacre."

At'water, a post-township of Portage co., O. P. 1180.

Atwater (Caleb), born at North Adams, Mass., Dec. 25, 1778, graduated at Williams College in 1804, became a lawyer, went to Ohio in 1811, resided at Circleville, and was an Indian commissioner under Jackson. He published a "Tour to Prairie du Chien" (1831), "Western Antiquities" (1833), "History of Ohio" (1838), and other works. Died Mar. 13, 1867.

Atwater (Jeremiah), D. D., born at New Haven, Conn., in 1774, graduated at Yale in 1793, was a college tutor (1795–99), first president of Middlebury College, Vt. (1800–09), and president of Dickinson College, Pa. (1809–15). Died July 29, 1858.

Atwater (Lyman Hotchkiss), D. D., born at Hamden, Conn., Feb. 23, 1813, graduated at Yale in 1831, was a tutor and theological student at Yale (1832–35), pastor of First Congregational church in Fairfield, Conn. (1835–54), became in 1854 professor of mental and moral philosophy, and afterwards of logic and moral and political science, at Princeton, N. J. He became editor of the "Princeton Review" in 1869. He has published a "Manual of Logic" (1867), and contributed much to periodical literature.

At'well, a township of Rowan co., N. C. Pop. 2051.

At'wood, or **Attwood** (George), F. R. S., an English mathematician, born in London in 1745. He was a fellow of Trinity College, Cambridge, where he lectured on natural philosophy. He published a "Treatise on the Rectilinear Motion and Rotation of Bodies" (1784), a "Dissertation on the Construction of Arches" (1801), and other works. He invented a machine noticed below. (See Atwood's Machine.) Died July, 1807.

Atwood's Machine was invented by George Atwood (noticed above) to demonstrate the laws of uniformly accelerated motion, and illustrate the relations of time, space, and motion in the case of a body falling under the action of gravitation. This machine is so constructed by means of pulleys and wheels that turn with the least possible friction, that a weight (or falling body) suspended from one of the pulleys descends much more slowly than a body falling in free space, yet increases in velocity in the same ratio as when falling in the air. (See Falling Bodies.)

Aubagne, a town of France, in the department of Bouches-du-Rhône, 22 miles by rail E. of Marseilles. It has manufactures of paper, pottery, and leather, and exports excellent wine. Pop. in 1866, 7408.

Aubaine, Droit d', a French term, denotes the right of a sovereign to inherit the property of a foreigner dying intestate without native-born heirs. This practice was abolished in 1790, but was restored by Napoleon I. (See International Law No. I., by Pres. T. D. Woolsey, S. T. D., LL.D.)

Aubbeenaubbee, a twp. of Fulton co., Ind. Pop. 745.

Aube, ōb, a river of France, rises in Haute-Marne, flows north-westward through the department of Aube, and after a course of 124 miles enters the Seine about 24 miles below Troyes.

Aube, a department in the N. E. part of France, was formed of the southern portion of the province of Champagne and a small part of Burgundy. It is bounded on the N. by the department of Marne, on the E. by Haute-Marne, on the S. by Côte-d'Or and Yonne, and on the W. by Seine-et-Marne. Area, 2317 square miles. It is intersected by the rivers Seine and Aube. The surface is nearly level; the soil is fertile, especially in the S. E. part, which produces grain, wine, etc. It has manufactures of cotton and woollen stuffs, hosiery, glass, and leather. It is divided into 5 arrondissements, 26 cantons, and 446 communes. Capital, Troyes. Pop. in 1872, 255,687.

Aubenas, a town of France, in the department of Ardèche, is picturesquely situated on or near the river Ardèche, 14 miles S. W. of Privas. It stands in a magnificent basin, surrounded by the extinct volcanoes of the Vivarais. It has an old castle, a college, and manufactures of silk and woollen stuffs, paper, etc. Several important fairs are held here. Pop. in 1866, 7694.

Auber (Daniel François Esprit), an eminent French composer, born at Caen Jan. 29, 1782, a pupil of Cherubini, produced in 1813 "Le Séjour Militaire," an opera which was not successful, but his comic opera called "La Bergère Châtelaine" (1820) was warmly applauded. In 1821 he composed "Emma," an opera which was much admired. His works are remarkable for grace, originality, and ingenious combinations. The opera of "La Muette de Portici," or "Masaniello" (1828), is called his masterpiece. He was elected a member of the Institute in 1829. Among his most popular operas are "Fra Diavolo" (1830), "Le Domino Noir" (1837), "Haydée" (1847), and "Manon Lescaut" (1856). He was appointed chapel-master at the Tuileries by Napoleon III. Died May 13, 1871. (See Fétis, "Biographie Universelle des Musiciens;" L. de Loménie, "Galerie des Contemporains.")

Au'ber (Harriet), an English authoress, was born Oct. 4, 1773, and died Jan. 20, 1862. In 1829 she published "The Spirit of the Psalms," containing some of the best versions of modern times.

Au'berlen (Karl August), a prominent German orthodox theologian, born at Fellbach, in Würtemberg, Nov. 19, 1824. Among his works are "The Theosophy of Friedrich Christoph Oetinger" (1847) and "The Prophet Daniel and the Revelation of John considered in their Reciprocal Relations" (1854). Died in 1864.

Aubert (Jean Louis), Abbé, a French poet and fabulist, born in Paris in 1731. He edited a journal called "Les Petites Affiches," and published in 1756 a collection of fables which gained a European reputation. They were highly commended by Voltaire, who wrote to Aubert, "You have placed yourself beside La Fontaine." He became professor of French literature in the College Royal, Paris, in 1773. Died in 1814.

Aubert du Bayet (Jean Baptiste Annibal), a French general, born in Louisiana Aug. 29, 1759. He fought for the U. S. under Rochambeau, and was chosen in 1791 a member of the French Legislative Assembly, in which he supported the same principles as La Fayette. He commanded at the siege of Menta, which was taken by the Prussians in 1793, and was minister of war for several months in 1795. Died at Constantinople, where he was ambassador, Dec. 17, 1797.

Aubervilliers, a town in France, in the department of the Seine, 4 miles N. of Paris, and one of its suburbs. Pop. 9240.

Aubigné, d' (Merle). See D'Aubigné.

Aubigné, d' (Théodore Agrippa), a French Protestant historian and soldier, distinguished for his wit, learning, and audacity, was born in Saintonge Feb. 8, 1550. He studied in a college at Geneva, and at an early age joined the Huguenot army, then waging a civil war against the court. He afterwards entered the service of Henry of Navarre, whose favor he enjoyed. He fought for Henry against the Catholic League, and distinguished himself at the battle of Coutras (1587). His chief work is a history of his own times, entitled "Histoire Universelle depuis l'An 1550 jusqu' à l'An 1601" (3 vols., 1616–20). He left autobiographic memoirs ("Histoire secrète de T. A. d'Aubigné," 1729–31). He had a son, Constantine, who was the father of Madame de Maintenon. Died at Geneva April 29, 1630. (See M. A. Savous, "Vie d'Aubigné;" Davila, "History of the Civil Wars of France.")

Aubin, a French town, department of Aveyron, 20 miles N. E. of Villefranche, in a mining region, with furnaces, etc. Pop. 8863.

Au'brey, a post-township of Johnson co., Kan. Pop. 1125.

Au'brey (John), F. R. S., an English antiquary, born in Wiltshire Mar. 12, 1625, inherited a large estate, and became a member of the club of Commonwealth's Men. He was a collector of antiquarian documents, and left several valuable works in manuscript. His "Natural History

and Antiquities of Surrey" was published in 1719. He also wrote memoirs of the English poets, which were published in 1813 under the title of "Letters written by Eminent Persons in the Seventeenth and Eighteenth Centuries." Died June 7, 1697.

Auburn, a post-village of Lee co., Ala., on the Montgomery and West Point R. R., 60 miles E. N. E. of Montgomery. It is the seat of the Alabama Agricultural and Mechanical College. Pop. 1018; of the township, 3822.

Auburn, the county-seat of Placer co., Cal., on the Central Pacific R. R., 36 miles N. E. of Sacramento. Fruit is extensively grown in the vicinity. There are near the town very rich quartz and gravel mines, and eleven quartz mills with 101 stamps continually running. Auburn has a courthouse and jail, a public hall, Masonic and Odd Fellows' halls, several churches and school-houses, and three large hotels. The principal buildings are of brick and stone. There are two weekly newspapers. Pop. 800.
W. B. Lyon, Ed. "Placer Argus."

Auburn, a township of Clark co., Ill. Pop. 602.

Auburn, a post-township of Sangamon co., Ill. Pop. 1303.

Auburn, the county-seat of De Kalb co., Ind., on the Baltimore Pittsburg and Chicago R. R., at the crossing of the Fort Wayne Jackson and Saginaw and the Detroit Eel River and Illinois R. Rs. It has large manufactories of hubs and spokes, staves, a weekly paper, and an extensive stocking factory. Pop. 677.
P. C. Mays, Ed. "Auburn Courier."

Auburn, a township of Fayette co., Ia. Pop. 1059.

Auburn, a post-township of Shawnee co., Kan. P. 662.

Auburn, a post-village of Logan co., Ky., on the Louisville and Memphis R. R., 18 miles S. W. of Bowling Green. Pop. 610.

Auburn, a post-village, capital of Androscoggin co., Me., 34 miles from Portland, on the Androscoggin and Little Androscoggin rivers, which furnish extensive water-power. The manufacture of cotton has recently been commenced, while that of shoes has attained considerable proportions. It is situated on the Maine Central R. R., and connected with the Grand Trunk system by the Lewiston and Auburn R. R. It has a national bank. Pop. in 1870, 6169. Ed. "Lewiston Journal."

Auburn, a post-township of Worcester co., Mass., on the Norwich and Worcester R. R. It has a public library, and manufactures of cottons, woollens, tape, worsted goods, etc. Pop. 1178.

Auburn, a post-twp. of Rockingham co., N. H. P. 815.

Auburn, a flourishing city, capital of Cayuga co., N. Y., on the New York Central R. R., 174 miles W. of Albany, and on both sides of the outlet of Owasco Lake, which is 2½ miles distant. The Southern Central R. R. connects it with Owego, 68 miles S., and with Fair Haven, 30 miles N., at which place they have the largest accommodations for storing coal in Central New York. The site of Auburn is moderately uneven; the streets are wide, well paved, and shaded with ornamental trees. The principal public buildings and mercantile houses are on Genesee street. Many of the private houses display an elegant style of architecture, and are adorned with beautiful gardens. Auburn contains fifteen churches, and is the seat of a theological seminary under the direction of the Presbyterians. This city was long the home of the late Hon. William H. Seward. Here is a large stone State prison, celebrated for its system of discipline. The convicts, numbering sometimes 1000 or 1200, are employed in the manufacture of boots, shoes, saddlery-ware, cigars, window-sashes, blinds, and doors. The city has eight banks, three daily and two weekly papers, and manufactures of wool, cotton, iron, paper, etc. Here are also five large manufactories of reapers and mowers, which are the most extensive in the Union. Pop. 17,225.
Ed. "Auburn Advertiser."

Auburn, a township of Crawford co., O. Pop. 910.

Auburn, a post-township of Geauga co., O. Pop. 783.

Auburn, a township of Tuscarawas co., O. Pop. 1251.

Auburn, a post-village of Baker co., Or., on Powder River, about 300 miles E. of Salem. Gold is found in this vicinity.

Auburn, a post-village of South Mannheim township, Schuylkill co., Pa., on the Philadelphia and Reading R.R., 9 miles S. E. of Pottsville. Pop. 611.

Auburn, a township of Susquehanna co., Pa. P. 2006.

Auburn, a township of Montgomery co., Va. P. 3171.

Auburn, a post-township of Fond du Lac co., Wis. Pop. 1626.

Au'burndale, a post-village of Newton township, Middlesex co., Mass., on the Boston and Albany R. R., 10 miles W. of Boston. It is the seat of Laselle Seminary.

Auburn Theological Seminary, or **The Theological Seminary of Central and Western New York,** occupies a large three-story stone building, with transept and wings, on elevated ground in the northern part of the city of Auburn. It was founded in 1820. In 1873 its removal was contemplated, but the friends of the seminary having by great exertions raised funds for its endowment, the institution will, it is understood, remain in Auburn. It is sustained by the Presbyterian denomination.

Aubusson, a town of France, department of Creuse, on the river Creuse, 22 miles S. E. of Guéret. It has a celebrated manufactory of carpets. Velvets and woollen stuffs are also made here. Pop. in 1866, 6625.

Aubusson, d' (Pierre), grand-master of the order of St. John of Jerusalem, was born of a noble French family in 1423. At an early age he joined the order, the headquarters of which was at Rhodes. He distinguished himself by his energy and courage in fighting against pirates, and was employed on important missions to several courts. In 1458 he formed a league between the kings of France and Hungary against the sultan Mahomet II. He was elected grand-master of his order in 1476, and fortified Rhodes as an advanced post for the defence of Christendom against the victorious Turks. The great aim and idea of his life was the formation of a league of Christian princes against the infidels. Early in 1480, Mahomet II. commenced the siege of Rhodes with an army of about 100,000 men. The Turks were repulsed in several desperate assaults, in which Aubusson was severely wounded, and they were forced to abandon the enterprise in July, 1480. In 1501 he was chosen general-in-chief of the armies of the German emperor, the king of France, and the pope, who had formed a league against the Turks. His success was hindered by the jealousy and discord of these allies. Died in 1503. He is regarded as one of the ablest Christian statesmen and commanders of his time. (See Bouhours, "Histoire de Pierre d'Aubusson," 1676.)

Auch, ōsh (anc. *Augus'ta Ausco'rum* or *Elimberis*), an old town of France, capital of the department of Gers, on the river Gers, 43 miles by rail S. of Agen. In the time of Cæsar it was the capital of the Ausci or Auscii. It has a beautiful Gothic cathedral, an archbishop's palace, a royal college, a public library, a museum of natural science, and a town-hall. Here are manufactures of linens, cotton stuffs, leather, etc. Armagnac brandy is exported from this town, which was once the capital of Armagnac. Pop. in 1866, 12,500.

Auche'nia [from the Gr. *αὐχήν*, the "neck" (so called from the length of their necks)], a genus of South American animals of the order Ruminantia and family Camelidæ. The genus comprises the alpaca and the llama, and other species, all of which inhabit the mountain-ranges of the Andes. They are nearly allied to the camel, which they resemble in general form and in the structure of the stomach. They differ from the camel in having no hump; also in dentition, and in the more cloven feet and movable toes. Some naturalists think that the alpaca is not a distinct species, but a variety of the llama. (See Alpaca.)

Auchmuty, â'mu-te (Robert), an eminent lawyer, born in Scotland, settled in Boston, Mass., about 1710. He held several high colonial offices. Died in 1750.

Auchmuty (Robert), an able lawyer, son of the preceding, practised at Boston, and was distinguished as an advocate in trials by jury. He was an admiralty judge (1767–76). Having become a zealous Tory in 1776, he went to England, where he died in 1788.

Auchmuty (Samuel), D. D., an Episcopal clergyman, a brother of the preceding, was born at Boston Jan. 16, 1722, and graduated at Harvard in 1742. He preached in Trinity church, New York, and obtained in 1764 the charge of all the churches in that city. He adhered to the royalist party in the Revolution. Died Mar. 6, 1777.

Auchmuty (Sir Samuel), a British general, a son of the preceding, was born in New York June 22, 1758, and graduated at King's (now Columbia) College in 1775. He fought against the U. S. in 1776–78, served many years in India, and in 1806 obtained command of an army sent to South America. He took the fortified city of Montevideo from the Spaniards in 1807, and captured Java from the Dutch in 1811. Died Aug. 11, 1822.

Auck'land, a seaport-town, the capital of the British colony of New Zealand, is situated on the N. E. coast of the island of New Ulster: lat. 36° 50′ S., lon. 174° 50′ E. It has two fine harbors and considerable trade. It is connected by steamships with Sidney, Melbourne, Honolulu, and San Francisco. It is the see of an Anglican bishop, and has four banks, three newspapers, and many fine

buildings. The mean temperature of the coldest month is about 50° F., and that of the warmest about 68°. Auckland was founded in 1840. Pop. in 1871, 12,937.

Auckland (George **Eden**), Earl of, an English peer, born in 1784, inherited the title of baron at the death of his father in 1814. He acted with the Whigs, became president of the board of trade in 1833, first lord of the admiralty in 1834, and governor-general of India in 1835. He was created earl of Auckland in 1839, and returned to England in 1841. He died without issue in 1849.

Auckland (William **Eden**), Lord, an English diplomatist and lawyer, was born in 1745. He was one of the three commissioners appointed in 1778 to negotiate with the revolutionists in the U. S. Having been sent as ambassador to France in 1785, he negotiated a commercial treaty with that nation. He published "Principles of the Penal Law" (1771) and other works. In 1793 he received the title of baron. Died in 1814.

Auckland Islands, a group of islands in the South Pacific, S. of New Zealand. The largest island is about 30 miles long and 15 miles wide, and has two good harbors. This group is valuable as a whaling-station, but is not inhabited.

Auc'tion [from the Lat. *augeo, auctum*, to "increase"], in law, the act of exposing property for sale by open competition to the highest bidder, by a person called an auctioneer. Every bid is deemed to be an offer, which is accepted by the auctioneer when his hammer falls. On general principles of the law of contracts, the offer may be withdrawn by the bidder at any time before acceptance. The acceptance of a higher offer is the rejection of the lower one. Such a sale must be fairly conducted, both on the part of the seller and buyer. The secret employment of "puffers" or fictitious bidders by the owner to unduly enhance the price is a fraud on the purchaser, who may avoid such a sale. The same rule applies to secret agreements between purchasers to stifle competition. Such sales frequently take place under conditions made known at the time of sale. These must be followed by the party to whom they are applicable. An auctioneer is to some extent an agent for both parties—as, for example, to sign on their behalf a written memorandum of sales, where that is required by law. The conduct of auctioneers is sometimes regulated by statute.

Au'cuba, a genus of plants of the order Cornaceæ. The only known species is the *Au'cuba Japon'ica*, an evergreen shrub which is a native of Japan and China, and is cultivated as an ornamental shrub. It is dœcious, has small purple flowers, and its fruit is a small red drupe. The leaves are pale-green, curiously mottled with yellow.

Audæ'us, or **Au'dius** [in Syriac *U'do*], the founder of a religious sect called Audians, was a native of Mesopotamia. He was banished to Scythia in 338 A. D., and died about 370 A. D. He incurred the enmity of the clergy by censuring their luxury and vices. The Audians are accused of professing anthropomorphism.

Aude (anc. *A'tax*), a river in the S. of France, rises in the Eastern Pyrenees, flows northward to Carcassonne, and thence eastward until it enters the Mediterranean, 6 miles E. N. E. of Narbonne. Length, 133 miles.

Aude, a maritime department in the S. of France, is bounded on the N. by the departments of Tarn and Hérault, on the E. by the Mediterranean, on the S. by the Pyrénées-Orientales, on the W. by Ariège and Haut-Garonne, and has an area of 2437 square miles. It was formerly part of the province of Languedoc. The surface is partly mountainous, being near the foot of the Pyrenees; the soil of the valleys is fertile and calcareous. It is intersected by the river Aude and the canal of Languedoc (or Canal du Midi). Among the mineral resources of Aude are iron, coal, and marble. The staple productions are grain, olives, wine, and fruits. It has manufactures of silk and woollen stuffs, paper, and brandy. Capital, Carcassonne. It is divided into 4 arrondissements, 31 cantons, and 435 communes. Pop. in 1872, 285,927.

Audebert (Jean Baptiste), an eminent French artist and naturalist, born at Rochefort in 1759. He first acquired distinction as a miniature-painter, and subsequently applied himself to natural history, the love of which became his ruling passion. He published in 1800 a "Natural History of Apes, Lemurs, and Galeopitheci," with sixty-two admirably colored plates, printed in oil-colors by a new method which he invented. He was the first to use gold-leaf in illustrating the plumage of birds. His splendidly illustrated "History of Humming-birds, Flycatchers, Jacamars, etc." appeared in 1802. He died in 1800, leaving several works unfinished.

Au'denar'de, or **Oudenarde,** a town of Belgium, in East Flanders, on the Scheldt, 14 miles S. S. W. of Ghent. It has a fine Gothic town-hall. Tanning and brewing are the chief branches of industry here. Pop. in 1866, 4835. Here the prince Eugène defeated the French army in July, 1708.

Au'dience [from the Lat. *au'dio*, to "hear"], the act of hearing; admittance to a hearing; the reception of an ambassador by a sovereign at court; sometimes used to denote an auditory or assembly of hearers. In England it is the name of a court held by the archbishop of Canterbury.

Au'ditor [from the Lat. *audio*, to "hear"], a person whose duty it is to examine and pass upon the accounts of those who have been entrusted with money, or to examine a particular account and certify the result. The U. S. government, as well as most public and private corporations, have such officers. An auditor is appointed by courts in the course of some actions to examine and state accounts, and report them to the court for further proceedings.

Au'ditory Nerve, the nerve of hearing, is the seventh in order of origin from the base of the brain, counting from before backward. The seventh pair consists of the portio dura (or facial), the portio mollis (or auditory), and a small intermediate portion. The portio mollis apparently commences in the floor of the fourth ventricle: it then runs forward to the back of the petrous portion of the temporal bone, and enters the internal auditory meatus. It then divides into two portions, which diverge—the smaller one for the semicircular canals and the vestibule, the other for the cochlea. Those entering the semicircular canals divide into five branches, forming at last a nervous expansion somewhat analogous to the retina. (See Ear and Acoustics.)

Audley (Thomas), Lord Audley of Walden, an English lawyer, born in Essex in 1488. He became Speaker of the House of Commons in 1529, keeper of the great seal in 1532, and lord chancellor of England in 1533. He presided at the trial of Sir Thomas More. According to some authorities, he disgraced himself by his subservience to the arbitrary will of Henry VIII. Died April 30, 1544. (See Lord Campbell, "Lives of the Lord Chancellors.")

Audouin (Jean Victor), an eminent French naturalist and comparative anatomist, born in Paris April 27, 1797. He was one of the founders of the "Annales des Sciences Naturelles," first issued in 1824, and co-operated with Milne-Edwards in researches into the Crustacea and Annelida. He succeeded Latreille as professor of entomology at the Museum in 1833, and was chosen a member of the Institute in 1838. Among his works is a "History of the Insects which Infest the Vine" (1840–43). Died Nov. 9, 1841.

Audrain', a county of the N. E. central part of Missouri. Area, 680 square miles. It is drained by the Davis Fork and Long Branch of Salt River. The surface is undulating or nearly level; the soil is fertile. Cattle, wool, dairy products, grain, and tobacco are raised. Coal is found. It is intersected by the North Missouri and the Louisiana branch of the Chicago and Alton R. Rs. Capital, Mexico. Pop. 12,307.

Audran (Gérard), a French engraver of the first order, was born at Lyons Aug. 2, 1640. He studied under Carlo Maratta at Rome for several years, and returned to Paris about 1670. Having been appointed engraver to the king, he engraved for him the masterpieces of Le Brun, "The Battles of Alexander." Among his works are two cartoons of Raphael, representing the "Death of Ananias" and "Paul and Barnabas at Lystra," and "Coriolanus," after Poussin. He is estimated by some critics as the greatest historical engraver that ever lived. Died Feb. 8, 1691. (See Fontenai, "Dictionnaire des Artists;" Strutt, "Dictionary of Engravers.")—Other members of the Audran family attained eminence as engravers: as Benoît (1661–1721), Claude père (1592–1677), Claude fils (1640–84), Germain (1631–1710), and Jean (1667–1756).

Audry de Puyraveau (Pierre François), a French republican, born at Puyraveau in 1783. He was elected to the Chamber of Deputies in 1827, and acted a prominent and efficient part in the revolution of 1830, during which his manufactory in Paris was the rendezvous of the revolutionists. In 1848 he was a member of the Constituent Assembly.

Au'dubon, a county in the S. W. of Iowa. Area, 630 square miles. It is intersected by the East Nishnabatona River, and drained by the West Nishnabatona, which rises within its limits. The surface is nearly level; the soil is fertile. Grain and wool are the chief crops. Capital, Exira. Pop. 1212.

Audubon, a township of Montgomery co., Ill. Pop. 1250.

Audubon, a township of Audubon co., Ia. Pop. 381.

Au'dubon (John James), a celebrated naturalist, born

in Louisiana on the 4th of May, 1780. He was the son of an opulent French naval officer who owned a plantation in the then French colony. In his childhood he became deeply interested in the study of birds and their habits. He was educated partly in Paris, whither he was sent about 1794, and he studied design under David, the eminent painter. He returned to the U. S. about 1798, and settled on a farm which his father gave him, on the Perkiomen Creek, in Eastern Pennsylvania. Here he found time and opportunity for his favorite study. He married Lucy Bakewell in 1808, sold his farm, and became a merchant at Louisville, Ky. About 1810 he began to make extensive excursions through the primeval forests of the Southern and South-western States, in the exploration of which he passed many years. He made colored drawings of all the species of birds that he found. He resided with his wife and children for several years at Henderson, on the Ohio River. In 1824 he visited Philadelphia, where he met Charles Lucien Bonaparte, who encouraged him to publish a work on ornithology. Before this date he is said to have failed in trade and been reduced to poverty, and to have successively followed the occupation of portrait-painter and dancing-master. He went to England in 1826, and commenced in London the publication of his great work, for which he obtained a large number of subscribers at $1000 a copy. This admirable work was entitled "The Birds of America" (10 vols. folio, 1830–39), and was illustrated with 448 beautiful colored plates of 1065 species of birds, of the natural size. The work is divided into five volumes of letter-press, and five of engravings designed by the author. This was pronounced by Cuvier "the most magnificent monument that art ever raised to ornithology." Audubon returned to America in 1829, and again explored the forests, lakes, and coasts from Canada to Florida, to collect materials for another work. This was his "Ornithological Biography, or an Account of the Habits of the Birds of the United States, etc." (Edinburgh, 5 vols., 1831–39). He revisited England in 1831, and returned home in 1839, after which he resided on the Hudson River, near the city of New York. He published a cheaper edition of his "Birds of America" (7 vols. 8vo, 1844), and was associated with Dr. Bachman in the preparation of a work on "The Quadrupeds of North America," with plates (6 vols., 1846–50), the drawings of which were made by his sons, Victor Gifford and John Woodhouse Audubon. He died in New York City Jan. 27, 1851. Professor Wilson of Edinburgh expressed the opinion that he was "the greatest artist in his own walk that ever lived." (See "Life and Adventures of John J. Audubon," edited, from materials supplied by his widow, by Robert Buchanan, 1869; C. C. Adams, "Journal of the Life and Labors of J. J. Audubon;" article on "American Ornithology" in the "Quarterly Review" for July, 1832.)

William Jacobs.

Au'enbrug'ger von Au'enbrug' (Leopold), called Avenbrugger by the French, a German physician who introduced percussion of the chest as a means of diagnosis, was born at Gratz, in Styria, in 1722. He announced his discovery in a work called "Inventum novum ex Percussione Thoracis Humani" ("New Discovery by the Percussion of the Human Chest," 1761). He practised in Vienna. Died in 1809.

Au'erbach' (Berthold), a popular German author, born at Nordstetten, in Würtemberg, Feb. 28, 1812. He published "Spinoza," a biography or romance (1837); "The Poet and Merchant," a novel (1839); "The Jews and Modern Literature" (1836); and "The Cultivated Citizen" ("Der Gebildete Bürger," 1842). His most popular work is perhaps his "Village Tales of the Black Forest" (2 vols., 1843). Among his other works are novels called "Die Frau Professorin," "Edelweiss," "Baarfüssle" ("Little Barefoot," 1857), "Auf der Höhe" ("On the Heights," 1865), and "Das Land-Haus am Rhein" ("Country-House on the Rhine," 1869). A number of these have been translated into English, French, Dutch, and Swedish, and an Italian version of his "Village Tales" appeared in 1869.

Auerbach (Heinrich), a German medical professor, whose proper name was Stromer, was born at Auerbach, in Bavaria, in 1482. He was a friend of Luther and a citizen of Leipsic. According to tradition, Doctor Faust rode out of Auerbach's cellar on a barrel. Died in 1542.

Au'ersperg', von (Anton Alexander), Count, a German poet whose *nom-de-plume* was Anastasius Grün, was born at Laybach April 11, 1806. He displayed much wit and humor in a poem called "Spaziergänge eines Wiener Poeten" ("Promenades of a Poet of Vienna," 1831). Published a volume of poems ("Gedichte," 1838). D. Sept., 1876.

Auersperg (Carlos), Prince, an Austrian statesman, born May 1, 1814. In 1867–68 he was for a short time president of the Cisleithan ministry. He has been a member of the Reichstag, of which he was president, and of the Bohemian Diet, where he acted with the German party.

Auerstädt, ŏw'er-stĕt, a village of Prussian Saxony, 10 miles W. of Naumburg, noted as the scene of an important victory gained by the French general Davoust over the Prussians, who were commanded by their king, on Oct. 14, 1806, which was also the date of the battle of Jena.

Au'erswald', von (Hans Adolph Erdmann), a Prussian general, born Oct. 19, 1792, gained distinction by his scientific attainments, and was elected to the Parliament at Frankfort in 1848. As he was walking in Frankfort in company with Prince Felix Lichnowsky, a mob attacked and killed them, Sept. 18, 1848. His death appears to have been an incidental consequence of his being in company with the prince, who was obnoxious to the populace.

Auf'fenberg', von (Joseph), Freiherr, a German dramatist and poet, born at Freiburg, in Brisgau, in 1798. Among his numerous works are "The Alhambra," a dramatic poem (1830), and "Louis XI. in Péronne," a drama. Died in 1857.

Au'fidus, the name of an ancient river in Italy, near the mouth of which was fought the great battle of Cannæ, 216 B. C. (See Ofanto.)

Au'geas [Gr. Αὐγέας or Αὐγείας], a mythical king of Elis, who is said to have owned 3000 oxen. One of the twelve labors imposed on Hercules by Eurystheus was to cleanse the Augean stables, in which the dung of these oxen had accumulated for many years. Hercules turned the rivers Alpheus and Peneus through the stables, and killed Augeas because he refused to pay his wages.

Augereau (Pierre François Charles), Duc de Castiglione, a French marshal, born in Paris Oct. 21, 1757, became a fencing-master at Naples before the Revolution, enlisted as a private in the French army in 1792, and gained the rank of general of division in 1796. In 1796 he contributed to the victories of Lodi, Castiglione, and Arcola. He enforced the will of the majority of the Directory in the *coup-d'état* of the 18th Fructidor, 1797, and was chosen a member of the Council of Five Hundred in 1799. He became a marshal of France in 1804, duke of Castiglione in 1805, served with distinction at Jena in 1806, and was wounded at Eylau in 1807. In 1813 he displayed intrepid courage at Leipsic. He transferred his allegiance to Louis XVIII. in 1814. Died June 12, 1815.

Au'gian Co'dex, a defective uncial manuscript of a part of the New Testament, was found in the monastery of Augia Major, at Rheinau, was purchased by Dr. Bentley in 1718, and is now in Trinity College, Cambridge.

Augier (Émile), a French dramatist and poet, a grandson of Pigault-Lebrun, was born at Valence, in Drôme, in 1820. He wrote a drama entitled "La Ciguë" ("Hemlock," 1844), which had complete success, and "Gabrielle," a comedy (1849), which gained the Montyon prize of the French Academy. In 1856 he produced a volume of poems, and in 1857 was admitted into the French Academy.

Au'gite [from the Gr. *αὐγή*, "splendor"], a crystalline mineral sometimes called **Pyroxene,** is nearly allied to hornblende. It often occurs in volcanic rocks, is composed of silica, lime, and magnesia, and is usually of a greenish color. It crystallizes in six or eight-sided prisms variously modified, and is an essential component of basalt, dolerite, and augite porphyry. Some mineralogists think that the difference between augite and hornblende arises only from the different circumstances in which they crystallize, the former being the result of a more rapid cooling.

Au'glaize, a river in the north-western part of Ohio, rises in Auglaize co., and after a course of about 100 miles enters the Maumee River at Defiance. Its general direction is nearly northward.

Auglaize, or **Grand Auglaize,** a small river of Missouri, rises in La Clede co., flows northward, and enters the Osage about 3 miles below Linn Creek.

Auglaize, a county in Western Ohio. Area, 400 square miles. It is drained by the Auglaize and St. Mary's rivers, which rise within its limits. The surface is nearly level; the soil is fertile. Dairy products, corn, wheat, oats, hay, and potatoes are the chief crops. This county is intersected by the Miami and Erie Canal, and by the railroad which extends from Dayton to Toledo. Capital, Wapakoneta. Pop. 20,041.

Auglaize, a township of Camden co., Mo. Pop. 1330.

Auglaize, a township of Miller co., Mo. Pop. 608.

Auglaize, a township of Allen co., O. Pop. 1696.

Auglaize, a township of Paulding co., O. Pop. 788.

Au Gres, a post-township of Bay co., Mich. Pop. 255.

Augs'burg (anc. *Augus'ta Vindelico'rum*), an ancient and important city of Germany, in Bavaria, capital of the

province of Swabia and Neuburg, is situated on the river Lech, at the mouth of the Wertach, 39 miles by rail W. N.W. of Munich; lat. 48° 21′ 42″ N., lon. 10° 54′ 16″ E. Several railways extend from it towards the four cardinal points, and connect it with Munich, Nuremberg, etc. The Roman emperor Augustus planted a colony here in 12 B. C. It became a free imperial city in 1276, after which it was an important commercial emporium. This city was also one of the chief centres of German art, and the native place of Holbein. It was also the native place of the Fugger family, at one time the richest family in Europe. Some decline in its prosperity occurred after 1500, but it still has an extensive trade and many large manufactories of cotton, silk, machinery, and paper. Augsburg is one of the principal money-markets of the Continent, and owes much of its importance to its banking-business and operations in stocks. The "Allgemeine Zeitung," issued in Augsburg, is one of the most celebrated and widely circulated journals of Germany. Pop. in 1871, 51,284.

Augs'burg Confes'sion, the first Protestant Confession of Faith, drawn up by Melanchthon, sets forth the doctrines held by Luther and his followers. This Confession was presented to Charles V. at a German Diet convened at Augsburg June 20, 1530. The original copies of this document, in German and Latin, are not known to be extant. The emperor forbade the publication of the Confession without permission obtained from himself; but a surreptitious and erroneous publication having been made, it became necessary for Melanchthon to issue correct copies of the text, both in German and Latin. This Confession, with its subsequent Apology, became a standard for the Reformers, and to this day is regarded as authoritative among the Lutheran churches. (See LUTHERANISM.)

Au'gur, a Latin word used by the ancient Romans to denote a soothsayer, a diviner, a person who professed to foretell events by the flight of birds or other omens. The augurs were supposed to be capable of interpreting the will of the gods, and divinely gifted with special qualifications for this service. Their office was considered as very important in the state, no public enterprise being undertaken unless they declared the omens favorable. Their divinations were called auguries or auspices, the latter of which terms, though properly applied to the inspection of the flight of birds, was extended by the Roman writers to other signs. In the early period of Roman history the number of augurs was only three or four, who must be patricians. The Ogulnian law, passed 300 B. C., rendered the plebeians eligible to the office of augur, and increased the number to nine. The augurs held office for life, and had the power of filling vacancies that occurred in their college. The college of augurs in some periods of Roman history had great political influence, it being contrary to the religion and usage of the Romans to hold an election, to commence a battle or campaign, or perform any important public business, without consulting the auspices. Sulla raised the number of augurs to fifteen, and Julius Cæsar to sixteen.

Augur (CHRISTOPHER C.), an American officer, born 1821 in New York, graduated at West Point in 1843, in infantry till Mar. 4, 1869, when he became brigadier-general U. S. army. He served chiefly at frontier posts 1843–61, in the military occupation of Texas 1845–46, in the war with Mexico 1846–48, engaged at Palo Alto, Resaca de la Palma, and as aide-de-camp to Brigadier-Generals Hopping and Cushing, scouting and on expeditions against Northern Pacific Indians 1855–56, engaged in several skirmishes, and as commandant of cadets at Military Academy 1861. In the civil war became, Aug. 9, 1862, major-general U. S. volunteers, and served in the defences of Washington 1861–62, in operations on Rappahannock and in the Shenandoah Valley 1862, in command of a division in the Fifth corps 1862, engaged at Cedar Mountain (severely wounded and brevet colonel), in General Banks's expedition to New Orleans 1862; in command of the district of Baton Rouge 1863, in expedition to Fort Hudson 1863 (brevet brigadier-general), engaged in action and siege of the place; in command of department of Washington 1863–66, of the Platte 1867–71, and of Texas since 1871. Brevet major-general Mar. 13, 1865, for gallant and meritorious services in the field. GEORGE W. CULLUM, *U. S. Army.*

Augur (HEZEKIAH), an American sculptor, born at New Haven, Conn., Feb. 21, 1791, was also noted for mechanical ingenuity. He invented a carving-machine which is in general use, and as sculptor produced "Jephthah and his Daughter." Died Jan. 10, 1858.

Au'gust [Lat. *Augus'tus;* Fr. *Août*], the eighth month of the year, was so named in honor of Augustus Cæsar. Before his time it was called *Sexti'lis*—that is, the *sixth* month, because the Roman year once began on the 1st of March. In the calendar of Julius Cæsar the first, third, fifth, seventh, ninth, and eleventh months consisted each of thirty-one days, and each of the other months of thirty, except February, which in common years had twenty-nine, and in leap-year thirty days. To gratify the vanity of Augustus, one day was taken from February and added to August.

Augus'ta, a county near the western part of Virginia, has an area of about 900 square miles. It is bounded on the S. E. by the Blue Ridge, and forms part of the Great Valley of Virginia. It is drained by the South Fork of the Shenandoah River, which rises by several branches within its limits. The surface is diversified; the soil is calcareous and very fertile. Corn, oats, wheat, and wool are largely raised. Fine limestone underlies a great part of the county, which is said to contain anthracite coal. It is intersected by the Chesapeake and Ohio R. R. Capital, Staunton. Pop. 28,763.

Augusta, a post-village, capital of Woodruff co., Ark., on White River, 69 miles N. E. of Little Rock. It has two weekly papers. Pop. of township, 2213.

W. E. ARMS, ED. "AUGUSTA SENTINEL."

Augusta, a city and the capital of Richmond co., Ga., the third city in size in the State, situated on the left bank of the Savannah River, 231 miles from its mouth, 120 N. N. W. from Savannah, and 136 N. W. from Charleston. It is at the head of steamboat navigation on the Savannah. Lat. 33° 28′ N., lon. 81° 54′ W. Its population in 1870 was 15,389; in 1860, 12,493; in 1850, 10,217. The city has a thriving trade, and does a good wholesale business with the towns of the State, with most of which it has a direct connection either by river or rail. It also draws considerable business from the hill-country of South Carolina. From its position it is actively engaged in the cotton trade, receiving cotton from a considerable portion of Georgia and South Carolina. What is not needed to supply its own cotton-mills is sent to Savannah and Charleston, and reported in their receipts. Augusta also furnishes a good market for the general produce of its region. For many years it was the centre of the wagon-traffic, sending out goods in all directions in the great lumbering wagons of that time, and receiving cotton and produce in return. After the railroads began to break up this trade, the city declined for a time, but soon regained its trade, and is now an enterprising and prosperous city. The Augusta Canal, 9 miles in length, brings the waters of the Savannah River from above the city at such an elevation as to give a head or water-power of forty feet. It is one of the largest manufacturing centres of the South. Its manufactories and those of Richmond county are of great importance. There were in the county in 1870, and by far the larger part in the city, 97 manufacturing establishments, of which 12 were driven by steam-engines, having an aggregate force of 180 horse-power, and 47 by water-power, employing an aggregate force of 1222 horse-power. In these manufacturing establishments 1280 hands were employed, of whom 1178 were men, 78 women, and 24 children. The amount of capital employed was $1,345,155; the wages paid $517,230; the material used was valued at $1,695,765, and the value of the manufactured products, $2,614,405. Probably about four-fifths in number and nine-tenths in value of these manufactures belonged to Augusta. Among its most important manufacturing establishments are two cotton-mills, employing 553 hands, having $648,000 capital, paying $182,939 for wages, and $782,506 for material, and producing goods of the annual value of $1,118,722. One of these manufactures cotton yarns, which are largely in demand at the North. There is also a car-factory, employing 90 men, and producing $108,370 worth of cars; 2 railroad machine-shops, employing 113 hands, and turning out $270,196 worth of machinery; and 5 or 6 other machine-shops, producing about $70,000 worth of work. There were 5 flouring-mills, employing 36 hands and turning out products of the value of $517,541. A beginning had also been made in foundries for iron castings, which produced nearly $40,000 worth of goods; in tobacco, snuff, and cigar factories, producing $86,250 of goods; 2 printing-offices turned out work worth $78,000, and 2 brick-kilns made brick to the extent of $39,042. The county of Richmond in 1870 had an assessed valuation of $14,075,615, and a true valuation, according to the ninth census, of $19,473,131, ranking as the second county in the State. Of this valuation about four-fifths pertained to the city of Augusta. The city tax the same year was $210,000, and the city indebtedness $1,355,250. Augusta has a medical school, the Medical College of Georgia, founded in 1830, and which in 1872 had 97 students. It has also an incorporated academy called the Richmond Academy, with 7 teachers and 300 scholars; a city normal school, with 2 teachers and 30 scholars; 7 grammar schools, with 7 teachers and 777 scholars; 17 primary schools, with 19 teachers and 1238 scholars. Of the 5439 per-

sons of school age (*i. e.* between six and twenty-one years), 3500 are enrolled either in public or private schools, and the average attendance is 2632. The income of the public schools from all sources is $25,000. There are two daily papers published in the city; both have a considerable circulation and issue weekly and tri-weekly editions. It has three national banks. There are about 20 churches, among which are 1 Roman Catholic, 1 Episcopal, 1 Presbyterian, 1 Lutheran, 1 Christian, 5 or 6 Baptist, and 6 or 7 Methodist—2 of them of the Northern Methodist Church. Of the Baptist and Methodist churches, several are for people of color. The number of sittings in these churches is over 12,000, and the estimated value of church property almost $400,000. The city has a hospital, a *clinique* connected with the medical college, a Masonic hall, and some other charitable institutions. Among its public buildings of note are a costly and very beautiful city-hall, Odd Fellows' hall, the Masonic hall, Richmond Academy, the medical college, the opera-house, Independence Monument, and several of the churches. The streets and avenues are broad and finely shaded, and many of the residences are tasteful and elegant. The principal avenue, Greene street, has a double row of widespreading trees on either side of the spacious highway, and with its elegant mansions forms a true boulevard. It is considered one of the most beautiful of Southern cities. The streets cross each other at right angles. There is a well-regulated police force. The city cemetery and the Cotton States' Agricultural Fair-Grounds, near the city, are both laid out in fine walks and drives, and are favorite places of resort. The city is connected with the coast by the Augusta and Port Royal R. R., the South Carolina R. R., and the Charlotte Columbia and Augusta R. R., in South Carolina, the Savannah being crossed to Hamburg, S. C., directly opposite, by a fine bridge; while the Georgia, and the Augusta and Macon, and the Savannah and Augusta R. Rs., with their branches, give it ready and speedy access to every portion of the State. There is also a horse-railroad from the city to Summerville, a beautiful suburb. Water is supplied to the city from the Augusta Canal, which is now being enlarged and its power greatly increased. It is lighted with gas. Though in a very level region, the grade of the city is sufficient to ensure a good and sufficient drainage.

History.—Augusta was settled by English colonists under Oglethorpe, and laid out in 1735 under royal charter, and was named in honor of an English princess. It was again chartered in Jan., 1798, and incorporated as a city in Dec., 1817. It was for many years the most important inland town of the colony. It had acquired a considerable trade at the commencement of the Revolutionary war, but in the beginning of 1779 was captured by the British and loyalists, who held possession of it till the spring of 1781, when the British force there was commanded by a loyalist named Brown. On May 23, 1781, an American force under command of General Henry Lee ("Lighthorse Harry") laid siege to it, and on the 5th of June Brown surrendered. The Americans lost 51 killed and wounded; the British lost 52 killed, and 334, including the wounded, were taken prisoners. During the war of 1812 or the Indian wars it was not molested. In the late civil war it was garrisoned by the Confederate troops, and twice threatened by Sherman—in his march to the sea, when he passed between it and Macon; and in his march through the Carolinas, when he made feints against both Augusta and Charleston—but it was not visited by a hostile force. Since the census of 1870 its population has greatly increased. It has long been distinguished for the intelligence, public spirit, and good order of its citizens. WALSH & WRIGHT,

PUBS. AND PROPS. "CHRONICLE AND SENTINEL."

Augusta (anc. *Megara*), a town of Italy, in the province of Nolo, is situated on an island, which is connected by a bridge with the peninsula Cape San Croce, 19 miles by rail N. N. W. of Syracuse. Pop. in 1861, 9223.

Augusta, a post-township of Hancock co., Ill. Pop. 1992.

Augusta, a post-township of Des Moines co., Ia. Pop. 584.

Augusta, a post-township of Butler co., Kan. It has one weekly newspaper. Pop. 515.

Augusta, a post-village of Bracken co., Ky., situated on the Ohio River, 43 miles above Cincinnati, is the seat of Augusta Male and Female College. It has good free and private schools; tobacco is the staple of the county; one paper is published here. The Kentucky and Great Eastern R. R. runs through the town. Pop. 960.

GEO. WINTER, PUB. "CHRONICLE."

Augusta, the capital of the State of Maine, and seat of justice of Kennebec co., is on the Kennebec River, at the head of tidal navigation, 43 miles from its mouth, and 63 miles by railroad N. N. E. of Portland; lat. 44° 19′ N., lon. 69° 50′ W. The Augusta division of the Maine Central R. R. passes through it. The main part of the city is on the right (W.) bank of the river, and many of the residences stand on ground which is much higher than the river. The State-house, a handsome granite structure, is

Maine State-house, at Augusta.

on an eminence, and commands an extensive prospect. Among the public institutions are a hospital for the insane, a U. S. arsenal, and St. Catharine's school for young ladies. By the construction of a dam across the river just above the city, abundant water-power has been obtained, which is employed in manufactures of cotton goods and lumber. There is also a card-factory, an iron-foundry, a free library, and the Maine State Library. The National Military Asylum is just outside the city limits. Nearly all the business portion of the city was consumed by fire in Sept., 1865. Augusta has three national banks, one daily, one semi-monthly, one monthly, and four weekly newspapers. Pop. in 1870, 7808.

ALDEN SPRAGUE, ED. OF "KENNEBEC JOURNAL."

Augusta, a post-township of Kalamazoo co., Mich. Pop. 608.

Augusta, a township of Washtenaw co., Mich. Pop. 1470.

Augusta, a post-village, capital of Perry co., Mich., on Leaf River, 110 miles S. E. of Jackson.

Augusta, a post-village and township of Oneida co., N. Y., 20 miles S. E. of Oneida Lake and 100 miles W. N. W. of Albany. The township contains several manufacturing villages. Pop. of township, 2067.

Augusta, a post-township of Carroll co., O. Pop. 1015.

Augusta, a post-village of Eau Claire co., Wis., on the West Wisconsin R. R., 22 miles E. S. E. of Eau Claire. It has one weekly newspaper. Pop. 761.

Augusta'na Col'lege and Theolog'ical Sem'inary was founded in 1860, and held its sessions in the basement of the Swedish Lutheran church in Chicago, Ill. In 1863 it was removed to Paxton, Ford co., Ill. Its primary object is the education of candidates for the gospel ministry of the Evangelical Lutheran Church among the Scandinavian population of this country. It was incorporated by the legislature of Illinois Feb. 16, 1865, and its charter was amended Mar. 10, 1869. The course of instruction consists of three years in the preparatory department and four years in the college department. The institution has a library of 7000 volumes. The faculty, at present, consists of the president and three professors; there is also one tutor. The first principal was the Rev. L. P. Esbjorn. In 1863, Rev. T. N. Hasselquist, D. D., was elected president, which office he yet holds. Measures are being taken for the removal of this institution to Rock Island, Ill. The institution has an endowment of 880 acres of improved land in Ford co., Ill., and efforts are now being made to raise $30,000 as an addition to the endowment. T. N. HASSELQUIST.

Augusti (CHRISTIAN JOHANN WILHELM), born Oct. 27, 1772, at Eschenburg, near Gotha, Germany, studied at Jena, where he became a professor extraordinary in 1800, professor of Oriental literature in 1803, and professor of theology in 1807. In 1812 he became professor of theology at Bres-

lau, and in 1819 at Bonn. In 1833 he became director of the conservatory at Coblentz, where he died April 28, 1841. He was a man of great learning, an orthodox conservative Lutheran. His writings are valued as books of reference, though they are not without serious faults. His best-known work is "Denkwürdigkeiten aus der Christlichen Archeologie" (12 vols., 1817–31). He published various other works, historical and dogmatical.

Au'gustine [Lat. *Aure'lius Augusti'nus*], Saint, the most eminent of the Latin Fathers of the Church, was born at Tagaste, in Numidia, on the 13th of Nov., 353 A. D. He was a son of a pagan father and a Christian mother (Monica or Monnica), an excellent and devout woman, by whom he was instructed in religion. Educated at the best schools of Madaura and Carthage, he learned rhetoric, the Greek language, philosophy, etc. When, at the age of seventeen, he entered the great city of Carthage to complete his education, he was an eager, ambitious student and a youth of ardent passions, with a propensity to sensual pleasure. According to his own statement in his "Confessions," he deviated widely from the path of strict morality during this period, and became a father before he was married. About the age of nineteen he embraced the doctrines of the Manichæans, and returned to Tagaste, where he taught rhetoric and grammar. He adhered to Manichæism about nine years, during part of which he lectured on rhetoric at Carthage. In the mean time his mother, by her prayers and exhortations, strove to convert him to Christianity, without success. He wrote at Carthage in his twenty-seventh year a treatise, "De Apto et Pulchro," which is not extant. At length he perceived that the mystical phrases and futile speculations of the Manichæans were not capable of satisfying the wants of his spiritual nature. Much perplexed with doubts and unrest, he removed in 383 A. D. to Rome, and thence to Milan, where he was appointed professor of rhetoric in 384. He was deeply interested in the Platonic philosophy, and after he renounced Manichæism studied the Bible from a Platonic point of view. The sermons of Saint Ambrose, then bishop of Milan, made a deep impression on him, and after severe spiritual conflicts he became a Christian, and was baptized on Easter Eve, 387. In 388 he went back to Tagaste, was ordained presbyter at Hippo in 391, associate bishop in 395, and bishop in 396. Among his earlier writings was a treatise against the Manichæans ("De Genesi contra Manichæos"), and "On True Religion" ("De Vera Religione"). He published about 397 his "Confessions," in thirteen books, a very interesting autobiography. He was a zealous opponent of Pelagianism, against which he wrote two treatises, entitled "On the Grace of Christ" and "On Original Sin." Semi-Pelagianism was opposed by him, in 428, in two famous treatises on "Predestination" and on "Perseverance." He also wrote vigorously against the Donatists. He finished about 426 a work, "De Civitate Dei" ("On the City of God"), which is regarded as the greatest monument of his genius and learning. One aim of this book was to vindicate the Christian faith against those pagans who asserted that the capture of Rome by Alaric and other calamities were consequences of the prevalence of the new religion. Near the end of his life he wrote the "Retractationes," in which he reviewed carefully all his own works. Other important treatises are the "De Doctrina Christiana" and the "De Trinitate." He left behind him also exegetical treatises, sermons, and letters in great number. The best edition of his works is that published by the Benedictines at Paris (11 vols., 1679–1700). He died at Hippo while that city was besieged by the Vandals, on the 28th of Aug., 430 A. D. His character and writings exerted an immense and durable influence on the Church. "Of all the Fathers of the Latin Church," says Villemain, "Saint Augustine manifested the most imagination in theology, the most eloquence, and even sensibility, in scholasticism." For learning his reputation is not so high. He was a poor Greek scholar, and knew nothing of Hebrew. (See Possidius, "Vita Sancti Augustini;" G. Morinco, "Vie de Saint-Augustin," 1533; Tillemont, "Mémoires Ecclésiastiques," 1702; Rivius, "Vita Sancti Augustini," 1646; Poujoulat, "Vie de Saint-Augustin," 1852; Bindemann, "Augustine's Leben," 1844; Butler, "Lives of the Saints;" Neander, "History of the Church.")

Revised by R. D. Hitchcock.

Augustine, or **Austin,** Saint, the "apostle of England" and first archbishop of Canterbury. He was a Benedictine monk, connected with a monastery in Rome, when he was sent by Pope Gregory I. to convert the Anglo-Saxons, in 596 A. D. He was received amicably by King Ethelbert, whose wife Bertha was already a Christian. He converted Ethelbert, and is said to have baptized 10,000 of his subjects. Augustine was appointed archbishop of Canterbury by the pope. Died in 604, or, as some say, 614. (See W. F. Hook, "Lives of the Archbishops of Canterbury," vol. i.)

Augustin'ian Monks, a monastic order of the Roman Catholic Church. This order was formerly divided into three classes, of which two still remain: I. *Canons Regular.*—This class of ecclesiastics originated at Avignon in the year 1038, by authority of the bishop Benedict of Avignon. They were called Canons Regular because their ranks were recruited from the lay and clerical canons who had not previously taken monastic vows. They assumed the name and rule of Augustine in 1139. They had 170 houses in England and 28 in Scotland. II. The so-called *Hermits of St. Augustine,* one of the four great mendicant orders of the Church. This body incorrectly claims to have been founded by Saint Augustine. Its true origin was in 1256, when Pope Alexander IV. compelled eight small bodies of Italian monks to unite in one order under the rule of St. Augustine, and exempted them from the jurisdiction of bishops. The Hermits of St. Augustine have now about 200 houses. They are much diminished in importance. *The Special Congregations* consisted of those Augustinians who desired a severer rule and better discipline than commonly prevailed in the order. Martin Luther was a member of the Special Congregation of Saxony. III. *The Barefooted Augustinians* originated in 1582, by command of the king of Spain. They have a very severe rule. The number of monasteries in 1860 was about fifteen. This class is nearly or quite independent of the former.

Augustinian Nuns are of four classes: First, those under the guidance of Augustinian monks; secondly, those under the control of diocesan bishops; thirdly, barefooted nuns; fourthly, Augustines of the Interior of Mary. (See Migne, "Dictionnaire des ordres Religieux," tom. iv.; Dudale, "Onomasticon," vi. 37.)

Augusto'wo, or **Augustow,** a town of Russian Poland, in the government of Suvalki, on the Netta, 140 miles N. E. of Warsaw. It has manufactures of cotton and woollen goods. Pop. in 1867, 9354.

Augustowo, Canal of, unites the Vistula with the river Niemen, and connects it with the Baltic at Memel. It is 150 miles long, extending from Wizna on the Narew to a point on the Niemen, 14 miles N. of Grodno.

Augus'tulus (Romulus), the last Roman emperor of the West, was a son of Orestes, a rich patrician. He obtained the title of emperor in 475 A. D., and was deposed by Odoacer in 476.

Augus'tus, a Latin word equivalent to the Gr. Σεβαστός, signifies "majestic," "sacred," "venerable." It was a name or surname conferred on Caius Julius Cæsar Octavianus by the Roman senate, 27 B. C.

Augus'tus (or **August**) **I.,** elector of Saxony, a son of Henry the Pious, was born at Freiberg in 1526, and succeeded his brother Maurice in 1553. He was an intolerant promoter of Lutheranism, and persecuted the Calvinists, but was a liberal patron of learning, and under his administration the manufactures, agriculture, and commerce of the country were greatly promoted and improved; he also introduced some valuable reforms in jurisprudence. He was chiefly instrumental in negotiating the peace of Augsburg (1555). He died in 1586, and was succeeded by his son, Christian I.

Augustus II. of Saxony (and **Augustus I.** of Poland), born at Dresden in 1670, was the second son of John George III., elector of Saxony, and Anna Sophia of Denmark. He possessed extraordinary physical strength, and was not deficient in mental faculties. He became elector of Saxony on the death of his brother in 1694, and was elected king of Poland in 1697, having, for the sake of the crown, adopted the Roman Catholic religion. His competitor in this election was the French prince of Conti. Augustus formed about 1700 an alliance with Peter the Great against Charles XII. of Sweden, by whom he was defeated in several battles. By a treaty signed in 1706 he renounced the crown of Poland, which Charles XII. gave to Stanislas Leszynski. In consequence of the defeat of Charles XII. by the Russians in 1709, Augustus recovered the throne of Poland, and as an ally of Peter the Great waged war against Sweden for several years. Augustus was luxurious, licentious, and fond of splendor. He squandered the revenues of Saxony on his mistresses and on alchemists, whom he patronized. He had many illegitimate children, among whom was the famous Maurice of Saxony (Marshal Saxe). He died in Feb., 1733, leaving the throne to his son Augustus. (See Fassmann and Horn, "Friedrich August des Grossen Leben," 1734; Desroches de Parthenay, "Histoire de Pologne sous le Roi Auguste II.," 4 vols., 1734.)

Augustus III. (Frederick), king of Poland, born at Dresden in 1696, was a son of the preceding. He was

inferior in talents to his father. Having joined the Roman Catholic Church, he married, in 1719, Maria Josephine, a daughter of Joseph, emperor of Austria. In 1733 he became elector of Saxony, and was chosen king of Poland by a party of the Diet. Favored by the courts of Austria and Russia, he prevailed over his rival Stanislas. In 1742 he formed an alliance with the empress Maria Theresa against Frederick the Great, who defeated the Saxons in 1745 and captured Dresden. This war was ended in 1746, but Augustus was soon involved in the Seven Years' war, which began in 1755, and his army was again defeated by the Prussians. He died in 1763, and his son, Frederick Christian, then became elector of Saxony.

Augustus (William), prince of Prussia, a younger brother of Frederick the Great, was born at Berlin in 1722. He distinguished himself at Hohen-Friedberg in 1745, became a general of infantry, and displayed skilful generalship at the battle of Lowositz in 1756. He died in 1758, and left a son, who became King Frederick William II.

Augus'tus Cæ'sar (often called simply **Augustus**), called in his youth Caius Octavius, and after he became the heir of Cæsar the dictator, Caius Julius Cæsar Octavianus, the first Roman emperor, was born at Velitræ in 63 B. C. He was the son of Caius Octavius, a senator, and Atia, who was a niece of Julius Cæsar. His father having died about 60 B. C., his mother was married to L. Marcius Philippus, who directed the education of young Octavius. At the age of sixteen he assumed the *toga virilis*, and was adopted as a son by Julius Cæsar, whom he attended in his expedition to Spain in 45 B. C. He became a pupil of Apollodorus of Pergamus, under whom he was pursuing his studies at Apollonia when Cæsar was killed, in Mar., 44 B. C. As he had been appointed the heir of the dictator, he hastened to Rome to claim his inheritance. Mark Antony, who then had the chief power in Rome, refused to deliver the property and papers of the late dictator. Octavius temporized, and in the turbulent and critical times that ensued exhibited the prudence and astuteness of a mature politician. He gained the favor of the senate, which in Jan., 43 B. C., gave him the command of an army which defeated that of Antony near Mutina (Módena). The adhesion of the army to his interest enabled him now to defy the authority of the senate. He marched to Rome, was elected consul in Aug., 43, and formed a triumvirate with Antony and Lepidus against Brutus, Cassius, and the senate. Antony and Octavius defeated Brutus and Cassius in the decisive battle of Philippi in 42 B. C., and, to confirm their power, proscribed and massacred thousands of their opponents in Italy. Augustus then obtained control of Italy by a new division of the provinces, but dissensions soon arose between him and Antony, who had command in Asia. An open rupture was, however, postponed, and Antony married Octavia, the sister of his great rival. About 38 B. C. the triumvirate was renewed for another period of five years, during which Octavius and Antony were virtually masters of the Roman world. Octavius defeated Sextus Pompey in battle in the year 36, and was chosen consul for the second time in 33. In the mean time, Antony, infatuated with passion for Cleopatra, neglected his own interests, and by his ill-treatment of Octavia broke the only bond of union with his colleague. The contest for supreme power was decided by a great naval victory which Octavius gained at Actium in 31 B. C., after which he was the sole master of the Roman empire. He was subsequently chosen consul several times, and professed an intention to restore the republic, but he usurped absolute power, partly disguised under republican forms. In 27 B. C. the title of Augustus was conferred on him by the obsequious senate, which retained the shadow of its former power. His favorite ministers and advisers were Agrippa, Mæcenas, and Asinius Pollio. He was thrice married; the names of his wives were Clodia, Scribonia, and Livia Drusilla. He had an only child, Julia. In 23 B. C. he accepted the *tribunitia potestas* (tribunitian power) for life. His reign was remarkably pacific and prosperous, and the Augustan Age was rendered the most brilliant in the Roman literature by the genius of Virgil and Horace, whom the emperor liberally patronized. He was a prudent and rather popular ruler, governing men with artful policy, and skilfully using their passions and talents to promote his own designs. The peace, order, and prosperity which his subjects enjoyed under his mild and modified tyranny reconciled them to the loss of their ancient liberty. He centralized the administration and enforced discipline in the armies. He adorned the city of Rome with public buildings, and made such improvement in that capital that it was said that he found it a city of brick and left it a city of marble. He was not happy in his domestic relations. His adopted sons, Caius and Lucius Cæsar, to whom he intended to leave the throne, died young. He was temperate in his diet and moderate and frugal in his style of living. He had studied oratory with some success, but on important occasions he would never speak without careful preparation. He composed numerous works in prose and verse on various subjects. Having designated his stepson Tiberius as his successor, he died in Aug., 14 A. D. (See Suetonius, "Life of Augustus" ("Vita Augusti"); Nicolas Damascenus, "De Vita Augusti;" Tacitus, "Annales;" Drumann, "Geschichte Roms;" Larrey, "Vie d'Auguste," 1840; Nougarède, "Histoire du Siècle d'Auguste," 1840; Beulé, "Auguste," 1867.)

Revised by Abel Stevens.

Auk (*Al'ca*), a genus of web-footed oceanic birds of the family Alcadæ. The auks are remarkable for the shortness of their wings, which in some species are used as paddles or fins in swimming under water, while in others they are used in flight. These birds are adapted solely for an aquatic life, and swim with wonderful rapidity; they pass their lives mostly in the sea and on the shore near the water's edge. They are found only in the northern hemisphere, and are most abundant in the Arctic regions. The genus *Alca*, restricted by Cuvier, comprises only two species—the great auk (*Alca impennis*) and the razor-bill (*Alca torda*). The great auk is about as large as a goose, and resembles a penguin, having very short wings unfit for flight, and being compelled by the form and situation of its legs to hold itself in an erect position when on the land. It moves under the water with extraordinary rapidity. This bird, so numerous a few years ago, has been lost sight of, and is thought to be extinct. About thirty-four birds and forty-two eggs are known, they being distributed among the various scientific institutions of the world. The razor-bills or black-billed auks have longer wings, and can fly well. They breed in immense numbers within the Arctic Circle, and are very valuable to the Esquimaux, who eat their flesh and clothe themselves with their downy skins. They derive the name razor-bill from the sharpness of the edge of their bills. The common puffin (*Fratercula arctica*) is remarkable for the singular shape, enormous size, and

Labrador Auk, or Arctic Puffin.

the light colors of its beak, owing to which it is often called the *sea-parrot* or the *coulterneb;* it is also sometimes called the Labrador auk. The name of little auk is often given to a species of *Mergulus*.

Au'la Re'gia, Latin words signifying "king's hall" or "court." This name was applied to a court established in England by William the Conqueror, and afterwards regulated by Magna Charta.

Au'lic [from the Lat. *au'la;* Ger. *Reichshofrath*] **Council,** one of the two highest councils or courts of the former German empire, co-ordinate with the imperial chamber. The aulic council, which was organized in 1495, consisted of a president, vice-president, and eighteen councillors, six of whom were Protestants, whose unanimous votes could not be overruled by the Catholic majority. The

members and officers of this council were appointed by the emperor, and had jurisdiction over all matters of feudality in which the emperor was directly concerned; all questions of appeal made by states from decisions in favor of the emperor in inferior courts; and Italian affairs in which the emperor was interested. After the dissolution of the German empire in 1806, the term aulic council was applied to the emperor of Austria's council of state.

Au'lick (Commodore JOHN H.), born in Virginia in 1787, entered the U. S. navy in 1809. He was promoted to be a lieutenant in 1814 for bravery in the fight between the Enterprise and Boxer. He afterwards served with great honor, becoming captain in 1841 and commodore in 1862. Died at Washington, D. C., April 27, 1873.

Au'lis, a town of ancient Greece, in Bœotia, on the Euripus, had a temple of Artemis (Diana). According to the poetical legend, Agamemnon here assembled the Grecian fleet before the siege of Troy, and here he offered his daughter Iphigenia as a sacrifice. Its present name is Vathi.

Aull'ville, a village of Lafayette co., Mo., on the Lexington and St. Louis R. R., has one wagon and carriage factory, one machine-shop, one manufactory of boots and shoes, and other industries. It has one weekly paper.

H. DULEY, ED. "AULLVILLE TIMES."

Au'lus Gel'lius, a Latin author who lived during the reigns of Hadrian and the Antonines. Little is known of the events of his life. He resided much at Athens, where he composed his "Noctes Atticæ," probably before 150 A. D. His book is a mass of curious information upon a great variety of subjects, and, though ill-arranged, is valuable to critics, from the light it throws upon many obscure points of ancient history and literature. The edition of Conradi (1762) is one of the best.

Aumale (formerly **Albemarle**), a small town of France, department of Seine-Inférieure, 13 miles E. N. E. of Neufchâtel. Pop. in 1866, 2229. In the reign of Henry II. Aumale was erected into a duchy, and the title of duke of Aumale was given to Claude, a brother of Francis, duke of Guise. (See the next article.)

Aumale, d' (CLAUDE II.), DUC, a French general, born in 1523, was a brother of the famous duke of Guise. He fought against the Huguenots at St. Denis (1567) and Moncontour (1569), and was one of the chief instigators of the massacre of St. Bartholomew (1572). He was killed in battle Mar. 14, 1573.—His son, CHARLES DE LORRAINE, duc d'Aumale, born about 1555, was an ardent partisan of the Catholic League. After the death of his cousin, Henry, duke of Guise, 1588, Aumale and the duke of Mayenne were the leaders of the League, and commanded the armies that fought against Henry IV. He had ill-success as a general. Having plotted treason with the king of Spain, he was condemned to death by Parliament in 1595, but escaped. Died at Brussels in 1631.

Aumale, d' (HENRI EUGÈNE PHILIPPE LOUIS D'ORLÉANS), DUC, the fourth son of Louis Philippe, king of the French, was born in Paris in 1822. He entered the army in 1839, served several campaigns in Algeria, and was rapidly promoted. In May, 1843, having defeated Abd-el-Kâder, whose camp and treasures became the spoil of the victors, he was raised to the rank of lieutenant-general. In Sept., 1847, he was appointed governor-general of Algeria, about three months after which Abd-el-Kâder surrendered to him. On learning the abdication of his father, he resigned his command, Mar., 1848, and went into exile, residing many years in England. He was chosen a member of the National Assembly in Feb., 1871, soon after which date that body annulled the decree or law which had excluded the Orleans princes from France. He was elected to the French Academy in the winter of 1871–72.

Aune [Lat. *ulna*, the elbow], an old European cloth measure, having many values in different places, varying between 27 and 54 inches. The French aune was about 46.8 inches. The name survives only in Switzerland, where it signifies a measure equal to four feet in length, the foot being thirty centimètres. The Swiss aune is therefore about 47¼ inches long.

Au'ra [a Latin word signifying a "breath," a "gentle breeze," from the Gr. *ἀω*, to "breathe"], a subtle vapor or exhalation.—*Aura electrica* (literally, the "electrical breeze"), the sensation as of cold air experienced when electricity is received from a sharp point.—*Aura epileptica*, the peculiar sensation felt by epileptic patients as of a cold fluid ascending towards the head.—*Aura hysterica*, the sensation as of cold air ascending to the head, said to occur sometimes in hysteria.—*Aura seminalis* or *aura seminis*, the supposed vivifying principle of the *semen virile*, formerly believed to ascend through the Fallopian tubes, thereby impregnating the ovum in the ovarium.—*Aura vitalis*, a name for the principle of life.

Aurantia'ceæ [from the Lat. *aurantium*, an "orange"], a natural order of exogenous trees and shrubs, natives of the warm parts of Asia and Northern Africa. All parts of these plants contain a fragrant volatile oil, which abounds especially in the leaves and in the rind of the fruit. The leaves are alternate, articulated with the petiole, and dotted or pellucid-punctate; the fruit is a *hesperidium*. The order comprises numerous species, some of which are remarkable for beauty and are highly prized for their fruits, as the orange, lemon, and citron. (See CITRUS.) The fruits of *Ægle marmelos*, *Crokia punctata*, *Glycosmis citrifolia*, and many others are also edible. The *Skimmia Japonica*, a beautiful shrub of Japan, is more hardy than the other plants of this order, and flourishes in the open air in England.

Aur'dal, a township of Otter Tail co., Minn. Pop. 85.

Aure'lian, or **Aurelia'nus** (CLAUDIUS DOMITIUS), a Roman emperor of humble origin, was born about 212 A. D. at Sirmium, in Pannonia, or, as some say, in Lower Dacia. He served with distinction in several campaigns, and raised himself by his merit to the highest rank in the army of Valerian. It is stated that he usually fought in the foremost rank. On the death of Claudius (270 A. D.), Aurelian was elected emperor by the army. Early in his reign the empire was invaded by the German tribe of Alemanni, whom he defeated. He abandoned Dacia to the Goths and Vandals, in order that the Danube might become the boundary of the empire. The most important and famous of his enterprises was an expedition against Zenobia, queen of Palmyra, whose extensive dominions included Syria and Egypt. Having defeated her army in battle near Emesa, he captured Palmyra and its queen in 273 A. D., after which he received at Rome a triumph of extraordinary magnificence. He recovered Gaul from Tetricus, who had usurped royal power, and obtained the title of "Restorer of the empire." His memory is stained by the judicial murder of Longinus the critic, and other acts of excessive severity. He was assassinated by his own officers between Byzantium and Heraclea in 275 A. D., and was succeeded by Tacitus. (See VOPISCUS, "Vita Aureliani;" TILLEMONT, "Histoire des Empereurs;" GIBBON, "Decline and Fall of the Roman Empire," chap. xi.)

Aure'lius, a post-township of Ingham co., Mich. Pop. 1506.

Aurelius, a post-township of Cayuga co., N. Y. Pop. 1952.

Aurelius, a township of Washington co., O. Pop. 799.

Aure'lius Victor (SEXTUS), a Roman historian who flourished about 380 A. D. He was appointed prefect of Pannonia Secunda by Julian the Apostate about 360, and was prefect of Rome under Theodosius I. He wrote a series of biographies of the Roman emperors from Augustus to Constantius, entitled "De Cæsaribus Historia," which is extant. Two other works are ascribed to him—namely, "The Lives of Illustrious Romans" and "Aurelii Victoris Epitome."

Aure'ola, Au'reole [Lat. *aure'olus*, "golden"], in painting, the golden glory which encircles the heads, or even the whole bodies, of saints and martyrs. The circle or *nimbus* when it encloses a cross belongs to Christ alone; without the cross it indicates canonized saints. There is also a form of aureole appropriated to saints who are called *beati*, "blessed," but are not canonized, whose heads are decorated with a radiation of golden lines. The idea of placing an aureole around the head of divine or sainted personages did not, there is reason to believe, originate with the Christians of the primitive or Middle Ages. Aureoles essentially resembling those which surround the heads of the saints appear to have been common in India in the representations of the Hindoo gods from early times. (See MOOR'S "Hindu Pantheon.")

Au'reus, or **Dena'rius Au'reus,** the standard and most ancient Roman gold coin, first struck in 207 B. C. The average weight of the aureus was about 121 grains—a little less than the Greek stater, and about the same as the Persian daric.

Au'ricle [Lat. *auric'ula*, the diminutive of *au'ris*, the "ear"], the external portion of the ear.

AURICLES OF THE HEART [Lat. *auricu'læ cor'dis*], the term applied to those cavities of the heart which receive the blood returning from the veins, and convey it to the ventricles. The auricles are popularly called "deaf-ears." (See HEART.)

Auric'ula (*Prim'ula Auric'ula*), a plant of the order Primulaceæ, nearly related to the primrose, is much cultivated in flower-gardens. It is a native of the Alps and

other mountains of Europe and Asia. It is prized for the beauty and fragrance of its flowers, which grow in the form of an umbel on a scape. The size and color of the flowers have been much improved by cultivation. Among the colors prevailing in the 1200 or more cultivated varieties are red, pink, crimson, and mulberry. Some varieties present a single color, and others are variegated or are adorned with a green margin. The flowers are covered with a fine meal or powder. The auricula blooms in April or May, and often has a second crop of flowers in autumn. It prefers a rich, light soil, and the finer varieties are usually cultivated in pots. The chief requisites of a good auricula are large flowers, which are nearly round, and have in the centre a white or yellow eye which is distinct and round, its color not mixed with the ground color; and a long scape, strong enough to hold itself erect.

Auricula, a genus of Auriculidæ, a family of Mollusca of the class Gasteropoda. They have a spiral shell covered with a horny epidermis. The spire is obtuse or short, and the aperture elongated and narrow. They have respiratory organs adapted for breathing in air, and they frequent salt marshes or the vicinity of the sea. They are chiefly found in and near warm seas. Several species are fossil.

Auric'ular Confes'sion [Lat. *auricula*, the "external ear"], private confession of sins to a priest. For certain offences the early Church required confession. In the fifth century, owing to some scandals in public confession, Leo the Great (440–461) authorized the parish priest to receive confessions. By the twenty-first canon ("*Omnis utriusque sexus fidelis*") of the Fourth Lateran Council, in 1215, under Innocent III., it is enjoined upon the faithful to confess their sins once a year, at least, to the parish priest, under pain of losing Christian burial.

Auri'ga, a Latin word signifying "charioteer," is the name of a northern constellation of the celestial sphere, sometimes called The Wagoner. It contains Capella, a star of the first magnitude.

Aurillac, ō're'yȧk' (anc. *Aureli'acum*), a town of France, capital of the department of Cantal, is pleasantly situated in a valley on the river Jourdanne, 272 miles S. of Paris. It is well built, and has wide and clean streets. The houses are covered with slate, which is quarried in the vicinity. Among its ancient and remarkable public buildings are the church of Notre Dame, built in the thirteenth century, the castle of St. Stephen, and the college, which has a valuable library. Here are manufactures of copper kettles, jewelry, paper, carpets, and woollen stuffs. Pop. in 1866, 10,998.

Auriol, a town of France, in the department of Bouches-du-Rhône, 16 miles N. E. of Marseilles. Pop. in 1866, 5182.

Au'rochs [Ger. pron. owr'oks], a contraction of the German *Auer-Ochs* (*i. e.* "wild-ox"), the *Bos urus* of some naturalists, and *Bison bonasus* of others, is a European species of Bisox (which see). Though once found in great numbers in many parts of Europe, it is now chiefly, if not wholly, limited to the forests of Lithuania, Moldavia, Wallachia, and the Caucasus. It bears many points of similarity to the American bison. It is a very powerful animal, being somewhat larger than an ordinary ox, and, though clumsy in appearance, can run rapidly for a short distance. The body of this animal exhales a strong odor, somewhat resembling musk. The aurochs is a good swimmer, and delights in dabbling in the water and rolling in the mud. Its food consists in a great part of lichens, of which it is especially fond.

Aurochs.

Auro'ra, a Latin word signifying "morning" or the "goddess of morning," corresponding to the Greek Ἠως. The poetical legends represent her as the daughter of Hyperion, the wife of the Titan Astræus, the mother of Hesperus, Boreas, Zephyrus, and Memnon. According to one mythical tradition, she loved Tithonus (a son of Laomedon), for whom she asked and obtained immortality, but forgot to ask perpetual youth. She was sometimes represented as dressed in a saffron-colored robe, with a torch in her right hand.

Aurora, a post village of York co., Ontario, Dominion of Canada, on the Northern Railway, 30 miles N. of Toronto. It has one weekly newspaper, three churches, and a public park. Pop. in 1871, 1132.

Aurora, a city of Kane co., Ill., on Fox River, and on the Chicago Burlington and Quincy R. R., 39 miles W. S. W. of Chicago, at the junction of that road with the O. O. and F. R. V. R. R., and the Chicago and Iowa R. R. It has a city-hall, which cost $75,000, and a fine building for the Young Men's Christian Association, which is doing a large benevolent work. It has three national banks, an extensive silver-plate manufacturing establishment, a foundry, several machine-shops, a woollen mill, and the shops and works of the Chicago Burlington and Quincy R. R., which employ 1500 men. It has twenty churches, five newspapers, and excellent public schools, and is the seat of Jennings' Seminary. The city is protected from fire by the Holly waterworks system. Pop. 11,162; of Aurora township, 2033.

Ed. "Beacon."

Aurora, Dearborn co., Ind., on the Ohio River and the Ohio and Mississippi R. R., 25 miles W. by S. from Cincinnati. It has one national bank, four large barrel-factories, Ohio and Mississippi R. R. car-shops, an extensive hay-trade, one distillery, one large brewery, one chair-factory, one furniture-factory, one hay-press factory, one foundry of great capacity, and one weekly paper. Pop. 3304.

L. W. Cobb, Ed. "Dearborn Independent."

Aurora, a post-township of Hancock co., Me. P. 212.

Aurora, a post-township of Steele co., Minn. Pop. 422.

Aurora, a post-village, capital of Esmeralda co., Nev., is situated on a level space at the junction of two ravines which extend between Silver, Middle, and Last Chance Hills, and about 100 miles S. E. of Carson City. Its altitude is about 7500 feet above the level of the sea. Rich silver-mines have been opened here. Pop. 160.

Aurora, a post-village of Ledyard township, Cayuga co., N. Y., finely situated on the E. side of Cayuga Lake. It is a place of summer resort, has many fine residences, some manufactures, a weekly paper, and a national bank, and is the seat of Wells's college for ladies and of Cayuga Lake Academy. It is on the Cayuga Lake R. R., 25 miles N. W. of Ithaca. Pop. 450.

Aurora, a township of Erie co., N. Y., 18 miles S. E. of Buffalo. It has an academy, and some manufactures. Pop. of township, 2573.

Aurora, a post-township of Portage co., O. Pop. 642.

Aurora, a township of Waushara co., Wis. Pop. 967.

Auro'ra Borea'lis (*i. e.* "northern light"), called also **Northern Lights,** the term applied to a certain luminous phenomenon generally appearing in the northern part of the sky, and presenting a light somewhat resembling the dawn or break of day. It is most frequent and brilliant in high northern and high southern latitudes; in the latter case it is called "aurora australis" or "southern light." The appearances are extremely various. Not unfrequently it seems to proceed from a sort of horizontal cloud or haze in the northern part of the sky, rising a few degrees above the horizon, and stretching from the north towards the east and west, so as to form an arc which in some instances has been observed to extend upward of one hundred degrees. The upper edge of the cloud is whitish and luminous, the lower part often dark or thick, and sometimes the clear sky may be seen between it and the horizon. From the upper part of the cloud streams of light shoot up in columnar forms, reaching sometimes only a few degrees, sometimes to the zenith, or even beyond it. Instances have occurred in which the whole hemisphere was covered with coruscations, but the brilliancy is greatest and the light strongest in the north, near the main body of the meteor. The streamers have in general a tremulous motion, and when close together present the appearance of waves or sheets of light following each other in rapid succession. When several columns, issuing from different points, meet at the zenith, a small meteor is formed of greater brilliancy than the separate columns. The aurora sometimes continues a few hours, occasionally the whole night, and even for several nights in succession. The height of the aurora above the earth has been variously estimated by different scientists. By taking observations of the altitude of the highest point of the arch of the same aurora at different stations, heights varying from five to five hundred miles have been calculated. It is now almost universally admitted that the aurora borealis occurs at various heights, and that it is seldom found less than forty-five miles above the surface of the earth. The distance of the stations at which the same aurora has been visible indicates the enormous geographical extent, and likewise the great altitude, which the phenomenon frequently attains. One aurora, for instance—that which occurred on Sept. 3, 1839—was seen in the Isle of Skye; at Paris; at Asti, in the Sardinian states; at New Haven, in Conn., and at New Orleans. That of Sept. 2, 1859, was seen all over Europe and North-America, and in the Sandwich Islands. The aurora of Feb. 4, 1872, was seen in the U. S., Europe, and British India. On the other

hand, observers of eminence assert that the aurora sometimes descends to the region of the clouds. The noise that is alleged to accompany the aurora would indicate for it a moderate height. Some compare it to the noise that is produced by the rolling of one piece of silk upon another, and others to the sound of the wind blowing against the flame of a candle, or that attending the discharge of fireworks. It is proper to observe, however, that scientific Arctic voyagers, such as Parry and Franklin, throw doubt on the existence of any such noise, for not one of the numerous and brilliant auroras seen by them was attended with the faintest sound. It is now certain that the aurora has an electric origin, and it is believed by some that its phenomena are due to the passage of electric currents through highly attenuated air at considerable distance from the earth. Telegraphic communications are frequently so interrupted by electric currents upon the wires during the continuance of an aurora that messages for the time cannot be sent. Occasionally, however, the auroral current is so strong and continuous that it can be utilized in sending despatches.

Periodicity in auroral displays has lately been asserted. A maximum occurs about once in ten years, and a period of remarkable brilliancy about once in sixty years. Some physicists associate these periods with the variations in the sun's spots and with the planetary rotations.

Auro'raville, a township of Anson co., N. C. P. 1843.

Aurungâbâd', a city of Hindostan, in the territory of the Nizam, on the Doodna, 68 miles N. E. of Ahmednuggur; lat. 19° 54′ N., lon. 75° 33′ E. It was a favorite residence of Aurung-Zeb, in whose honor it was named. Among the monuments of its former grandeur are a ruined palace of Aurung-Zeb, and a mausoleum with domes of white marble erected by that monarch to the memory of his daughter. Many of the mosques and other public buildings are substantial, but signs of decay are visible. Pop. estimated at 60,000.

Au'rung-Zeb, or **Aurang-Zebe** (*i. e.* the "ornament of the throne"), afterwards called **Alum-Geer** or **Alam-Gir** ("conqueror of the world"), a famous Mogul emperor of Hindostan, was born Oct. 22, 1618. He was a younger son of Shah Jehân, who ceased to reign in 1657. The elder sons, Dara and Shuja, then contended for the crown in battle, while Aurung-Zeb affected indifference to temporal power, and craftily concealed his designs under the cloak of piety. Having procured the assassination of Dara and Shuja, he became master of the empire in 1658, and detained in prison his father until his death in 1666. As a bigoted Moslem he persecuted the Hindoos and provoked the Mahrattas to revolt. He added Bejapoor and Golconda to his empire, and was one of the most powerful of the Mohammedan monarchs of India. His long reign was a period of outward and specious prosperity, but the empire was diseased at heart, and soon entered a state of decadence, which was partly the effect of his policy, duplicity, and intolerance. Conscious of the crimes by which he obtained power, he lacked confidence in his ministers, and is said to have lived in continual fear of treachery. Died Feb. 21, 1707. (See Elphinstone, "History of India;" Bernier, "Voyages et Description de l'Empire Mogol;" J. Mill, "History of British India.")

Au Sa'ble, a township of Grundy co., Ill. Pop. 927.

Au Sable, a post-village of Iosco co., Mich.

Ausa'ble, a village and township of Clinton co., N. Y., on the Au Sable River, about 7 miles above its entrance into Lake Champlain. Excellent iron ore abounds, and iron is extensively manufactured. There is an academy at Keeseville. Pop. of township, 2863.

Au Sable Forks, a post-village of Jay township, Essex co., and Black Brook township, Clinton co., N. Y., on the Au Sable River, has extensive iron-works, which produce metal of the best quality, also nail-works, lumber-mills, etc.

Ausculta'tion [Lat. *auscul'to, ausculta'tum*, to "listen"], a method of determining the condition of the heart and lungs by listening to the sounds produced in the cavity of the chest. This is done either by the unassisted ear (called *immediate auscultation*), or by the aid of a simple sound-conveying instrument, the stethoscope (termed *mediate auscultation*). The stethoscope was invented by Laennec in 1816. By care and attention the normal sounds produced by respiration and the beating of the heart may be distinguished from the several abnormal sounds indicating disease. Auscultation is classed among the most important of discoveries in modern medical science. Its details were ably explained by Laennec, who published a treatise on it in 1819. Recent leading writers upon it have been Skoda in Germany, Walshe in England, and Flint in the U. S. (See Stethoscope.)

Auso'nius (Decimus Magnus), an eminent Latin poet, born at Burdigala (Bordeaux) about 309 A. D. He was liberally educated, practised law in his early life, and gained distinction as a professor of rhetoric at Burdigala. In 367 A. D. he was appointed tutor to Gratian by the emperor Valentinian. He held several high offices under the reign of Gratian, who raised him in 379 to the dignity of consul. The learned disagree on the question whether he was a Christian or a pagan. He wrote epigrams, epistles, idyllia, etc., which were admired by his contemporaries, but display little genius, and are very faulty in style. Died about 394 A. D. (See M. de Peyrarède, "Vie d'Ausone;" J. Demogeot, "Études historiques et littéraires sur Ausone," 1857.)

Au'spices [from the Lat. *auspic'ium* (*i. e. avispicium*, the "observing of birds"), from *avis*, a "bird," and *specio*, to "see"], a term applied by the ancient Romans to divinations founded on the flight of birds or other omens, by which the augurs or soothsayers professed that they could ascertain the will of the gods and predict events. (See Augur.) No important enterprise or business was undertaken without consulting the auspices. In performing this ceremony the augur with a wand marked out a portion of the sky for his observations, which portion, called a *templum*, was divided into right and left. If the birds appeared on the right hand, the omen was favorable; if they flew towards the left (*ad sinistrum*), it was unfavorable. The chief magistrates also had the right to conduct this ceremony, and the commander of the army in time of war had the exclusive power of taking the auspices. If a victory was gained by his legate or lieutenant, it was said to be won under the auspices of the general-in-chief. Thus originated the common English phrase, "under the auspices" of some one. In such cases "auspices" signifies influence, patronage.

Aus'sig, an Austrian town, in Bohemia, on the Elbe, 46 miles W. N. W. from Prague, has coal mines in the vicinity, and manufactures of linen, gold, and silver work. Pop. 10,933.

Aus'ten (Jane), an English authoress, born at Steventon, in Hampshire, Dec. 16, 1775. She was educated by her father, who was rector of Steventon, and after his death she lived at Southampton and Chawton. She is said to have been beautiful in features. Her first novel, "Sense and Sensibility," appeared anonymously in 1811. She afterwards produced "Pride and Prejudice," "Mansfield Park," "Emma" (1816), "Northanger Abbey" (1818), and "Persuasion" (1818), the first three of which were anonymous. These works represent with great fidelity the ordinary life of the middle classes of England. According to Sir Walter Scott, "she had a talent for describing the involvements, feelings, and characters of ordinary life which is to me the most wonderful I have ever met with." Died July 18, 1817. (See the "Quarterly Review" for Jan., 1821; "Atlantic Monthly" for Feb., 1863.)

Aus'terlitz, a small town in Moravia, on the Littawa, 12 miles E. S. E. of Brünn. It has a fine castle. Pop. in 1857, 3452. It is celebrated as the scene of a great victory which Napoleon I. gained over the combined armies of Austria and Russia, commanded by their respective emperors, on Dec. 2, 1805. Napoleon had taken Vienna about Nov. 12, after which he fixed his head-quarters at Brünn, where he had about 75,000 men. The armies of the allies, amounting to about 85,000, advanced in five columns to offer battle to the French, who occupied high ground partly covered by wooded eminences, morasses, and small lakes. The battle began about 7 A. M., when the allies attempted to turn the right wing of Napoleon, who attacked them in flank and at various points with great advantage. While a portion of the allied army was retreating across a frozen lake, the ice was broken by the French artillery, and nearly 2000 men perished in the water. The allies lost about 30,000, killed, wounded, and prisoners, and the French about 12,000. Among the results of this victory was the treaty of Presburg, Dec., 1805.

Austerlitz, a post-township of Columbia co., N. Y. Pop. 1442.

Aus'tin, a county in the S. E. central part of Texas, has an area of 1024 square miles. It is intersected by the Brazos River, which is navigable for steamboats. The soil is fertile; cotton is the staple crop, but corn, cattle, tobacco, and wool are raised. Manufacturing is carried on quite extensively. The Houston and Texas Central R. R. passes through the county, which is one of the most thriving in the State. Capital, Bellevillo. Pop. 15,087.

Austin, the capital of Texas and seat of justice for Travis county, is situated on the left bank of the Colorado River, in lat. 30° 16′ 25″ N., lon. 97° 43′ 58″ W. It is surrounded by fine scenery. The river has been recently made navigable for steamboats. Austin became the capital

of the republic of Texas in 1839, was chosen capital of the State in 1850, and in 1872 was made permanent capital by vote of the people. It is connected by rail with Houston and Galveston. Among the public buildings are the Capitol, the general land-office, the comptroller's and treasurer's building, governor's mansion, asylums for lunatics, for the blind, and for the deaf and dumb, and the supreme court building. It has a well-organized fire department, several steam saw-mills, two ice-factories, several planing-mills, and two sash-and-door factories. It is the seat of the flourishing Texas Military Institute, and has three daily and six weekly papers and one national bank. Pop. 4428.

STANLEY WELCH, ED. "STATE JOURNAL."

Austin, a township of Macon co., Ill. Pop. 713.

Austin, a post-village of Jennings township, Scott co., Ind., has three manufactories of shingles, two of barrel heads and staves, five saw-mills, two churches, and one weekly newspaper. Pop. 321.

J. H. J. SIERP, ED. "AUSTIN NEWS."

Austin, a township of Mecosta co., Mich. Pop. 346.

Austin, a township of Sanilac co., Mich. Pop. 349.

Austin, a thriving little city, capital of Mower co., Minn., on the Red Cedar River, and on the Milwaukee and St. Paul R. R., and terminus of the Burlington Cedar Rapids and Minnesota and Austin and Mason City R. Rs., 104 miles S. of St. Paul. It has two newspapers and two national banks. It is near the route of the Southern Minnesota R. R. Pop. 2039; of the township, 2631.

DAVIDSON & BASFORD, PUBS. "AUSTIN REGISTER."

Austin, a post-village, the capital of Tunica co., Miss., on the Mississippi River, 44 miles by land and 75 miles by water S. W. of Memphis, Tenn. It has two weekly papers.

ED. OF "COTTON PLANT."

Austin, a post-township of Cass co., Mo. Pop. 1366.

Austin, a city, the county-seat of Lander co., Nev., on the eastern slope of the Toyabe range of mountains, 90 miles S. of Battle Mountain Station, and 6 miles E. of Reese River. There are four quartz-mills and many rich silver-mines here. It has one daily paper. Pop. 1324.

CASAMAYOU & DENNIS, PUBS. OF "DAILY REVEILLE."

Austin, a township of Greenville co., S. C. Pop. 1512.

Austin (JAMES TRECOTHIC), LL.D., an American lawyer, born at Boston Jan. 7, 1784. He graduated at Harvard in 1802, and became in 1806 a son-in-law of Elbridge Gerry. He was attorney-general of Massachusetts from 1832 to 1843. He published, besides other works, a "Life of Elbridge Gerry." Died May 10, 1870.

Austin (JONATHAN LORING), a patriot, the father of the preceding, was born in Boston Jan. 2, 1748, and graduated at Harvard in 1766. He was sent to Paris in 1777 as a bearer of despatches, and remained there two years as Dr. Franklin's secretary. After the Revolutionary war he was secretary of state in Massachusetts. Died May 10, 1826.

Austin (MOSES), an American pioneer, born in Durham, Conn., about 1776. He emigrated to Texas about 1820, and obtained from the Mexican government a grant and permission to plant a colony in that province. As he was returning to Missouri for settlers, he died June 10, 1821, but the colony was founded by his son, Stephen F. Austin.

Austin, SAINT. See AUGUSTINE, SAINT.

Austin (SAMUEL), D. D., an American Congregational clergyman, born at New Haven, Conn., Oct. 7, 1760, graduated at Yale in 1783, was pastor at Fair Haven, Conn., for three years from 1786, and afterwards at Worcester, Mass., for nearly twenty-five years. In 1815 he accepted the presidency of the University of Vermont, which post he occupied for about six years. The last years of his life were spent in much bodily weakness and mental depression. Died Dec. 4, 1830.

Austin (SARAH), an English writer and accomplished translator, was a member of the eminent Taylor family of Norwich. She was married to John Austin, a barrister of London. She wrote, besides other works, "Characteristics of Goethe" (3 vols., 1833), which was very successful, and "Sketches of Germany from 1760 to 1814." She produced a good translation from the German of Prince Pückler-Muskau's "Travels in England," and also one of Ranke's "History of the Popes" (3 vols., 1840), which was highly commended by Macaulay. Died in 1867.

Austin (STEPHEN F.) was a son of Moses Austin, noticed above. About 1821 he conducted a company of emigrants from New Orleans, and planted a colony where the town of Austin now stands. The grant made to his father was confirmed to him in 1822 or 1823. Early in 1833 the Texan colonists formed a constitution, to obtain a ratification of which Austin and other delegates went to the city of Mexico. In consequence of the frequent revolutions and anarchy of Mexico they did not obtain the admission of Texas into the confederacy. In 1835, Austin was chosen commander of the Texan army, and joined in the movement for the liberation of Texas. He went as a commissioner to the U. S. to obtain the recognition of Texas as an independent state. Died Dec. 27, 1836. (See YOAKUM, "History of Texas," 1856.)

Aus'tinburg, a post-township of Ashtabula co., O. Pop. 1111.

Aus'tintown, a township of Mahoning co., O. P. 1948.

Australa'sia (*i. e.* "Southern Asia"), a part of Oceanica, extending between the equator and lat. 47° S., comprises Australia, Van Diemen's Land (Tasmania), New Zealand, and those parts of the Malay Archipelago and Polynesia between lon. 130° and 170° E.—viz. Papua, the Arroo Islands, New Britain, Timor-Laut, New Ireland, New Caledonia, and the Admiralty, Solomon, New Hebrides, and Queen Charlotte's Islands. Its area is estimated by Behm and Wagner at 3,425,000 square miles, and its population at 4,365,000.

Austra'lia [from the Lat. *australis*, "southern"], or **New Holland,** the largest island of the world, is so extensive that it may be not improperly called a continent. It is bounded on the N. by the Arafura Sea, on the E. and S. by the Pacific Ocean, and on the W. and N. W. by the Indian Ocean. It is included between lat. 10° 44′ and 39° 8′ S., and between lon. 113° 5′ and 153° 22′ E. Its greatest length from E. to W. is 2536 miles, and its greatest breadth from N. to S. 1585 miles. The area is about 2,975,000 square miles.

Surface, etc.—This continent is remarkably compact in form, is not indented by large inlets of the ocean (except the Gulf of Carpentaria), and presents no wide estuaries of rivers. The eastern, southern, and western coasts are almost destitute of indentations, and have few good harbors. Australia presents no great variety or inequality of surface, compared with its vast extent, and has no very high mountains. There are in its compact mass few well-marked, lofty mountain-chains, and the interior is consequently unfavorable to the production of large and permanent rivers. The central part of the island is an immense plain or low table-land, which is arid and barren except in the rainy seasons, and sends little or no tribute to the ocean.

Mountains.—The principal chain is the Blue Mountains and Australian Alps, called Warragong Mountains by the natives, which extend nearly parallel to the eastern coast at distances varying from thirty to ninety miles. The highest peaks of this chain are in New South Wales, and rise nearly 7000 feet above the level of the sea. None of these summits are covered with perpetual snow. The Australian Alps present scenery of remarkable grandeur and wildness, diversified by immense precipices and gigantic fissures. From the principal chain extend a number of spurs or detached ranges.

Rivers and Lakes.—Australia has no great navigable rivers, and is less fortunate than the other continents in its facilities for inland navigation. A scarcity of fresh water, whether in the form of rivers or lakes, is one of the most obvious characteristics of this great region. Many of the rivers flow towards the interior, and are evaporated or absorbed in the sand. Along the southern coast no permanent stream occurs for a distance of over 1500 miles. The poverty of the Australian hydrography is aggravated by an alternation of long droughts and violent floods. The lakes are not reservoirs for the supply of rivers, but rather marshes and landlocked receptacles of its streams. The largest of these lakes are Lake Torrens, Gairdner Lake, and Lake Eyre, in South Australia, and Lake Austin, Lake Moore, and Lake Barlee in Western Australia. The principal river of Australia is the Murray, with its large tributaries, the Darling and Murrumbidgee, rising on the W. or inner slope of the Australian Alps. The Murray rises in the south-eastern part of the island, flows westward, northwestward, and nearly southward, and enters Encounter Bay. The Darling rises much farther N., and flows southwestward, being apparently longer than that part of the Murray which is above the junction. Among the other rivers in the south-eastern and eastern parts of Australia are the Macquarrie, Lachlan, Lynd, and Burdekin. Along the northern coasts occur numerous small rivers, named Albert, Victoria, Roper, etc. In Western Australia the Gascoyne and Murchison rivers are among the largest in that part of the continent.

Geology and Minerals.—The geology of this vast region has not been fully explored, but is supposed to be remarkably simple. An immense central expanse of tertiary rocks extends from lon. 124° to 138° E., and from the southern coast to lat. 18° S. This tertiary formation is surrounded on all sides except the S. by a continuous belt of plutonic

and metamorphic rocks. This belt is separated from the sea on its eastern, western, and northern sides by a tract nearly 100 miles wide. Secondary strata prevail along the northern and western coasts, while the eastern shore from Cape York to Bass's Strait is composed of palæozoic strata, granite, basalt, and other primary rocks. The auriferous rocks of South-eastern Australia are lower Silurian.

The gold-mines of Australia, discovered in 1851, are among the richest in the world. Gold abounds in Victoria and New South Wales, in quartzose veins and in the vicinity of granite, porphyry, and greenstone. The discovery of gold stimulated a rapid emigration from foreign countries to Australia. The product of the mines in 1852 was about $70,000,000, and in 1867, $60,000,000. It is stated that a lump of pure gold weighing twenty-seven pounds was found at Mt. Alexander. Valuable coal-fields occur in New South Wales, in the basin of the Hunter River. The next most important mineral of this island is copper, a rich mine of which is worked at Burra-Burra in South Australia. Lead, iron, zinc, manganese, and quicksilver are also found, the iron being widely and abundantly distributed. Deposits of tin, supposed to be the richest in the world, have been recently discovered in Australia.

Climate.—The northern part has a dry, tropical climate, and is subject to monsoons which blow with much regularity. From the sterile plains of the interior come hot winds, which fill the air with fine dust, and raise the temperature to 120° in the shade. In New South Wales prevail long droughts, which sometimes last a whole year, dry up the rivers, and destroy the vegetation, while the rainy season often ravages the country with violent floods. The mean annual rainfall is reported to be 49 inches at Sydney, 29 inches at Port Philip in Victoria, 70 inches at Port Macquarrie, and 19.9 at Adelaide. The mean temperature of Melbourne (Victoria) is 59° F. In New South Wales the average temperature of spring is 65°, of summer 72°, of autumn 66°, and of winter 55°. As a whole, Australia is remarkably healthful. Intermittent and remittent fevers prevail in the extreme N., and rheumatism in parts of the N. W.

Soil and Productions.—The part of New South Wales lying W. of the mountains is fertile, and is generally based on limestone. A large portion of this colony is adapted to pasturage. "Between Port Macquarrie and Moreton Bay," says Sidney, "are vast tracts of well-watered land covered with heavy timber. Pasture-lands extend for hundreds of miles, now ascending the mountain-slopes to their very summits, and here spreading out into vast plains." Wheat and other cereals flourish in Victoria, the soil of which is generally very productive. Next to gold, wool is the chief article of export. In 1870, 177,728,247 pounds of wool were exported. Western Australia has much fine land, but the interior of the continent is to a great extent, it is believed, a desert.

Botany.—The vegetation of this region is very peculiar. Its trees, which seldom form dense forests, but are scattered as in a park, present generally a very singular appearance, and have evergreen leaves, except those that are leafless. Among them are many varieties of *Acacia*, the *Casuarina*, the Norfolk Island pine, the tree ferns, the palm, the grass tree, and several species of *Eucalyptus*, or gum trees, one species of which is reported to have examples which reach 500 feet in height—probably the highest trees in the world. These *Eucalypti* furnish valuable timber. The *Casuarina* and many species of *Acacia* are destitute of true foliage. Among the most beautiful plants is the fern tree, which grows to the height of twenty feet. Australia has no good indigenous fruits, and produces few native vegetables that are worthy of cultivation in gardens. It is stated that there are 5440 species of plants peculiar to Australia.

Zoology.—The zoology of Australia is perhaps even more anomalous than its vegetation. Here, before colonization, were found no ruminating animals, no Pachydermata, no true Carnivora except the dog; the carnivorous marsupials taking the place of the Carnivora proper. The island has many animals peculiar to itself. It has more than forty species of marsupial quadrupeds, the largest of which is a kangaroo. Here is found a wild dog called *dingo*. Perhaps the most remarkable animal is the *Ornithorhynchus paradoxus*, a quadruped with the bill of a duck and a body like an otter, which is regarded as a connecting link between quadrupeds and birds. Among the Australian birds are the emeu, eagle, hawk, owl, parrot, birds of paradise, cranes, pelicans, geese, and black swans. Here are numerous reptiles, the largest of which is the crocodile. The shores are frequented by whales, seals, sharks, codfish, and many species of fish which are not found elsewhere.

Population.—The aborigines of Australia are a distinct race from the natives of the Malay Archipelago, and are sometimes called Alfurus. They are nearly black, have usually coarse straight hair, and have often been described as among the most deformed and debased of the human species. They are inferior to the average European in stature, and are deficient in muscle and strength. Some of them practise cannibalism, go naked, and have no fixed habitations. Some tribes of them are gentle, and others fierce and warlike. They are very expert in the use of a missile weapon called the BOOMERANG (which see). The whole number of the aborigines is not large (in 1871 about 50,000), and is rapidly diminishing. The total population of the island in 1871 was 1,565,294.

Political Divisions.—Australia is divided into the following colonies, each noticed under its proper head:

COLONIES.	Square miles.	Population.
New South Wales	323,437	501,580
Victoria	86,831	729,868
South Australia	383,328	188,905
Queensland	678,000	120,966
Western Australia	978,000	24,785
Northern Territory	523,500	
Total	2,973,096	1,565,294

Finances.—The receipts, expenditures, and debts for the several colonies were as follows in 1870:

COLONIES.	Receipts.	Expenditures.	Debts in 1869.
New South Wales	£2,490,203	£2,688,264	£9,681,130
Victoria (1869)	3,210,324	2,214,303	11,924,800
South Australia	878,124	995,065	1,944,600
Queensland	786,349	812,238	3,509,250
Western Australia	98,132	113,046	

History.—Australia was first discovered by a Spaniard, Louis Vaez de Torres, who saw the north coast in 1605, but did not land. During the seventeenth century the Dutch navigators landed at several points on the northern and western coasts, but planted no colonies. Dampier visited the island, and coasted New South Wales. In 1776, Captain James Cook explored a large part of the eastern coast. The first settlement was made in 1788, at Port Jackson, to which about 850 convicts were transported from England. Convicts continued to be sent to Botany Bay until 1840. In 1829 a settlement was made at Swan River, in Western Australia. The colony of South Australia was planted in 1834. Victoria was separately organized in 1851, and gold was discovered in the same year. In 1859, Queensland became a separate colony. Among the recent explorers of Australia, the most prominent are Sturt, Burke (1860), Stuart, Howitt (1861), Walker (1861), Kinlay (1862), McIntyre (1865), and Barnitt (1866).

Literature.—Compare MEINICKE, "Das Festland Australien" (2 vols., 1837); HEISING, "Das Australische Festland und die Goldentdeckung" (1855); CHRISTMANN, "Australien" (1869); MUNDY, "Our Antipodes" (1857); FORSTER, "South Australia, its Progress and Prosperity" (1866); JEUNESSE, "Géographie de l'Océanie" (1869); B. SMITH, "The Gold-fields and Mineral Districts of Victoria" (1869); and PETERMANN, "Australien in 1871" (in supplementary Nos. 29 and 30 of Petermann's "Mittheilungen," 1871).

A. J. SCHEM.

Austra'lian Alps, a range of mountains in the south-eastern part of Australia, in the colonies of New South Wales and Victoria. They are called Warragong Mountains by the natives. They are the highest mountains in Australia, but their tops hardly reach the line of perpetual snow. The highest peak is Mount Kosciusko, which has an altitude of 7176 feet above the level of the sea.

Austra'sia, the eastern dominions of the Franks under the Merovingians, made a kingdom by Clovis, 511 A. D., comprising the present Lorraine, Belgium, and some adjacent territory. It was merged in the empire of Charlemagne.

Aus'tria, Archduchy of, is the nucleus around which the Austrian empire has grown. Area, 12,270 square miles. It is bounded on the N. by Bohemia and Moravia, on the E. by Hungary, on the S. by Styria, and on the W. by Bavaria. It is intersected by the Danube, and is divided by the river Enns into two provinces, Upper Austria (Ober-oesterreich) and Lower Austria (Unter- or Nieder-oesterreich), in which Vienna is situated. Pop. of Upper Austria in 1869, 736,557; of Lower Austria, 1,990,708. Both provinces are mountainous and abound in beautiful scenery. The Noric Alps extend along the southern boundary, and the northern parts of the archduchy are occupied by mountains called the Böhmerwald. The climate is moderate, the average annual temperature of Vienna being 51° F. The soil in the valley of the Danube is fertile, and the hilly regions produce valuable timber. Among the staple products are grain, wine, and excellent fruits. Lower Austria

has a more extensive commerce than any other province of the empire.

Austro-Hungarian Monarchy, an empire of Europe, is, with regard to size, the second, and with regard to population the fourth, in the order of the European states. It has an area of 240,348 square miles, and according to the census of 1869 a population of 35,904,435. It consists since 1867 of two independent parts, which are only connected by a single ruler and several common institutions—Cisleithania and Translcithania. (See HUNGARY.) Cisleithania consists of the following crownlands, which are represented in the "Reichsrath," or national assembly:

PROVINCES.	Area.	Pop. in 1869.
Austria above the Enns	7,654	1,990,708
Austria below the Enns	4,632	736,557
Salzburg	2,767	153,159
Styria	8,670	1,137,990
Carinthia	3,995	337,694
Carniola	3,857	466,334
Littoral	3,085	600,525
Tyrol and Vorarlberg	11,324	885,789
Bohemia	20,061	5,140,544
Moravia	8,583	2,017,274
Silesia	1,988	513,352
Galicia	30,299	5,444,689
Bukowina	4,035	513,404
Dalmatia	4,940	456,961
Total	115,887	20,394,980

It comprises the S. E. part of Central Europe, and more than half of the territory of the Danube, and forms a nearly regular quadrilateral. It is almost entirely a continental state, touching an inland sea (the Adriatic) only at one side. Next to Switzerland, it is the most mountainous country of Europe, the mountainous regions comprising an area of over 170,000 square miles. The extensive alpine region (the Tyrol, Salzburg, southern part of Austria, Styria, Carinthia, and the northern part of Carniola) gradually changes its character, sloping down in terraces into a hilly region in the S. E., but in the N. E. is without such gradation (southern part of Carniola, Istria, Croatia, S. E. part of Dalmatia, N. E. part of Austria), and terminates in the valley of the Danube. Beyond the Danube rises the Bohemian-Moravian-Silesian plateau, enclosed by high mountains, and undulating in the interior. To the E. of the March are the Carpathian Mountains, which run in a curved line along the northern boundary of Hungary. The Carpathians are flanked on both sides by a plateau, which passes in the N. into the Polish-Russian plain, continues in the S. to the Danube and the Theiss, and in the S. E. is connected with the highlands of Transylvania. The plains occupy about one-fourth of the area of the empire; the largest are in Hungary and Galicia. Among the waters, the Adriatic Sea is the largest, which washes the coast of Austria for over 1000 miles, besides a coast-line of over 1400 miles in the islands belonging to Austria. The principal rivers are the Danube and Dniester (Black Sea), Vistula and Oder (Baltic), Elbe and Rhine (German Ocean), and the Etsch (Adriatic). The Danube has the largest river-basin in the empire (170,000 square miles), and the Rhine the smallest (850 square miles). The most important river in Austria is the Danube, which enters the empire at Passau, and after a course of 800 miles leaves it at Orsowa. It receives numerous tributaries on its course through Austria, of which the Theiss, March, and Grau on the left, and the Inn, the Enns, the Leitha, and the Drave on the right are the most important. A large number of lakes connect with the system of the Danube, while a number of smaller lakes are found in the interior of the alpine country. The Neustädter Canal leads from the Leitha to Vienna. Austria is rich in mineral springs. The most famous are Carlsbad and Marienbad in Bohemia, Gastein in Salzburg, Ischl and Hall in Upper Austria, and Baden-bei-Wien in Lower Austria. The large extent of the monarchy is the cause of considerable difference with regard to the mean annual temperature. Three climatic belts are generally distinguished: 1, the northern belt extends from the northern boundary to lat. 49° N., and comprises Northern Bohemia and Moravia, Silesia, and Galicia, and produces chiefly grain and flax, but very little wine; 2, the central belt, from lat. 49° to 46° N., contains Central and Southern Bohemia and Moravia, Upper and Lower Austria, Styria, Salzburg, the Northern Tyrol, Carinthia, Carniola, Northern and Central Hungary, Transylvania, and Bukowina, and, with the exception of the highlands, is favorable for the production of wine, fruit, and grain; 3, the southern belt, from lat. 46° to 42° N., includes the Southern Tyrol, the Littoral provinces, Dalmatia, Southern Hungary, Croatia, Slavonia, and the Military Frontier, and produces, besides the common kinds of grain, corn, rice, much wine, and along the southern boundary tropical fruits. The empire is entirely in the temperate zone. The mean annual temperature varies between 39° F. (Marienbad) and 56° (Trieste). The bora and sirocco winds often visit the southern part of the empire, and the latter, under the name of Föhn, causes great destruction in the alpine countries. Excepting platinum, no useful mineral is wanting; metals, salt, and coal are present in inexhaustible quantities. Gold is found in Transylvania, Upper Hungary, and in the gneiss formation of the Central Alps. Silver occurs in the lead and copper deposits of Upper Hungary, Bukowina, Bohemia, the Military Frontier, the Tyrol, and Styria. Besides these, copper, zinc, mercury, tin, lead, sulphur, petroleum, and salt are found in considerable quantities.

The manufacturing industry, which is almost entirely restricted to the western half of the empire, has enormously increased of late years. The most important manufactures are woollen goods in Bohemia, Moravia, and Vienna, glass and china-ware in Bohemia, linen in Bohemia, Moravia, and Silesia, cotton goods in the same regions and in Lower Austria, and iron-ware in Styria, Carinthia, Upper Austria, and Bohemia. Besides these, manufactures of silk, leather, paper, beet-sugar, chemicals, etc. are extensively carried on. Beer-breweries are found in Vienna and Bohemia, and distilleries in Galicia and Hungary, and twenty-seven state establishments manufacture all kinds of tobacco. Since May 1, 1860, freedom of trade exists throughout the empire. Commerce has also considerably increased in late years. From 428,800,000 florins in 1868 (1 florin = 47 cents) the imports have risen to 534,100,000 in 1871, and the exports from 475,099,000 in 1868 to 506,500,000 in 1871. The chief articles of export are woollen and cotton goods, linen, glass, silk, iron, steel, and leather-ware, musical instruments, tobacco, grain, wine, oil, salt, and timber. The chief articles imported are cotton, cattle, iron rails, coffee, etc. In 1872 the number of miles of railway in operation in the monarchy was 7470 miles, while 2819 miles were in construction. In 1870 the railways of Cisleithania forwarded 19,404,543 passengers, and received 30,511,311 florins as fare, while the transportation of freight amounted to 420,736,340 centner (1 centner = 123.426 pounds), with an income of 90,202,202 florins. The monarchy has 35 ports opened to trade in the Littoral provinces, 54 in Dalmatia, and 11 in Croatia and the Military Frontier. The commercial navy of Austria consisted in 1870 of 7843 vessels, with 375,822 tons, of which 91 were steamers. In 1870 the steam-navigation company of the Danube had 155 steamers, with 13,946 horse-power. In 1871 there were 3504 post-offices and 584 telegraph stations in Cisleithania, while the length of the lines amounted to 16,204 miles, and the wires to 38,297 miles. In 1870, Cisleithania had 42 chambers of commerce, 38 banks, of which the Austrian National Bank, with 23 branches, is the largest, and 197 savings banks.

The Roman Catholic Church has nine archbishopries (Vienna, Salzburg, Goeritz, Prague, Olmütz, Zara, and Lemberg) and twenty-four bishoprics in Cisleithania. There are also one Greek Catholic and one Armenian archbishop at Lemberg. The vicars-general of Feldkirch and Teschen and the apostolic vicar of the army also act as bishops. The Oriental Greek rite has three bishopries (Czernowitz, Zara, and Catharo) in Cisleithania.

Education.—In consequence of the neglect of the elementary schools, education has not advanced as much in the German crown-lands as in the other parts of Germany, while in the other parts of the monarchy it was until recently very low. But owing to the reform measures introduced of late, education has greatly advanced in the last few years. In 1870, Cisleithania had 419 high and 13,880 elementary schools. In 1871 it had 176 gymnasia, realschulen, and realgymnasien, 6 universities (Vienna, Gratz, Innsbruck, Prague, Lemberg, and Cracow), 8 polytechnic institutes, besides numerous other schools for special sciences.

Constitution.—Austria is, according to the Pragmatic Sanction of Dec. 6, 1734, a united, indivisible empire, hereditary according to the right of primogeniture in the male and female line of the dynasty of Habsburg-Lothringen. Since Oct. 20, 1860, it is a constitutional monarchy, and by an imperial decree of Feb. 17, 1867, is divided into two parts—the Germano-Slavic countries, and the countries belonging to the crown of Hungary. The two parts have only the sovereign, the dynasty, the finances, the army, and foreign representation in common. The sovereign has the title of emperor of Austria and king of Hungary, and as king of Hungary is styled "His Apostolic Majesty." The imperial ministry, which is presided over by the chancellor of the empire, consists of the minister of the imperial house, of foreign affairs, of finances, and of war. Both parts of the empire have their own parliaments and

cabinets. The parliament of the Cisleithan countries is called the *Reichsrath*, and consists of the Herrenhaus (181 members) and the house of delegates (203 members).

Finances.—In the budget of 1872, for the whole monarchy, the expenses are estimated at 110,647,500 florins, of which 17,208,900 florins were covered by receipts, and the balance, 93,438,600 florins, was to be furnished by both parts of the monarchy, Cisleithania contributing 70 per cent., and Transleithania 30 per cent. In the budget of the Cisleithan countries for 1872 the receipts are estimated at 308,599,800 florins, and the expenses at 359,380,900 florins, leaving a deficit of 50,781,100 florins. The public debt of the countries represented in the Reichsrath amounted on Dec. 31, 1871, to 412,001,426 florins.

Army and Navy.—Since 1866 compulsory military service has been introduced throughout the empire. In Aug., 1872, the army was constituted as follows:

Branches of Service.	On a peace-footing.	On a war-footing.
Infantry	121,440	486,320
Chasseurs	19,771	58,853
Cavalry	43,993	58,999
Artillery	27,447	70,614
Engineers, etc.	13,032	67,821
Frontier troops	5,547	45,235
Military establishments	9,147	19,883
Gensdarmes	4,586	8,519
Total	244,963	816,241

The navy consisted in 1872 of 46 vessels, of 93,270 tons, and with 365 guns.

History.—The germ of the empire was the archduchy of Austria. In 791, Charlemagne united it with Germany as the Eastern March. Under Henry I. (died 1018) the name "Oesterreich" (Osterrichi, "East empire") was first used. Henry II. received in 1156, from the emperor Conrad III., the two marches above and below the Enns. Under his son, Leopold V. (until 1230), Styria, and under Frederick (died 1246), Carniola, were united to Austria. In 1276, Rudolph of Habsburg was elected the first emperor of Germany from the ducal house of Austria. After him, Albrecht I. (died 1308) and Albrecht II. (died 1439) were also emperors of Germany from the same house. From Frederick IV. the crown of Germany remained with the Habsburg family until the dissolution of the empire in 1806. Ferdinand IV. raised Austria to the dignity of an archduchy. Ferdinand I. in 1526 gained by marriage the crown of Hungary and Bohemia, together with Moravia, Silesia, and Lusatia. In 1683 the Turks besieged Vienna. In the treaty of Vienna of 1738, Naples and Sicily and a part of Milan, and in 1739 Belgrade, Servia, Bosnia, etc., were lost to the Turks. In the treaties of 1742 and 1743 Austria lost Silesia and Glatz, which it was not able to recover in the Seven Years' war. In 1748, Parma, Piacenza, and Guastalla were taken by Spain. In 1772, Galicia was obtained at the first division of Poland, and in 1777 Bukowina. On Aug. 11, 1804, Francis II. (I. of Austria) assumed the title emperor of Austria. Much territory was lost in consequence of the treaty of Presburg in 1805, and the treaty of Vienna in 1809. In the treaty of Paris of 1814, its German territory, Milan, Venetia, and Dalmatia, were restored to Austria. After that time Austria followed a strictly conservative policy under Prince Metternich, which caused a revolution in Vienna and other parts of the country in 1848, when Metternich was dismissed and great concessions were made to the people. The revolt in Hungary was only suppressed in 1850 through the intervention of Russia. The revolutionary movements in the Italian provinces continued, and in 1859 Austria was compelled to cede Lombardy to Sardinia. In 1860 a new and liberal policy began to be introduced, the first result of which was the new constitution promulgated by the emperor on Feb. 20, 1861. (On the part taken by Austria in German affairs, as well as on the war of 1866, see Germany.) In consequence of this war it was excluded from the German Bund, and was compelled to recognize Prussia as the leader of the North German Confederation, to cede its Italian possessions to Italy, and to recognize the latter as a united kingdom.

With 1866 a new era began for Austria. Count von Beust, who now became minister of foreign affairs, instituted an entirely new policy. The chief danger that now threatened the empire was the national movement arising among all the different nationalities of Austria. Beust, in opposition to the old policy of favoring the Slavic races to the exclusion of the Germans and the Hungarians, attempted to make the Germans and Hungarians the leading nations of the empire. This led to a conflict between Beust and his opponents, with Belcredi at their head, and eventually to a ministerial crisis, which resulted in a complete triumph for Beust, who became premier on Feb. 7, 1867. On Feb. 17 an imperial decree granted to the Hungarians their principal demands. (See Hungary.) Beust now set to work to organize a common parliament for the German and the Slavic peoples, which met with general approbation among the Germans and the Poles, but did not satisfy the Czechs. On July 8, 1867, the emperor was crowned king of Hungary, and Hungary pledged herself to contribute to the common expenses for the army, navy, and foreign representation. After the compromise with Hungary had been effected the government also undertook to regulate the affairs of the Cisleithan countries. Among the privileges granted were a general citizenship for all inhabitants of Cisleithania, the equality of all before the law, the right of all to serve in any branch of the civil service, and the right to settle in any part of the country. Furthermore, religious freedom and freedom of the press were introduced, and besides the sectarian schools established by the Church, it was made lawful to institute non-sectarian schools. By the law of Dec. 22, 1867, all nations of Cisleithania were granted equal privileges, and an inalienable right to preserve their languages and nationalities was conceded. At the same time the jury system, publicity, and oral proceedings were introduced into the courts. The institution of the "delegations" is still another product of the year 1867. They meet annually, alternately in Vienna and Pesth, and each delegation consists of sixty members, who meet separately to decide on the common affairs of the empire. On Jan. 1, 1868, a cabinet was formed for the Cisleithan countries, with Prince Carlos Auersperg as president. A week before this time the emperor had formed a common ministry for the whole empire, and had appointed Beust chancellor. Although Beust in his despatches professed friendship for Prussia, still, the attitude of the Austrian court in several important questions showed that bitterness towards Prussia had not entirely disappeared. In the Luxemburg question Beust was induced by considerations of safety to strive to prevent by all means the impending war, and for that reason attempted to conciliate Prussia and France, although rumors of a Franco-Austrian alliance were not uncommon at that time. Austria's position, however, towards these two powers was entirely reserved, while in the East it was entirely without policy.

With regard to its commercial affairs, Austria has advanced considerably since 1866. As early as Dec. 21, 1866, important commercial treaties had been concluded with France, and a treaty with Prussia was concluded before the first German customs-parliament assembled in April, 1868. Commercial treaties were also concluded with Belgium, Holland, and Italy, and postal treaties with Greece, Italy, the North German Confederation, and the three South German states; and Austria also joined the coinage treaty of Dec. 25, 1865, concluded by France, Belgium, Italy, and Switzerland. A new question now arose in the abolition of the Concordat. The chancellor was supported by the public opinion and the Hungarian influence, but, though the government did not sanction its entire abolition, still its most important provisions were removed by legislative acts. This was done chiefly by the introduction of the civil marriage and the new school law, which places the entire schools under the supervision of the state, and makes them independent of all churches or religious associations. Another important act was the abolition of imprisonment for debt and the revision of the usury laws, while in the financial department many important reforms were introduced. After considerable difficulties a resolution was passed by a large majority to change all classes of the general funded debt into a uniform debt bearing 5 per cent. interest, which was to be taxed not more than 16 per cent. The object was to cover a deficit for the next three years of 150,000,000 florins annually. For this reason the direct taxes were increased, and the laws regulating the production of brandy, beer, and sugar were revised. On June 24 the Reichsrath adjourned until September. In August the separate diets were called, in which, especially in Bohemia, Carinthia, and Carniola, the Slavic inhabitants showed a strong spirit of resistance towards the new organization of the empire. In Bohemia especially the Czechs wished to restore the crown of Wenceslas. The proceedings of the delegations, which assembled in Vienna in the same year, took a prompt and satisfactory course. The bishops showed a considerable opposition to the confessional laws which were proclaimed on May 25, 1868, which opposition considerably increased when the pope in his allocution sanctioned the proceedings of the bishops. In consequence of this, Beust sent a despatch to Cardinal Antonelli protesting against the intervention of the clergy in political affairs. At the same time the government showed its determination to keep the clergy within bounds by arresting and convicting the bishop of Linz. In relation to the Œcumenical Council of the following year, the Austrian government assumed an expectant attitude. When the infallibility of the pope was

proclaimed, Beust declared in a despatch of July 30, 1870, that the Concordat of 1855 was regarded as abolished by the government.

A reduction of the rate of interest on the national debt caused great dissatisfaction among the foreign creditors of the empire. Compulsory service was made the basis of the reorganization of the army. But the most serious question, and the most difficult for the government to solve, arose in the question of nationalities. Even in the session of 1867 the Poles and the southern Slavic tribes had demanded separate concessions for their nationalities, while the Czechs had not taken any part whatever in the proceedings of the Reichsrath. The same thing was repeated, only in a more demonstrative manner, in 1868. The Diet of Galicia demanded in a resolution of Sept. 24 the complete political autonomy of that kingdom, while the Czechs in Bohemia and Moravia retired from the diets, and in their declarations proposed the complete independence of the crown of Wenceslas. In October, Prague was declared in a state of siege in consequence of excesses committed there. Soon the nationality question was brought before the Reichsrath. But this body adjourned on May 15, 1869, without having done anything in regard to this question. In the cabinet two parties had arisen on this point, and the minority, which was in favor of a compromise with the different nationalities, was forced to resign. But when the Poles and the South Slavic deputies resigned their seats in the Reichsrath, the emperor was forced to organize a more liberal cabinet. But even this was not liberal enough to effect a compromise, and the emperor was again compelled to receive the resignation of the cabinet and to call upon Count Hohenwart to form a new one. But although Hohenwart's policy was so reactionary and opposed to the Germans that in every part of the country a movement as general as it was sudden arose among that class, still, he was not able to satisfy the demands of the Czechs. After negotiations held under the auspices of the emperor himself with the two principal leaders of the Czechs, Rieger and Clam-Martinicz, had led to no result, Hohenwart, and even Count Beust, resigned on Nov. 6. A new cabinet, belonging to the German constitutional party, with Prince Adolf Auersperg at its head, was formed Nov. 25, 1871. On Feb. 20, 1872, an important law was passed at the suggestion of the government, which provided that when members chosen from a provincial diet to the Reichsrath resign their seats in the diet or in the Reichsrath during its session, or when in consequence of permanent absence they may be regarded as having resigned, the emperor can order new elections by a direct vote of the respective districts. At a new election for the Diet of Bohemia ordered by the government, the latter was victorious, and 40 of the 54 members elected to the Reichsrath were friendly to the government, its majority now being over two-thirds. In the Diet of the Tyrol a violent opposition was made to the government, because it had deprived the theological faculty of the University of Innsbruck, composed entirely of Jesuits, of its right to elect the rector of the university. The majority of the diet therefore refused to admit the new rector, and the government dissolved the diet. In Galicia a law favored by the Ruthenians to introduce direct elections to the Reichsrath was voted down by the Polish majority. In order to prevent the frequent refusal of members of the minority to attend the Reichsrath, the government immediately after the opening of the session on Dec. 12, 1872, proposed a new electoral law, according to which the members of the House of Deputies are no longer to be chosen by the diets, but are to be elected by a direct vote of the people.

Among other important events in Austria during the last few years was a disturbance in Dalmatia in Sept., 1869, occasioned by the new conscription laws. It was settled in Jan., 1870, by a compromise with the insurgents. But the German-French war of 1870 turned away the attention of Austria from its own affairs. Although a party at court, together with the Czechs and Slavic tribes, wished to make use of the opportunity to take revenge for 1866, the rapid success of the German arms and the position of Russia soon dispelled all such plans. On Aug. 23 a treaty of neutrality was concluded with Great Britain and Italy. Since then the relations of Austria to the German empire have been of the most friendly character, and have been strengthened by a series of conferences of the monarchs of the two countries, the last of which was held, with great pomp and splendor, in Berlin Sept. 6–11, 1872. In Vienna great preparations had been made since 1871 for the international exposition of 1873, which was formally opened by the emperor on May 1, and bids fair to eclipse in grandeur and variety all former expositions. A. J. Schem.

Autau'ga, a county in Central Alabama. Area, 700 square miles. It is bounded on the S. by the Alabama River, and also drained by the Autauga Creek. The surface is undulating; the soil is fertile. The Selma Rome and Dalton R. R. passes along the western border of the county. Cotton, corn, wool, and rice are the chief crops. Capital, Prattville. Pop. 11,623.

Autau'gaville, a post-township of Autauga co., Ala. Pop. 2387.

Author'ity [Lat. *auctoritas*, "right," "dominion"], power lawfully delegated by one person to another. In the plural, the word, as used in law, includes statutes, adjudged cases, and the opinions of text-writers or other persons learned in the law, relied on to support any legal proposition sought to be applied to a particular case. The opinions of counsel, of court, or of a text-writer are usually fortified by a citation of authorities. (See also Reports.)

Autobiog'raphy [from the Gr. *αὐτός*, "self," *βίος*, "life," and *γράφω*, "to write"], a life of a person written by himself. Such memoirs are divisible into two classes—those in which the object of the writer is to illustrate the history of his own mind and heart, as the "Confessions" of Saint Augustine and Goethe's "Dichtung und Wahrheit;" and those in which his purpose is to give a sketch of the events which have occurred within his own experience, and of characters with which he has associated. The "Mémoires d'Outre-Tombe" of Chateaubriand may be said to combine the characteristics of both classes. The autobiography of Franklin, the "Confessions" of Rousseau, and the "Recollections of a Busy Life" by Hon. Horace Greeley are valuable autobiographic works.

Autoch'thones [Gr. *αὐτόχθονες*, from *αὐτός*, "self," and *χθών*, "ground," "country"], a Greek term applied to the original inhabitants of a country, implying that they were sprung from the soil. The Athenians claimed to be autochthones, and wore on their headdress an emblematic grasshopper in reference to their origin. The same claim was made by many other peoples.

Au'tocrat [Gr. *αὐτός*, "one's self," and *κρατέω*, to "rule"], literally, "one who rules by himself," without the interference or restraint of any other person or persons; an absolute sovereign; a monarch who unites in himself the legislative and executive powers of the state or empire. Such are nearly all the Asiatic sovereigns. Among European rulers the emperor of Russia alone is styled an autocrat. He takes the title of "autocrat of all the Russias." The term autocracy is sometimes applied to the government administered by an autocrat.

Au'to-de-Fé (*i. e.* "act of faith"), the Spanish name of a public ceremony held in Spain and Portugal at the execution of heretics who were burned by order of the Inquisition. Multitudes of spectators assembled to witness the execution and the procession of monks and priests which formed a part of the ceremony. The first ceremony of this kind is said to have taken place at Valladolid in 1560. In 1761 an auto-de-fé was held at Lisbon, at which upwards of fifty persons perished.

Au'tograph [from the Gr. *αὐτός*, "one's self," and *γραφή*, "writing"], a manuscript written by the hand of the author; an original manuscript as distinguished from a copy. The term is sometimes applied to a specimen of the handwriting of any eminent person. In modern times many persons devote much time to the collection of autographs, which are articles of literary trade. Some men study autographs as exponents of the character or temperament of the writers. The signature of Shakspeare is one of the most scarce and highly prized of autographs. (See John G. Nichols, "Autographs of Royal, Noble, Learned, and Remarkable Personages conspicuous in English History from the reign of Richard II. to that of Charles II." (1829), and "Isographie des Hommes Célèbres," Paris, 3 vols., 1828–30.)

Autol'ycus [Αὐτόλυκος], a Greek astronomer and mathematician, born at Pitane, in Æolis, lived about 325 B. C. He wrote a work on the revolving sphere, and another on the rising and setting of the fixed stars; both are extant.

Autom'aton, plu. **Autom'ata** [from the Gr. *αὐτόματος*, "acting spontaneously"], a piece of mechanism so constructed as to imitate the actions of an animal. This exercise of mechanical ingenuity is of very ancient origin. Dædalus was among the first who excelled in this art. Archytas of Tarentum, who lived about 400 B. C., is said to have made a dove that could fly. Among the most wonderful automata of modern times was the flute-player which Vaucanson exhibited in Paris in 1738. This had the form of a man, and performed with its fingers. He also produced an automaton duck which swam, dived, ate and digested barley (!), and quacked like a real duck. Kempelen constructed a famous automaton chess-player, the mechanism of which was very ingenious and complex. This automaton could beat the most of the players who tested

its skill, but it was long suspected that a man was concealed in it—a Russian officer who had been sentenced to death and escaped by this contrivance. It was afterwards fully proved that the supposed skill of the automaton was due to the presence of a living man, who was concealed within the machine.

Auton'omy [from the Gr. *αὐτός*, "one's self," and *νομός*, a "law"], the power or right of self-government; political independence. The term is used to designate the characteristic of the political condition of ancient Greece, in which nearly every city was a separate state, and the people were very tenacious of the independence and sovereignty of their respective cities. For this reason they could not form a large centralized republic or stable government.

Au'toplasty [Lat. *autoplas'tia*, from the Gr. *αὐτός*, "one's self," and *πλάσσω*, to "form"], an operation by which lesions are repaired by means of healthy parts being taken from the patient himself (usually from the immediate neighborhood of the lesion to be repaired), and made to supply the deficiency caused by wounds or disease. The operations for this purpose have different names, according to the part affected, as *cheiloplastic* (the operation for the lips), *rhinoplastic* (for the nose), etc.

Autrefois Acquit [Fr. "formerly acquitted"], a plea by a person indicted for a crime or misdemeanor that he has previously been tried for the same offence and acquitted.

Autrefois Convict ("formerly convicted"), a plea by a defendant under the same circumstances as in the case of *autrefois acquit*, that he has previously been tried and convicted of the same offence. These pleas, if true, are a bar to the action by the rules of the common law. They are in this country established as constitutional rights, both by the U. S. Constitution and those of the respective States. The constitutional provision is that no person shall be subject for the same offence to be put twice in jeopardy of life or limb. This rule does not apply where a new trial is ordered for errors in a previous trial, nor where the judge in the course of a trial, in the exercise of a sound discretion, discharges the jury, so that there is no acquittal nor conviction. In each of these cases the accused may be tried again as often as the case arises. In a legal sense he has not been in jeopardy. The rule upon this point is the same in England under the common law as in the U. S. under constitutional provisions.

Au'tumn [Lat. *autum'nus;* originally, *auctum'nus*, from *au'geo, auc'tum*, to "increase," because it is in autumn that the earth yields its increase], the season of the year which follows summer, sometimes in the U. S. called Fall, in reference to the fall of the leaves. In a vague and popular sense it comprises September, October, and November. In the language of astronomy it is the time which elapses between the autumnal equinox and the winter solstice. In the southern hemisphere, March, April, and May are the months of autumn. Autumn may be regarded as occupying the same relative position among the seasons of the year as evening among the periods of the day, and mature age among the stages of human life.

Autun (anc. *Bibrac'te* and *Augustodu'num*), a city of France, department of Saône-et Loire, on the river Arroux, 26 miles by rail N. W. of Chalons-sur-Saône. It is picturesquely situated at the foot of mountains, has a fine Gothic cathedral, a college, and library; also manufactures of cloth, paper, and carpets. It is the seat of a bishop. The ancient Bibracte was the chief city of the Ædui. Here are ruins of an amphitheatre, temples, and other Roman antiquities. Autun was the scene of hostile operations between Garibaldi and the Germans in the winter of 1870–71. Pop. 12,398.

Auvergne (anc. *Arver'ni* or *Alver'nia*), a former province in the S. central part of France, coincided nearly with the present departments of Cantal and Puy-de-Dôme. It is a mountainous district of volcanic formation, presenting many conical and dome-like summits of extinct volcanoes. The soil in some parts is fertile, especially near the river Allier. Auvergne has produced many eminent men, among whom were Pascal, Turenne, Desaix, and La Fayette. The chief towns were Clermont and Aurillac.

Auvergne, d' (Latour). See Latour d'Auvergne.

Auvergne, Mountains of, a branch of the Cevennes, situated in the French departments of Cantal and Puy-de-Dôme. They separate the basins of the Allier, Cher, and Creuse from those of the Lot and Dordogne. The highest summits of these volcanic mountains are Mount d'Or, 6188 feet high, Cantal, 6093, and Puy-de-Dôme, 4806 feet high. The last is a remarkable specimen of an extinct volcano. They are generally like truncated cones. The scenery of Auvergne is grand and picturesque.

Auxerre (anc. *Autissiodo'rum*), a town of France, capital of the department of Yonne, on the left bank of the Yonne, 93 miles S. S. E. of Paris, with which it is connected by railway. It has a fine Gothic cathedral, a college, a museum, and a public library of 25,000 volumes. Calico, serge, hosiery, and good wine are manufactured here. Pop. 15,497.

Auxonne, a town of France, in the department of Côte-d'Or, on the Saône, here crossed by a bridge, 20 miles by rail S. E. of Dijon. It has an arsenal, a barrack, and a magazine, with manufactures of woollen cloth and nails. Pop. 5911.

Auxvasse, a township of Callaway co., Mo. Pop. 2050.

A'va, a city, the former capital of the Burman empire, is situated on a plain on the river Irrawaddy, 350 miles N. of Rangoon. The official native name of it is *Ratnapura*, "the city of pearls." It stands on an island formed by the Irrawaddy and two of its affluents. The most substantial buildings of this city were destroyed by an earthquake in Mar., 1839, after which the seat of government was removed to Monchobo. Pop. about 30,000.

A'va, a post-township of Oneida co., N. Y. Pop. 1160.

Ava (Kingdom of). See Burmah.

A'va, or **Ka'va** (*Macro'piper methys'ticum*), a narcotic plant of the natural order Piperaceæ, is a native of many South Sea islands, the inhabitants of which intoxicate themselves with a fermented liquor prepared from its root (rhizome). It is a shrubby plant, with cordate, acuminate leaves, and was formerly classed with the genus *Piper*. The effect of this liquor is a stupefaction like that caused by opium, and is followed by copious perspiration. The liquor is prepared by maceration in water.

Avadu'tas, a sect of Hindoo Brahmans, who practise excessive austerities, and mortify themselves by painful and disgusting forms of penance. They hold their bodies in contorted positions until they become permanently deformed. They procure a subsistence by begging.

Av'alanche [Fr. *lavanche*], a mass of snow or ice which collects on the steep declivity of a high mountain, and sliding down the side gathers accessions of snow until it attains an enormous bulk, and descends to the valley with ruinous momentum. Drift or powder avalanches consist of dry, loose snow which is set in motion by the wind and accumulates in its descent; these occur mostly in winter. Another kind is formed in spring, when the snow begins to melt, and slides down the declivity by its own weight, carrying with it trees and rocks which sometimes bury cottages in ruins. Avalanches are common among the Alps, but are rare in the Andes. A touch of the foot or a slight movement of the air, even that produced by the sound of a bell, is sometimes sufficient to set the avalanche in motion. On account of the frequent occurrence of avalanches, some parts of the Alpine valleys remain uninhabited.

Avallon (anc. *Aval'lon*), a town of France, department of Yonne, on the river Voisin, 18 miles S. E. of Auxerre. It has manufactures of paper and woollen cloth. The adjacent country is fertile, and renowned for its picturesque beauty. Pop. 6070.

Ava'ri, or **A'vars,** a warlike tribe of Mongolians that entered the countries near the Don, the Caspian Sea, the Volga, and westward. Part of them remained near the Caucasus, and another part proceeded about 555 A. D. to Dacia. They served in the army of Justinian, and fought against the Gepidæ. They in 568 obtained Pannonia. They oppressed the Slavi, and made inroads into Germany and Italy. In 769 they were defeated by Charlemagne, and nearly exterminated. They used to intrench themselves in circular walled camps, traces of which, called "Avarian rings," are still visible in Hungary. The Avars penetrated into Greece and established colonies in the Morea. Navarino derives its name from them. (See Thierry, "Attila.") They appear to have amalgamated with the Bulgarians, or rather to have adopted the Bulgarian language, and their descendants are confounded with the Bulgarians, of whom numbers are found throughout Greece.

Av'atâr, or **Avatâra** [from *ava*, "off," "away," "down," and *târa*, a "crossing over" or "passing from one thing to another"], in Hindoo mythology signifies "descent" or "transformation," and is applied to incarnations of some of the principal deities, especially Brahma, Siva, and Vishnu. The avatars of Vishnu, which are particularly celebrated, are reckoned as follows: 1, Matsya, the "fish;" 2, Kûrma, the "tortoise;" 3, Varâha, the "boar;" 4, Narasingha, the "man-lion;" 5, Vâmana (or Wâmana), the "dwarf;" 6, Parasurâma (called in the common dialect Pûrasoorâm); 7, Râma Chandra; 8, Krishna; 9, Buddha: the tenth, yet to come, is called Kalki, the "horse."

Avat'cha, or **Avatch'ka,** a bay in the south-eastern part of Kamtchatka, affords the best harbor of the whole peninsula. The capital, Petropaulowski, is on this bay, a

few miles from which is a volcano called Avatcha or Avatchinskaya. (See next article.)

Avatchinskay'a, or Mount Avatcha, an active volcano in Kamtchatka, near the sea: lat. 53° 15′ N., lon. 158° 50′ E. It has an altitude of 9055 feet, has a crater at its summit, and another at a height of 5000 feet.

A'vebury, A'bury, or **Abiry,** a small village of England, in Wiltshire, 25 miles N. of Salisbury. It is the site of extensive remains of the pre-historic period in Europe, and is in the vicinity of several remarkable barrows and cromlechs of great antiquity. The principal relics, formerly ascribed to the Druids, consist of 100 large blocks of stone placed on end in a circle, enclosing a level area of about 470 yards in diameter, which was surrounded by a ditch and a high embankment. Some of the stones measure twenty feet high above the ground. Nearly a mile S. of this temple is a barrow or conical artificial mound called Silbury Hill, which is 170 feet high, and covers a space of five acres. This was undoubtedly constructed long before the Roman conquest of Britain, and the opinion of the later archæologists refers the whole group to times of very remote antiquity.

Avei'ro, a seaport-town of Portugal, province of Beira, at the mouth of the Vouga, 35 miles by rail N. W. of Coimbra. It is the seat of a bishop, and has a considerable trade in oil, wine, sardines, oranges, salt, etc. Pop. 6557.

Avellane'da, de (Gertrude Gomes), a Spanish poetess, born in the island of Cuba in 1816. She became a resident of Madrid about 1840, and published a volume of lyric poems in 1841. Soon after this date she produced several novels, and successful tragedies entitled "Alfonso Munio" and "Egilona." She was married in 1846 to Don Pedro Sabator, who died the same year. Among her works are "La Cruz," a poem, and dramas called "The Glories of Spain" (1850) and "Sonambula."

Avellino (formerly called **Principato Ulteriore**), a province of Southern Italy, is bounded on the N. by Benevento, on the E. by Foggia and Potenza, on the S. by Salerno, and on the W. by Caserta. Area, 1410 square miles. The country is throughout mountainous. The soil everywhere is extremely fertile, and the harvests are therefore generally very large. The country is traversed by the Calore and the Ofanto. The chief products are cattle, Salami, linen, and leather. Chief town, Avellino. Pop. in 1871, 375,103.

Avelli'no (anc. *Abelli'num*), a fortified town of Italy, the capital of the above province, is 25 miles E. of Naples, and at the foot of Mount Vergine. It is the seat of a bishop, has a cathedral, a college, manufactures of paper, woollen goods, and maccaroni, and an extensive trade in hazelnuts (*Nuces Avellanæ*), chestnuts, and grain. It was much damaged by an earthquake in 1694. Pop. 13,446.

A've Mari'a, or **Angel'ica Saluta'tio,** a form of prayer to the Virgin Mary (commencing Ave Maria, "Hail Mary"), which in the time of Damiani (died 1072) was simply the "annunciation" or salutation of the angel in Luke i. 28, but grew by successive additions till it reached its present form in the time of Pius V. (1566–72). (See Rosary.)

Ave'na, a township of Fayette co., Ill. Pop. 1182.

Avenger of Blood. In early ages, as now in barbarous countries, the infliction of the penalty for murder did not take place by the action of public authorities, but was left to the nearest male relative of the murdered person, whose duty was to pursue and slay the murderer. He was called the "avenger of blood" (in Hebrew *göel*, which term, however, was of wider signification). The Mosaic law did not set aside this custom, but placed it under regulations, prohibiting the commutation of the penalty of death for money, and appointing six cities of refuge, three on either side of the Jordan, for the manslayer who was not a murderer. The Koran sanctions the avenging of blood by the kinsman, but also sanctions the pecuniary commutation. The custom prevails among the Arabs at present, as well as in other rude nations.

Aventi'nus (Johannes), a German historian whose proper name was Thürmaier or Thürnmaier, was born at Abensberg, in Bavaria, in 1466. He was invited to Munich in 1512, and appointed tutor to the sons of the duke of Bavaria. His principal work is a "History of Bavaria" ("Annales Boiorum," 1554), which was highly esteemed. The most complete edition is that published by Cisner in 1580. Died Jan. 9, 1534. (See J. Ziegler, "Vita Aventini.")

Aven'turine, a name applied to certain varieties of quartz or felspar which contain bright red, brown, or golden scales of mica, oxide of iron, etc. It is often used as a gem.

Aventurine Glass, also called **Gold Flux** or **Gold Stone,** a variety of glass used as an ornamental stone by jewellers. The ground is of a rich yellowish-brown color, with innumerable golden scales. It may be made by fusing together 300 parts of powdered glass, 40 parts of copper filings, 80 parts of iron filings, and cooling slowly.

Av'erage [Lat. *avera'gium*, from *ave'ro*, to "prove," to "estimate"], a mean proportion; a medial sum or quantity intermediate between several unequal quantities. The relation of the average to the other quantities is such that the sum of the excesses of the greater above the average is equal to the sum of the defects of the less below it. The average of several quantities—for example 3, 7, 9, and 13—is obtained by adding them together, and dividing the sum by the number of quantities. The sum, 32, divided by 4, gives 8 as the average.

Average, in law, is a term employed in maritime commerce, and is used in different senses when preceded by the words general, particular, or petty.

1. *General Average.*—This means the case where several interests connected together, as being engaged in a common adventure at sea, such as ship and cargo, are exposed to a marine peril, and one of these interests is voluntarily sacrificed, either in whole or in part, as the price of the safety of the residue of the property at risk; or expense is incurred for the same reason, and the amount of such sacrifice or expenditure is charged by law upon the respective interests in proportion to their value. The act of voluntarily casting away property under such circumstances is termed a "jettison." The elements of a general average case are said to be these: there must be a sacrifice of property, it must be voluntary, and must be successful. There is no general average allowed in cases of goods laden on deck, unless it is usual to place the goods there on a voyage such as the one in which this question arises. The master of the ship by the maritime law is entrusted with the power to order a jettison when the circumstances justify it. The American law allows general average where a ship which would have foundered is voluntarily wrecked in such a manner as to save the cargo or a part of it. Expenditures of money in some instances justify a contribution of the nature of general average, as where they are incurred for the preservation of the ship or cargo from extraordinary perils, or where they are necessary for the completion of the adventure in which all the interests at risk are concerned; as, for example, for the prosecution of the voyage. The property upon which the contribution is assessed is the ship, cargo, and freights. The property lost contributes as well as that which is saved. The general principle is substantially this: as the whole property at risk is to the whole amount of the loss, so is each owner's particular interest to his share of the loss. This rule results in assessing a certain percentage of the loss on each owner, according to the value of his interest. The values are estimated by rule: the ship and appurtenances are valued as at the end of the voyage, and the cargo at its value at the time and place of discharge. An adjustment made at the end of a voyage at the port of arrival is deemed to be valid everywhere, according to a settled maritime rule. The special rules applicable to the cases in which general average is allowed are not precisely the same in England and in the U. S., and the subject branches out into much detail in the books of maritime law. Practically, it is closely connected with the business of marine insurance, as the insurance on ship, cargo, and freight may be made by different underwriters, and under the law of abandonment the rights to claim general average, as well as the burden of its assessment, may vest in and rest upon the respective insurers. 2. *Particular Average.*—This signifies damage happening to interest (ship, cargo, and freight) at risk at sea in consequence of pure accident. The loss in such a case rests upon the owner of the property injured or upon his insurer. 3. *Petty Average.*—This term refers to certain petty charges in port for pilotage, lights, towage, anchorage, and the like, which were formerly apportioned upon the owners of the ship and cargo. The modern practice is to include these charges in the freight.

T. W. Dwight.

A'verell (William W.), born in the State of New York 1830, graduated at West Point 1855, appointed lieutenant Mounted Riflemen; served on frontier and fighting Indians till 1859, when wounded. During the civil war he was present at the battle of Bull Run, July, 1861; colonel Third Pennsylvania Cavalry, 1861; commanded cavalry brigade about Washington, D. C. In Virginia peninsular campaign 1862 was engaged at Yorktown, Williamsburg, Fair Oaks, Malvern Hill. In 1862 he was appointed brigadier-general of volunteers; engaged at Fredericksburg Dec., 1862; in command at Kelly's Ford Mar., 1863; participated in Stoneman's cavalry expedition towards Richmond April–May, 1863; engaged in, and in command of,

skirmishes, actions, and raids in West Virginia, Tennessee, Shenandoah Valley; at Opequan Sept. 19, 1864, and Fisher's Hill Sept. 22, 1864; captain Third Cavalry U. S. A. July, 1862, and brevetted major, lieutenant-colonel, colonel, brigadier-general, and major-general U. S. A. Resigned May, 1865. Appointed U. S. consul-general to Canada 1866; at present president of manufacturing company, New York.

A'verill, a township of Essex co., Vt. Pop. 14.

Averill, a township of Jefferson co., West Va. P. 2030.

Aver'nus [Gr. Ἄορνος, from a, priv., and ὄρνις, a "bird"], a famous lake [It. *Lago d'Averno*] of Italy, 10 miles W. of Naples. It occupies the crater of an extinct volcano, is about a mile in diameter, and 170 feet deep. It was supposed that the name Avernus was given to it because the mephitic vapors killed the birds that flew over it. The ancients imagined that this lake was the entrance to the infernal regions. Agrippa opened a canal from Avernus to the sea, converting it into a harbor, but the canal was destroyed by an earthquake in 1538.

Aver'roës, or **Averrhoes,** originally **Ibn-Roshd,** a celebrated Arabian philosopher and physician, was born at Cordova, in Spain, 1120. He rose to great dignity in the Moorish kingdom, but was accused of heretical opinions and deprived of his office, from which time he lived in poverty until the accession of the caliph Al-Mansur-Billah, whom he followed to Morocco, where he died in 1198. He was a great admirer of Aristotle, on whom he wrote a celebrated commentary. In the Middle Ages he was called "The Commentator," and was said to have translated Aristotle into Arabic, which story was repeated over and over again until in 1852 E. Renan proved it to be a fable; indeed, Averroës did not understand the Greek language.

Aver'sa (anc. *Atella*), a town of Italy, in the province of Caserta, and in a beautiful plain 9 miles N. of Naples. It is the seat of a bishop, is well built, has a cathedral, several convents, about ten churches, and a lunatic asylum. Pop. in 1872, 21,176.

A'very (Waightstill), born at Groton, Conn., May 3, 1745, graduated at Princeton in 1766, became in 1769 a lawyer in Mecklenburg co., N. C. He was an early and constant patriot in the Revolutionary war, being one of the signers of the Mecklenburg Declaration (1775), a member of the Hillsborough congress (1775), of the State congress (1776), first attorney-general of the State (1777), and was in 1779 a colonel of militia in active service. Died in Burke co., N. C., Mar. 15, 1821.

A'verysboro', a post-village and township of Harnett co., N. C., on Cape Fear River, about 40 miles S. of Raleigh. During Gen. Sherman's Carolina campaign, while his army was marching towards Goldsboro', a strong force of Confederates under Gen. Hardee was intrenched in front of Averysboro' (Mar. 16, 1865), the object being to check Gen. Sherman, and gain time for the concentration of forces at Smithfield under Gen. Johnston. After three or four hours' severe fighting the Confederates fell back to a second and stronger line. The attack being renewed along this line, fighting continued through the day, the Confederates being driven within their intrenchments; during the night, which was dark and stormy, their works were evacuated, and on the morning of the 17th it was found that the army of Gen. Hardee was retreating towards Smithfield. The Federal loss was about 600, killed and wounded, the Confederate loss was probably smaller, except in prisoners, of which many remained in Gen. Sherman's hands. This battle is known as the battle of Averysboro'. Pop. of township, 716.

A'very's Creek, a post-township of Buncombe co., N. C. Pop. 655.

Avery's Gores, a number of tracts of land in Vermont, granted to Samuel Avery in 1791. One of them is in Addison co., near the top of the Green Mountains. Another in Franklin co. has a pop. of 34.

Aveyron, a department in the S. part of France, is bounded on the N. by Cantal, on the E. by Lozère, Gard, and Hérault, on the S. by Tarn, and on the W. by Lot. Area, 3376 square miles. It is intersected by the river Lot and the Tarn, and also drained by the river Aveyron. The surface is mountainous, and the chain of the Cevennes extends along the south-eastern border of the department. Among its mineral resources are coal, copper, lead, zinc, and iron. The coal-mines are very valuable. It has manufactures of cotton yarn, paper, woollen stuffs, carpets, and leather. It is divided into 5 arrondissements, 42 cantons, and 285 communes. Among the chief articles of export is Roquefort cheese. Capital, Rodez. Pop. in 1872, 402,474.

Avezac, d' (Auguste Geneviève Valentin), a lawyer, born in St. Domingo (Hayti) in 1777, was a brother-in-law of Edward Livingston. He practised medicine in Virginia, and law in New Orleans with great success. He served in the army in the war of 1812, and afterwards removed to New York. He was chargé d'affaires at The Hague in 1831 and 1845-49. Died Feb. 15, 1851.

Avezac, d' (Pierre Valentin Dominique Julian), an uncle of the preceding, was born in St. Domingo July 17, 1769. He became a citizen of New Orleans, and translated Scott's "Marmion" into French. Died Feb. 1, 1831.

Avezza'na (Giuseppe), an Italian republican and patriot, born in Piedmont Feb. 19, 1797. He fought against Bustamente in Mexico in 1832, and became a merchant in the city of New York in 1834. Early in 1848 he returned to Italy to fight for the independence of his country, and was appointed commander of the national guard at Genoa. In Mar., 1849, he was chosen minister of war of the Roman republic and commander of the army. Rome was taken by the French in July of that year, and Avezzana escaped to the U. S.

Avia'no, a town of Italy, in the province of Udine, 48 miles N. N. E. of Venice. Pop. 6184.

Avicen'na [Fr. *Avicenne*], the Latin form of **Ibn-Sinâ,** the most eminent of Arabian physicians, was born near Bokhara in 980 A. D. He was well versed in mathematics, astronomy, philosophy, and other sciences. Before he was twenty years old he was reputed the most learned man of his time. He was employed as a physician by several Samanide sovereigns, and resided at Ispahân and Hamadân. He wrote in Arabic a large number of works on medicine and philosophy, the most important of which is his "System of Medicine" ("Canon Medicinæ"), which, translated into Latin by Gerardius Cremonensis (2 vols., 1595), was for five centuries a standard book of the highest authority in the schools of Europe. He died in 1037. (See S. Klein, "Dissertatio de Avicenni Medico," 1846; Ibn-Khallikân, "Biographical Dictionary," edited by De Slane, Paris, 1842; Freind, "History of Physic.")

Avicen'nia, a genus of plants of the natural order Myoporaceæ, consists of trees or shrubs resembling mangroves, and growing in salt swamps in tropical regions and in the southern hemisphere. The *Avicennia tomentosa*, the white mangrove of Brazil, has cordate, ovate leaves, downy on the lower side. Its bark is used for tanning. Its gum is used as food in New Zealand, and its seeds in India.

Avid'ius (Cassius), an able Roman general, born in Syria, commanded for Marcus Aurelius an army which defeated the Parthians in 165 A. D. Having become governor of Syria and commander of several legions, he revolted in 175 A. D., and took the title of emperor. He obtained possession of Egypt and part of Asia. He was killed by his own officers in 175 A. D.

Avigliano, a town of Italy, in the province of Potenza, 11 miles N. W. of Potenza, is near the Apennines. It has a fine church and a college. It was the scene of a landslip in 1824, which caused great destruction. P. 9236.

Avignon (anc. *Ave'nio*), an ancient city of France, capital of the department of Vaucluse, is situated on the left bank of the Rhone, 74 miles by rail N. N. W. of Marseilles. It is the seat of an archbishop, and is surrounded by a rich country with delightful scenery. It contains a college, a public library of about 45,000 volumes, a museum of natural history, a botanical garden, a fine theatre, a lunatic asylum, etc. Among the interesting and ancient public edifices is the former palace of the popes, a vast irregular Gothic structure, now used as a barrack and prison; and the cathedral called Notre Dame des Dons, rebuilt by Charlemagne, and containing a richly-sculptured chapel which is much admired. Petrarch passed several years at Avignon and at Vaucluse (which is about three miles distant), where he first saw Laura. The manufacture of silk is the principal branch of industry in this city, which also has several paper-mills, iron-foundries, and manufactures of velvets and woollen stuffs. It has an active trade in wine, brandy, grain, etc. Steamboats ply daily between Avignon and Lyons. Avenio was the capital of the Cavares before the time of Cæsar. It was taken by the Saracens in 730 A. D., and after many changes was purchased in 1348 by Pope Clement VI., and became the seat of the papal government. Seven successive popes resided at Avignon in the fourteenth century, during which it had about 100,000 inhabitants. The papal court was transferred to Rome in 1377, and Avignon was annexed to France in 1791. Pop. in 1866, 36,427.

A'vila, a province of Spain, in Old Castile, is bounded on the N. by Valladolid, on the E. by Segovia and Madrid, on the S. by Toledo and Caceres, and on the W. by Salamanca. Area, 3407 square miles. The surface is mountainous, except the northern part. The chief article of export is merino wool. Capital, Avila. Pop. in 1867, 176,769.

Avila (anc. *Ob'ila* or *Ab'ula*), an episcopal city of Spain,

the capital of the above province, is on the river Adaja, 71 miles by rail N. W. of Madrid. It was once a rich and more populous city, having a flourishing university, founded about 1482 and abolished in 1807. It has a fine cathedral and convent. Pop. 6892.

A'vila y Zuñi'ga, de (Luis), a Spanish historian and diplomatist, born in Estremadura about 1490. He enjoyed the favor of Charles V., who sent him as ambassador to Rome about 1558. He wrote "Commentaries on the War of Charles V. in Germany in 1546 and 1547" (1548). This work has considerable literary merit, but is not impartial. Died probably after 1560.

A'viles, a Spanish town at the mouth of the river of the same name, 15 miles W. N. W. of the city of Oviedo, is one of the most important trading-places in the province of Oviedo. Pop. about 8350.

A'vis, or **Aviz,** an order of knighthood in Portugal, instituted by King Alphonzo I. in 1143 to promote the defeat of the Moors. The king of Portugal is grand-master of the order.

Avi'tus (Alcimus Ecdicius), Saint, a poet and bishop of Vienne, obtained this dignity about 490 A. D. He was an adversary of Arianism. He wrote a poem on the "Creation of the World and on Original Sin," which is said to present some analogy to Milton's "Paradise Lost." Many other of his writings are extant.

Avitus (Marcus Mæcilius), a Roman emperor, born in Auvergne about 400, was the father-in-law of Sidonius Apollinaris. He became prefect of Gaul, and succeeded Maximus as emperor of the West in 455 A. D. He was deposed by Ricimer in 456. Died in 457 A. D.

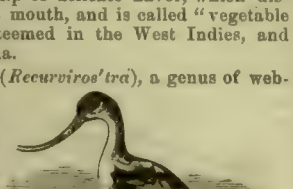
Avlo'na, or **Valona** (anc. *Aulo'na*), a fortified town and seaport of Albania, on the Gulf of Avlona, which is an inlet of the Adriatic 10 miles long. It is 30 miles S. W. of Berat, and has the best harbor on the Albanian coast. Here are manufactures of arms and woollen stuffs. Pop. about 6000.

Avo'ca, or **Ovo'ca,** a small river in Wicklow county, Ireland, enters the sea at Arklow. It runs through a very narrow and picturesque valley, enclosed between wooded banks from 300 to 500 feet high. The Vale of Avoca is the subject of one of Moore's songs.

Avoca, a post-township of Lawrence co., Ala. P. 936.

Avoca, a township of Livingston co., Ill. Pop. 825.

Avoca, a post-village of Pottawatomie co., Ia., on the Chicago Rock Island and Pacific R. R., 35 miles from Council Bluffs. It has a considerable trade and one weekly newspaper.



Avoca, a post-township of Cass co., Neb. Pop. 480.

Avoca, a post-township of Steuben co., N. Y., on the Rochester division of the Erie R. R., 28 miles N. W. of Corning. It has three churches, an iron-foundry, and a lumber and flouring mill. Pop. of village, 492; of township, 1740.

Avoca, a post-village of Clyde township, Iowa co., Wis., on the Milwaukee and St. Paul R. R., 49 miles W. of Madison. Pop. 418.

Avoca'do Pear, or **Alligator Pear** (*Per'sea gratissima*), a fruit tree of the order Lauraceæ, a native of the warm parts of America. It has leaves which resemble those of the laurel. The fruit is a drupe, like a pear in shape, and has a soft pulp of delicate flavor, which dissolves like butter in the mouth, and is called "vegetable butter." It is much esteemed in the West Indies, and grows in Southern Florida.

Av'oset, or **Avoset** (*Recurviros'tra*), a genus of web-footed birds, of the order Grallatores, having long legs, and very long, slender bills. They are easily distinguished from other wading birds by the upward curvature of the bill, which is like elastic whalebone, and is adapted to seeking in the mud for its food, which consists almost wholly of worms, insects, and little crustaceans. They are birds of powerful wing, and better adapted for flying and walking than swimming. The *Recurvirostra Americana* abounds in the U. S. Another species, *Recurvirostra avocetta,* is common in Europe. The length of both species is about eighteen inches.

Avocet.

Avoid'ance, in English ecclesiastical law, is the term by which the vacancy of a benefice is signified. It is the condition of a benefice void of an incumbent.

Avoirdupois', or **Averdupois,** the name of the common system of weights by which we ascertain the weight of all commodities except medicines, gems, and precious metals. A pound avoirdupois contains 7000 grains, the legal standard of which is such that a cubic inch of water weighs 252.458 grains. The pound is divided into 16 ounces, and an ounce into 16 drams. An ounce is equal to 437½ grains.

TABLE OF AVOIRDUPOIS.

27¹¹⁄₁₆ grains	= 1 dram,	dr.
16 drams	= 1 ounce,	oz.
16 ounces	= 1 pound,	lb.
28 pounds	= 1 quarter,	qr.
4 quarters	= 1 hundredweight,	cwt.
20 hundredweight	= 1 ton,	ton.

A cubic foot of water weighs 997.17 ounces avoirdupois.

Avo'la, a seaport-town of Sicily, in the province of Noto, 13 miles S. W. of Syracuse, is supposed to occupy the site of the ancient *Ibla* or *Hybla,* famous for honey. It has an active trade in grain, cattle, oil, and fruits. An earthquake in 1693 destroyed the ancient *Avola.* Pop. in 1861, 10,778.

A'von, a post-township of Hartford co., Conn. P. 987.

Avon, a post-village of Union township, Fulton co., Ill., on the Chicago Burlington and Quincy R. R., 19 miles S. by W. of Galesburg. Pop. 672.

Avon, a township of Lake co., Ill. Pop. 1005.

Avon, a post-township of Coffey co., Kan. Pop. 905.

Avon, a post-township of Franklin co., Me. Pop. 610.

Avon, a township of Oakland co., Mich. Pop. 1850.

Avon, a township of Stearns co., Minn. Pop. 211.

A'von, a post-village of New York, delightfully situated in Livingston co., on the right bank of the Genesee River, and on the Rochester division of the Erie R. R., 18 miles S. S. W. of Rochester, and on the Avon Geneseo and Mount Morris R. R. Avon stands on a terrace 100 feet above the river, and commands a beautiful prospect. Here are sulphur springs, with seven hotels, which are much frequented in summer by invalids. Pop. 900; of Avon township, 3038.

Avon, a post-village and township of Lorain co., O., 17 miles W. of Cleveland and 3 miles from the shore of Lake Erie. Pop. of township, 1924.

Avon, a township of Rock co., Wis. Pop. 886.

Av'ondale, a post-village of Chester co., Pa.

Av'on, Lower, a river of England, rises in Wiltshire, flows southward, then nearly north-westward, passes by Bath and Bristol, and enters the Bristol Channel after a course of about 80 miles. It is navigable for large vessels to Bristol, 7 miles. The valley of the Avon is very picturesque. Another river called Avon, or East Avon, rises in Wiltshire, flows southward, passes Salisbury, and enters the English Channel at Christ Church.

Avon, Upper, a river of England, rises near Naseby, in Northamptonshire, flows in a general S. W. direction through Warwickshire and Worcestershire, passing Rugby, Warwick, and Stratford, and joins the Severn at Tewkesbury. It is about 100 miles long.

Avo'nia, a township of Osage co., Kan. Pop. 588.

Avoyelles, a parish of Louisiana. Area, 800 square miles. It is intersected by the Red River, and bounded on the E. by that river and Atchafalaya Bayou. The surface is nearly level, and partly subject to inundation. Fertile prairies occur in the western part. Cotton, corn, rice, and molasses are largely exported. Capital, Marksville. Pop. 12,926.

Avranches (anc. *Abrin'cæ*), a town of France, in the department of the Manche, 32 miles S. W. of Saint Lo. It is beautifully situated on a hill, and has a ruined cathedral, a college, and a convent. Here reside many English families, attracted by the beauty of the position and the cheapness of living. Pop. in 1866, 8642.

'Awaj, the ancient Pharpar, one of the two rivers of Damascus. (2 Kings v. 2.)

Award' [from the Old Fr. *awarder,* to "adjudge"], the result of an arbitration. (See Arbitration.) An award is governed by well-established rules, such as that it must conform to the agreement whereby the matters in dispute were submitted to arbitration; it must embrace them all; it must be final, as well as certain and reasonable. Where several matters are submitted, it is not necessary that each one should be specifically referred to in the award. If the arbitrators purport to dispose of the things submitted by a general result, it will be presumed that each subject was acted upon and embraced in their conclusion. An award does not have the force of a judgment in a court of justice.

If not performed, an action may be brought upon it. If a sum of money were directed to be paid, a debt would be created which could be collected by action. Statutes sometimes allow a clause to be inserted in the submission that judgment in a court of justice may be entered upon the award. In such a case no action is necessary, and a judgment may be taken in accordance with the statute.

Awe, Loch, a lake of Scotland, in the county of Argyle, 8 miles N. W. of Inverary, extends 24 miles in a direction N. E. and S. W. Its average width is about 1 mile, but in some places it is 2½ miles wide. The adjacent scenery is very picturesque. The north-eastern end is overshadowed by rugged mountains, one of which, Ben Cruachan, is 3669 feet high. The water of this lake is discharged through the river Awe into Loch Etive. Loch Awe encloses many islands, and abounds in trout. Its scenes are favorites with artists and with tourists. On its islands are the ruins of several convents and castles.

Awn (*aris'ta*), the botanical name of a stiff and pointed bristle which occurs in the flowers of many grasses, forming the extremity of a glume or palea, as the beard of wheat and barley. The flowers of some grasses are awnless. The parts which are furnished with this organ are called *aristate.* The awn is a prolongation of the midrib of a glume or palea, or is a rigid, barren branch of inflorescence. Sometimes it is twisted, and liable to twist and untwist hygrometrically: sometimes it is serrate, as in barley.

Aw'yaw' (**Aga-Ojo** or **Oyo**), the capital of Yoruba, in Central Africa. Pop. about 70,000.

Axe, a tool used by carpenters and others for cutting wood, is of very ancient origin. Savage peoples of antiquity formed axes of stone, copper, bronze, etc. The axe of modern civilized nations is constructed of wrought iron, with a cutting edge of steel, which is welded to the iron when they are heated to a white heat. After it has been hammered and ground into the proper form, it is carefully tempered by heat and cold water.

Axe'stone, a mineral regarded as a variety of nephrite, is hard, tough, and more or less translucent. It occurs in primitive rocks in Saxony and New Zealand: the natives of the latter use it to make axes, hence the name.

Ax'holme Isle, a level and once marshy tract of England, in the N. part of Nottinghamshire, was drained in 1634 by a Dutchman named Vermuyden, and was for a long time inhabited by French and Dutch Protestant refugees. After much litigation between the colonists and the proprietors, the lands were divided in 1691, and about one-sixth was given to the former. It is now extremely fertile of all kinds of crops.

Ax'ia, a town of ancient Etruria, whose remains are identified with the sculptured tufaceous rocks at Castel d'Asso, 6 miles W. of Viterbo. Here are many chambers believed to be sepulchral. There are many Etruscan inscriptions. The architecture is of the Tuscan order, closely resembling the Doric Greek. These remains were discovered in 1808. It is probable that Axia never was a large town, but it must once have been quite important.

Ax'inite [from the Gr. ἀξίνη, an "axe"], an anhydrous silicate of alumina, lime, etc. with boracic acid, so named because it occurs crystallized in oblique rhomboidal prisms, so flat as to appear tabular and sharp like the edge of an axe. The crystals have a brilliant, glassy lustre, and are translucent or sub-translucent.

Ax'iom [Gr. ἀξίωμα, from ἀξιόω, to "think worthy," also to "demand"], in geometry, a proposition which admits of no demonstration, but is taken for granted as a self-evident truth; as, "The whole is greater than its part." Every rational science requires such fundamental propositions and established principles, to which the assent of the student is demanded without proof as a basis for further argument. It is an axiom in logic that he who admits a principle admits its consequence.

Ax'is, plu. **Axes,** a Latin word signifying "axle." A straight line, real or imaginary, about which a body revolves is called the axis of rotation. Axis is an important term in astronomy, botany, crystallography, geometry, and mechanics. The axis of the earth or other planet is that diameter about which it revolves. In botany, the axis is the central part of a plant, around which various organs are arranged. The stem is called the ascending axis, and the root is the descending axis. The stem is an axis for the branches, the branch is an axis for the leaves, and the rachis is an axis of inflorescence. In geometry, the axis of any geometrical solid is the right line which passes through the centre of all the corresponding parallel sections of it, or the right line about which the parts of the figure are symmetrically disposed. Thus, the axis of a cone is a right line drawn from the vertex to the centre of the base. The axis of a curved line is formed by a right line dividing the curve into two symmetrical parts. A right line drawn through the foci of an ellipse is its transverse axis. The lines upon which the abscissas and ordinates of plane curves are measured are called co-ordinate axes, of which one is the axis of abscissas and the other the axis of ordinates. For determining points in space a third axis is used. In crystallography, each form of crystal except the hexagonal prism and the rhombohedron has three axes, one vertical and two lateral. In anatomy, the axis is the second cervical vertebra, which in man is the pivot on which the head turns. *Ax'is in Peritra'chio,* an old term for one of the five mechanical powers, commonly called the Wheel and Axle. It consists of a wheel fixed immovably to an axle, so that both turn together around the axis of motion. *Axis of Elevation,* in geology, the line or direction in which rocks have been elevated by an internal force. This line generally governs the strike of the strata, or the direction of a horizontal line upon them, when removed from their natural or original position and inclined to the horizon.

Axis (*Axis maculatus*), a species of deer found in India and in many of the East Indian islands, is sometimes called *chittra* by the natives; *axis* is the ancient name of a kind of deer or antelope mentioned by Pliny. It resembles in

Axis Deer.

size and color the European fallow-deer, but its horns are slender, pointed, and little branched. The female has no horns. It is easily domesticated, and is kept in parks in Europe. Other species, or marked varieties, are known. The horns are brought to Europe and used for knife-handles.

Ax'le [Lat. *ax'is*], a bar of iron or a wooden shaft which supports the body of a carriage or wagon, and is supported on two wheels, in the hubs or naves of which its ends are inserted. Also, the part of machinery which forms the centre of the revolving portion, or the immediate bearing of the revolution of a piece of machinery which revolves on its own centre. Axles of railway cars, instead of revolving in the hubs of the wheels, are strongly keyed in them, and journals are turned on the portions outside the wheels. These journals pass through and revolve in boxes.

Ax'ley, a township of Johnson co., Ill. Pop. 1109.

Ax'minster, a town of England, in the county of Devon, 16 miles E. of Exeter. The Axminster carpets, whose manufacture is the chief employment of the inhabitants, are excellent imitations of those of Persia and Turkey, but most of the so-called Axminster carpets are made elsewhere. Pop. 2918.

Ax'olotl' (*Siredon lichenoides*), a remarkable batrachian found in the Mexican lakes, is a permanent larva of the Amblystoma type of salamanders. It resembles a fish in its general form, has four legs, and a long, compressed, and tapering tail. On each side of the neck the gills form three long feather-like processes, which give it a remarkable appearance. Length, about ten inches. It is much esteemed as food by the Mexicans. (See SIREDON.)

Axolotl.

Ax'um, or **Axoom** [Gr. Αὐξούμη or Ἀξώμη], an ancient and decayed town of Abyssinia, the former capital of the Axumite empire, is in the province of Tigre, 85 miles N. W. of Antalo. Here is a Christian church, built about 1657, which is held in great veneration. Among the antiquities of Axum and the monuments of its former grandeur are several finely-sculptured prostrate obelisks, and one granite monolith sixty feet high, which is still standing. The Axumite empire extended over Abyssinia and Yemen in Arabia. Through Adule, a port on the Red Sea, the people of ancient Axum carried on commerce with Arabia and India. Pop. between 2000 and 3000.

Ayacu'cho, a department of Southern Peru, bounded on the N. by Junin, on the E. by Cuzco, on the S. by Arequipa, and on the W. by Huancavelica. Area, estimated at 42,000 square miles. It is drained by the Apurimac and its affluents. Gold and silver are found here, and in agricultural respects it is the richest part of Peru. Pop. about 130,000.

Ayacucho, a town of Peru, in the above province, 25 miles E. N. E. of Huancavelica. Here the armies of Colombia and Peru completely defeated the Spaniards on the 9th of Dec., 1824. This victory, gained by General Sucre, ended the Spanish dominion on the American continent, and was followed by the speedy surrender of all the Spanish soldiers in Peru. Pop. about 25,000.

Ayamon'te, a seaport-town of Spain, in the province of Huelva, on the Guadiana River, about 2 miles from its mouth, and 71 miles W. S. W. of Seville. It has two churches, one hospital, and a town-house. The chief occupation of its people is fishing. Pop. 5969.

Aye-Aye (*Chei'romys Madagascarien'sis*), a very singular quadruped of Madagascar, ranked by Cuvier among the Rodentia, but placed by other naturalists in the family of lemurs. It has a long, bushy tail, and is about as large as a hare. Each of its four extremities has an opposable thumb, and the digits are armed with pointed nails, which it sometimes uses to pick kernels out of nuts. It sleeps during the day, and is very active in the night, feeding on insects and fruits.

Aye-Aye.

A'yer (PETER), one of the founders of the society of Shakers, was born in Canterbury, N. H., in 1760. He served in the war of the Revolution. Died Sept. 14, 1857.

Ayer, a post-village and township of Middlesex co., Mass., formerly known as Groton Junction, was incorporated as a separate town in 1870. It is at the junction of the Fitchburg, the Stony Brook, the Worcester and Nashua, and the Peterboro' and Shirley R. Rs., 35 miles from Boston, 15 from Lowell, and 27 from Worcester. Some thirty-six passenger trains pass through the town daily. It has manufactures of agricultural tools, leather, iron castings, and machinery, and has one weekly newspaper. ED. OF "AYER PUBLIC SPIRIT."

Ay'eshah, or **Aieshah** [Ger. *Aischah*], the favorite wife of the prophet Mohammed, born at Medina about 610 A. D., was a daughter of Abu-Bekr, who afterwards became calif. Mohammed wrote a chapter of the Koran expressly to vindicate her chastity, which had been questioned. After his death she took an active part in public affairs as an enemy of the calif Othman and his successor Ali, who defeated her in battle. Died in 677 A. D. (See IRVING, "Mahomet and his Successors.")

Aylesbury, an ancient market-town of England, the capital of the county of Bucks, is 38 miles by railway N. W. of London. It returns two members to Parliament. Many ducks are reared here for the London market. It has some manufactures of silk and lace. Pop. in 1871, 28,760.

Aylesford, EARLS OF (1714, in the peerage of Great Britain), and barons of Guernsey (1703, in the English peerage), a noble English family. —HENEAGE FINCH, the seventh earl, was born Feb. 21, 1849, and succeeded his father in 1871.

Ayl'mer, a lake in British North America, about 80 miles N. of Great Slave Lake. It is about 50 miles long and 30 miles wide.

Ayl'mer, or **El'mer** (JOHN), a learned English Protestant bishop, born at Tilney, in Norfolk, in 1521. He was tutor to Lady Jane Grey, and became an exile on the accession of Queen Mary. He published in 1559 an answer to John Knox's "Blast of the Trumpet against the Monstrous Regiment of Women." He was appointed bishop of London in 1576, after which he treated the Catholics and Puritans with severity. Died June 3, 1594. (See WOOD, "Athenæ Oxonienses.")

Aylmer, a village of Malahide township, Elgin co., Ontario, Canada. It has one weekly newspaper, and is actively engaged in manufactures. Pop. about 1400.

Aylmer, a village of Ottawa co., Quebec, is situated on Lake Deschênes. It has one weekly newspaper, and is engaged in lumbering and general manufactures. A line of steamers for the Upper Ottawa starts from here. Pop. about 2500.

Ayr, a small river of Scotland, flows nearly westward through Ayrshire, and enters the sea at the town of Ayr.

Ayr, a handsome seaport-town of Scotland, the capital of Ayrshire, is at the mouth of the Ayr, 32 miles S. S. W. of Glasgow. The river is here crossed by three bridges, which connect this town with Newton-upon-Ayr. Among the principal edifices are the assembly-rooms, with a spire 217 feet high, and the Wallace Tower. Ayr has many elegant villas, and is a place of fashionable resort. In the vicinity are objects of interest connected with the memory of the poet Burns. Coal is the chief article of export. Pop. of parliamentary borough in 1871, 17,851.

Ayr, a flourishing village of Dumfries township, Waterloo co., province of Ontario, Canada, has extensive lumber and flouring mills and is an important commercial point. Pop. about 1300.

Ayr, a township of Fulton co., Pa. Pop. 1247.

Ayres (ROMEYN B.), an American officer, born 1825, in New York, graduated at West Point 1847; lieutenant-colonel Third Artillery July 26, 1866, and Nov. 29, 1862, brigadier-general of U. S. volunteers; served in war with Mexico 1847–48, at various posts 1848–73, and on expedition to Yellow Medicine River 1857. In the civil war, served in the Manassas campaign 1861, engaged at Blackburn's Ford and Bull Run as chief of artillery of division 1861–62, and of corps 1862–63, in Virginia Peninsula 1862, engaged at Yorktown, Williamsburg, New Bridge, Garnett's Farm, Gaines's Mill, Golden's Farm, and Glendale; in the Maryland campaign 1862, engaged at South Mountain and Antietam, in Rappahannock campaign 1862–63, engaged at Fredericksburg and Chancellorsville, in the Pennsylvania campaign, in command of a division 1863; engaged at Gettysburg (brevet major), in suppressing New York draft riots 1863, in Rapidan campaign 1863, engaged at Rappahannock Station and Mine Run, in Richmond campaign 1864–65, engaged at Wilderness (brevet lieutenant-colonel), Laurel Hill, Spottsylvania, Jericho Ford, Tolopotomy, Bethesda Church, Petersburg (wounded), Weldon

Railroad (brevet colonel), Chapel House, Rowanty Creek, Dabney's Mill, Five Forks (brevet brigadier-general), and Appomattox Court-house; in command of a division in the district of Shenandoah 1865–66, and member of tactics board 1867–69. Brevet major-general U. S. army Mar. 13, 1865, for gallant and meritorious services in the field, and brevet major general U. S. volunteers Aug. 1, 1864, for conspicuous gallantry in battles of Richmond campaign.

GEORGE W. CULLUM, *U. S. Army.*

Ayr'shire, a maritime county of Scotland, bounded on the N. by Renfrew, on the E. by Lanark and Dumfries, on the S. by Kirkcudbright and Wigtown, and on the W. by the Frith of Clyde. Area, 1149 square miles. The surface is generally undulating or hilly, and the south eastern part mountainous. It is drained by the Ayr, the Doon, the Lugar, and other small streams. The county is rich in minerals, especially coal, limestone, freestone, and iron. Silurian and Devonian strata occur here. The soil is generally fertile and well cultivated. Ayrshire is noted for its good dairies and superior breed of milch cows. It has important manufactures of cotton and wool. Capital, Ayr. Pop. in 1871, 200,745.

Ay'toun (WILLIAM EDMONDSTOUNE), an eminent British poet and essayist, born in Edinburgh in 1813, was educated in the university of that city. He studied law, was called to the bar in 1840, and married a daughter of Prof. John Wilson. He became professor of rhetoric in the University of Edinburgh in 1845. Under the assumed name of "Augustus Dunshunner" he contributed many articles to "Blackwood's Magazine," and distinguished himself as a humorist as well as a poet. In 1849 he produced "The Lays of the Scottish Cavaliers, and other Poems," which had great success. Among his other works are a humorous tale called "How I Became a Yeoman," "Firmilian, a Spasmodic Tragedy" (1854), and "Bothwell," a narrative poem (1856). Died Aug. 4, 1865. (See THEODORE MARTIN, "Memoir of William E. Aytoun.")

Ayuntamien'to (literally, a "joining" or "meeting"), the name of Spanish councils or governing bodies of towns, which acquired much political influence and importance during the wars between the Moors and Spanish Christians. The Spanish kings granted to the towns municipal privileges and institutions which were similar to those of the ancient Romans, and promoted a spirit of liberty. The councils were elected by the vote of the citizens. These institutions were abolished under the Bourbon kings, and were restored in 1837. They were deprived of political power in 1844.

Azad'irine, a bitter principle found in an East Indian tree (*Melia Azedirach*), used to some extent as a substitute for quinine. This tree is called "Pride of China" in the U. S.

Aza'lea [from the Gr. ἀζαλέος, "parched," probably so called because it is usually found in dry situations], a genus of plants of the order Ericaceæ and the Linnæan class Pentandria. It comprises 100 species or more, natives of North America, China, and other countries. Many of them are

Azalea Indica.

cultivated for their flowers, which are beautiful and fragrant. The *Azalea Pontica*, a small shrub growing near the Black Sea, has fragrant flowers covered with glutinous, hairy glands. The whole plant is narcotic and poisonous. Among the American species (which have deciduous leaves) are the *Azalea nudiflora*, sometimes called honeysuckle, which is cultivated in English gardens, and the *Azalea viscosa*, which has glutinous and fragrant flowers. The *Azalea Indica*, a native of India, is a favorite of florists, and is remarkable for its brilliant colors. The *Azalea calendulacea*, found in the Southern U. S., is said sometimes to clothe the mountains with a robe of living flame-color. Many hybrid azaleas are cultivated as flowering shrubs.

Aza'ni, an ancient and ruined city of Asia Minor, in Anatolia, on the Rhyndacus, which is here crossed by two Roman bridges, 73 miles S. S. W. of Brusa. Here are extensive remains, among which are an Ionic temple of Jupiter, with eighteen columns standing, and a theatre 232 feet in diameter.

Aza'ra, de (Don FELIX), a Spanish naturalist, born in Aragon May 18, 1746. He was a member of a commission sent in 1781 to South America to determine the boundary between the Spanish and Portuguese possessions, and he remained there twenty years. He prepared numerous maps of South America, and published in Spanish "Observations on the Quadrupeds, Reptiles, and Birds of Paraguay and La Plata" (5 vols., 1802). He also wrote "Travels in South America," which were published in French (4 vols., 1809). These works are highly esteemed. He died in Aragon in 1811. (See WALCKENAER, "Notice sur F. Azara," prefixed to his "Voyage dans l'Amérique Méridionale," 1809.)

Azari'ah [Heb. עֲזַרְיָה, "the Lord helps"], a name of frequent occurrence in the Old Testament: (1) Another name for Uzziah, the tenth king of Judah, who began to reign, according to Winer, 809 B. C. (2) One of Daniel's three friends, a noble of the tribe of Judah, carried captive to Babylon in 605 B. C., whose name was changed to ABEDNEGO (which see). (3) The name of some twelve other persons mentioned in the Old Testament, most of whom were either priests or high priests.

Aze'glio, d' (MASSIMO TAPARELLI), MARQUIS, an eminent Italian statesman, author, and artist, was born at Turin Oct. 2, 1798. He studied and worked as an artist in Rome, where he passed eight years (1821–29), and became a skilful landscape-painter. Having removed to Milan, he married a daughter of the celebrated author Manzoni. He published in 1833 a historical novel entitled "Ettore Fieramosco," which was very popular. He stimulated the national spirit and patriotism of the Italians by another popular historical romance, "Niccolo di Lapi" (1841). His political principles were liberal but moderate. He wrote numerous political treatises, and fought against the Austrians at Vicenza in 1848. In May, 1849, he was appointed president of the council (prime minister) by King Victor Emmanuel. In this position he rendered important services to his country. He was superseded by Cavour in 1852. Died Jan. 15, 1866.

Azela'ic Ac'id, one of the products of the oxidation of oleic acid by nitric acid.

Azeve'do-Couti'nho (JOZE JOAQUIM), a bishop of Pernambuco and writer, born in Brazil Sept. 8, 1742. He wrote an essay on commerce, a pamphlet against the abolition of the slave-trade, and other works. Died Sept. 12, 1821.

Az'imuth [Arab. *as sumût*, "the path," a name of the zenith], an astronomical term, denotes the angle made at the zenith by the meridian and the vertical circle in which a heavenly body is situated, or the angle measured along the horizon between the north or south pole and the point where a circle passing through the zenith and the body cuts the horizon. In trigonometrical surveys on the surface of the earth the accurate determination of the azimuth of an object is very important. It is usually performed with a theodolite. Azimuth circles or vertical circles are great circles of the sphere, passing through the zenith and intersecting the horizon at right angles.

Azobenzole, $C_{12}H_{10}N_2$, produced by reducing nitrobenzole or oxidizing benzidine. It is obtained in reddish yellow scales.

Azobenzoyl', $C_{21}H_{15}N_2$, a white crystalline powder formed by the action of ammonia on crude oil of bitter almonds.

Az'of, Azoph, or **Azov, Sea of** (the anc. *Pa'lus Mæo'tis*, called by the Russians *Mare Azovskoe*), is situated between Russia and the Black Sea, with which it communicates by the Strait of Yenikale or Kertch (anc. *Cimmerian Bosporus*). It extends from the Crimea to the mouth of the Don, about 200 miles, and is in some places 100 miles wide or more. Its area is estimated at 14,000

square miles. The navigation is generally obstructed by ice from November to March. This sea, the water of which is nearly fresh, contains a great abundance of fish.

Azof, or **Azov** (anc. *Tan'ais*), a small town and fort of Russia, in the government of Ekaterinoslav, near the mouth of the river Don, 25 miles E. S. E. of Taganrog. It has declined in population and importance. Its harbor is shallow. Azof was taken from the Turks by Peter the Great. It was settled by the Carians, and in ancient times had the name Tanais. After the taking of Constantinople by the Italians it passed into the hands of the Venetians, who held it until, in 1410, it was captured by the Tartars. The Christians were put to death by the captors, from whom came its present name.

Azores [Port. *Aço'res*, from *açor*, a "hawk"], or **Western Islands,** are situated in the North Atlantic, about 500 miles W. of Portugal, to which they belong, and between lat. 36° 55′ and 39° 44′ N., and lon. 25° 10′ and 31° 16′ W. They are arranged in three groups, one of which consists of Flores and Corvo. About 114 miles S. E. of this group is the central group of Terceira, St. George, Pico, Fayal, and Graciosa. St. Michael and St. Mary form the third group, which is nearly 70 miles S. E. of the central group. St. Michael, the largest of all, is 50 miles long, and varies in width from 5 to 12 miles, and has an area of 340 square miles. They are of volcanic formation, and have fertile soils, though the surface is mostly mountainous. The highest point is the Peak of Pico, which has an altitude of 7613 feet. Volcanic disturbances of a terrible character have occurred at various times. Whole towns have disappeared in opening chasms, and in 1811 an island emerged suddenly from the deep, and later disappeared. The sugar-cane, coffee-plant, orange, and grapevine flourish here, but the soil is not well cultivated. The chief articles of export are wine, brandy, grain, and oranges. The inhabitants are very ignorant. The land is held by feudal tenure, and under such restrictions that the farmers never think of improving it, and simply gather the products which grow wild. It is owned in immense entailed estates. The people are extremely fond of music. They are not intemperate in their habits, are very clean in their dress, but are prone to the grossest superstition. The Azores have no good harbors. The Portuguese took possession of these islands in 1449. Area, 1149 square miles. Pop. in 1868, 252,480.

Az'otized Bodies (or **Principles**) are substances which contain nitrogen (azote), and form part of the living structure of an animal or plant. Among them are albumen, fibrine, caseine, gelatine, and kreatine.

Azo'tus, the Greek name of *Ashdod*, an ancient city and stronghold of the Philistines, on the Mediterranean, 21 miles S. of Jaffa.

Azoxybenzole, $C_{12}H_{10}N_2O$, a body which crystallizes in beautiful yellow needles. It is produced by the action of potassic hydrate on an alcoholic solution of nitrobenzole.

Az'talan, a post-township of Jefferson co., Wis. P. 1261.

Az'tec Children, the name commonly applied to a boy and a girl who were taken from America to England in 1853, and were represented as descendants of the Aztecs. They were under three feet high, had long black hair, olive complexions, and very prominent noses. They were exhibited to the public for money by a person who told an incredible story of their antecedents, and pretended that they had been abducted from the ancient city of Iximaga. It was commonly believed by naturalists that they were monstrosities—dwarfs that never attained their proper development.

Az'tecs, a name of a Mexican nation which inhabited the table-land of Anahuac at the time of the Spanish conquest of Mexico. According to tradition, they came originally from Aztlan to Mexico, which was inhabited by the Toltecs before the migration of the Aztecs. It is supposed that the latter founded the city of Mexico (or Tenochtitlan) about 1325, some say as early as 1216, and became the most powerful and dominant people of Mexico or Anahuac. They made considerable progress in civilization and the useful arts, derived partly from the Toltecs. They were a warlike people, and conquered several neighboring tribes. "At the beginning of the sixteenth century," says Prescott, "the Aztec dominion reached across the continent from the Atlantic to the Pacific." The government was an elective monarchy, and the sovereign was selected from the brothers or nephews of the preceding king, so that the choice was always restricted to the same family. As they had never learned the art of alphabetical writing, their laws were exhibited to the public in hieroglyphical paintings or picture-writing. Their religion was a gross polytheism. They sacrificed human victims to their gods on a larger scale than other nations—*i. e.* about 20,000 annually. Astronomy was the science which they cultivated with most success. "We cannot," says Prescott, "contemplate the astronomical science of the Mexicans without astonishment." They were acquainted with the cause of eclipses, and they recognized some of the most important constellations. They adjusted the times of their festivals by the movements of the planets, and fixed the true length of the tropical year with great precision. An immense dial, disinterred in 1790 in the great square of Mexico, has supplied us with interesting facts. The calendar engraved on it shows that they settled the hours of the day precisely; also the periods of the solstices and equinoxes, and the transit of the sun across the zenith. The Aztecs were diligent cultivators of the soil, and had acquired respectable proficiency in agriculture, but they had no horses, oxen, or other animals of draught. Their staple productions were maize and the agave or Mexican aloe, which supplied them with food, drink, and clothing. They were ignorant of the use of iron, but found a substitute in bronze, an alloy of copper and tin, of which they made weapons and tools. They also cast golden and silver vases of large size. In mimetic art they were much inferior to the Egyptians. The Spanish conquerors of Mexico destroyed nearly all the manuscripts which they found in the country, and it is not probable that the art of reading the picture-writing will ever be recovered. "The Aztec character," says Prescott, "was perfectly original and unique. It was made up of incongruities apparently irreconcilable. It blended into one the marked peculiarities of different nations, not only of the same phase of civilization, but as far removed from each other as the extremes of barbarism and refinement. It may find a fitting parallel in their own wonderful climate, capable of producing on a few square leagues of surface the boundless variety of vegetable forms which belong to the frozen regions of the north, the temperate zone of Europe, and the burning skies of Arabia and Hindostan." (See Prescott, "Conquest of Mexico," vol. i.)

Revised by R. D. Hitchcock.

Az'uline, a fine permanent blue dye prepared from certain constituents of coal-tar. (See Aniline Colors.)

Azulin'ic Ac'id, a brown substance produced by the spontaneous decomposition of hydrocyanic (prussic) acid.

Azu'ni (Dominico Alberto), an Italian writer known from his researches in maritime law, born Aug. 3, 1749, was a judge in Genoa. He published "Droit Maritime de l'Europe" (Paris, 1805), and "Dizionario Universale ragionato della giurisprudenza mercantile" (2d ed., Livorno, 1822).

A'zure [Fr. *azur*], the fine blue color of the sky; also the blue pigment which is produced by melting a mixture of a salt of cobalt with quartz-sand and potash, and is used in coloring porcelain. In heraldry, azure is one of the colors employed in blazonry, and is represented in engraving by horizontal lines. It is equivalent to the color of sapphire among precious stones. In painting, azure is a sky-colored blue, called ultramarine.

Azure Stone. See Lapis-Lazuli.

Az'urine (*Leucis'cus cæru'leus*), a fresh-water fish resembling the red-eye or rudd, is found in Lancashire, England (where it is called the blue roach), and in Switzerland. The color of its back is a slate-blue.

Azurine or Blue Roach.

Az'urite, a beautiful blue carbonate of copper, sometimes called **Blue Malachite.** It occurs in blue crystals which are very brittle, consequently this malachite is not well adapted for the ornamental purposes for which green malachite is so extensively used. Its composition is $2Cu\,CO_3 + CuH_2O_2$. The most beautiful specimens are found at Chessy, near Lyons. The name *azurite* has also been applied to Lazulite (which see).

Az'ymites [from the Gr. *a*, priv., and *ζύμη*, "leaven"], a name given to Christians who use unleavened bread in the sacrament, as the Latins, Armenians, and Maronites. The Greek and Protestant churches use the leavened bread.

B.

B, the second letter of most alphabets, is a consonant of the class known as labial mutes. It is cognate with the mutes *p* and *f*, and etymologically interchangeable with them and with the liquid *m* and the semi-vowels *w* and *v*. In ancient Rome, B sometimes stood for 300, and B for 3000. The Greek β stood for 2, and β for 2000. In music, B is the seventh letter in the natural diatonic scale. B also stands for *basso* as an abbreviation in music. On old French coins B stands for Rouen; on Prussian, for Breslau. B in chemistry is the symbol of the element boron. As an abbreviation, B., or b., signifies "born," and sometimes "book."

Baader, von (F. X.). See APPENDIX.

Ba'al, or **Bel,** the principal god of the Phœnicians, Chaldæans, and Carthaginians, is regarded as a personification of the sun. Among the Phœnicians, Baal was the god of the sun, the vivifier of nature, and Astarte (or Baaltis) the goddess of the moon. Baal was identical with the Bel or Belus of the Babylonians and Assyrians. The worship of Baal prevailed among the ancient Jews in the time of the prophet Elijah and earlier. (See 1 Kings xviii. and Romans xi. 4.) The word *Baal* enters into the composition of many Hebrew, Chaldee, and Carthaginian proper names, as Jezebel, Hannibal, Baal-Peor, Baal-bec, and Beelzebub.

Baal'bec, Balbec, or **Baalbek** [the final *bek* derived, perhaps, from the Arabic *bakka*, "to be thronged"], (called by the Greeks *Heliop'olis, i. e.* "city of the sun"), an ancient and magnificent city of Syria, situated in a valley or plain near the foot of Anti-Libanus, about 42 miles N. W. of Damascus; lat. 34° 1′ 30″ N., lon. 36° 11′ E., and about 3800 feet above the level of the sea. Its origin and early history are not known. It was formerly one of the most populous and important cities of Syria, and contained many palaces and monuments. Antonius Pius built here a grand temple, which subsequently became a Christian church. In 636, Baalbec fell into the hands of the Mohammedans, and in 748 was sacked by the calif of Damascus. The site is now occupied by a small modern village and extensive ruins of ancient temples, among which was the great temple of the sun. This was 324 feet long, and had a peristyle of fifty-four Corinthian columns, about seven feet in diameter and eighty-nine feet high, including capital and pedestal. Six of these columns are now standing. Some of the stones used in the walls or substructions of this temple are sixty-four feet long and twelve feet thick. The chief material of these temples was limestone or marble and granite. (See WOOD and DAWKINS, "Ruins of Baalbec," 1757; CASSAS, "Voyage Pittoresque de la Syrie," 1799; VOLNEY, "Voyage en Syrie;" ROBINSON'S "Later Biblical Researches," 1852, pp. 505–527.)

Ba'ba-Dagh, a town of European Turkey, in Bulgaria, on a tributary of the Danube, is 93 miles N. E. of Silistria. It has considerable commerce with the coasts of the Black Sea, and has a Tartar high school. It was stormed by the Russians in 1771 and 1828, and was ineffectually besieged in 1854. Pop. about 10,000.

Babahoy'o, a town of Venezuela, in the province of Guayaquil, 20 miles N. E. of Guayaquil, on the Cabacol. The goods sent from Guayaquil into the interior go to this place, and are thence sent farther by mules. In consequence, there are large warehouses here. But Babahoyo is, in spite of this great trade, only a small, poorly-built town.

Bab'bage (CHARLES), F. R. S., an English mathematician, born Dec. 23, 1792, graduated at Trinity College, Cambridge, in 1814. He became professor of mathematics at Cambridge in 1828, and published in 1832 a work "On the Economy of Manufactures and Machinery," which was translated into several languages. Among his other works is a "Ninth Bridgewater Treatise" (1837). He invented and partly constructed a calculating-machine, which was never completed, although about £17,000 of the public money was expended on it. Died Oct. 20, 1871.

Bab'bitt (ISAAC) was born at Taunton, Mass., July 26, 1799. He was a goldsmith, and made at his native town the first Britannia ware produced in this country. In 1841 he received a gold medal for his valuable invention of the alloy which bears his name. Congress also gave him $20,000. He afterwards engaged extensively in the manufacture of this alloy, and also of soap. Died insane at the McLean Asylum, Somerville, Mass., May 26, 1862.

Bab'bitt's Met'al, a soft alloy invented by Mr. Isaac Babbitt of Boston, and used in lining boxes for axles and gudgeons, in order to diminish the friction and abrasion. These boxes are extensively used in the machinery of steamboats and locomotives. The alloy is prepared thus: to 4 pounds of melted copper add gradually 12 pounds of the best Banca tin, then 8 pounds of antimony, and finally 12 pounds more of tin.

Bab'cock (C. A.), U. S. N., born June 12, 1833, in the city of New York, entered the navy as a midshipman April 8, 1850, became a passed midshipman in 1856, a lieutenant in 1859, a lieutenant-commander in 1862, a commander in 1869. From 1862 to 1864 he commanded the steamer Morse, North Atlantic blockading squadron, and was repeatedly in action with Confederate batteries and troops while co-operating with our army on the James, York, and Pamunkey rivers. He was highly commended for his services by Rear-Admiral Lee, who, in the latter part of 1864, upon being appointed to the command of the Mississippi squadron, selected Babcock as his fleet-captain. D. at New Orleans June 29, 1876. F. A. PARKER, U. S. N.

Babcock (ORVILLE E.), an American officer, born in Berkshire, Franklin co., Vt., Dec. 25, 1835; graduated at the U. S. Military Academy July 6, 1861, and entered the army as second lieutenant of engineers; promoted to be first lieutenant Nov., 1861; captain, 1863; major, 1867; immediately upon graduating he was assigned to active duty as assistant engineer on the defences of Washington, and subsequently on the staff of Gen. Banks on the Upper Potomac. In the Virginia Peninsula campaign of 1862 he served with the engineer battalion at Yorktown and subsequent operations of the campaign; in Jan., 1863, he was appointed lieutenant-colonel of volunteers, and served as assistant inspector-general of the 6th army corps; as chief engineer and assistant inspector-general of the 9th corps; chief engineer department of the Ohio; and in 1864 was appointed aide-de-camp to Gen. Grant, with whom he served in the battle of the Wilderness and subsequent operations terminating with the surrender of the Confederate armies in Virginia and North Carolina; in July, 1866, he was appointed colonel and A. D. C., and continued to serve as such to Gen. Grant until the latter was inaugurated President, when he was assigned to duty with the President as his secretary. In 1871, in addition to his other duties, he was placed in charge of public buildings and grounds in the city of Washington, and also made engineer in charge of the Washington aqueduct, which duties he still continues to perform; he is also president of the board of directors of Columbia Hospital for Women and Lying-in-Asylum. GEO. C. SIMMONS.

Babcock (RUFUS), D. D., was born at North Colebrook, Conn., Sept. 18, 1798, and graduated at Brown University in 1821. He was ordained pastor of a Baptist church in Poughkeepsie, N. Y., in 1823, was president of Waterville College (1833–36), and has been pastor of churches in Salem, Mass., Philadelphia, Paterson, N. J., etc. He has published a number of biographical and religious works.

Ba'bel, or **Ba'bil,** was the Hebrew or native name of the city commonly called Babylon, which is the Greek form of the word Babel: it was also the name of a famous tower which the descendants of Noah began to build soon after the Deluge, on the plain of Shinar, but in consequence of the confusion of tongues they could not finish it. The projectors of this tower said, "Go to, now; let us build us a city, and a tower whose top may reach unto heaven, and let us make us a name, lest we be scattered abroad upon the face of the whole earth." (Genesis xi.) There is no evidence that the work was ever raised above the foundations, but several extravagant reports or traditions of its immense height have obtained currency. It is generally believed that the position of this tower was identical with the site of Babylon. Some persons have confounded the tower of Babel with the temple of Belus. Others have entertained the opinion that Birs-Nimrud, near Borsippa, is the remains of Babel. Others have identified it with a ruin near Hillah. But it may be doubted whether any remains of the tower long survived the defeat of its builders.

Bab-el-Man'deb (*i. e.* "gate of tears"), a strait which connects the Red Sea with the Gulf of Aden and the Indian Ocean. On the Arabian side of the strait is a cape called Bab-el-Mandeb. The strait is about 20 miles wide, and encloses the small rocky island of Perim, on which is a British fort. The name was given to the strait

because the navigation of the sea to which it is the entrance, owing to numerous small rocky islets, was, before the introduction of steamers, extremely dangerous.

Baber (Ambrose), Dr. See Appendix.

Bâ'ber, or **Babur** (Mohammed), written also **Babour,** surnamed Zaheer-ed-Deen ("protector of religion"), a celebrated emperor of India, and the first of the Great Moguls, was born Feb. 14, 1483. He was a descendant of Tamerlane (Timur-Leng). In 1494 he succeeded his father, who was king of Ferghâna. The first part of his reign was disturbed by wars with neighboring powers, and he experienced great vicissitudes of fortune. He performed remarkable exploits in war, and extended his dominions by the conquest of Kandahar, Cabul, etc. He made an incursion into the Punjâb in 1505, and a second time in 1519. Having again crossed the Indus in 1524, he defeated Ibrahim, king of Delhi, on the plain of Paniput in 1526, and became master of India. He was an able ruler, and had a genius for poetry and music. He died Dec. 26, 1530, and was succeeded by his son Humayoon. (See his autobiography, of which there is a review in Lord Jeffrey's "Essays;" R. M. Caldecott, "Life of Bâber, Emperor of Hindostan:" Ferishta, "Mohammedan Power in India," translated by J. Briggs, London, 4 vols., 1829; William Erskine's "History of India and the First Two Sovereigns of the House of Taimur," 2 vols., 1854.)

Babeuf (François Noel), a French conspirator and Socialist, who assumed the name of Caius Gracchus, was born at St.-Quentin in 1764. He founded in Paris, in 1794, "The Tribune of the People," a journal in which he advocated equality and community of property. His disciples were called Babouvistes, and his system Babouvisme. He formed a conspiracy against the Directory, was arrested and tried, and the sentence of death being pronounced upon him, he stabbed himself with a dagger, May 23, 1797. (See Sudre, "Histoire du Communisme" (1849).)

Babi, the Malay word for "hog," is the name of several islands in the Pacific and Indian oceans. One of these is about 85 miles W. of Sumatra, and near lat. 3° N. Length, about 40 miles.

Bab'ingtonite, a silicate of iron and calcium.

Bab'ists [in Arabic and Persian, *Bâbî*], a Mohammedan sect which originated in Persia in the second quarter of the present century. It is said to derive its name from a prophet named Bâb, who was killed by order of the king of Persia in 1850. Many of the early Babists took up arms to propagate or defend their religion, and no inconsiderable numbers were taken and put to death; but this does not appear to have checked the spread of the new doctrines. The adherents of Babism are said at present to amount to several millions. They profess to be reformers, assert the absolute unity of God, and claim that Bâb is as much superior to Mohammed as the latter is to Christ.

Bab'lah, the fruit of several species of acacia. It contains tannic acid and a red coloring-matter. It is used in dyeing and calico-printing for fawn colors.

Ba'boo, a Hindoo title equivalent to the English "Mr.," is usually given to gentlemen who are educated and wealthy. The Baboos are noted for generosity and public spirit, and are liberal in religion. Many of them are bankers and merchants.

Baboon' (*Cynoceph'alus*), a genus of Old World monkeys, distinguished by long truncated muzzles and cheek-pouches. Its face has a general resemblance to that of a dog, and the ridges over the eyes are very distinct. Baboons have callosities on the buttocks, and a repulsive physiognomy, which indicates the ferocity of their disposition. They walk or run easily on the ground, and climb trees with agility. They are exceedingly strong, cunning, and mischievous. Troops of these animals sometimes enter a plantation for plunder, and destroy much besides what they eat and carry away in their cheek-pouches. They are chiefly found in Africa and Southern Asia. They feed mostly on fruits and vegetables. The genus is divisible into two groups—the baboons proper, which have long tails, and the mandrills, which have very short tails. As examples of baboons of the first group may be mentioned the chacma, or pig-faced baboon, also called the ursine baboon (*Cynocephalus porcarius*), a native of South Africa, and the dog-faced baboon (*Cynocephalus hamadryas*), a native of Arabia, Persia, and Abyssinia. The latter species is often sculptured on the ancient monuments of Egypt, and it is supposed to have been the "Thoth" baboon to which divine honors were paid. It was frequently embalmed, and the mummies are still found. The chacma is one of the largest of the baboons, about the size of an English mastiff. The mandrill, or rib-nosed baboon (*Cynocephalus mor'mon*), a native of Guinea, is the largest, ugliest, and fiercest of the whole genus. Its muzzle is marked with blue and scarlet ribs. It is scarcely possible to imagine anything more hideous than its aspect. Numerous other species are known to the later naturalists.

Ba'brius, or **Babrias,** a Greek fabulist who is supposed to have lived a short time before the Augustan Age. He made a collection of fables ascribed to Æsop, and turned them into verse. Some of them were the original works of Babrius. In 1844, Minoides Minas discovered in the East a manuscript of 123 fables of Babrius, which were published in Paris in 1844.

Babuya'nes Islands, a group of small islands in the Pacific Ocean, between Formosa and the Loo Choo Islands. They are of volcanic formation, and very fertile. Among the largest of them are Calayan and Babuyan. Large quantities of sulphur are obtained on these islands. Pop. about 8000. Chief town, Batan.

Bab'ylas, Saint, bishop of Antioch from 237 to 250 A. D., when he suffered martyrdom. Miracles are reported in connection with his remains. Chrysostom wrote a book about him in 382, and in 387 delivered a discourse in commemoration of him.

Bab'ylon [Gr. Βαβυλών; Heb. *Babel*], an ancient and celebrated city of Chaldæa, was situated in the plain of Shinar, on both sides of the river Euphrates, about 60 miles S. of Bagdad; lat. 32° 28′ 30″ N., lon. 44° 9′ 45″ E. Its site is partly occupied by the modern town of Hillah. It is generally believed that it was built near Babel, which is mentioned in Genesis (chap. x.) as the beginning of Nimrod's kingdom. We have no subsequent notice of Babylon or Babel in the Hebrew sacred history until the reign of Hoshea, about 730 B. C., when the people of Samaria were carried away captive to Assyria. (2 Kings xvii. 24.) The statements of ancient historians in relation to the origin of this city are confused and discordant. According to Greek tradition, it was founded by Semiramis or Belus, but Berosus affirms that this story is a fiction of the Greeks. The earliest historian who gives a description of Babylon is Herodotus, whose testimony is that of an eye-witness. He visited it about 450 B. C., but he does not inform us who founded the city. He says Babylon, which after the fall of Ninus (Nineveh) became the capital of the Assyrian empire, had already been ruled by several kings and by two remarkable queens, Semiramis and Nitocris. He states that the form of the city was a square, each side of which was 120 stadia (about fourteen miles) in extent, that it was enclosed by brick walls, the height of which was 200 royal cubits (about 335 English feet), and the breadth or thickness was 50 cubits (about 85 feet). Pliny, however, gives 235 feet as the height of these walls, which were reckoned among the Seven Wonders of the World. It is supposed that a large part of the space enclosed by them was occupied by gardens, orchards, and open fields. The houses were built of bricks, and the streets, which were wide, crossed each other at right angles. "Babylon," says G. Rawlinson, "was probably the largest and most magnificent city of the ancient world." The prophet Isaiah, who lived about 300 years before Herodotus, describes it (chap. xiii. 19) as "the glory of kingdoms, the beauty of the Chaldees' excellency." There is reason to believe that Babylon attained its highest prosperity and splendor in the reign of Nebuchadnezzar, who, inflated with pride and success, once exultingly asked, "Is not this great Babylon, that I have built for the house of the kingdom, by the might of my power, and for the honor of my majesty?" (Daniel iv.) The most remarkable buildings of this city were two royal palaces, one on either side of the river, and the great temple of Belus. Connected with one of these palaces was the "hanging garden," which the Greeks regarded as one of the Seven Wonders of the World. This singular structure, which is ascribed to Nebuchadnezzar, was a square, each side of which measured 400 Greek feet. It was supported on several tiers of open arches, built one over the other like the walls of a classic theatre, and sustaining at each stage or story a solid platform from which the piers of the next tier of arches rose. The top of the building, which was about seventy-five feet high, was covered with a large mass of earth, on which grew not only flowers and shrubs, but trees of a large size. Herodotus gives a description of the temple of Belus, the chief feature of which was the *Zigurat* or tower, a huge solid mass of brickwork, built with receding stages, square being emplaced on square, so as to form a rude pyramid, on the top of which the shrine was placed. The number of stages was eight, and the height of the tower, according to Strabo, was about 600 feet. "When we turn," says G. Rawlinson, "from this picture of the past to contemplate the present condition of the localities, we are at first struck with astonishment at the small traces which remain of so vast and wonderful a metropolis. The broad walls of Babylon are utterly broken down." God has "swept it with the besom of destruction."

(Isaiah xiv. 23.) On its site are visible no pillars, arches, or ruins in the common acceptation of the term, but the traveller finds here many heaps or mounds, some of which are of enormous size, scattered over the plain, so as to verify the prophecy of Jeremiah, "Babylon shall become heaps" (chap. li.). Between the "heaps" the soil is in many places filled with fragments of pottery and bricks, and impregnated with nitre, indicating that it was once covered with houses. Prominent among the remains of Babylon is the Babil mound, a pile of brickwork about 140 feet high, which is supposed to be the ruins of the temple of Belus. The palace of Nebuchadnezzar is identified with a mound which the native Arabs call *El-Kasr* ("the castle"), in which are found fragments of alabaster vessels, fine earthenware, and bricks of excellent quality stamped with the name of Nebuchadnezzar. According to M. Oppert, several slabs found in the Kasr mound bear the following inscription: "Grand palace of Nebuchadnezzar, king of Babylon, son of Nabopolassar, who walked in the worship of Nebo and Merodach his lords." About 6 miles S. W. of Hillah is a ruined building which the natives call Birs-i-Nimrood, which, says G. Rawlinson, "strikes moderns with more admiration than any other now existing in the country." It consisted of seven receding stages, representing the seven planetary spheres, and each stage painted with a different color. The first or basement stage was a square, each side of which measured 272 feet; the second stage was 230 feet square, and had a vertical height of 26 feet; the third stage was 188 feet square and 26 feet high; the fourth stage was 146 feet square; and the others diminished in a similar ratio. From the ruins of Babylon successive generations obtained materials with which Seleucia, Ctesiphon, and other great cities were built.

History.—About 1270 B. C. the Assyrian kings became masters of Chaldæa or Babylonia, of which Babylon was the capital. This country was afterwards ruled by an Assyrian dynasty of kings, who reigned at Babylon, and sometimes waged war against those who reigned in Assyria proper. At other times the kings of Babylon were tributary to those of Assyria. Several centuries elapsed in which the history of Babylon is almost a blank. In the time of Tiglath-pileser of Assyria, Nabonassar ascended the throne of Babylon in 747 B. C. He is celebrated for the chronological era which bears his name, and which began in 747 B. C. About 720, Merodach-baladan became king of Babylon, and sent ambassadors to Hezekiah, king of Judah (see 2 Kings xx. and Isaiah xxxix.). A few years later Sargon, king of Assyria, defeated and dethroned Merodach-baladan. Sennacherib completed the subjection of Babylon, which he annexed to the Assyrian empire about 690 B. C. The conquest of Nineveh and the subversion of the Assyrian empire, which was effected about 625 B. C. by Cyaxares the Mede and his ally Nabopolassar, the rebellious governor of Babylon, enabled the latter to found the Babylonian empire, which was the fourth of Rawlinson's "Five Great Monarchies," and included the valley of the Euphrates, Susiana, Syria, and Palestine. His reign lasted about twenty-one years, and was probably pacific, as the history of it is nearly a blank; but in 605 B. C. his army defeated Neco, king of Egypt, who had invaded Syria. He was succeeded by his more famous son, Nebuchadnezzar (604 B. C.), who was the greatest of the kings of Babylon. According to G. Rawlinson, "It is scarcely too much to say that but for Nebuchadnezzar the Babylonians would have had no place in history. At any rate, their actual place is owing almost entirely to this prince, who to the military talents of an able general added a grandeur of artistic conception and a skill in construction which place him on a par with the greatest builders of antiquity." Our records of his history are derived almost entirely from the Bible—*i. e.* the Second Book of Kings, Second Chronicles, Jeremiah, and Daniel. Zedekiah, king of Judah, having revolted, Nebuchadnezzar captured Jerusalem about 588 B. C., burned the great temple of Solomon, and carried away the Jews as captives to Babylon. (See BABYLONISH CAPTIVITY.) He also took Tyre and conquered Egypt, and became without doubt the most powerful monarch of his time. He promoted the Hebrew prophet Daniel to the second place in the kingdom. (For an account of his character, his marvellous experience, his loss of reason, and his restoration, the reader is referred to the Book of Daniel.) He died in 561 B. C., and was succeeded by his son, Evil-merodach, who reigned only two years. Nabonadius (or Labynetus), who became king in 555 B. C., formed an alliance with Cræsus against Cyrus the Great. He appears to have shared the royal power with his son Belshazzar, whose mother was a daughter of Nebuchadnezzar. Cyrus besieged Babylon, which he took by stratagem in 538 B. C., and with the death of Belshazzar, whom the Persians killed, the kingdom of Babylon ceased to exist. Alexander the Great died in Babylon, which he had selected as the capital of his empire. (See RICH, "Memoirs on the Ruins of Babylon," 1818; Sir R. K. PORTER, "Travels;" LAYARD, "Nineveh and Babylon;" RAWLINSON, "Herodotus," 1858; RAWLINSON, "Five Great Monarchies of the Ancient Eastern World," 4 vols., 1860–67; 2d ed. in 3 vols., 1871; MIGNAN, "Travels in Chaldæa," 1829.)

REVISED BY R. D. HITCHCOCK.

Bab'ylon, a post-village and township of Suffolk co., N. Y., is on South Bay, and on the South Side R. R. of Long Island. It contains 4 churches, 6 hotels, 4 mills, 2 manufactories, and 1 weekly paper. It is connected with Fire Island by horse railroad and steam ferry, and is famed for the salubrity of its climate, and much frequented as a summer resort. Pop. of village, 1225.

H. LIVINGSTON, ED. "SIGNAL."

Babylo'nia, or Chaldæ'a, an ancient country of Asia, which the Scriptures call "the land of Shinar" and "the land of the Chaldees." It coincided nearly with the modern Irak Arabee. Babylonia proper was a part of the great Mesopotamian plain, and was that alluvial tract which intervenes between the Arabian desert and the river Tigris, and was situated on both sides of the Euphrates. It extended from the Persian Gulf north-westward more than 300 miles, and had an area of about 23,000 square miles. The distance is *now* 430 miles, and the area about 30,000 square miles; but the Persian Gulf then ran up 120 miles farther than now. The great and almost sole physical features of this level region were the rivers Euphrates and Tigris, the former of which is navigable about 1200 miles from its mouth. It receives no tributaries from the right in the lower part of its course for a distance of 1000 miles or more, and few from the left, except the Tigris, so that its volume diminishes as it approaches the sea. The plain through which it passes is a dead level, and remarkable for its featureless character. The fertility of its soil in ancient times was proverbial. "Of all countries that we know," says Herodotus, "there is none that is so fruitful in grain, of which it yields commonly two hundred fold." The soil was irrigated by canals, and was well cultivated. The date-palm flourished here, and furnished several products of great value. Babylonia was favorably situated for commerce, and her people were among the most commercial nations of the ancient world. The Babylonians—the Chaldæans of the Hebrew prophets—were a mixed race, in which the dominant element was Semitic. They were distinguished for their intellectual ability, their high civilization, and martial spirit. Their "wisdom and learning" are attested by the prophets Isaiah and Jeremiah: "Thy *wisdom* and thy *knowledge*, it hath perverted thee" (Isaiah xlvii. 10). The luxury of the Babylonians is often censured by both sacred and profane writers. The Chaldæans excelled other ancient nations in astronomy, and were especially addicted to the study of astrology. They attained superior skill in architecture, although they had no better material than brick. Two of their structures, the walls of Babylon and the "hanging garden," were reckoned among the Seven Wonders of the World. Their grand temples and palaces were built of kiln-dried bricks of square form, and very hard and durable. The finest quality of brick was yellow. Brick or clay was also the material on which they wrote and made cuneiform inscriptions. Agriculture and commerce were the chief occupations of these people, who also excelled in the manufacture of textile fabrics and carpets. The Babylonian empire, which was the fourth of the five great Oriental monarchies, included, besides Babylonia proper, Susiana (Elam), Mesopotamia, Syria, Palestine, Idumea, and part of Arabia. (For an outline of its history see BABYLON.) The government was a loose organization of provinces under native princes, who paid tribute, but frequently revolted against the sovereign, who failed to win the affection of the subject nations. "Babylonian civilization," says G. Rawlinson, "differed in many respects from Assyrian, to which, however, it approached more nearly than to any other known type. Its advantages over the Assyrian were in its greater originality, its superior literary character, and its comparative width and flexibility. . . . Babylonia, so far as we know, drew her stores from no foreign country. To Babylonia, far more than to Egypt, we owe the art and learning of the Greeks. It was from the East, not from Egypt, that Greece derived her architecture, her sculpture, her science, her philosophy—in a word, her intellectual life."

REVISED BY R. D. HITCHCOCK.

Babylo'nish Captiv'ity. In the Hebrew sacred history there occurs frequent mention of the fact that the Israelites were carried away captive to Babylon. It was a part of the policy of the kings of Assyria and Babylon to transport a large part of the population of conquered countries and plant them in a distant part of the empire. One

political object of this deportation was the more easy government of a people separated from local traditions and associations. The captives were not enslaved or treated with severity, but they enjoyed probably the same privileges as the other subjects of the empire, and some of them were raised to the highest official positions. Sargon took Samaria in 721 B. C., and carried the ten tribes of Israel away to Assyria. The great Babylonish captivity of the Jews occurred in the reign of Nebuchadnezzar, who in 586 B. C. deposed Zedekiah, king of Judah, burned the temple at Jerusalem, and transported the Jews to Babylon. The tribes of Judah and Benjamin, by the permission of Cyrus the Great, returned to Palestine about 536 B. C., but the other ten tribes remained in exile, and disappeared from history. The seventy years are reckoned from 605, the date of Nebuchadnezzar's first invasion, when Daniel and his friends were carried captive.

Babyrous'sa (*Babyroussa alfurus*), an animal of the hog family, is a native of Borneo, Java, and the Molucca Islands. It is remarkable for the long tusks of the upper jaw, which are curved backward and resemble horns. Its legs are more slender than those of the hog.

Babyroussa.

Bacchana'lia (called by the Greeks *Dionysia*), the feasts and orgies of the votaries of Bacchus among the ancient Greeks and Romans. On account of the licentious practices and drunkenness which prevailed on these occasions, they were prohibited by the Roman senate in 186 B. C. In modern language the term is applied to wild revels and intemperate feasts.

Bacchanten. See Appendix.

Bacchan'tes [the plural of *bac'chans*, the present part. of the Latin verb *bacchor*, to "revel" or "riot"], the Latin term for those, whether male or female, who joined in the orgies of Bacchus among the ancient Greeks and Romans. Their conduct was very disorderly. They danced, swung about the thyrsus, and made a great noise. According to an ancient poetical legend, Orpheus was torn to pieces by some female Bacchantes.

Bac'chus [Gr. Βάκχος], the god of wine, was called Dionysus by the Greeks, and sometimes Liber by the Romans. He was said to be the son of Jupiter and Semele, or, according to one tradition, of Ammon, king of Libya, and Amalthea. He taught men the culture of the vine, and first produced from grapes an intoxicating drink. His worship was spread over many countries of the world, and the myth of Bacchus was variously modified by different peoples. Bacchus is usually represented as an effeminate young man, crowned with vine or ivy leaves, with a *thyrsus* in his hand. His votaries carried sticks or staves called *thyrsi* (sing. *thyrsus*), which were bound with leaves of the ivy and vine. He is said to have performed a successful expedition to India. The Greek festivals in honor of Bacchus were called *Dionysia*. (See Bacchanalia and Bacchantes.)

Bach, the name of a celebrated German family which for upwards of two centuries was distinguished for musical talent and produced more than fifty distinguished artists.—Veit Bach, the founder of the family, was a native of Presburg, in Hungary, and emigrated to Thuringia about 1600. Besides the great Johann Sebastian (1685–1750), other eminent members of the family were Johann Christian, called the "Milanese Bach" (1735–82); Johann Christoph (1643–1703), with his sons Johann Christoph and Johann Nikolaus; also Karl Philipp Emanuel (1714–88) and Wilhelm Friedmann (1710–84).

Bach (Johann Sebastian), youngest son of Johann Ambrosius, court-musician of Eisenach, born there Mar. 21, 1685, the most distinguished of the remarkable family of Bach, and one of the great musicians of the world. A North German and a Protestant, he was a patriarch and founder of German music, and has been not inaptly termed the Albert Dürer of his art. An extraordinary talent, united with enthusiasm and tireless industry, made his whole long life, from childhood on, a career of acquisition and greatness. Early throwing aside the traditions of the Italian school, he penetrated by severe study the secrets of musical science, sought the boldest masters, and pursued the most rigorous methods. Music in every style interested him—instruments of all kinds, but the organ was his great delight. He walked miles, as a boy, to hear a master's performance on that instrument. Such ability and enthusiasm were recognized from the first. Bach was spared the struggle with poverty, and rapidly, by his own efforts, rose to eminence. He had, till his voice became manly, sung treble in a choir at Lüneburg; at eighteen he was a violinist at the court of Weimar; at twenty he filled the place of organist at Arnstadt; at twenty-one he was at Mühlhausen; at twenty-two he was at Weimar again as court-organist; seven years later he resigned that most honorable position for that of concert-master to the duke, an office demanding high capacity, imposing varied responsibilities, and offering rich opportunity for study and practice in composition. His industry at this period was marvellous. Here, however, his stay was short. In 1723—in the mean time he had passed six years as chapel-master to the court at Köthen, capital of the duchy of Anhalt-Köthen—the city authorities of Leipsic chose him to the place of musical director of the St. Thomas School; he was thirty-eight years old. Here for the rest of his life, twenty-seven years, he lived, honored and happy, in the bosom of a large family, for he had ten sons, all musicians—beloved by numerous pupils, and occupied with the art he had done so much to create. Died at Leipsic July 28, 1750.

Bach's compositions were numerous, original, and in many styles. He wrote for voice and instrument—for orchestra, organ, pianoforte, instruments of wood and metal, himself being a performer on them all. He wrote for sacred occasions masses, oratorios, concerted pieces of every kind; his preludes, fugues, cantatas are famous; but his stately genius unbent at festive occasions, births, and weddings; and even comedy was not out of his range. In nearly every field of his art he was a discoverer—in some he was a prophet of future discoveries. The fame of Bach has been increasing since his death. For generations to come they who would study the difficult science of music will go to him, as students of literature or painting go to the grand masters. O. B. Frothingham.

Bache (Alexander Dallas), LL.D., a distinguished educator and scientist, born July 19, 1806, died Feb. 17, 1867, a native of Philadelphia, great-grandson of Benjamin Franklin, received his higher education at the U. S. Military Academy, where he graduated in 1825 at the head of his class. After serving there as assistant professor for one year, and on military engineering duty for two more, he was called to the chair of natural philosophy and chemistry in the University of Pennsylvania, which position he filled with great success for eight years, during which he was also constantly engaged upon scientific researches in physics and chemistry, and as member of the Franklin Institute conducted important experiments on steam-boiler explosions and kindred matters. In 1836 he was appointed president of Girard College, then about to be organized, and went to Europe to study the systems of education and methods of instruction and discipline adopted there. His report on education in Europe (1839), embodying the results of his studies, has done very much to improve the theory and art of education in America. The Girard College not being ready to go into operation, Bache undertook the organization of the school-system of Philadelphia; after accomplishing which he resumed his old chair at the university. He established at Girard College, and during five years directed, a magnetical and meteorological observatory, supported by the American Philosophical Society, of which he was a member. The results of these observations, which were made in correspondence with other observations in different countries, have largely added to our knowledge of terrestrial magnetism. In 1843 he was appointed superintendent of the U. S. coast survey, which important position he filled to the end of his life, displaying the highest administrative ability, combined with all the scientific knowledge requisite for the successful prosecution of that important work. By the confidence with which he inspired the government he was enabled largely to increase the scale of expenditure for the survey, resulting in a still greater ratio of progress. He omitted no opportunity of securing for science the collateral results that could be gathered during the prosecution of the work; he organized a systematic exploration of the Gulf Stream, an extended series of tidal observations, on the magnetism of the earth, on the direction of the winds, and instituted researches in regard to the bottom of the ocean within soundings, and the forms of animal life existing there. His annual reports to Congress are a monument, not only of his administration, but also of his personal investigations in regard to the subjects named, and many others connected with the improvement of methods of geodesy. In addition to the direction of the coast survey, Prof. Bache had, *ex officio*, charge of the construction of standard weights and measures for the U. S., and was a member of the light-house board. As a regent of the Smithsonian Institution from 1846 to the end of his life, he had a large share in shaping its operations. During the civil war he was active as a member of the Sanitary Commission, and in directing the resources of the coast survey to the assistance of the naval and military forces. When, in 1863, the National

Academy of Sciences was organized by Congress, Prof. Bache, as the acknowledged leader of science in the country, was elected its president; nor were his distinguished services to science less acknowledged abroad, as evinced by his election to membership of the most prominent scientific bodies of Europe. Prof. Bache married Miss Nancy Clarke Fowler of Newport, but had no issue. He left his property in trust to the National Academy of Sciences, the income to be devoted to researches in physical science. Died at Newport, R. I., after a lingering illness, on the 17th of Feb., 1867. J. E. Hilgard.

Bache (Benjamin Franklin), an American journalist, son of Richard Bache, noticed below, was born in Philadelphia Aug. 12, 1769. He went to Europe with Dr. Franklin, and while there learned printing and type-founding in the famous establishment of Didot Brothers. After his return he established a paper called the "General Advertiser," the influence of which was in opposition to the administrations of Washington and Adams. Died Sept. 10, 1798.

Bache (Franklin), M. D., a son of the preceding, was born in Philadelphia Oct. 25, 1792. He graduated at the University of Pennsylvania in 1810. He published a "System of Chemistry for the Use of Students of Medicine" (1819), became professor of chemistry in the Philadelphia College of Pharmacy in 1831, and obtained the same chair at the Jefferson Medical College in 1841. He was one of the authors of Wood and Bache's "Dispensatory of the United States," a work of much merit and an acknowledged standard of authority. Died Mar. 19, 1864.

Bache (George M.), U. S. N., born Nov. 12, 1840, in the District of Columbia, graduated at the Naval Academy in 1860, became a lieutenant in 1862, and a lieutenant-commander in 1866. He commanded the iron-clad Cincinnati during her various engagements on the Mississippi River, and until she was sunk by the Vicksburg batteries May 27, 1863. His conduct in this last affair elicited the admiration of Admiral Porter and General Sherman, and the secretary of the navy, Gideon Welles, in his "letter of thanks to Lieutenant-Commander Bache," says: "Amidst an incessant fire of shot and shell, even when the fate of the vessel had been sealed, and destruction both from the elements and the enemy was threatened, the officers and men appear to have stood bravely at their posts; and it is a proud record of the Cincinnati that when her last moments came she went down with the colors nailed to the mast. It is with no ordinary pleasure that I express to you, and to the surviving officers and crew of the Cincinnati, the department's appreciation of your brave conduct." He was in command of a little squadron of three vessels, the Tyler, the Naumkeag, and Fawn, in the very spirited action of June 24, 1864, at Clarendon, Ark., where in forty-five minutes he drove the enemy from their battery of seven guns, capturing guns, ammunition, and stores. He was in both attacks on Fort Fisher, and led the men of the Powhatan in the naval assault on the fort Jan. 15, 1865, where he was wounded in the right shoulder. Referring to this assault, Rear-Admiral Porter, in his despatch of Jan. 28, 1865, says: "Nowhere in the annals of war have officers and sailors undertaken so desperate a service. The names of some of these officers will be found on record on the files of the department, among which those of Lieutenant-Commander T. O. Selfridge and Lieutenant George M. Bache will be found most conspicuous."

Foxhall A. Parker, U. S. N.

Bache (Hartman), an American officer, great-grandson of Dr. Franklin, born Sept. 3, 1798, at Philadelphia, Pa., graduated at West Point in 1818, colonel of engineers Mar. 3, 1863, served chiefly as topographical engineer on surveys for coast defence, naval dépôts, harbor and river improvements, roads, and canals, and for lighthouse sites 1818–47, in constructing Brandywine screw-pile lighthouse and ice harbor, Del., 1848–51, on engineer boards 1852–55, as lighthouse engineer 1852–70, in charge of military roads on Pacific coast 1855–58, in topographical bureau, Washington, D. C., 1861–62, in charge 1861, and member of lighthouse board 1862–70. Became brevet brigadier-general U. S. A. Mar. 13, 1865, for long, faithful, and meritorious services, and retired from active service May 7, 1867. Died Oct. 8, 1872, at Philadelphia, Pa., aged 74.

George W. Cullum, *U. S. Army.*

Bache (Richard), an Englishman, born Sept. 12, 1737, emigrated to the U. S., and in 1767 married Sarah, only daughter of Benjamin Franklin. He became postmaster-general of the U. S. in 1776. Died in July, 1811.

Bache (Sarah), wife of Richard Bache, noticed above, and only daughter of Dr. Benjamin Franklin, was born in Philadelphia Sept. 11, 1744. She was a very accomplished lady, and was distinguished for her efforts to relieve the sick and disabled soldiers of the Revolution. Died Oct. 5, 1808.

Bach'man (John), D. D., LL.D., an American naturalist, born in Dutchess co., N. Y., Feb. 4, 1790. He was pastor of a German Lutheran church at Charleston, S. C. He contributed to Audubon's great work on ornithology, and wrote the principal part of the work on the quadrupeds of North America, which was illustrated by Audubon and his sons. Among his other works is "Characteristics of Genera and Species, as applicable to the Doctrine of the Unity of the Human Race" (1854). Died Feb. 25, 1874.

Bach'mut, a Russian town, in the province of Ekaterinoslav, 127 miles S. E. of Kharkov. In the vicinity are large coal-mines. It manufactures much tallow, and is a market for meat and grain. Pop. 10,482.

Back (Sir George), F. R. S., D. C. L., an English navigator, born in Stockport Nov. 6, 1796. He accompanied Sir John Franklin on his Arctic voyage in 1819, and in 1833 commanded an expedition sent out in search of Capt. Ross. He wrote an account of this voyage, entitled "A Narrative of the Expedition along the Shores of the Arctic Ocean in 1833–34." He became an admiral in 1867.

Back Creek, a township of Frederick co., Va. P. 1895.

Back Creek, a township of Randolph co., N. C. Pop. 1212.

Back'gammon, a game of combined skill and chance, played upon a peculiar board or table with men and with dice. The men are of two colors, and the table is divided into two compartments, each with two sets of points, of which there are twenty-four in all. Upon these points the men are placed in playing, and their movements are determined by throws of the dice alternately made by each player; but the rules of the game are such that much skill may be exercised in executing the movements of the men as indicated by the dice. The object of the game is for the player to bring his own men into his own inner table, and to prevent his adversary from doing the same. There are several games of backgammon, for which the rules are given in "Hoyle's Games." Backgammon is a very ancient recreation, and is by many authorities said to have originated in England, or perhaps in ancient Britain.

Back'huysen, or **Bakhuysen** (Ludolf), a celebrated Dutch marine-painter, born at Emden Dec. 18, 1631. He was a close student of Nature, and often ventured out to sea during storms. His paintings are said to express the poetry of the sea. Among his works is a marine view which the magistrates of Amsterdam presented to Louis XIV. of France. Died in 1709.

Back Swamp, a township of Robeson co., N. C. P. 800.

Back'us (Azel), D. D., a nephew of Charles Backus, noticed below, was born at Norwich, Conn., Oct. 13, 1765, graduated at Yale 1787, in 1791 succeeded Dr. Bellamy as pastor of the Congregational church in Bethlehem, Conn., in 1812 was chosen first president of Hamilton College, and died Dec. 9, 1817. He took great interest in political questions, was an eloquent preacher, and a successful teacher and disciplinarian. He published only a few sermons.

Backus (Charles), D. D., was born at Norwich, Conn., Nov. 5, 1749, graduated at Yale 1769, was settled over the Congregational church in Somers, Conn., in 1774, and died there Dec. 30, 1803. For many years he was accustomed to receive theological students into his family. Nearly fifty were trained by him, among whom were Dr. Woods of Andover, President Moore of Amherst College, President Davis of Hamilton College, and several other distinguished men. He published many sermons.

Backus (Rev. Isaac), born at Norwich, Conn., Jan. 9, 1724, ordained pastor of a Separatist church in Titicut (a parish of Bridgewater and Middleboro'), Mass., April 13, 1748, preached in Titicut till his death, which occurred Nov. 20, 1806. In 1751, Mr. Backus espoused Baptist principles, and soon became one of the most active and influential ministers of that denomination. He was for thirty-four years a trustee of Rhode Island College (now Brown University), was in 1774 agent of the Warren (R. I.) Association to advocate before Congress equal privileges for all religious denominations, and in 1788 delegate from Middleboro' to the Massachusetts convention which ratified the Federal Constitution. In 1777–84 Mr. Backus published "A History of New England, with especial reference to the Baptists," a work which is still of value to the general student of the history of New England, and especially so to one who is studying the progressive recognition of the principles of religious liberty in America. A new edition (carefully edited by Prof. David Weston of Madison University) was published by the Backus Historical Society, Newton Centre, Mass., in 1871, 2 vols. 8vo.

Backus (Jay S.), D. D., born Feb. 17, 1810, at Gran-

ville, Washington co., N. Y., educated at Granville Academy and Hamilton, N. Y., pastor of Baptist churches in Groton, Auburn, N. Y., and Syracuse, N. Y., and from 1862 till May, 1874, was an earnest and efficient secretary of the American Baptist Home Mission Society.

Baco'li, a village of Italy, near Naples. It is on the site of the ancient *Villa Bauli*, which was the seat of the country residences of the ancient Romans. Many ruins are found here.

Bacolor', a town on Luzon, one of the Philippine Islands, is the capital of the province of Pampanga. It is near the river Pampanga, and 38 miles N. W. of Manila. Pop. about 8500.

Ba'con, a township of Vernon co., Mo. Pop. 813.

Bacon, a township of Charlotte co., Va. Pop. 3683.

Bacon (Ezekiel), LL.D., born in Stockbridge, Mass., Sept. 1, 1776, graduated at Yale in 1794, was one of the chief-justices of the Massachusetts court of common pleas in 1813, first comptroller of the U. S. treasury (1813–15), and a member of Congress from Massachusetts (1807–13). Died at Utica, N. Y., Oct. 18, 1870.

Bacon (Francis), [in Latin *Francis'cus Baco'nus*], Baron Ver'ulam, Viscount Saint Albans, one of the most illustrious of modern philosophers, was born in London Jan. 22, 1561. His father, Sir Nicholas Bacon, was lord keeper of the great seal under Elizabeth. His mother, a lady of fine talents, whose maiden name was Anne Cooke, was a sister of Mildred, the second wife of Lord Burleigh. Bacon, soon after he had completed his twelfth year, was sent to Cambridge, where he is said to have distinguished himself by his diligence and by his rapid progress in his studies. While at the university he conceived, it is said, a decided dislike to the philosophy of Aristotle as it was then taught in the schools. Soon after leaving Cambridge he visited France, in order to acquire the French language and to continue his studies on the Continent, but his father's death, in 1579, obliged him to return to England. In 1582 he was admitted to the bar, and became in 1589 member of Parliament, and in 1590 counsellor-extraordinary to the queen—a distinction almost without example for one so young. Ben Jonson speaks in the highest terms of his gifts as an orator; he tells us that Bacon "commanded when he spoke, and had his judges angry or pleased at his devotion. No man had their affections more in his power. The fear of every man that heard him was, that he should make an end." Lord Burleigh, though Bacon's uncle by marriage, appears rather to have retarded than aided the promotion of his nephew. The latter, left wholly to his own exertions, applied himself diligently to his profession, and at length acquired a lucrative practice. He became in 1594 a candidate for the office of solicitor-general, but was unsuccessful. The earl of Essex, who appears to have conceived a warm and sincere friendship for Bacon, in order to console him under his disappointment made him a present of an estate near Twickenham worth £1800 sterling, which in real value was, in all probability, nearly if not quite equal to five times that number of pounds at the present day.

It appears to have been Bacon's aim for many years to acquire a fortune by a wealthy marriage. He paid court to a rich widow by the name of Hatton, but, though aided by the intercession of Essex, who was then in great favor at court, he was not successful; which, according to Macaulay, was a very fortunate circumstance for Bacon. The lady afterwards married Bacon's rival and enemy, Sir Edward Coke, and "did her best to make him as miserable as he deserved to be." When Essex, seduced by a wild and reckless ambition, embarked on those schemes which afterwards led to his death on the block (see Essex), Bacon appears to have used whatever influence he had in order to mitigate the resentment of the queen against her misguided kinsman. Unhappily for his reputation, he was induced by the desire to advance his interest at court—for we can scarcely suppose he was influenced by a sense of duty—to abandon the office of intercessor, and to take an active and prominent part in the prosecution of his former friend. And worse still, after the death of Essex, in order to vindicate the conduct of the queen, he employed his talents and eloquence to blacken the character of his benefactor. After the accession of James I., Bacon appears to have enjoyed the highest favor at court. He was knighted before the king's coronation. His law practice had now become, if not very extensive, at least very lucrative. In 1606 he married Alice Barnham, the daughter of a rich London merchant. He had previously been appointed king's counsel, and in 1607 he was made solicitor-general. He became in 1613 attorney-general and a member of the privy council. He was selected by the king as his agent to conduct the prosecution against Peacham, in which affair Bacon is accused of having sought, against law and justice, to obtain the opinions of the judges before the case came up for trial. Bacon was appointed in 1617 keeper of the great seal, and in January of the ensuing year he was made lord high chancellor of England, the highest civil office to which any subject could then attain. In the following July he was created Baron Verulam, and admitted to a seat in the House of Peers. In 1619 he became Viscount Saint Albans, and in 1620 published his greatest work, the Novum Organum (which see). The cup of his prosperity and fame appeared to be full to overflowing, but a great reverse was near. It seemed as if Fate had raised him to the highest pinnacle of greatness that his fall might be the more tragic and more conspicuous. He was accused of accepting bribes by a man named Waynham, against whom Bacon had decided a suit in chancery. A committee of the House of Commons was appointed to inquire into the case, which was referred to the House of Lords as the only legitimate tribunal for trying it. At the beginning of the trial Bacon strongly asserted his innocence, but he subsequently abandoned his defence and confessed his guilt. He was sentenced (May 3, 1621) to pay a fine of forty thousand pounds, and to be imprisoned at the king's pleasure. James was disposed to show him every indulgence. As a mere form he was sent to the Tower, but two days afterwards he was set at liberty. His fine was also remitted, and he was allowed an income of £1200, a sum which may safely be pronounced fully equal to £6000 at the present day. He died April 9, 1626, and left no children. Bacon's celebrated "Novum Organum" and his "De Augmentis" are but parts of a more extensive work, entitled "Instauratio Magna," or "Great Restoration," so called because through its means he hoped to recall Philosophy from what he considered the vain and idle speculations of the Aristotelian school, and restore her to her true and legitimate office of interpreter of Nature. Among his other works should be mentioned his "Essays" (first published in 1597), doubtless the most popular and widely read of all his writings, and his "De Sapientia Veterum" ("On the Wisdom of the Ancients," 1609), of which a good translation by Sir A. Gorges was published in 1619. Although Bacon's celebrity as an author may be said to rest exclusively on his philosophical writings and his "Essays," he left some very able legal treatises; among others his "History of the Alienation Office," which Lord Campbell pronounces worthy of Hale. "No one," says the same able critic, "ever sat in Westminster Hall with a finer judicial understanding; no one ever more thoroughly understood the duties of a judge." In person Bacon was well formed, but not robust, of a middling stature, with a high and broad forehead, his countenance conveying the impression both of intellectual power and benevolence of disposition. In society he is said to have been "a most delightful companion, adapting himself to company of every degree, calling, and humor, . . . bringing out with great effect his unexhausted stores of jests new and old." (See Montague, "Life of Bacon," added to Bacon's collected works; William Rawley, "Life of Lord Bacon" (1658); Spedding, "Life of Bacon," in his very complete edition of Bacon's works (4 vols., 1861–68).)

J. Thomas.

Bacon (Joel S.), D. D., born in Cayuga co., N. Y., in 1801, graduated at Hamilton College, Clinton, N. Y., in 1826, studied theology at Newton, Mass., was successively president of Georgetown College, Ky., pastor of a Baptist church in Lynn, Mass., professor in the institution at Hamilton, N. Y. (1834–37), president of Columbian College, D. C. (1843–54), and subsequently was a teacher in Alabama and in Virginia. Died at Richmond, Va., Nov. 9, 1869.

Bacon (Leonard), D. D., LL.D., the son of a missionary to the Indians, was born at Detroit, Mich., Feb. 19, 1802, graduated at Yale 1820, and at Andover 1824. From 1825 to 1866 he was pastor of the Centre church (Congregational), New Haven, Conn.; from 1866 to 1871 he was acting professor of systematic theology, and since 1871 has been lecturer on church polity and American church history in the Divinity School of Yale College. He has contributed largely to the "Christian Spectator" and the "New Englander," and was for several years one of the editors of the "Independent." He has been one of the foremost champions of New England Congregationalism. Besides numerous occasional sermons and addresses, he has published "Select Practical Writings of Richard Baxter" (1831; 2d ed. 1835), "Thirteen Discourses on the Two-Hundredth Anniversary of the First Church in New Haven" (1839), "Slavery Discussed" (1846), "Historical Discourse at the Old South Meeting-house, Worcester, Sept. 22, 1863."—One of his sons, Rev. Leonard Woolsey Bacon, M. D., born Jan. 1, 1830, graduated at Yale in 1850, is an able preacher and author.—Another son, Rev. George Blagden Bacon, born at New Haven May 23, 1836, was in 1861 ordained to the ministry at Orange Valley, N. J.

Bacon (Nathaniel), an English lawyer and leader of Virginian insurgents, was born in Suffolk about 1640. He practised law in Virginia, became an eloquent speaker and a popular favorite. He was chosen as leader of the people who about 1676 took arms ostensibly to defend the province against the savages, but partly to resist the policy of Governor Berkeley. Bacon defeated both these enemies, but in the midst of the contest he died Oct. 1, 1676. (See Sparks's "American Biography," vol. iii. of new series.)

Bacon (Sir Nicholas), an English statesman, born at Chiselhurst, in Kent, in 1510, was the father of the great Bacon, Baron Verulam. He was educated at Cambridge, studied law, and was appointed solicitor to the court of augmentations in 1537. In 1546 he obtained the office of attorney to the court of wards, of which he was deprived by Queen Mary in 1553 because he was a Protestant. He was appointed lord keeper of the great seal by Elizabeth in 1558. He was distinguished for his moderation, sagacity, and discretion, and rendered important services to the Protestant cause. Among the English statesmen of that age he was ranked next to Lord Burleigh, who was his friend and brother-in-law. Having held the office of lord keeper about twenty years, he died Feb. 20, 1579. (See G. Whetstone, "Memoir of Sir N. Bacon;" Lord Campbell, "Lives of the Lord Chancellors.")

Bacon (Roger), an eminent English philosopher and monk, called the Admirable Doctor, was born near Ilchester, in Somersetshire, about 1214. He studied at Oxford and at Paris, where he took the degree of doctor of laws. Having entered the order of Franciscan monks, he settled at Oxford and devoted much time to experimental philosophy. He was far in advance of his age, and made discoveries in several sciences. He wrote in Latin a number of works on chemistry, optics, physics, etc. By denouncing the immorality and ignorance of the clergy and monks he made many enemies. His mechanical skill and his insight into the secrets of nature were such that he was suspected of dealing in magic. His writings having been condemned by a council of Franciscan monks, he was thrown into prison about 1278, and confined at least ten years. Indeed, it is not certain that he ever came out of prison. Nor is it certain in what year he died, whether 1292 or 1294. His capital work, which treats of several sciences, is entitled "Opus Majus," and was written about 1266. It was first printed in 1733. Several of his works, such as the "Opus Tertium," "Opus Minus," and "Compendium Philosophiæ," were published for the first time in 1859. It appears that he was acquainted with the composition and explosive power of gunpowder. "The mind of Roger Bacon," says Hallam, "was strangely compounded of almost prophetic gleams of the future course of science and the best principles of the inductive philosophy, with a more than usual credulity in the superstitions of his own time." Gieseler says of him that he "showed a wonderful keenness of vision on all points in every branch of human knowledge." And yet he believed both in alchemy and in astrology! (See Anthony Wood, "History and Antiquities of Oxford;" "Biographia Britannica.")

Bacon Level, a township of Randolph co., Ala. P. 515.

Ba'conthorp, or **Bacon** (John), an English Carmelite, surnamed the Resolute Doctor, was born in Norfolk about the beginning of the fourteenth century. He advocated the philosophy of Averroës, and had great reputation for learning. Among his works is a commentary on the "Master of Sentences" (Peter Lombard). Died in 1346.

Bacs, a county of Hungary, is bounded on the N. by the county of Pesth, on the E. by Torontal, on the S. by Slavonia, and on the W. by Torontal. Area, 3940 square miles. The Danube flows along the western boundary, and the Theiss along the eastern, while the two are connected by the canal of Bacs, which is about 60 miles long. The county is entirely level, and, with the exception of the swamps along the rivers, is very fertile. Chief town, Zombor. Pop. in 1869, 576,149.

Bacte'ria (plu.), [Gr. βακτηριον, a "club," alluding to the form], in microscopy, a name for certain plant-cells which are cylindrical, spherical, or oblong, but sometimes distorted in shape. That they are of vegetable not animal character is shown by their power of taking up nitrogen from ammonia-compounds. They occur either single or compound, and multiply by transverse division. They are propagated in water, and are not (according to Cohn and Burdon-Sanderson) capable of transmission through the air, like fungus spores. Cohn divides them into four groups, and assigns them a place near the Algæ.

Bac'tria, or **Bactria'na,** an ancient country of Central Asia, bounded on the N. by the river Oxus (Amoo or Gihon), and on the S. by the Hindoo-Koosh Mountains (anc. *Paropamisus*). Its boundaries are not perfectly known, but it is considered to be identical with the modern province of Balkh. This is supposed by some to have been the native country of the Aryan race. Bactria was the centre of a powerful kingdom which flourished before the historical period. Its capital, Bactra or Zariaspa, which stood on the site of the modern Balkh, was the head quarters of the Magi. In the time of Cyrus the Great, Bactria became a Persian province, and was conquered, with the rest of the Persian empire, by Alexander the Great. The history of Bactria has recently been elucidated by numerous Greco-Bactrian coins and other antiquities found in the *topes* or burial-places of Afghanistan. Some of these coins present Greek letters, and also letters of a dialect of Sanscrit. (See Wilson, "Ariana Antiqua," 1841; Lassen, "Indische Alterthumskunde," 1849.)

Bac'tris [from the Gr. βάκτρον, a "cane"], a genus of palms, comprising about fifty known species, all natives of America. They are generally small trees, with slender stems and pinnate leaves. Some of them are spiny, and form thickets which are almost impenetrable. The *Bactris Maraja*, or the maraja palm, bears clusters of fruit resembling small grapes, with a pulp of an agreeable flavor. The stems are used as walking-sticks.

Bactri'tes, a group of fossil Ammonitidæ, with a straight shell, and indented but not ramified septa. Several species of it have been found in the Devonian strata.

Baculi'tes [from the Lat. *bac'ulus*, a "stick"], a genus of fossil univalve mollusks of the family of Ammonitidæ, found in the upper chalk. The shell is chambered, perfectly straight, round (or compressed), and tapers to a point. Various species are found in Europe, North and South America, etc.

Bac'up, a flourishing town of England, in Lancashire, 22 miles by rail N. of Manchester. It is situated in a beautiful valley, and is a terminus of a branch of the Lancashire and Yorkshire Railway. It has many churches and chapels, a fine market-house, and a literary institute. Here are extensive cotton-factories and several brass and iron foundries and dye-works. Coal-mines are worked in the vicinity. Bacup is said to be increasing rapidly. Pop. in 1861, 10,935.

Badag'ry, a seaport-town of Africa, on the Gold Coast of Upper Guinea, 50 miles E. N. E. of Whydah. The Portuguese once had several factories at this place, which was a market for slaves. Pop. about 10,000.

Badajos, a province of Spain, is bounded on the N. by Caceres, on the E. by Ciudad Real and Córdova, on the S. by Seville and Huelta, and on the W. by Portugal. Area, 8688 square miles. It is for the greater part a poor and uncultivated region, and is chiefly used as pasture-grounds for immense herds of sheep and swine. Chief town, Badajos. Pop. 430,649.

Badajos' [Sp. *Badajoz*; anc. *Pax Augus'ta*], a fortified town of Spain, capital of the above province, is situated on the left bank of the Guadiana, 175 miles by rail E. of Lisbon. The river is here crossed by a good granite bridge of twenty-eight arches. The town contains an old cathedral, an arsenal, and a cannon-foundry. It has manufactures of soap, coarse woollen stuffs, and leather, and a brisk contraband trade. Badajos was the native place of the painter Morales. It has been the scene of several important military events. It was besieged and taken by the French general Soult in Mar., 1811. Wellington attempted to retake it in April, but he failed. Having renewed the siege in Mar., 1812, he took it by storm on the 6th of April ensuing, after a desperate contest, in which the British lost 4824 men, killed and wounded. Pop. in 1860, 22,895.

Badakhshan', or **Budukshan,** a territory of Central Asia, dependent upon Afghanistan, bounded N. by the Amoo-Darya (Oxus), S. by the Hindoo Koosh. It includes several valleys of the head-streams of the Oxus (Amoo). The surface is mountainous, and a great mountain-range extends along the eastern border. Here are ruby-mines and massive cliffs or quarries of lapis-lazuli. Iron, salt, and sulphur are also obtained here. The inhabitants are Mohammedans. Cap. Fyzabad.

Badakhshan, or **Fyzâbâd',** a town of Central Asia, capital of the above territory, is on one of the head-streams of the Amoo, about 210 miles N. E. of Cabool. It was once an important place.

Bad'deck, a post-village, capital of Victoria co., N. B., Dominion of Canada, in Cape Breton Island, on the Big Bras d'Or. It is visited by steamers, and has a trade in cattle and butter. It is in a township of the same name.

Badeau (Adam), an American officer, born in New York, became a captain and aide-de-camp of U. S. volunteers in 1862, served on the staff of Gen. Sherman, and was wounded at Port Hudson; became in 1864 lieutenant-colonel

and military secretary to Gen. Grant, and was colonel and aide-de-camp 1865–69. He received a brevet as brigadier-general U. S. army, and was some time secretary of legation in London. He published a "Military History of Gen. Grant" (1868). He is (1874) U. S. consul-general at London.

Ba'den [Lat. *Ba'da*], **Grand Duchy of,** a state of Germany, bordering on Alsace and Switzerland, is bounded on the N. by Hesse-Darmstadt, on the E. by Würtemberg, and on the S. and W. by the Rhine. It has an area of 5912 square miles. Pop. in 1871, 1,461,428. The surface is mountainous. A long mountain-range called "The Black Forest" (Schwarzwald) extends along the eastern border. The highest point is the Feldberg, 4886 feet high. The western part of Baden is a long plain extending along the Rhine from Bâle to Mannheim. The chief rivers, besides the Rhine, are the Danube, which rises in Baden, and the Neckar. The valley of the Rhine has a mild climate and a very fertile soil, which is well cultivated. The grape and other fruits flourish here in abundance. Among the staple products are wheat, barley, maize, potatoes, and tobacco. Good pine timber abounds in the Black Forest. The average quantity of wine produced annually is about fourteen million gallons. Among the mineral resources are copper, coal, silver, iron, lead, and salt. Baden is rich in mineral springs, which are much frequented as watering places, as Baden-Baden, Badenweiler, etc. More than 9000 persons are engaged in the manufacture of cotton fabrics, ribbons, paper, toys and trinkets, wooden clocks, etc. The chief articles of export are wine and timber. A railroad extends along the valley from Mannheim to Bâle. The chief towns are Mannheim, Carlsruhe (the capital), Freiburg, Heidelberg, Pforzheim, and Constance.

Religion and Government.—A majority of the people are Roman Catholics, and about one-third Protestants. Baden has two universities (Heidelberg and Freiburg), an excellent system of public instruction, and the children are compelled to attend school. This state is governed by an hereditary grand duke, who in relation to foreign and military affairs is dependent upon the emperor of Germany. He governs according to a constitution which is among the most liberal in Germany. The parliament of Baden consists of a chamber of peers and a chamber of sixty-three deputies. Hermann II., who died in 1130, was the first to assume the title of margrave of Baden. The grand ducal family now reigning in Baden are lineal descendants of him. In 1746, Charles Frederick became margrave of Baden, which under his reign increased in extent and importance. He acquired the dignity of elector in 1803, and the title of grand duke in 1806. Having joined the Confederation of the Rhine, he gained a large accession of territory. His grandson, Charles Louis, granted in 1818 a charter which forms the basis of the present constitution. Under the impulse of the revolutionary movement which began in France in Feb., 1848, the popular party of Baden took arms to found a republic. The grand duke fled, and a constituent assembly was convened in May, 1849. By the aid of a Prussian army he was restored in July of that year. In Aug., 1866, Baden formed with Prussia a secret alliance, which was made public about April, 1867. Baden became, in 1870, a state of the new German empire, in the federal council of which she has three votes, the whole number of votes being 58.

A. J. Schem.

Baden (anc. *Ther'mæ Helvet'icæ*), a town and watering-place of Switzerland, in the canton of Aargau, on the Limmat, 14 miles by rail N. W. of Zurich. In Jan., 1834, the "conference of Baden" was held here, in which the representatives of Lucerne, Aargau, Thurgau, Soleure, Berne, Bâle-City, and St. Gall met to settle the relations of the Catholic Church to these cantons. The temperature of the baths is about 117° F. Pop. in 1870, 3412.

Baden, a post-village of Wilmot township, Waterloo co., Ontario, Canada, has important manufactures of linen and woollen goods, staves, lumber, flour, beer, etc. It is on the Grand Trunk Railway, 72 miles from Toronto. Pop. about 500.

Baden-bei-Wien (anc. *Ther'mæ Co'tiæ* or *Panno'niæ*), a town and bathing-place of Lower Austria, on the river Schwächat, 16 miles by rail S. S. W. of Vienna. Here are warm mineral springs, which are frequented by the citizens of Vienna. Many of the Austrian nobility have mansions here. Pop. in 1869, 7590.

Ba'den-Ba'den (anc. *Civ'itas Aure'lia Aquen'sis*), a town and a celebrated watering-place in the grand duchy of Baden, is beautifully situated in a pleasant valley at the foot of the Schwarzwald Mountains (Black Forest), 23 miles by rail S. S. W. of Carlsruhe and 6 miles from the Rhine. Here are warm saline springs, the temperature of which ranges from 117° to 154° F., which were much resorted to in the time of the Roman emperors. They are efficacious in cases of gout and chronic cutaneous diseases. Baden-Baden is frequented in summer by visitors from all parts of Europe, to the number of about 30,000 annually. In former years its gambling-hall was a great attraction, but upon the restoration of the German empire gambling here, as in the other watering-places, was suppressed. Pop. in 1871, 10,083.

Badenwei'ler, a village and watering-place of Baden, 2 miles E. of Mülheim, has alkaline thermal springs, the temperature of which is 82° F. Large ruins of Roman baths were found here in 1784, which are among the grandest known. Inscriptions on old coins let us suppose that the baths flourished until the middle of the third century.

Badge [perhaps a contraction of *bandage*], a mark, sign, or token by which a person is distinguished; an honorary decoration or special cognizance; as, for example, the stars and crosses worn by persons of rank and princes in Europe, the button on the cap of a Chinese mandarin, or a medal given to a soldier as a premium for bravery. Finger-rings are mentioned in the Bible as badges of authority; for instance, Pharaoh took off his ring and put it on Joseph's hand as a token of the power delegated to him (Genesis xli.). The ambassadors of ancient Rome wore gold rings during their mission as badges of authority. Several countries have distinctive badges. The badge of England is a rose, white and red, ensigned with the royal crown, the origin of which was the union of the white rose of the House of York with the red rose which was the badge of the rival House of Lancaster. The badge of Scotland is a thistle ensigned with a royal crown. Ireland has two badges, the golden harp and the trefoil, both of which are carried ensigned with the royal crown. The badge of France was formerly a *fleur-de-lis*, a "lily or iris," sometimes called in English "flower de luce."

Bad'ger, a name applied to certain animals of the order Mustelidæ, assigned, however, by some to the bear family, which they approach in character. They were formerly ranked in one genus (*Meles*), but now are assigned by most naturalists to at least four different genera. They are plantigrades, have a pointed skull, and feet adapted for burrowing. They have anal glands which secrete substances with a disagreeable odor. The common badger, brock or grey, of Europe (*Meles taxus*), found also in Asia, is about the size of the common fox. It was formerly, and is even now, kept for "badger-drawing." The animal is put into a barrel and assailed by numerous dogs, which are trained to pull the badger out. The animal resists obstinately until overpowered, when he is allowed a short rest,

The Indian Badger.

and is then ready for another struggle with his enemies. The animal is quite harmless if not abused. The East Indian badger (*Arctonyx collaris*) is a more formidable animal. Japan has still another badger. Two American species of badger (*Taxidea Americana* and *Taxidea Ber-*

laudieri) are known, the former found most abundantly in the valley of the Missouri, and the other in Mexico, California, etc. They are more carnivorous than the European badger, and are remarkable for their short ears, long hair, and the rapidity with which they burrow in the earth.

Badger, a township of Webster co., Ia. Pop. 431.

Badger (George Edmund), LL.D., an American statesman, born at Newbern, N. C., April 13, 1795. He graduated at Yale in 1813, practised law at Raleigh with distinction, and in Mar., 1841, was appointed secretary of the navy by President Harrison. He resigned in September of that year, because Tyler vetoed the bill to recharter the U. S. Bank. He was a Senator of the U. S. for about seven years (1846–53). Died May 11, 1866.

Badger (Joseph), an American minister, born at Wilbraham, Mass., Feb. 28, 1757, graduated at Yale in 1785. He served four years in the Revolutionary army, after which he obtained an education, and was sent as a missionary to Ohio, where he labored more than thirty years. Died May 5, 1846.

Badger (Milton), D. D., an American clergyman, born May 6, 1800, at Coventry, Conn., graduated with honor from Yale College in 1823, and studied theology at Andover Seminary. In 1826 he was appointed a tutor in Yale College, and in 1828 was ordained pastor of the South Congregational church, Andover. Dr. Badger was elected associate secretary of the American Home Mission Society in 1835, with which society he was officially connected thirty-eight years. He died Mar. 1, 1873.

Badger (Oscar C.), U. S. N., born Aug. 12, 1823, in Windham, Conn., entered the navy as a midshipman Sept. 19, 1841, became a passed midshipman in 1847, a lieutenant in 1855, a lieutenant-commander in 1862, a commander in 1866, a captain in 1872. He served in the steamer Mississippi on the E. coast of Mexico during the Mexican war. In 1861–62 he commanded the steamer Anacostia of the Potomac flotilla, was engaged at various times with the batteries on the Potomac River, and the "precision" of the fire of his vessel is more than once referred to by the commanding officer of the flotilla, Lieutenant-commanding Wyman, in his reports to the navy department. He was in command of the iron-clads Patapsco and Montauk in their many engagements with the forts and batteries of Charleston harbor in the summer of 1863; as fleet-captain was with Rear-Admiral Dahlgren on board the iron-clad Weehawken in a night-attack upon Fort Sumter, Sept. 1, 1863, when he received a severe wound in the right leg, from the effects of which he has never entirely recovered. His services, character, etc. are thus mentioned by Rear-Admiral Dahlgren, in his report to the secretary of the navy of Sept. 2, 1863: "I shall feel greatly the loss of Commander Badger's services at this time. He has been with me for more than eight years, and his sterling qualities have rendered him one of the very best ordnance officers in the navy." Foxhall A. Parker, U. S. N.

Badi'to, a post-village, capital of Huerfano co., Col., on the Huerfano River, 54 miles from Pueblo. It has a population partly of Mexican origin, and has a large trade in wool, hides, and stock.

Baena (bä-ā'nä), or **Vaena,** a town of Spain, in the province of Córdova, on the Marbella, 32 miles S. E. of Córdova. It occupies the site of an ancient Roman town. Grain and oil are exported from this place. Pop. 13,000.

Baĕpen'di, a town of Brazil, in the province of Minas Geraes, is situated on one of the head-streams of the Rio Verde, in the Serra Mantiqueira, about 180 miles N. W. of Rio de Janeiro. Pop. about 9000.

Baer, von (Karl Ernst), a Russian naturalist of German extraction, born in Esthonia in 1792. He became in 1819 professor of zoology at Königsberg. He wrote, besides other works in German, a "History of the Development of Animals" (2 vols., 1828–37). In 1834 he removed to St. Petersburg, and was appointed librarian of the Academy of Sciences. He made several discoveries in physiology and zoology.

Ba'ez (Buenaventura), a mulatto politician, born in 1820, was elected president of Santo Domingo in 1849, and re-elected in 1856 and 1865. In 1874 he left the country and came to the U. S. (See Domingo, Santo, Projects of Annexation to the U. S., by Hon. A. D. White, LL.D.)

Bae'za, or **Baeça** (anc. *Biatia*), an old town of Spain, in the province of Jaen, 22 miles N. E. of the city of Jaen. It contains a cathedral and several monasteries in the Gothic style, which, with other buildings, present an imposing appearance. The university, established in 1533, has ceased to exist in recent times. Under the Moors it was the capital of the kingdom of Bajasat, and is said to have had 150,000 inhabitants. Cloth, leather, and soap are made here. Pop. 13,405.

Baf'fa (anc. *Pa'phos*), a seaport-town on the S. W. coast of the island of Cyprus. It was once an important place, but is now ruined or decayed and nearly deserted. In ancient times Paphos was a beautiful city, having several temples, and was a famous place for the worship of Venus. Lat. 34° 47′ N., lon. 32° 26′ E.

Baf'fin (William), an English navigator, born in 1584. He accompanied James Hall in an Arctic expedition in 1612, and discovered Baffin's Bay in 1616. He wrote two narratives of these voyages, and gave in the first a new method of ascertaining the longitude at sea by observation of the heavenly bodies. He was killed at the siege of Ormuz, May 23, 1622.

Baffin's Bay, or **Bylot's Bay,** a large gulf or inland sea of North America, communicates with the North Atlantic by Davis's Strait, and with the Arctic Ocean by Smith's Sound. It is about 950 miles long, and has an average width of about 300 miles. The greatest depth is about 1050 fathoms. The shores are generally high and rocky, backed by ranges of snow-covered mountains. It was first explored by William Baffin in 1616. Whales abound here.

Bagatelle [Fr. a "trifle"], the name of a game somewhat resembling billiards. A bagatelle-table is usually about seven feet long and twenty-one inches wide, and is lined with cloth. The other apparatus of the game consists of small ivory balls and a mace or cue.

Bag'by (Arthur Pendleton), a lawyer, born in Virginia in 1794, was governor of Alabama (1837–41), U. S. Senator (1843–49), and minister to Russia (1849–53). Died at Mobile Sept. 21, 1858.

Bag'dad, a pashalic forming the S. E. portion of Asiatic Turkey, bordering on Arabia and Persia. It extends from the Persian Gulf north-westward about 600 miles, and is intersected by the Euphrates and the Tigris. It includes the ancient Chaldæa, Susiana, and Mesopotamia. The part which lies between the Euphrates and Arabia is a barren, sandy plain. The soil of some other parts is fertile. The population is a mixture of Turks, Arabs, Kurds, Armenians, etc. Capital, Bagdad.

Bagdad, a celebrated city of Asiatic Turkey, formerly the capital of the empire of the califs, and now the capital of the pashalic of Bagdad, is situated on both banks of the Tigris, about 60 miles N. of Babylon; lat. 33° 20′ N., lon. 44° 22′ 38″ E. The river is here about 700 feet wide, and is crossed by a bridge of boats. The appearance of the city at a distance is rendered picturesque by groves of palm trees and numerous minarets, but the streets are narrow, crooked, and dirty. The dwelling-houses, having no windows on the side next to the street, present an unpleasing exterior, but the interior is often richly decorated. Bagdad contains about one hundred mosques, some of which have beautiful domes and lofty minarets. Here are large bazaars filled with the products of European and Turkish markets. It was formerly a very magnificent city, and was for many ages the great emporium of commerce of the surrounding countries, but its trade has declined. It has manufactures of silk and cotton stuffs and red and yellow leather. The population is 70,000. In 1831 an inundation destroyed a large part of the city. Bagdad was founded by the calif Almansur about 763 A. D., and built out of the ruins of Ctesiphon. In the ninth century it was enlarged by Haroun-al-Raschid, who built here a fine palace. In the tenth and eleventh centuries it is said to have had 2,000,000 inhabitants. It was sacked by Hulaku about 1258, and after several changes of masters was conquered by the Turks in 1638.

Bagdad, or **Boca del Rio,** a town on the Rio Grande, near its mouth, in the Mexican state of Tamaulipas, was during the late civil war in the U. S. a place of great importance to blockade-runners, who carried on from this point a heavy trade with Western Texas.

Bagdad, or **Blackwater,** a village of Santa Rosa co., Fla., on the navigable Blackwater River, 28 miles from Pensacola and 1½ miles below Milton. It has extensive lumber-mills and manufactures of juniper (red cedar) window-sash.

Bag'gage [Lat. *impedimen'ta*; Fr. *bagage*], a term applied to the tents, clothing, utensils, and other necessaries of an army, which are carried on carts, pack-horses, or mules. In every army the amount of baggage is limited by strict rules. A private soldier is allowed to carry nothing except that which his knapsack and other accoutrements can hold. The baggage of officers is more extensive. In the U. S. the trunks and carpet-bags of travellers are called "baggage," in England they are "luggage."

Bag'gesen (Jens), a Danish poet, born at Korsör, in the island of Seeland, Feb. 15, 1764. He was highly gifted, but of a weak character; with a fine fancy, but of

a restless spirit; excitable, but without passion; fantastic, but without imagination. Born between two periods, he could neither stay with the old nor march with the new. He was intimate with men of second rank, and enthusiastically received by the educated; but no man of first rank would acknowledge him, and the great public he never reached. Born a Dane, and married first to a German, then to a French lady, he fluttered from one country and language and literature to another—made a noise in all, and became great in none. Of his Danish writings, his "Komiske Fortællinger" and "Labyrinthen" are entertaining. Of his German writings, his "Haideblumen" are not without merit. His letters, of which he wrote thousands in different languages, are very interesting. Died in Hamburg Oct. 3, 1826.

Baghe'ria, a town of Sicily, in the province of Palermo, 8½ miles E. of Palermo. Here are numerous villas of the nobility of the island. Pop. in 1861, 11,762.

Bagley (John J.). See Appendix.

Bagli'vi (Giorgio), F. R. S., an Italian medical writer, born at Ragusa in 1668. He became in 1692 the pupil of Malpighi at Rome, and subsequently professor of anatomy at the college Della Sapienza in that city. He gained distinction as the author of the system of "Solidism"—*i. e.* the theory that diseases originate in the solids. He published "Opera Omnia Medico-practica" (1704). Died Mar., 1707.

Bagnacaval'lo, an Italian painter, whose proper name was Bartolommeo Ramenghi, born near Bologna in 1484. He was a pupil of Raphael, and is regarded as the greatest painter of the Bolognese school. Among his works is "The Coronation of Charles V. at Bologna." Died in 1542. (See Vasari, "Lives of the Painters.")

Bagnères de Bigorre (anc. *Vi'cus Aquen'sis*), a town and fashionable watering-place in the S. of France, in the department of Hautes-Pyrénées, and on the river Adour, 14 miles by rail S. S. E. of Tarbes. It is situated in the romantic valley of Campan, and is among the most frequented watering-places in France. It has a college, a public library, a theatre, a museum, and good hotels. The springs, of which there are thirty-two, and whose temperature ranges from 72° to 124° F., are visited by about 16,000 persons annually. Baréges and woollen stuffs are made here. Pop. in 1866, 9433.

Bagnères de Luchon (anc. *A'quæ Convena'rum*), a town of France, in the department of Upper Garonne, and in the Pyrénées, 42 miles by rail from Bagnères de Bigorre. It has sulphurous thermal springs, and is a place of summer resort. Pop. in 1866, 3921.

Bagnes, a French word signifying "galleys," is now the name of the convict prisons of France in which criminals were confined and employed at hard labor, since the galleys were abolished in 1748. Large numbers of convicts were thus confined at Brest and Toulon, and were employed in mechanical and other work. Various trades or mechanical arts were taught to the convicts. In the reign of Napoleon III. the bagnes were gradually abolished, and the penal colonies substituted in their place.

Bagnes-le-Chable, a parish and village of Switzerland, in Valais, on the Dranse, 12 miles E. S. E. of Martigny. Pop. of the parish, which is coextensive with the Val-de-Bagnes, 4256 (1870). This valley was inundated in 1818 by a *débâcle* which carried away 400 cottages.

Bagnoles, a village and summer resort of France, in the department of Orne, and in a valley 13 miles E. S. E. of Domfront. It has warm saline springs and cold ferruginous springs.

Bago'as, a Persian eunuch and soldier in the service of Artaxerxes Ochus. In 338 B. C. he poisoned that king and several of his sons. He raised to the throne of Persia Darius Codomannus, who put Bagoas to death about 336 B. C.

Bag'ot (Sir Charles), an English diplomatist, born Sept. 23, 1781. He was minister to France in 1814, ambassador to St. Petersburg in 1820, and to Holland in 1824. He in 1842 became governor-general of Canada, where he died May 18, 1843.

Bagot, a county of Canada, in the S. central part of Quebec, is intersected by the Grand Trunk R. R., and bounded on the W. by the Yamaska River. Copper ores and fine black limestone are found. Capital, St. Liboire. Pop. in 1871, 19,491.

Bag'pipe, a wind instrument supposed to be of great antiquity, consists of a leathern bag which the player inflates by blowing with his mouth through a tube, or, in some cases, by a bellows worked by the elbow. The music proceeds from three or four pipes, whose mouthpieces are inserted into the bag, the wind being forced out by pressing the bag under the arm. One of the pipes, called the "chanter," is pierced with eight holes, while the others, or "drones," sound each only one continuous low note. Though generally fallen into disuse, the bagpipe is still a popular instrument in the Highlands of Scotland and the west of Ireland, and the Highland regiments are always accompanied by their pipers, dressed in proper costume. The bagpipe is still used in Southern Italy, as formerly in Spain.

Bag'radites, the name of a royal family of Georgia and Armenia. It was founded by Bagrad, who had the privilege of crowning the Armenian monarchs. In the eighth century a younger son of the Bagradites became king of Georgia, and from him the Georgian Bagradites claim descent.

Bagra'tion (Peter), Prince, a Russian general, born in 1765, was descended from the noble Georgian family of Bagradites. He served with distinction under Suwarrow in Italy in 1799. In Nov., 1805, he kept in check for six hours a superior force of French under Murat. He led the vanguard at Austerlitz, December, 1805, and rendered important services at Eylau and Friedland (1807). He was mortally wounded at Borodino, Sept. 7, and died Oct. 7, 1812.

Bag'shot Beds [named from Bagshot Heath, Surrey], the lowest strata in the middle eocene formation of Britain. The strata are arranged into four groups: 1. The Upper Bagshot, yellow and white sands with ferruginous stains, generally unfossiliferous, though at Whitecliff Bay, Isle of Wight, a bed contains a large number of shells. 2. The Barton beds, colored clays interstratified with sand and loam, rich in fossils, shells of Mollusca, etc. 3. The Bracklesham beds, composed of marly clays and white sands, capped by a bed of flint-pebble conglomerate. This is the most fossiliferous group in the series. 4. The Lower Bagshot, consisting of variously-colored sands, gray, chocolate-colored, or white pipe-clays. The white clays contain the only fossil found in this group—beautifully preserved leaves in the layers of the clay. The series rests on the London clay. Its maximum thickness is about 1200 feet. Some writers restrict the term to this last group.

Bahama (bạ-hā'mạ), **Grand,** the most north-western island of the Bahama group, is 69 miles E. of Florida. It is 74 miles long and 9 miles wide. Area, 428 square miles. The soil is moderately fertile. Pop. 1020.

Baha'ma Islands, or **Lucay'os,** a group of islands in the Atlantic Ocean, lie N. E. of Cuba, from which they are separated by the old Bahama Channel. They belong to Great Britain. They consist of twelve islands, 661 keys, and 2387 reefs and cliffs, together 3060 islands and islets. They extend like a chain from latitude 21° to 27° 31′ N., in a north-western direction for a distance of about 700 miles. They are generally long and narrow, and have little elevation above the sea. The climate in winter is very mild and salubrious. The soil is thin, but produces maize, cotton, oranges, pineapples, etc. The area is variously estimated from 3012 to 5123 square miles. Capital, Nassau, in New Providence. In 1870 the receipts amounted to £46,000, and the expenses to £47,000. The value of the imports was £284,000, and of the exports £190,000. The names of the larger islands are Grand Bahama, Abaco, Eleuthera, New Providence, Andros, San Salvador (or Cat Island), Exuma, Long Island, Crooked Island, Inagua, and Caicos. These are mostly covered with forests of the madeira tree, the mastic, lignumvitæ, etc. San Salvador (or perhaps Watling's Island) was the first land discovered by Columbus in 1492. The Bahamas were then inhabited by a gentle race of aborigines, who were soon exterminated by the Spaniards. The English obtained possession of them in 1629. Among the exports are canella, arrow-root, sponges, salt, conch-shells, eleuthera bark, fresh and canned pineapples, etc. Pop. in 1871, 39,162.

Bahi'a, a province of Brazil, is bounded on the N. by Pernambuco, on the E. by Sergipe and the Atlantic Ocean, on the S. by Minas Geraes and Espirito Santo, and on the W. by Goyaz. Area, 176,500 square miles. The large river São Francisco flows along or near the north-western border of the province, which is traversed by a high mountain-range about 200 miles from the sea-coast. The soil of the lowlands is fertile. The chief products are sugar, tobacco, cotton, rice, manioc, and coffee. Diamonds and gold are found in this province. Pop. about 1,450,000.

Bahia, or **São Salvador,** an important maritime city of Brazil, capital of the above province, is situated about 740 miles N. N. E. of Rio Janeiro; lat. 13° 0′ S., lon. 38° 32′ W. The name is derived from Bahia de Todos-os-Santos (All Saints' Bay), at the entrance of which it is pleasantly situated. The upper part of the city is several hundred feet higher than the lower, and presents a very fine

appearance from the sea. The upper town is the most populous, most beautiful, and contains the important public buildings, among which are the governor's palace, the cathedral, the theatre, the mint, and many fine churches and convents. It is the seat of the archbishop of San Salvador. A public library was founded here in 1811. The harbor of Bahia is one of the best in America, and admits vessels of the largest size. It is defended by several forts, and has a lighthouse at the entrance. The chief exports of Bahia are sugar, cotton, coffee, tobacco, rum, dyestuffs, hides, and horns. The commerce is almost entirely in the hands of Englishmen. Bahia is the oldest city of Brazil, having been founded in 1549, and was until 1763 the capital. It is, next to Rio de Janeiro, the largest commercial city of Brazil. The Bahia Steam Navigation Company, organized in 1861, had sixteen steamers afloat in 1868. Pop. 120,000.

Bähr, or **Baehr** (Johann Christian Felix), an eminent German philologist, born at Darmstadt in 1798, and educated at Heidelberg, where in 1826 he became professor of classical literature. He published a "History of Roman Literature," 2 vols., 1828; 4th ed. 1868–70, 3 vols. 8vo, and edited several of Plutarch's "Lives." He also published Herodotus, with valuable notes, 2d ed. 1856–61, 4 vols.

Bahrdt (Karl Friedrich), D. D., a German rationalist theologian, born at Bischofswerda, in Saxony, Aug. 25, 1741. He became professor of philosophy at Erfurt in 1762, but he professed such skeptical or deistical doctrines that he was ejected from that position in 1768. Among his works are "Aspirations of a Mute Patriot" and "Letters on the Bible in a popular style." He was successively professor, preacher, teacher, and tavern-keeper. Died April 24, 1792. (See his "Autobiography" ("Geschichte meines Lebens"), 4 vols., 1790.)

Bahrein', or **Aval Island** (anc. *Ty'los* or *Ty'ros*), is in the Persian Gulf, near the Arabian coast, about 200 miles S. of Bushire. It is 27 miles long and 10 wide, and is surrounded by several small islands. Manama, the capital, on the northern extremity, has a good harbor. These islands derive their importance from their pearl-fisheries, the annual product of which is estimated at $1,000,000.

Bahr-el-A'biad (*i. e.* "white river"), the Arabic name of the White Nile, which is the main branch of the Nile. It rises in Lakes Victoria Nyanza and Albert Nyanza, under the equator, flows N. along the eastern boundary of Kordofân, and unites with the Blue Nile at Khartum. It is said to be navigable 1000 miles above Khartum.

Bahr-el Az'rek (*i. e.* "blue river"), one of the two great branches of the Nile. It unites with the other branch, the Bahr-el Abiad ("white river"), in lat. 15° 37′ N. Its sources are in lat. 10° 58′ N., lon. 36° 50′ E., but its spiral course, traced through all its windings, will probably exceed 800 miles. In this distance it descends with immense impetuosity from an elevation of 9000 feet to one of 1500 feet, collecting the waters of a basin having an extent of 1000 miles or more. The Blue River is navigable up to Fazogle, under the twelfth parallel, 1500 miles from Rosetta.

Bai'æ (mod. *Ba'ja*), an ancient town of Italy, beautifully situated on the bay of its own name, in Campania, 10 miles W. of Naples. It was the favorite watering-place of the ancient Romans, who were attracted by the beauty of its position and adjacent scenery, the amenity of the climate, and the virtues of its warm mineral springs. Julius Cæsar and Pompey had country-houses at Baiæ, which Horace preferred to all other places. The society of Baiæ was proverbially voluptuous and dissolute. Ruins of ancient temples and villas are visible in this vicinity.

Bai'ersbronn, a town in Würtemberg, 40 miles S. W. of Stuttgart. It has manufactures of glass. Pop. in 1867, 5138.

Bai'kal [from the Mongolian *Bai-Kul*, *i. e.* "rich sea"], called also the **Holy Sea,** a large lake in the southern part of Siberia, in the government of Irkutsk, is an expansion of the river Angara. It is situated between lat. 51° 28′ and 55° 41′ N., and lon. 103° and 110° E. It is about 400 miles long, and has an average width of nearly 45 miles. Area, estimated at 12,118 square miles. It is said to be in some places 300 fathoms deep. It receives the Selenga and other rivers, and discharges its waters by the Angara, an affluent of the Yenisei. In summer steamboats navigate this lake, which is frozen from November to April. Here are valuable seal and sturgeon fisheries. The waters of this lake are said to have a curious ground swell called *zyb*, the nature of which has never been explained. The Christian kingdom of the Prester Johns, between the eleventh and the thirteenth centuries, was just S. of the Baikal Sea.

Baikal Mountains, in Siberia, extend eastward in three ranges, from the Egtag Altai, and enclose in their midst Lake Baikal. They appear to be mostly of volcanic origin, and possess considerable mineral resources.

Bail [Fr. *bailler*, to "deliver"]. The original signification of this word is to "deliver." It is used both as a noun and a verb, and refers to property, as well as to a person, in the custody of the law. It implies safe-keeping or delivery for a special purpose. It may signify the delivery of a person arrested, either on civil or criminal process, from the custody of the sheriff or some other officer of the law, into the safe-keeping of persons who bind themselves for his appearance in court or obedience to its processes. Again, it denotes the persons into whose keeping the party discharged from actual arrest is delivered, and sometimes the amount of security given or required for the defendant's appearance.

In all civil actions the defendant may give bail as a matter of right, and generally in criminal proceedings, unless he is charged with a capital offence. The amount of bail is in the discretion of the court, controlled by the somewhat vague constitutional provision that excessive bail shall not be required.

Bail *below*, or bail *to the sheriff*, is bail given to the sheriff to secure the appearance of the defendant in the action, or his putting in special bail on a required day. Bail *to the action*, or bail *above*, are bound either to satisfy the judgment if one should be recovered, or to deliver up the defendant to custody. In some of the States the defendant when arrested gives bail to render himself at all times amenable to the process of the court, which takes the place of bail below and bail above.

Common bail is the formal entry of fictitious security with the clerk of the court. It is given for the appearance of the defendant and his future obedience in cases where he has not actually been arrested. *Special* bail is responsible bail, given when the defendant has actually been arrested. Bail must in general possess certain prescribed qualifications. They must be *freeholders* or *householders*; must be within reach of the process of the court, and must not be privileged from arrest; must be competent to make a contract, and of sufficient means to pay the amount for which they become responsible. Bail can be compelled, on suitable application in the action, to justify; this means, to show by satisfactory evidence that they possess the qualifications required by law.

While the prisoner, when released on bail, is in fact generally allowed to go at large, he is regarded by the law as in custody of his bail. They can take possession of his person at any time or in any place, even though it is necessary to break into his house. By delivering him to the sheriff and complying with legal forms of surrender, they can discharge themselves from liability.

It should be remarked that when a prisoner is held under final process—that is, process to enforce a judgment of the court—he cannot be released on bail. However, by statute law he is sometimes allowed in civil cases, on giving security of the nature of bail, to be released from strict confinement in jail, at the same time being partially restrained of his liberty by the action of rules defining territorial limits beyond which he cannot lawfully go.

T. W. Dwight.

Bail'ey (Gamaliel), M. D., born at Mount Holly, N. J., Dec. 3, 1807. In conjunction with J. G. Birney he founded in 1836 the "Cincinnati Philanthropist," an anti-slavery journal. Although his press was destroyed by a mob, he continued the publication till 1847, when he issued the first number of the "National Era" at Washington. The celebrated novel of "Uncle Tom's Cabin" first appeared in this journal. Died June 5, 1859.

Bailey (Gilbert Stephens), D. D., born at Abington, Pa., Oct. 17, 1822, educated at Oberlin College, O., pastor of a Baptist church in Cornwall, N. Y., 1845–46, pastor in Illinois 1846–63, superintendent of missions for the Baptist General Association of Illinois 1863–67, and since 1867 secretary of the Baptist Theological Union at Chicago. He is the author of several works, mostly denominational. Dr. Bailey originated the system of "minister's institutes" now prevalent in the Baptist denomination, holding the first at Chicago in 1864.

Bailey (Guilford D.), an American officer, born in New York 1833, killed at the battle of Seven Pines May 31, 1862; graduated at West Point July 1, 1856, and promoted second lieutenant of artillery; served on frontier duty and in Kansas border disturbance 1856–59, served during the civil war in defence of Fort Pickens, Fla., to June 27, 1861, appointed colonel First New York Light Artillery volunteers Sept., 1861, and was engaged in the various actions of the Army of the Potomac during the Peninsular campaign of 1862 till his death.

G. C. Simmons, *Clerk Board of Engineers.*

Bailey (Jacob Whitman), an American officer and nat-

uralist, born April 29, 1811, at Ward (now Auburn), Mass., graduated at West Point 1832, served as lieutenant of artillery in Charleston harbor, 1832–33, during threatened nullification of S. C., at Bellona Arsenal, Va., 1834–35, as assistant professor at Military Academy 1834–35, and acting professor of chemistry, mineralogy, and geology 1835–38, becoming, upon resigning his lieutenancy, July 8, 1838, full professor, which position he held, to the great benefit of the Academy and advantage to cadets, till his death. He was the inventor of "Bailey's Indicator," and of many improvements in the microscope, in the use of which he achieved the highest distinction, particularly in the examination of infusoria, algæ, and the products of the deep-sea soundings of the coast survey, U. S. exploring expeditions, and the Atlantic telegraph plateau, of which he made valuable collections and numerous delineations, bequeathing them to the Boston Society of Natural History. He was president of the American Association for the Advancement of Science 1857, and member of various societies of savants at home and abroad, and author of over fifty able papers in various scientific journals. His health, always delicate, was completely shattered by exposure in the Hudson River while attempting to rescue his wife and daughter, lost in the burning of the steamer Henry Clay, he dying five years after, Feb. 26, 1857, at West Point, aged forty-five.

GEORGE W. CULLUM, *U. S. Army.*

Bailey (JAMES MONTGOMERY), editor of the "Danbury News," a well-known American humorist, born Sept. 25, 1841, in Albany, N. Y., commenced journalism on the Danbury "Times" (afterwards "News") in 1865, which paper soon acquired a celebrity throughout the U. S. from an incessant flow of rich, original, and healthy humor which the brilliant pen of its editor imparted to its columns. He has published "Life in Danbury" and "The Danbury News Man's Almanac."

Bailey (JOSEPH), an American officer who served on the Federal side in the late war, and distinguished himself by his successful attempt to save thirteen gun-boats, etc. of the Mississippi flotilla. The water of the Red River having fallen so low that Admiral Porter's squadron was unable to pass the rapids, Col. Bailey in the course of eleven days constructed dams which, by raising the water, enabled the boats to descend safely, for which he received the thanks of Congress and was made a brigadier-general. He removed to Mo., where he was shot by some ruffians Mar. 21, 1867.

Bailey, or **Bailay** (NATHAN), an English lexicographer and classical scholar, who kept a school at Stepney, where he died June 27, 1742. Soon after 1720 he published his "Universal Etymological English Dictionary," the first English dictionary which aimed at completeness, and which was the basis of Dr. Johnson's more celebrated work (1755). He wrote also a "Domestic Dictionary," and other books on education.

Bailey (PHILIP JAMES), an English poet, born at Nottingham April 22, 1816. He studied law, and was called to the bar in 1840. In 1839 he published "Festus" (8th ed. 1868), a poem which treats of the highest themes of philosophy and religion. It excited much admiration, and had a wide temporary success, to which its extravagance and defects contributed. "The faults of the poem are as great as the beauties; there is no congruity or proportion in it, and you lay it down with a sense of admiration qualified with disgust." He wrote other poems, entitled "The Angel World" (afterwards incorporated with "Festus"), 1850, "The Mystic" (1855), "The Age," a satire (1858), and "The Universal Hymn" (1867).

Bailey (RUFUS WILLIAM), D. D., was born at North Yarmouth, Me., April 13, 1793, and graduated at Dartmouth in 1813, was pastor of several Congregational churches in New England, was professor of languages at Austin College, Huntsville, Tex., and its president (1858–63). He published "The Issue" (1837) and several educational and other works. Died April 25, 1863.

Bailey (SAMUEL). See APPENDIX.

Bailey (SILAS), D. D. See APPENDIX.

Bailey (THEODORUS), U. S. N., born April 12, 1805, in Plattsburg, N. Y., entered the navy as a midshipman Jan. 1, 1818, became a lieutenant in 1827, a commander in 1849, a captain in 1855, a commodore in 1862, a rear-admiral in 1866. He did good service on the W. coast of Mexico in the Mexican war, and during a part of 1861–62 commanded the frigate Colorado, western Gulf blockading squadron. On April 24, 1862, he commanded the right column of Farragut's fleet in the passage of Forts St. Philip and Jackson, and at the capture of the Chalmette batteries and the city of New Orleans, where he led the fleet, and was conspicuous for his great gallantry and self-possession. From 1862 to 1865 he was in command of the eastern Gulf blockading squadron.

FOXHALL A. PARKER, U. S. N.

Bailey's Harbor, a post-township of Door co., Wis. Pop. 297.

Bail'eyville, a post-township of Washington co., Me. Pop. 377.

Bai'lie, a Scottish term having several legal applications. The most common and popular signification is a superior officer or magistrate of a municipal corporation in Scotland, with judicial authority within the city or burgh. In royal burghs the office is in some respects analogous to that of alderman in England.

Bail'iff [probably a corruption of the Lat. *baj'ulus* or *bai'ulus*, a "porter;" Fr. *baillí*], a term applied in England to a deputy of a sheriff or of a local magistrate; also to magistrates of certain towns and keepers of castles. Bailiff may be defined as the keeper or superintendent of some duty or charge legally imposed on him. As officers of the law, bailiffs arrest culprits, summon juries, and collect fines. There is a class of men employed by the sheriff on account of their adroitness and dexterity who are called bound bailiffs, because, the sheriff being responsible for their official misdemeanors, they are annually bound in an obligation, with sureties, for the due performance of their service. The sheriff himself is the queen's bailiff.

Bailleul, a well-built town of France, in the department of Nord, near the Belgian frontier, about 19 miles by rail W. of Lille. It has manufactures of woollen and cotton stuffs, hats, lace, etc. Pop. in 1866, 12,896.

Bail'lie (JOANNA), a British poetess, born in Lanarkshire in 1762. In early life she went to reside in London with her brother, Matthew Baillie, the celebrated physician. Her life was happy, but devoid of remarkable incidents. She published in 1798 the first volume of "Plays of the Passions," which had great success. Several other volumes of the same appeared in 1802, 1812, etc. Among the most popular of her other works are "De Montfort," a tragedy, and "Basil," a drama. She wrote several ballads and songs which are much admired. She was an intimate friend of Sir Walter Scott, and her house was the resort of many other British and foreign literary celebrities. She died Feb. 23, 1851, aged eighty-nine. Commenting on her "Plays of the Passions," the "Edinburgh Review" for April, 1836, says: "This great work is completed, and in a manner worthy of its commencement; a noble monument of the powerful mind and the pure and elevated imagination of its author."

Baillie (MATTHEW), M. D., a brother of the preceding, was born in Lanarkshire, Scotland, Oct. 27, 1761. His mother was a sister of the great anatomists, John and William Hunter. He studied anatomy under his uncle, and entered Oxford, where he graduated as M. D. In 1783 he succeeded Dr. Hunter as lecturer on anatomy in London. He acquired a high reputation as a teacher and expositor of that science. He published in 1793 an excellent work on "The Morbid Anatomy of some of the most Important Parts of the Human Body," which had a remarkable influence on the study of medicine. He practised medicine in London with great success, and was appointed physician to the king in 1810. Died Sept. 23, 1823.

Baillie (ROBERT), an eminent Scottish Presbyterian theologian, born at Glasgow April 30, 1602. He was distinguished for his learning and moderation. He was one of the commissioners sent to London in 1640 to prepare charges against Laud, became professor of divinity at Glasgow in 1642, and was principal of the University of Glasgow after the Restoration. He wrote various works and letters. Died in July, 1662.

Baillie of Jerviswood (ROBERT), a Scottish patriot of excellent abilities and character. He opposed the tyrannical measures of the duke of Lauderdale, and about 1676 was fined and imprisoned for four months. Having entered into a correspondence with Russell and Sidney, he was arrested and charged with complicity in the Rye-House Plot. He was condemned on insufficient evidence, and executed Dec. 24, 1684.

Bailly (JEAN SYLVAIN), an eminent French astronomer, born in Páris Sept. 15, 1736. He was admitted into the Academy of Sciences in 1763, and published in 1771 a remarkable "Treatise on the Light of the Satellites of Jupiter." In 1775 he produced the first volume of his "History of Astronomy, Ancient and Modern" (4 vols., 1775–83), which by its eloquent diction and ingenious ideas obtained great popularity. He became a member of the French Academy in 1784, and of the Academy of Inscriptions in 1785. Fontenelle was the only Frenchman who before that time had had the honor to be a member of the three great academies of Paris. He was the first president of the States-General or National Assembly in 1789, and was elected mayor of Paris in July of that year. His influence was exerted to promote order and moderation. He

offended the Jacobins by commanding the national guard to fire on a riotous crowd in July, 1791, and resigned his office soon after that date. During the Reign of Terror he was proscribed by the Jacobins, and after insulting treatment was guillotined Nov. 12, 1793. Among his works is "Memoirs of the Revolution by an Eye-witness" (3 vols., 1804). (See F. Arago, "Biographie de Bailly," 1852, and an English translation of the same, Boston, 1859; Lalande, "Éloge de Bailly," 1794; Lacretelle, "Éloge de Bailly," 1836; "Edinburgh Review" for April, 1805.)

Bailly (Joseph A.), a French sculptor, born in Paris in 1825, emigrated to Philadelphia in 1850. Among his best works are "Adam and Eve," a group of "Eve and her Two Children," and a marble monument of Washington (1869) placed in front of the State-house in Philadelphia.

Bail'ment [Fr. *bailler*, to "deliver"], a delivery of goods for some particular purpose, or on mere deposit, upon contract, express or implied, that after the purpose has been performed the identical goods shall be redelivered to the bailor, or otherwise dealt with according to his direction. If the contract permits the return of an equivalent instead of the goods bailed, there is no bailment, but the transaction constitutes a debt or some cognate engagement. Also, a delivery of a thing in trust for some special object, and upon contract, express or implied, to conform to the object of the trust.

Bailment includes the borrowing, lending, hiring, or keeping of chattels, and the carrying or working upon them for another. The party making the delivery, or *bailing* the property, is termed the *bailor;* the party to whom it is delivered, the *bailee*.

Bailments have been classified as follows: 1, *Depositum*, or deposit; a delivery of goods to be kept by the bailee, and returned on demand, without recompense. 2, *Mandatum*, or mandate; where the bailee agrees to do something with or about the thing bailed, without recompense. 3, *Commodatum*, or loan; where the thing bailed is lent for use, without recompense. 4, *Pignus*, or pledge; where the thing bailed is security for a debt or other engagement. 5, *Locatio*, or hiring; where the use of something is to be given, or labor performed about it, for a compensation. *Locatio* is subdivided as follows: *Locatio rei*, where the bailee by hire gains the temporary use of a thing; *Locatio operis faciendi*, where the bailee agrees to perform labor and services, or bestow care and attention upon the thing bailed, for a recompense; *Locatio operis mercium vehendarum*, where goods are delivered to a bailee to be transported to another place, for a recompense.

The question which most frequently arises and presents the greatest difficulty in the law of bailment relates to the responsibility which attaches to a bailee if the property is lost or injured, and the degree of care which he is bound to bestow upon it. With reference to this question, bailments have been divided into three groups: 1, Where the bailment is for the benefit of the bailor alone. This class includes deposits and mandates. Here, as the bailee receives nothing for his services, he is held only to the care which prudent men are supposed to give to their own affairs, and he is responsible only for such loss or injury as results from the absence of such care. The degree of care depends much upon the circumstances of each case; for example, upon the bulk of the article, its fragility, or its exposure to thieves from the dense population of a city as compared with the scanty population of a country district. In each case it is a question of fact whether the care which all the circumstances required was used. 2, Where the bailment is for the benefit of the bailee only. This class includes *commodatum*. Here the greatest care is required of the bailee, and he is responsible for the slightest negligence. It is also a rule that he must keep strictly within the privilege conferred on him with respect to the thing bailed, or he will be liable for any loss or injury to it, even though he is guilty of no negligence. 3, Where the bailment is for the benefit of both bailor and bailee. This is the case in *pignus* and *locatio*. Here the bailee is held to the exercise of the care and attention which prudent men under the circumstances would reasonably be expected to take.

There is a class of bailments of an exceptional nature, embraced under the head of *locatio*, where the policy of the law imposes upon the bailee responsibilities for loss or injury to the property delivered to his charge, entirely irrespective of the question of his care or negligence: this class includes innkeepers and common carriers, the liabilities of whom will be considered in another place. (See Carriers, Hiring, and Innkeepers.)

The relation of bailor and bailee is largely one of trust, and the law requires good faith of each party. As a rule, the bailee will not be allowed to dispute the title of his bailor. He has a right to the possession of the thing bailed during the bailment, and in some instances a special property in it. In other cases he has a bare custody. This would enable him to maintain an action against any one who should unlawfully interfere with the chattel or deprive him of its possession. In such an action he would hold the proceeds beyond what was sufficient to indemnify him for his special interest as a trustee for the bailor.

T. W. Dwight.

Bai'ly (Edward Hodges), an English sculptor, born at Bristol Mar. 10, 1788, was a pupil of Flaxman. He gained the gold and silver medals of the Royal Academy about 1809, and became a royal academician in 1821. Among his masterpieces are "Eve at the Fountain," which is exquisitely graceful; "Apollo Discharging his Arrows;" "The Graces Seated;" "Eve Listening to the Voice;" and a statue of Lord Nelson. Died May 22, 1867.

Baily (Francis), D. C. L., an English astronomer, born at Newbury, in Berkshire, Mar. 10, 1744, became a stockbroker of London. He was one of the founders of the Astronomical Society, and rendered important services to astronomy by the improvement of the "Nautical Almanac" and the production of the "Astronomical Society's Catalogue of Stars." He wrote several standard works on life annuities, and a "Life of Flamsteed" (1835). Died Aug. 30, 1844.

Bain (Alexander), LL.D., born at Aberdeen, in Scotland, in 1818, graduated as M. A. at Marischal College in 1840. In 1845 he was elected professor of natural philosophy in the Andersonian University at Glasgow, and in 1857 was appointed examiner in logic and moral philosophy in the London University. In 1860 he became professor of logic in the University of Aberdeen. He has published "The Senses and the Intellect" (1855), "The Emotions and the Will" (1859), "Study of Character, including an Estimate of Phrenology" (1861), "English Composition and Rhetoric" (1866), "Mental and Moral Science" (1868), "Logic, Deductive and Inductive" (2 vols., 1870), and an "Elementary English Grammar" (1872). Mr. Bain is a philosopher of the school of Mill and Herbert Spencer. His works on grammar, composition, and mental science have been republished in America.

Bain'bridge, a thriving town, capital of Decatur co., Ga., on Flint River, 50 miles from its mouth and at the head of navigation, is the western terminus of the Atlantic and Gulf R. R., 236 miles W. S. W. of Savannah, and is the southern terminus of the Bainbridge Cuthbert and Columbus R. R. It has a cotton manufactory, three academies, two weekly newspapers, and is a considerable shipping-point for cotton. Pop. 1351.

B. E. Russell, Ed. "Democrat."

Bainbridge, a township of Schuyler co., Ill. P. 1200.

Bainbridge, a township of Dubois co., Ind. P. 2521.

Bainbridge, a post-village of Monroe township, Putnam co., Ind., on the Louisville New Albany and Chicago R. R., 9 miles N. by E. of Greencastle.

Bainbridge, a post-tp. of Berrien co., Mich. P. 1337.

Bainbridge, an incorporated village of Chenango co., N. Y., on the Albany and Susquehanna R. R., 32 miles E. of Binghamton. It has two weekly newspapers, two hotels, some thirty business places, one foundry and machine-shop, four churches, and a handsome brick union school-house. In front of the churches is a beautiful park, and the sidewalks of the village are well flagged with stone and shaded with maples. Pop. 681; of Bainbridge township, 1793. G. A. Dodge, Ed. "Saturday Review."

Bainbridge, a township of Geauga co., O. Pop. 660.

Bainbridge, a post-v. of Ross co., O., on Paint Creek, 19 miles S. W. of Chillicothe, has four churches, a bank, newspaper, mills, woollen factory, hotels, union schools, etc. Pop. 647. W. E. Nelson, Pub. of "Times."

Bainbridge, a post-village of Lancaster co., Pa., on the Susquehanna River and a branch of the Pennsylvania R. R., 20 miles S. E. of Harrisburg. Pop. 762.

Bainbridge (William), an American commodore, born at Princeton, N. J., May 7, 1774. He obtained the rank of captain in 1800, and commanded the frigate Philadelphia in the war against Tripoli. This vessel, having run aground, was captured by the enemy in Oct., 1803. He remained a prisoner until peace was concluded, June, 1805, and was afterwards raised to the rank of commodore. In Sept., 1812, he obtained command of a squadron consisting of the Constitution, of 44 guns, the Essex, and the Hornet. In Dec., 1812, he captured the British frigate Java, mounting 49 guns. Died July 28, 1833. (See Thomas Harris, "Life of Commodore Bainbridge," 1837.)

Bains (*i. e.* "baths"), the name of several watering-places in France. The most important of these is Bains-les-Bains, in the department of Vosges, 14 miles S. W. of

Épinal, situated about 1000 feet above the sea. The place has thirteen springs. Among these "La Grosse Source" has a temperature of about 120° F.

Bai'ram, a feast of the Mohammedans, begins at the end of the fast of Ramadan. It is inaugurated with great public rejoicings and illuminations. Its observance is commanded by the Koran. "Little Bairam" occurs seventy days later.

Baird (Absalom), an American officer, born Aug. 20, 1824, at Washington, Pa., graduated at West Point 1849 in artillery, captain and assistant adjutant-general Aug. 3, 1861, and major and inspector-general Nov. 12, 1861, and April 28, 1862, brigadier-general U. S. volunteers. He served at various posts 1849–61, in Florida hostilities 1851–53, as assistant professor at Military Academy 1856–59, assistant adjutant-general at Washington, D. C., 1861, in Manassas campaign 1861, engaged at Blackburn's Ford and Bull Run, in the adjutant-general's office 1861, in the Virginia Peninsula campaign 1862, engaged at Yorktown and Williamsburg, in command of a brigade in the army of the Ohio, 1862, engaged in the capture of Franklin in Rosecrans' Tennessee campaign, 1863, engaged at Tullahoma, Shelbyville, Dug Gap, Chickamauga (brevet lieutenant-colonel), and occupation of Chattanooga, in command of a division in the Fourteenth corps in the operations about Chattanooga (brevet colonel) 1863–64, engaged at Missionary Ridge and skirmished in pursuit of the enemy in the invasion of Georgia, 1864, engaged at Resaca, Pine Mountain, Kenesaw, Vining's Station, Peach Tree Creek, Atlanta (brevet brigadier-general), Jonesboro', pursuit of Hood's army, in the "march to the sea" and surrender of Savannah, in the invasion of the Carolinas 1865, engaged at Bentonville, Raleigh, and surrender of Johnston's army at Durham Station. He was brevetted major-general U. S. army Mar. 13, 1865, for gallant and meritorious services in the field, and major-general U. S. volunteers Sept. 1, 1864, for distinguished conduct in the Atlanta campaign and at Savannah.

George W. Cullum, *U. S. Army.*

Baird (Charles Washington), son of Rev. Robert Baird, D. D., was born at Princeton, N. J., Aug. 28, 1828, and graduated at the University of the City of New York in 1848, and at the Union Theological Seminary in 1851. He was American chaplain at Rome in Italy from 1851 to 1853, pastor of the Reformed (Dutch) Church, Bergen Hill, Brooklyn, from 1859 to 1861, and since then has been pastor of the Presbyterian church at Rye, N. Y. Besides translations, fugitive contributions to the press, and works, part of which he wrote, he has published "Eutaxia, or the Presbyterian Liturgies," 1855, "A Book of Public Prayer, compiled from the Authorized Formularies of Worship of the Presbyterian Church, as prepared by the Reformers Calvin, Knox, and others," 1859, and a "History of Rye, N. Y. (from 1660–1870)," 1871.

Baird (Henry Martyn), Ph. D., son of the Rev. Robert Baird, D. D., was born in Philadelphia Jan. 17, 1832, graduated at the University of the City of New York 1850, attended lectures in the National University (then University of Otho), Athens, Greece, 1851–52, studied theology in the Union Theological Seminary, New York, 1853–55, and Princeton, N. J., 1855–56. He was tutor of Greek in the College of New Jersey 1855–59, and since 1859 has been professor of the Greek language and literature in the University of the City of New York. In 1866 he was ordained as an evangelist. He has published "Modern Greece," 1856, "The Life of the Rev. Robert Baird, D. D.," 1866, and a large number of articles in the "Methodist Quarterly Review," "Princeton Review," "New Englander," and other quarterlies.

Baird (Robert), D. D., an American theologian and writer, born in Fayette co., Pa., Oct. 6, 1798. He graduated at Jefferson College in 1818. He spent several years (1835 to 1843) in Europe, where he did much to promote Protestant Christianity and the temperance cause. Few American clergymen have had so wide an acquaintance with distinguished men, or have accomplished a greater amount of good. Among his works are "A View of Religion in America" (1842) and a "History of the Waldenses, Albigenses, and Vaudois." Died at Yonkers, N. Y., Mar. 15, 1863.

Baird (Spencer Fullerton), LL.D., a distinguished American naturalist, born at Reading, Pa., in 1823, became assistant secretary of the Smithsonian Institution. Among other works he translated the "Iconographic Encyclopædia." In conjunction with J. Cassin he wrote "The Birds of North America" (Philadelphia and Salem, 1870) and "The Mammals of North America," and, with Charles Girard, produced an excellent work on North American serpents. He has contributed valuable articles to the publications of the Smithsonian Institution and to the "Journal of the Academy of Natural Sciences of Philadelphia," etc., and is a member of the National Academy of Sciences.

Baireuth, bī'rūth [Ger. pron. bī'roit], a city of Bavaria, capital of the circle of Upper Franconia, on the Red Main, 126 miles by rail N. of Munich. It is pleasantly situated and well built; its streets are wide and well paved, and the city is adorned with gardens and public fountains. The principal buildings are the new palace, the mint, the opera-house, and town-hall. There are three palaces in the vicinity, named Fantasie, Sanspareil, and Hermitage. Here are manufactures of cotton and woollen stuffs, porcelain, and leather. Pop. in 1871, 17,837.

Bai'us, the Latinized name of De Bay (Michael), a Flemish theologian, born in Hainault in 1513. He became professor of divinity at Louvain in 1550, and in 1578 chancellor of that university. He adopted the doctrines of Saint Augustine, and wrote works on free-will and grace which were condemned by Pope Pius V. in 1567. Baius retracted or submitted, but his doctrines were afterwards maintained by the Jansenists. He was eminent for learning and piety. Died Dec. 16, 1589.

Ba'ja, an important market-town of Hungary, in the county of Bács, on the Danube, 115 miles S. of Pesth. It has Roman Catholic and Greek churches, a synagogue, and a castle. Here is an important market or annual fair for swine. Large quantities of grain and wine are produced in the vicinity. Pop. in 1869, 18,110.

Baja'da de Parana', or simply **El Parana',** a town of the Argentine Republic, in the province of Entre Rios, is situated on the Rio Parana, in lat. 31° 42′ 54″ S. and lon. 60° 32′ 39″ W., 230 miles N. W. of Buenos Ayres. It was founded in 1730, was the capital of the state from 1819 to 1862, and of the republic from 1852 to 1862. Among its numerous beautiful buildings are the palace of Gen. Urquiza, the government palace, and the theatre. It is well built, but has of late begun to decline. Pop. about 7000.

Bajazet. See Bayazid.

Bajmok, a town of Hungary, in the county of Bács, 20 miles S. E. of Maria-Theresiopol. Pop. in 1869, 6446.

Ba'ker, a county in Central Alabama, has an area of about 650 square miles. It is bounded on the E. by the Coosa River. The surface is undulating; the soil is fertile. Tobacco, cotton, corn, and wool are the chief crops. It is traversed by the Selma Rome and Dalton and the South and North Alabama R. Rs. Capital, Chestnut Creek. Pop. 6194.

Baker, a county in N. E. Florida, bordering on Georgia; it is partly bounded on the N. by St. Mary's River. Sea-Island cotton and sugar-cane are the chief crops. The surface is nearly level. Timber is abundant. It is traversed by the Jacksonville Pensacola and Mobile R. R. Capital, Sanderson. Pop. 1325.

Ba'ker, a county in S. W. Georgia. Area, 450 square miles. It is bounded on the S. E. by Flint River, and intersected by the Ichawaynockaway Creek. Corn, cotton, and wool are the chief crops. The surface is nearly level; the soil is fertile. Capital, Newton. Pop. 6843.

Baker, a county which forms the S. E. extremity of Oregon. It is intersected by the Malheur and the Owyhee rivers. Gold is found near the Malheur River. Silver is also found. The county is chiefly an agricultural and pastoral region. Oats, barley, and wool are largely raised. Capital, Baker City. Pop. 2804.

Baker, a township of Martin co., Ind. Pop. 1018.

Baker, a township of Morgan co., Ind. Pop. 456.

Baker, a township of Crawford co., Kan. Pop. 962.

Baker, a township of Linn co., Mo. Pop. 1269.

Baker (A. R.), D. D., born in Franklin, Mass., Aug. 30, 1805, graduated at Amherst in 1830, became a teacher in Medway, Dorchester, and Andover, Mass., ordained pastor of a Congregational church in Medford, Mass, and has subsequently been settled in Lynn, Wellesley, and Boston. He has published a "School History of the U. S.," "The Catechism Tested by the Bible," an "Exposition of the Sermon on the Mount," and numerous other works.—His wife, Harriette N. W. Baker, a daughter of Rev. Dr. Leonard Woods, was born in 1815. She has published over 160 volumes, mostly works for children, written under the pseudonym of "Madeline Leslie."

Baker (Charles M.), born in New York City about 1805, resided in Vermont, and after 1838 in Wisconsin, where he was a prominent lawyer, and was distinguished for his benevolence and piety. He was for some time a judge of the State circuit court. Died Feb. 5, 1872.

Baker (Daniel), D.D., born at Midway, Liberty co., Ga., in 1791, graduated at Princeton in 1815, was ordained

to the Presbyterian ministry in 1818, was pastor at Washington, D. C., Savannah, Ga., Frankfort, Ky., Tuscaloosa, Ala., and Holly Springs, Miss., was for a time president of Austin College, Huntsville, Tenn., was a popular and successful preacher, and author of several practical and polemical religious works. Died in 1857.—His son, Rev. William Mumford Baker (born in 1825, graduated at Princeton in 1846), is the author of a "Life" of his father and of several other popular works, such as "Inside, a Chronicle of Secession," "The New Timothy," "The Virginians in Texas," etc. He has been a Presbyterian minister in Galveston and Austin, Tex. (1850–65), and at Zanesville, O.

Baker (David Jewett), born at East Haddam, Conn., Sept. 7, 1792, graduated at Hamilton College in 1816, became a prominent lawyer of Illinois, was a probate judge in Randolph co., U. S. Senator (1830–31), and U. S. attorney for Illinois (1833–35). He was one of the leading anti-slavery men of Illinois in the contest of 1830. Died at Alton Aug. 6, 1869.

Baker (Edward Dickinson), Colonel, a lawyer, born in London, Eng., Feb. 24, 1811, emigrated to the U. S. in his youth. He was chosen a member of Congress in 1848, removed to California in 1852, and became a popular orator of the Republican party. In 1860 he was elected a Senator of the U. S. for Oregon. Having obtained command of a brigade of the Union army, he was killed at Ball's Bluff Oct. 21, 1861.

Baker (George A.), an American portrait-painter of great merit, born in New York City. His delineations of children are much admired.

Baker (Osmon Cleander), D. D., born in Marlow, N. H., July 30, 1812, studied at Wesleyan University, Conn., became teacher in the Newbury Wesleyan Seminary (Vt.), 1834, and subsequently its principal. He was one of the founders of the Methodist theological schools, and for some time professor in the Biblical Institute at Concord, N. H. In 1852 he was elected bishop. Died Dec. 20, 1871. "Baker on the Discipline" is a standard work.

Baker (Samuel), M. D. See Appendix.

Baker (Sir Samuel White), K. C. B., the English explorer, was born June 8, 1821. Having a strong desire for adventure, he organized, with his brother, an extensive agricultural colony in Ceylon, where he went in 1848, remaining in that country eight years. In 1861 he went to Africa, with the design of visiting the sources of the Nile. He fell in with Speke and Grant, and afterwards explored the western arm of the Nile, and discovered the Albert Nyanza Lake. In 1869 he set out, under the direction of the khedive of Egypt, with 1000 picked men, with the design of suppressing the slave-trade, extending the boundaries of Egypt and spreading the cultivation of cotton. In 1873 he returned from this expedition, reporting complete success. His wife has accompanied him upon all his African expeditions.

Ba'ker Cit'y, a post-village, capital of Baker co., Or. It has one weekly newspaper. Pop. 312.

Baker's Creek, Miss. See Champion Hills.

Ba'ker's Falls, a cascade of the Hudson River, in Kingsbury township, Washington co., N. Y. The stream falls 56 feet in sixty rods, and the scene is one of remarkable beauty. The falls furnish a great water-power. Here are two machine-shops and some paper-mills.

Ba'kersfield, a post-village of Kern co., Cal., is situated on Kern River, about 60 miles from Visalia. It has two weekly newspapers, and is the centre of a considerable cotton-trade.

Bakersfield, a post-township of Franklin co., Vt., 50 miles N. W. of Montpelier. It has an academy, and manufactures of leather, lumber, doors, sash, blinds, etc. Pop. 1403.

Ba'kersville, a post-village, capital of Mitchell co., N. C., 95 miles N. W. of Charlotte. Pop. of township, 1101.

Bakewell, an old market-town of England, in Derbyshire, on the river Wye, near its confluence with the Derwent, is 25 miles by rail N. W. of Derby. It has an ancient Gothic church, and chalybeate springs with warm baths, which are visited by many persons. Quarries of black marble and mines of coal and lead are worked in the vicinity. Chatsworth House, the splendid mansion of the duke of Devonshire, is three miles from this town, which is surrounded by beautiful scenery. Pop. in 1861, 11,254.

Bakewell (Robert), an English agriculturist, born in Leicestershire in 1726. He gained distinction by his improvement of domestic animals, especially sheep and horned cattle. He originated a breed of sheep formerly called by his name, but now known as the Leicester breed. Died Oct. 1, 1795.

Bakh'tchissaroi', or **Baktshi-Serai,** a Tartar town of Russia, in the government of Taurida (Crimea), 15 miles S. W. of Simferopol. It was formerly the capital of the Tartar khans, whose palace is a remarkable Oriental edifice and in good repair, with spacious galleries, brilliant paintings, and pavilions of light and airy form. The town consists of a single street at the bottom of a narrow valley, enclosed between steep rocks, and is one of the most singular in Europe. Pop. in 1867, 11,448.

Bakhtegan', Lake, in Persia, is 50 miles E. of Shiraz. It is 60 miles long, with an average breadth of 8 miles, and receives at its western extremity the river Bundemir (anc. *Araxes*). The lake yields large quantities of salt.

Ba'king is the mode of cooking food in an oven usually nearly or quite airtight. The term is also employed in the manufacture of bricks, porcelain, etc. (The baking of bread will be treated under Bread.) In baking, strictly so called, the oven is so closed that the steam and aroma arising from the substances within are confined; but by opening ventilators a current of air may be produced, and then these ovens may be used for oven-roasting. The offensive taste that often characterizes baked dishes is thus avoided. Baking, although a convenient mode of cooking, is not so good a process for cooking meats as Roasting (which see).

Ba'kony-Wald ("forest of Bakony"), a densely-wooded mountain-range of Hungary, extends between the river Raab, the Danube, and Lake Balaton. It is 56 miles long and 23 miles wide. The average height is 2000 feet. Large herds of swine are annually driven hither to feed on mast (acorns). Quarries of good marble are worked in these mountains.

Bak'sheesh', or **Bakshish,** an Arabic and Persian word signifying a "present," a "gratuity," is much used by beggars and others in Egypt, Palestine, and other Eastern countries. Travellers in those countries are much annoyed by the importunate, and even insolent, cries of the natives who demand baksheesh.

Ba'ku, a seaport-town of Asiatic Russia, capital of Baku, on the W. shore of the Caspian Sea, and on the S. side of the peninsula of Apsheron (which see). It has several fine mosques and bazaars. Here are naphtha springs which ignite spontaneously, and caused Baku to be regarded as a holy city by the Parsees, who built several temples here. Naphtha and salt are exported from Baku, which is an important entrepôt of trade between Europe and Persia. Pop. in 1867, 12,383.

Bal'abac', an island of the Malay Archipelago, between Borneo and Palawan, 30 miles S. of the latter. It has an area of 130 square miles.

Ba'la Beds, a local deposit of hard crystalline limestone, alternating with softer argillaceous bands, which occurs near Bala, in Wales, and forms a group of the Lower Silurian formation. Trilobites and Cystideæ are the predominant fossils of this group, which is believed to correspond to the Hudson formation of America. It is sometimes called the Caradoc limestone.

Balæn'iceps (the "whale-head"), a genus of wading birds of the stork family, includes the whale-headed stork (*Balæniceps rex*) or shoe-bird of Northern Africa, where it lives in the swamps, feeding on snakes and fishes. Its enormous bill is one of its most remarkable characteristics. It has been called shoe-bird, from a fancied resemblance of its bill to a shoe.

The Balæniceps.

Bal'aghauts' (*i. e.* "above or beyond the Ghauts"), an extensive district of India, in the presidency of Madras, extends from the river Cavery to the river Krishna. The surface is hilly; the soil is fertile, producing sugar, cotton, and indigo. It is stated that diamonds are found here.

Balakla'va, or **Balaclava,** a small port and town of Russia, in the Crimea, and on the Black Sea, about 7 miles S. from Sevastopol, is separated from the harbor of Sevastopol by a rocky peninsula. It has a good landlocked harbor, supposed to be the port of the Læstrigonians at which Ulysses landed. The ruins of churches and mosques attest the ancient magnificence of this town. Pop. in 1867, 742. A few days after the battle of Alma, which occurred in Sept., 1854, Balaklava was occupied by the British army,

and the harbor became the head-quarters of the fleet. The British army suffered here great privations in consequence of the inefficiency of the war office and the mismanagement of the commissariat. Soldiers perished with hunger and cold, while ample stores of food and clothing were in the holds of ships in the harbor. Here occurred the battle of Balaklava between the British and Russians, Oct. 25, 1854. The charge of the British cavalry in this action was a famous but unsuccessful exploit.

Bal'ance [supposed to be derived from *bilanx*, having two scales; from *bis*, "twice," and *lanx*, a "scale or plate"] is a lever of the first kind, the fulcrum being between the power and the weight; used to ascertain the weight of bodies in comparison with the standard units of weight. The ordinary balance consists essentially of a metallic bar or lever, called the beam, either delicately suspended, or supported on a stand by the intervention of a wedge-shaped prism, technically termed a knife-edge, exactly at its middle point. An index is fixed at right angles to the beam, and made to travel over a graduated arc, so as to show when the beam is horizontal. A scale-pan is suspended from each end of the lever. Since the arms of the balance are equal, it is plain that there cannot be equilibrium unless the weights placed in each scale are also equal. When this is the case, the beam is perfectly horizontal and the index vertical. The balance is then said to be true. When the beam is horizontal with unequal weights, the balance is false. Thus it is easy to test the truth of a balance by first placing in the scales weights which apparently are equal, and then transferring each into the other scale. If the weights are not really equal, one of them will appear heavier than the other after the transfer. There are, however, two methods of finding the exact weight of a body by means of a false balance. The body may be weighed with standard weights in each scale successively, and the true weight is the mean proportional between the two apparent weights. Or the body (placed in one scale) may be balanced by a sufficient quantity of any convenient substance—sand, for instance—so that the beam is horizontal, and then replaced by standard weights until the sand is balanced; the weight thus obtained is the true one. A good balance should have its beam in stable equilibrium, for which purpose the centre of gravity of the beam and its appendages should fall a little below the knife-edge. The points of suspension of the scale-pans and the fulcrum of the beam should be in the same straight line. Both when the scales are empty, and when equal weights are placed in them, the beam should be horizontal and the index vertical, the arms, of course, being exactly equal to one another. It is of great importance that the balance should be very sensitive and indicate very slight inequalities in the weights. The sensibility of a balance becomes greater, first, as the length of the arms is increased, which renders the movement about the fulcrum more obvious; and secondly, as the weight of the beam is diminished, for when the beam is displaced by the inequality of the weights, its own weight gives it a tendency to return to its first position. But this displacement is less for a given inequality in the weights as the weight of the beam is increased; so that the less the beam weighs the more sensitive it becomes. A form of balance, more convenient for counterpoising, but less exact than the common form, is that in which the scale-pans are placed above the beam.

The balance of a watch is a wheel nicely poised on its axis, the pivot-holes in which it turns being frequently formed in rubies or other jewels. The natural effect of an impulse given this wheel would be complete rotation, but this is arrested by the balance-spring, so that it recoils, and a vibratory motion results. The balance-spring is a coil of steel wire so fine and delicate that 4000 springs weigh only about one ounce. One of the extremities of the spring is fastened to a point independent of the balance, and the other end is attached near its axis. When the impulse is given to the balance, it moves round just so far as the impulse given is able to overcome the elastic resistance of the spring. When that resistance becomes equal to the impulse, the balance is driven back by the elastic recoil of the spring. In marine chronometers a cylindrical helical spring is used. F. A. P. BARNARD.

Balance of Power [Fr. *équilibre politique, i. e.* "political equilibrium" or "equilibrium of states"], a phrase used in modern European diplomacy to express a state of political equilibrium among neighboring powers, or a political system so arranged and counterpoised that no nation or monarch may be so powerful as to endanger the independence of other states. Such a balance was aimed at in the political combinations in behalf of Greece; in those of Italy just before the Reformation; in the policy of Europe under the lead of France against Austria and Spain; in the alliances against Louis XVI., against Napoleon I., and more recently against Russia in order to preserve the independence of Turkey. Its object is to prevent *political* aggrandizement only. There were in Europe, after the overthrow of Napoleon in 1815, five monarchies recognized as the great powers—namely, France, Austria, Great Britain, Russia, and Prussia, to which, in 1859, the kingdom of Italy was added. The victories of the Prussians in 1866 and 1870 have so prostrated the armies of Austria and France that there now remain in Europe only two first-rate powers, Russia and Prussia (or Germany), and the balance of power is supposed to be destroyed, for if these two should form an offensive alliance they would be a match for all the other powers on the Continent. (See INTERNATIONAL LAW No. I., by PRES. T. D. WOOLSEY, S. T. D., LL.D.)

Balance of Trade [Fr. *balance du commerce*], in political economy, is the difference between the value of the exports and the imports of a country. If the exports exceed the imports in value, the balance of trade is in favor of that country which usually receives a quantity of gold equal to that excess. A nation may, however, derive profit from its foreign commerce even when its imports exceed its exports in value, for merchants who export commodities may find it more profitable for them to bring back some foreign produce than to bring the money which they receive for the articles exported.

Bal'anus, a genus of Cirripedia distinguished by the absence of a flexible stalk and the possession of a symmetrical shell. The name is derived from the Greek word for *acorn*, and was given to it because some species resemble an acorn. The base is usually formed of a thin calcareous plate, the sides of six valves; and four small valves form the operculum, exactly closing the aperture at the top. This genus comprises many species, known as sessile barnacles, which are found in nearly all seas, attached to stones, shells, and other objects. It is remarkable that in the early stage of their existence they are capable of active locomotion, and have large eyes, which disappear, along with the organs of locomotion, when they become stationary. Some of the large species were esteemed a delicacy by the ancient Romans. The Chinese collect and eat the *Balanus tintinnabulum*, which is said to resemble lobster in taste; and *Balanus psittacus*, a South American species, is also eaten. This species is sometimes four inches in diameter, its height considerably more. There are several species found in the U. S.

Bal'ashof, a town of Russia, in the government of Saratov, 138 miles W. of Saratov. Pop. in 1867, 7186.

Balasore, the chief town of the South Cuttack district, in Bengal, on the Boorabullung River, which has a bar at its mouth. It has an American mission, salt-works, and a coasting-trade. It is 145 miles S. W. of Calcutta. P. 11,000.

Bal'assa-Gyar'mat, a town of Hungary, in the county of Neograd, 40 miles N. of Pesth. Pop. in 1869, 6435.

Bal'aton, Lake [Ger. *Platten-see;* Hun. *Balatony;* anc. *Pelso*], the largest lake in Hungary, 55 miles S. W. of Pesth, is 51 miles long and 7 miles wide. The area is estimated at 383 square miles. It receives numerous streams, the largest of which is the Szala, and discharges its water through the Sio and Sarvitz into the Danube. Fish of various kinds are found here. This lake is often celebrated in the old romantic ballads of the Magyars.

Bal'bi (ADRIANO), an eminent Italian geographer, born at Venice April 25, 1782. He became a resident of Paris, where he passed many years. He published in 1826 an "Ethnographical Atlas of the Globe," which is highly esteemed. His other chief work is a "Compendium of Geography" ("Abrégé de Géographie," 1 vol. 8vo), which is considered one of the best treatises on that science that has ever appeared. His works are mostly written in French. He removed from Paris to Italy in 1832. Died Mar. 14, 1848.

Bal'bo (CESARE), an Italian statesman and author, born at Turin Nov. 21, 1789. He was appointed commissioner of the Illyrian provinces by Napoleon in 1812. He advocated the independence of Italy in a work called "Speranze d'Italia ("Hopes of Italy," 1843), which widely extended his reputation. As a moderate and liberal patriot he took a prominent part in the revolutionary movements of 1848. Among his works is a "History of Italy from the Beginning to 1814" (1849), which is highly esteemed. Died June 3, 1853.

Balbo'a, de (VASCO NUÑEZ), a famous Spanish navigator and explorer, born in Estremadura in 1475. He emigrated to Hayti about 1500, and in 1510 accompanied Enciso in an expedition to Darien. Having quarrelled with Enciso, Balboa obtained the chief command of the party, and in Sept., 1513, discovered the Pacific Ocean from the top of a mountain. He descended to the shore and

took possession of the ocean in the name of his sovereign. In 1514, Pedrarias Dávila was sent from Spain to supersede Balboa, who was punished by a fine for his insubordination. He served as a deputy under Pedrarias, who, actuated by cruelty and jealousy, accused Balboa of treasonable designs, and put him to death in 1517. (See Irving, "Voyages and Discoveries of the Companions of Columbus;" M. J. Quintana, "Vidas de Españoles Celebres.")

Balbue'na, de (Bernardo), a Spanish poet, born at Val de Peñas in 1568. He became bishop of Porto Rico in 1620. Of his works, only three have been preserved: "La grandeza Mejicana" (Mexico, 1609; Madrid, 1829), "El Siglo de Oro" (1608), and "El Bernardo," an epic poem (1624 and 1808). Died at Porto Rico in 1627.

Bal'bus (L. Cornelius), surnamed Major, a Roman officer, born at Gades (Cadiz), became an intimate friend of Cæsar, whom he accompanied to Spain in 61 B. C. In 40 B. C. he was chosen consul, being the first adopted citizen who received that honor. He wrote a diary of the events of his own and Cæsar's life.

Balch (George B.), U. S. N., born Jan. 3, 1821, in Tennessee, entered the navy as a midshipman in 1837, became a passed midshipman in 1843, a lieutenant in 1850, a commander in 1862, a captain in 1866, and a commodore in 1872. He served during the Mexican war on the east coast of Mexico, from 1862 to 1865 commanded first the steamer Pocahontas, and afterwards the steamer Pawnee, South Atlantic blockading squadron, during which period, in co-operation with our army, he was almost constantly engaged with the enemy's batteries and forts on the Stone and Black rivers, S. C. In one action the Pawnee was struck forty-six times, but finally succeeded in driving the Confederates from their guns "in the wildest confusion." Rear Admiral Dahlgren spoke in the highest terms of Balch's bravery, conduct, and sound judgment.

Foxhall A. Parker, U. S. N.

Bal'cony [Fr. *balcon;* It. *balco'ne*], a platform or gallery projecting in front of a window or several windows, is supported by consoles or brackets fixed in the wall or by pillars resting on the ground, and has a parapet or balustrade before it. The term *balcony* is also applied to several seats in a theatre which are nearest the stage, and considered the most desirable seats in the house.

Bal'dachin [It. *baldachi'no*], a canopy in the form of a crown or umbrella, made of costly materials, richly adorned, and raised over a throne, couch, pulpit, or altar. In the church of St. Peter in Rome there is a magnificent baldachin cast in bronze by Bernini, and supported by four twisted columns. The baldachin is used in processions of the Roman Catholic Church. The name *baldachin* is said to have been derived from *Baldack*, a corrupted form of a name of Bagdad, and was originally applied to the canopy which was carried over an Oriental prince.

Bald (or **White-Headed**) **Eagle** (*Halia'ëtus leucocephalus*), so called on account of the snowy-white color of the head and neck, is a native of North America, where it is found along the sea coasts and at the mouths of large rivers. The length of this bird is about forty inches, the stretch of wing from seven to eight feet. The nest of the bald eagle is generally made upon some lofty tree, and sometimes becomes of great size, as the bird is in the habit of using the same nest year after year, and making additions to it every season. The female bird generally lays her eggs in January, two or three in number and of a dull white color, and they are hatched by the middle of February. It is strongly attached to its young, and will not forsake them, even if the tree on which they rest be enveloped in flames. The bald eagle will eat almost anything, even carrion, but it is especially fond of fish, which it steals from the osprey when practicable, but also takes them from the water with much skill. For an interesting description of the manner in which it takes its prey the reader is referred to the account given by Audubon. The bald eagle has been adopted by the Americans as their national emblem.

Bald Eagle.

Bald Eagle, a township of Clinton co., Pa. Pop. 950.

Bal'der, or **Baldur** [from *ballr*, "good," "strong," "valiant"], often called Balder the Good, in the Norse mythology was the second son of Odin. He is supposed to typify the brightness of the summer sun, and to make all things bright and cheerful; hence he has been termed the "Apollo of the North." His abode was Breidablik ("widely shining"), where nothing impure could enter. The account of his death is as follows: He dreamed one night that his life was in the utmost danger; and when he related this dream, the gods were so distressed that his mother, Frigga, exacted an oath from all things, animate and inanimate, that they would not injure Balder. She did not, however, exact any oath from the mistletoe, because it seemed so harmless and insignificant. Now, the gods were accustomed to amuse themselves by shooting arrows and throwing stones at Balder, to all of which he proved invulnerable. When Loki, the god of evil, found that the mistletoe had not taken the oath, he obtained the plant and went to the assembly of gods, where he found Balder's brother Hoder, standing apart from the others. He asked him why he also did not throw something at Balder. "Because I am blind," answered Hoder, "and have nothing to throw." "Come," said Loki, "do like the rest; show honor to Balder by casting this trifle at him, and I will direct your hand." Hoder did as the tempter bade him, and Balder, pierced through by the mistletoe, fell dead. So great was the grief of the gods that Hermod visited the realms of death, and besought Hela to release her prey and allow Balder to return to the dwelling of the Æsir. Hela answered that if everything mourned him, then he should return, but if anything whatever failed to weep, then Balder must remain in the world of shades. All things animate and inanimate were requested by the Æsir to weep for Balder, and all did so except a giant hag named Thökk (afterwards found to be Loki himself, who had assumed this form in order to prevent Balder from returning to life). She answered their request by jeers, and Balder was accordingly forced to remain in the abode of the dead. (See Thorpe's "Northern Mythology," vol. i.; Keyser's "Religion of the Northmen.")

J. Thomas.

Balderic, or **Baudry,** a French chronicler, bishop of Dol, born about the middle of the eleventh century. He took part in all the Church councils of the time, and made active efforts to restore the rigor of monastic discipline. He visited England, and left an account of his travels. He wrote a chronicle of the first Crusade, entitled "Historim Hierosolomytanæ." We have also from him a life of Robert d'Arbrissel.

Baldi d'Urbino (Bernardino), a mathematician and man of letters, born at Urbino June 6, 1553, accomplished as a writer, and in science as well, under the tutelage of Commandino developed a remarkable zeal for the study of mathematics. He learned the Hebrew and Chaldean tongues in order to better understand the Bible, and every year he acquired some new language. His multitudinous writings deal with almost every branch of science. Chief among his works are "Cronica de' Matematici" ("Chronology of Mathematicians"), "Nautica," a didactic poem on navigation, an Arabic grammar and dictionary, and a translation of the Targum of Onkelos. He commenced a geographic dictionary, which he only brought to the letter C in four enormous volumes. Died Oct. 12, 1617.

Bald Mountain Plantation, a township of Somerset co., Me. Pop. 8.

Bald Mountain, a post-village of Greenwich township, Washington co., N. Y., has extensive lime-kilns, which afford great quantities of lime.

Bald'ness (*Alopecia*), the loss or absence of the hair of the scalp. There are some few cases on record in which

the hair has never been developed. This is termed congenital baldness. Accidental baldness is caused by an atrophy of the hair-follicles. Baldness in the comparatively young may occur from wearing waterproof caps or unventilated hats, which, by preventing evaporation from the head, occasion an unhealthy state of skin. It may be complete, or partial, occurring in patches. Senile baldness (*calvities*) is the consequence of age; it arises, like the preceding variety, from an atrophy of those parts on which the hairs depend for nutrition. It generally commences on the crown of the head. Women are not so frequently bald as men. The causes of baldness are defective supply of nutrition, a hereditary tendency, dissipation, but especially old age. The hair falls off after severe illnesses, or after other causes of general debility. Alopecia is sometimes the result of syphilis. The treatment consists in cleanliness, and in exciting the circulation of the scalp by using a hairbrush and the application of stimulants, as the Spanish-fly ointment, two drachms to an ounce of lard, mixed with the same quantity of pomatum, or some equivalent preparation. Any constitutional debility should be remedied. Shaving the head is sometimes resorted to, and is often useful. FAVUS (which see) permanently destroys the hair.

Bald'pate, called also **American Widgeon,** the *Mareca Americana*, a duck which breeds in Mexico and the South-western States, and also along the western coast; found also throughout the U. S., Canada, the northern part of South America, and occasionally in Europe. It is highly prized for the delicacy of its flesh. It takes its name from its white crown. It is variously marked with reddish-brown, gray, white, and chestnut. The male has a green band running from the eyes to the nape. The bird is nineteen and a half inches long.

The Baldpate, or American Widgeon.

Bal'dung (HANS), also called **Haus Grün,** a German painter and engraver, born at Gmünd, in Swabia, in 1470. He belonged to the Swabian School, and derived from Dürer and Schöngauer the fantastic element which marked his works. He excelled those masters in the handling of color and light and shade. His chief work is the altar-piece at Freiburg. His wood-cuts are wonderful in their Gothic strangeness and bizarre fancifulness. Died in 1552.

Bald'win I., king of Jerusalem, born in 1058, was a brother of Godfrey of Bouillon. He joined the first Crusade in 1096, and fought bravely against the infidels. He was chosen count of Edessa by the Christian inhabitants of that city. On the death of Godfrey, in 1100, he succeeded him as king of Jerusalem. He defeated the Saracens in several battles, and captured Acre, Cæsarea, and Sidon. He was more ambitious and worldly than his brother Godfrey. Died in 1118. (See GIBBON, "Decline and Fall of the Roman Empire.")

Baldwin II. (BALDWIN DU BOURG), king of Jerusalem, was a cousin of Baldwin I., whom he succeeded in 1118. He waged war against the Saracens. During his reign the military order of Templars was instituted for the defence of the Holy Land. He died Aug. 21, 1131, and left the throne to his son-in-law, Foulques of Anjou.

Baldwin III., the son of Foulques of Anjou, was born in 1129, and became king of Jerusalem in 1143. He defeated Noor-ed-Deen, the sultan of Aleppo, at Jerusalem, in 1152 and 1157. He acquired much renown and influence, and was respected even by the Saracens. His wife was Theodora, a daughter of the Greek emperor Manuel. He died Feb. 10, 1162, and was succeeded by his brother, Amalric or Amaury.

Baldwin IV., king of Jerusalem, surnamed THE LEPER, was born in 1160. He succeeded his father Amalric in 1174. He defeated the famous Saladin near Tiberias in 1182, but was afterwards defeated by that prince. He died in 1186, and was succeeded by his nephew, Baldwin V., who died in childhood.

Baldwin I., the first Latin emperor of Constantinople, was born at Valenciennes in 1171. He was Baldwin IX., count of Flanders, having inherited that title from his father, Baldwin VIII. He joined the fourth Crusade in 1200, and co-operated with the Venetians in an enterprise against Constantinople, the throne of which was occupied by Alexis, an usurper. The crusaders defeated Alexis, captured the city, and elected Baldwin emperor in 1204. He was defeated and taken prisoner by the Bulgarians in 1205, and died in 1206, leaving the throne to his brother Henry. (See A. CAHOUR, "Baudouin de Constantinople," 1850.)

Baldwin II., emperor of Constantinople, born in 1217, was a son of Peter de Courtenay, and a nephew of Baldwin I. He succeeded to the throne in 1228, and was placed under the guardianship of John de Brienne. He began to reign in 1237, and encountered much opposition from the Greeks and Bulgarians. In 1261 his capital was taken by Michael Palæologus, and Baldwin fled to Italy, where he died. (The English family of Courtenay claims to be descended from the stock of this emperor.)

Baldwin, a county of Alabama, bordering on Florida and the Gulf of Mexico. Area, estimated at 1800 square miles. It is bounded on the W. by the Mobile River and Mobile Bay, and on the E. by the Perdido River. The surface is nearly level; the soil is sandy. Corn and wool are the chief products. The county is intersected by the Mobile and Montgomery R. R. Capital, Blakely. Pop. 6004.

Baldwin, a county in Central Georgia. Area, 257 square miles. It is intersected by the Oconee River, and bounded on the N. by Little River. The surface is mostly hilly; the soil near the Oconee is fertile. Corn, cotton, and wool are the chief crops. The dividing line between the primary and tertiary formations passes through this county. It is intersected by the Macon and Augusta R. R. Capital, Milledgeville. Pop. 10,618.

Baldwin, a post-village of Duval co., Fla., at the crossing of the Jacksonville Pensacola and Mobile and the Florida R. Rs., 47 miles W. by S. of Jacksonville.

Baldwin, a post-village of St. Mary's parish, La., is the seat of Thompson University.

Baldwin, a township of Cumberland co., Me., on the Portland and Ogdensburg R. R., 25 miles N. W. of Portland. It has manufactures of carriages, boxes, spokes, hay-rakes, etc. Pop. 1101.

Baldwin, a township of Sherburne co., Minn. P. 234.

Baldwin, a township of Chemung co., N. Y. Pop. 969.

Baldwin, a township of Allegheny co., Pa. Pop. 3104.

Baldwin (ABRAHAM), a distinguished statesman of Georgia, born in Guilford, Conn., in Nov., 1754, graduated at Yale in 1772, was five years a tutor there, and became in 1777 a chaplain in the army. In 1784 he became a lawyer of Savannah, Ga., was a member of Congress (1785–88 and 1789–99), of the convention which framed the U. S. Constitution (1787), and U. S. Senator from Georgia (1799–1807). He was the originator of the State University. Died Mar. 4, 1807.

Baldwin (CHARLES H.), U. S. N., born Sept. 3, 1820, in the city of New York, entered the navy as a midshipman April 24, 1839, became a passed midshipman in 1845, a lieutenant in 1853, a commander in 1862, and a captain in 1869. He served on the W. coast of Mexico during the Mexican war, and was in several sharp engagements with the enemy on shore near Mazatlan. He commanded the steamer Clifton of the mortar flotilla at the passage of Forts St. Philip and Jackson by Farragut's fleet, April 24, 1862, and at the attack on Vicksburg of June 28, 1862.

FOXHALL A. PARKER, U. S. N.

Baldwin (ELIHU WHITTLESEY), S. T. D., born at Durham, N. Y., Dec. 25, 1789, graduated at Yale in 1812 and at Andover in 1817, was pastor of the Seventh Presbyterian church in New York City (1820–35), and president of Wabash College, Ind. (1835–40). Died at Crawfordville, Ind., Oct. 15, 1840. (See a "Memoir" by E. F. HATFIELD, 1843.)

Baldwin (GEORGE COLFAX), D. D., born at Pompton,

N. J., Oct. 21, 1817, educated at Madison University, for twenty-nine years pastor of the First Baptist church in Troy, N. Y. He is the author of "Representative Men," "Representative Women," "The Model Prayer," etc.

Baldwin (Henry), LL.D., an American jurist, born at New Haven, Conn., in 1779, became a citizen of Pennsylvania. He was elected to Congress several times, and was appointed a judge of the Supreme Court of the U. S. in 1830. Died April 21, 1844.

Baldwin (Henry P.) was born in Coventry, R. I., Feb. 22, 1814, emigrated to Detroit in his youth, and was governor of Michigan (1869–71).

Baldwin (John Denison) was born at North Stonington, Conn., Sept. 28, 1810. After studying law and theology he became a journalist, and was long the editor and proprietor of the "Worcester (Mass.) Spy." He was a member of Congress from Massachusetts (1863–69), and has published "Raymond Hill and Other Poems" (1847), "Pre-historic Nations" (1869), "Ancient America" (1872).

Baldwin (Joseph G.), of Sumter, Ala., was a native of Virginia. He was an able lawyer and active politician, author of "Flush Times in Alabama and Mississippi" and of "Party Leaders," 1840.

Baldwin (Loammi), born at Woburn, Mass., Jan. 21, 1745, studied at Harvard College, and became an engineer, was a major, lieutenant-colonel, and colonel in the Revolutionary army, and was afterwards a prominent engineer in Massachusetts. Died Oct. 20, 1807.—His son, Loammi Baldwin (born May 16, 1780, graduated at Harvard in 1800), was also an eminent engineer, and was employed in the U. S. government works at Charlestown navy-yard and at Newport. Died June 30, 1838.

Baldwin (Matthias W.), an American machinist, born at Elizabethtown, N. J., in 1796. He is said to have constructed the first locomotive on the American continent. He also made several improvements in locomotives. Died in Philadelphia Sept. 7, 1866.

Baldwin (Roger Sherman), LL.D., an American statesman, born in New Haven Jan. 4, 1793. He became governor of Connecticut in 1844 and U. S. Senator in 1847. In 1841, Governor Baldwin was associated with J. Q. Adams in the famous Amistad trial. Died Feb. 19, 1863.

Baldwin (Theron), D. D., born at Goshen, Conn., July 21, 1801, graduated at Yale in 1827, was sent as a home missionary of the Congregationalists to the West in 1829, was one of the founders of Illinois College, organized the Monticello Female Seminary near Alton, Ill., of which he was principal (1838–43). He was for twenty-seven years secretary of the "Society for Promoting Collegiate and Theological Education." Died at Orange, N. J., April 10, 1870.

Baldwin (Thomas), D. D., a Baptist minister, born in Norwich, Conn., Dec. 23, 1753. He became pastor of the Second Baptist church in Boston in 1790, preached there thirty-five years, and published a work in defence of the Baptists. Died Aug. 29, 1825.

Baldwin (William Owen), M. D. See Appendix.

Bald'win Cit'y, a post-village of Douglas co., Kan., on the Leavenworth Lawrence and Galveston R. R., 15 miles S. of Lawrence. Here is an institution called Baker University.

Bald'winsville, a village in Lysander and Van Buren townships, Onondaga co., N. Y., on the Seneca River and the Oswego and Syracuse R. R., 12 miles N. by W. from Syracuse. A branch of the Oswego Canal runs to this place. It has an academy, national bank, one weekly newspaper, fork-factory, axe-factory, and various other manufactories. Pop. 2130. G. S. Clark, Ed. "Gazette."

Baldwinsville, a village of Hempstead township, Queen's co., N. Y., on the South Side R. R. of Long Island, is situated 1 mile from the sea-beach, and is a place of summer resort.

Bald'winville, a post-village of Templeton township, Worcester co., Mass., on the Vermont and Massachusetts R. R., 21 miles W. by N. of Fitchburg. It has important manufactures.

Bâle, or **Basel** [Ger. *Basel*; Fr. *Bâle* or *Basle*; anc. *Basili'a* or *Basile'a*], an important city of Switzerland, beautifully situated on both sides of the Rhine, 65 miles by rail N. of Berne, and about 3 miles from the frontier of Alsace; lat. 47° 34′ N., lon. 7° 36′ E. The Rhine, which is here crossed by a bridge, divides it into two parts, named in German Gross Basel, "Great Basel," and Klein Basel, "Little Basel" (called in French *Grande Bâle* and *Petite Bâle*). A railway extends from this point south-eastward to Lucerne and north-westward to Mülhausen, in Alsace. Bâle is at or near the head of navigation on the Rhine, and is the most important commercial and manufacturing city of Switzerland. It was more populous in the Middle Ages than at present. Among its public buildings is a fine cathedral built by the emperor Henry II. between 1010 and 1019, with towers 218 feet high, which were not completed till 1500. The University of Bâle, founded in 1459, once had a high reputation. This city also has a valuable museum of natural history, a botanic garden, and the university library of about 85,000 volumes and 4000 MSS. The museum of art is noteworthy for its fine collection of the works of the younger Holbein. A large majority of the inhabitants are Protestants. Bâle has extensive manufactures of ribbons, printed cottons, paper, gloves, jewelry, etc. It was first mentioned in 372 A. D., was destroyed by the Huns and rebuilt by Henry I. in 917. Pop. 44,834.

Bâle, or **Basel,** a canton of Switzerland, bordering on Alsace and Baden, has an area of 176 square miles. The Rhine forms part of the northern boundary of the canton, which is bounded on the N. by Germany, on the E. by Aargau, on the S. by Soleure, and on the W. by Germany and Soleure. It is intersected by the river Birs. The surface is diversified with hills and valleys; the soil is fertile. Salt is made from salt-wells, and considerable quantities of good wine are made. It has extensive manufactures of ribbons, paper, woollen stuffs, etc. Bâle was first admitted as a Swiss canton in 1501. The town had previously been a free city of the German empire. In 1833, Bâle was divided into two independent portions or half-cantons—namely, Bâle city (Ger. *Basel Stadt*) and Bâle country (Ger. *Basel-landschaft*; Fr. *Bâle campagne*). Area of the former, 14 square miles; of the latter, 164 square miles. Pop. of the former in 1870, 47,760; of the latter, 54,127.

Bâle (or **Basel**), **Council of,** a memorable œcumenical council of the Church held in Bâle, was summoned by Pope Martin V., who died (Feb. 20, 1431) before the appointed time of its meeting. It was opened Dec. 14, 1431, under the pontificate of Eugenius IV. (elected Mar. 3, 1431). The pope tried repeatedly to dissolve the council, but in vain. A quarrel in regard to the manner and place of holding negotiations with the Greek Church led finally to a split. Many bishops, and all the cardinals but one, went off with Julianus Cesarini, the pope's legate, first to Ferrara (Jan., 1438), and thence to Florence (Feb., 1439). Those who remained chose a new president, and went on with their work. Excommunicated by Eugenius, they elected a new pope, Felix V., Nov. 17, 1439. Very few acknowledged him. This blunder broke the moral power of the council. Its forty-fifth and last formal session was held May 16, 1443, though the council was not technically "dissolved" till May 7, 1449, when it gave in its adhesion to Nicholas V., the successor of Eugenius IV. The Roman Catholic Church acknowledges only the first twenty-five sessions of the council, before the split. (See Wessenberg, "Die Allgemeinen Concilien des 15ten und 16ten Jahrhundertes," 2 vols., Constance, 1870.)

Bâle (or **Basel**), **Treaty of,** the name of an important treaty of peace signed at Bâle, April 5, 1795, between the French republic and Prussia. The latter then agreed to abandon the coalition against France, and to give up her possessions on the left bank of the Rhine. In July, 1795, another treaty was here concluded between France and Spain.

Bale (John), bishop of Ossory, was born at Cove, Suffolk, England, Nov. 21, 1495, became a Carmelite, and was educated at Cambridge, became a prior (1529), but becoming a Protestant, was obliged to leave the country; returning, he became a bishop in 1552. He was again exiled after Edward VI.'s death, but returned and became prebend of Canterbury in 1560. He wrote voluminously. His "Summarium" (1549), a catalogue of British authors, is his most celebrated work. Died Nov., 1563.

Balear'ic Isles (anc. *Balea'res* or *Balea'res Insulæ*), a group of five islands in the Mediterranean, forming a Spanish province, the area of which is 1860 square miles. Pop. in 1867, 284,398. Capital, Palma. Their names are Majorca, Minorca, Iviça, Formentera, and Cabrera. The soil is mostly fertile, though badly cultivated. The climate is very fine. Vegetation has a tropical aspect. The chief exports are olive oil, figs, oranges, wool, mules, wine, hats, brooms, brandy, capers, saffron, cheese, salt, wooden ware, baskets, etc. The ancient natives of these islands were very expert slingers, and served in the Carthaginian army. The Baleares were made an independent kingdom in 1256, but soon became feudal to Aragon, to which kingdom they were annexed in 1344. The Moors were long masters here, but were expelled in 1285. The kings of Spain long retained the title of "king of the Balearic Islands" as one of their secondary honors. The language is made up of various dialects (Mallorquin, Minorquin, etc.) of the Catalan, mingled with Arabic (and perhaps Punic) elements. (See Majorca and Minorca.)

Balear'ic Crane (*Balearica pavonina*), a beautiful crane found in Northern and Western Africa, conspicuous

Balearic Crane.

for its crown of golden plumes and its scarlet cheeks. It is readily tamed, often indulging in fantastic dances, running about with great speed, and screaming with a harsh and ringing voice. It is of a bluish-slate color, and is four feet high. Its bill is shorter and thicker than that of other cranes. It is exceedingly gentle, and, unlike some other cranes, is quite harmless. It is doubtful whether this bird is the Balearic crane of the ancients.

Balechou (Jean Joseph Nicolas), a very eminent French engraver, born at Arles in 1715. He was the first burinist of his time. His works are remarkably neat, and his style brilliant, vigorous, and bold; but his drawing is often defective, and he paid too little attention to detail. His "Women Bathing," "Storm" and "Calm" (after Vernet), "Saint Genevieve" (after Charles Vanloo), and his full-length portrait of Augustus, king of Poland, are his most famous works. The last mentioned is one of the great triumphs of the engraver's art. Died Aug. 18, 1765.

Baleen' [from the Lat. *balæna;* Gr. φάλαινα, a "whale"], a substance commercially known as whale-fin and whalebone, is procured from the mouth of the right whale, the Greenland whale, the Bahia fin-back, the Cape whale, the humpback, and various other species. It grows from the roof of the mouth of all the Balænidæ or true whales, though in some it is too small to be of much use. It is never found in the sperm whales or the dolphins. From single whales as much as two tons of baleen has been taken. It consists of horny plates of albuminous matter charged with phosphate of lime. Baleen takes the place of teeth, and serves as a strainer for separating from the water the little animals which serve as food for the whale. (See Whalebone.)

Balen, or Ballen, van (Hendrik), a Flemish painter, born in Antwerp in 1560, studied with Adam van Oort and in Italy, and was the first instructor of Vandyck. In spite of a certain coldness and mannerism, his harmonious coloring, correct taste, and skilful composition have given him a more than respectable rank among painters. Of his numerous works, the best known are scriptural and ecclesiastical pieces. His nude figures are well executed. Died in 1632.

Bales'tra (Antonio), an Italian painter, born at Verona in 1666. After his father's death he followed commercial pursuits until he came of age, when he went to Venice and became a pupil of Belucci (an able colorist), and afterwards studied at Rome with Carlo Maratti. His "Defeat of the Giants" gained the prize at the Academy of St. Luke in 1694. Among his other famous pictures are a "Saint Theresa" at Bergamo, a "Virgin" at Mantua, a "Life of Saints Cosmas and Damian" at Padua, and his own portrait at Florence. He was one of the last able artists of the Venetian school, though not a slavish follower of any school. He was a skilful designer, a good colorist, a laborious and faithful student of his art, and was possessed of a vigorous hand and spirit. The works of Giovanni Balestra, a skilful engraver, are often incorrectly assigned to the subject of this notice. Antonio Balestra died April 2, 1740.

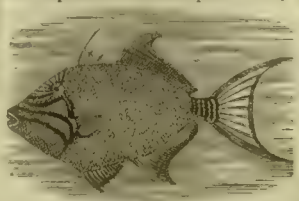
Balfe (Michael William), a distinguished musician and composer, born in Dublin, Ireland, May 15, 1808, was a skilful violinist. He visited Italy in 1825, gained distinction as a singer, and composed in rapid succession many operas, which are not remarkable for originality. Among his most popular operas are "Falstaff" (1838), "The Bohemian Girl" (1844), "The Rose of Castile," and "The Talisman," the latter a posthumous work now (Sept., 1873) in preparation for representation in London. Died Oct. 20, 1870.

Balfour (John Hutton), M. D., F. R. S., a British botanist and physician, born in Edinburgh Sept. 15, 1808. In 1845 he became professor of botany at Edinburgh. He published a "Manual of Botany" (1849), and a "Class-book of Botany" (1852) which is highly esteemed. He contributed the article on Botany to the eighth edition of the "Encyclopædia Britannica."

Balfour (Robert), a Scotchman, born about 1550, and for many years principal of the Guienne College at Bordeaux. He had great learning, and was called the "phœnix of the age." His principal works were commentaries on Aristotle, 1616, 1618, and 1620.

Balfour (Rev. Walter), born at St. Ninian's, Stirlingshire, Scotland, in 1777. He was brought up a Presbyterian of the national Kirk, but coming to the U. S. at the age of twenty, he became a Baptist ten years later. In 1823 he became a Universalist, and was long a preacher of that faith in Charlestown, Mass. He published, besides other works, "Inquiries concerning the Devil," "Scriptural Import of the Words translated Hell" (1824), "The State of the Dead" (1833), and controversial letters to Prof. Moses Stuart and others. Died Jan. 3, 1852.

Balfurosh', or **Balfrush,** originally **Barfurosh** ("the mart of burdens"), an important commercial town of Persia, in the province of Mazanderân, on the river Bahbul, 14 miles from its entrance into the Caspian Sea, and about 110 miles N. E. of Teherân. It has an extensive trade, and contains numerous colleges and caravanserais. The bazaars are large, and filled with a great variety of goods. A good road extends from this town to its port, Meshedi-Ser, on the Caspian. Pop. estimated at 120,000.



Ba'li, or **Bal'ly,** an island of the Malay Archipelago, is about 3 miles E. of Java. Area, 1999 square miles. It is nearly 70 miles long and 35 miles wide. The chief exports are rice, cotton, coffee, tobacco, hides, etc. The island is divided into several small states, of which Badong is the chief. The Balinese mostly profess Brahmanism. They are said to be superior to the Javanese in mind and other respects. Their language resembles that of Java. Pop. about 800,000.

Baliol, or **Bal'liol** (Edward), a son of King John Baliol, invaded Scotland in 1332. Having gained several victories over the Scottish army, he was crowned king at Scone in September of that year. About three months later he was surprised in his camp, and lost his crown. His subsequent career was unfortunate. Died in 1363.

Baliol, or **Balliol** (John), lord of Galloway and king of Scotland, was born about 1259. He became the rival of Robert Bruce, and claimed the crown as the grandson of David, who was a brother of King William the Lion. The dispute was referred to Edward I. of England as arbiter, who decided that Baliol was the rightful heir, and imposed the condition that he should do homage to the king of England. He was crowned in 1292, and swore fealty to Edward, but soon renounced his allegiance. Edward invaded Scotland, defeated Baliol's army, and compelled him to resign the crown in 1296. Baliol died in France in 1314.

Ba'liol College, Oxford, was founded about 1263 or 1268 by John de Baliol, whose son of the same name was king of Scotland. It was enriched by several benefactors separated by long intervals of time. Among the graduates of this college were John Evelyn and Bradley the astronomer.

Balis'tes, or **File-Fish,** a genus of osseous fishes of the order Plectognathi of Cuvier, is the type of the family Balistidæ or Sclerodermata. They are mostly found in tropical or sub-tropical seas, have brilliant colors, and a body which is remarkably compressed. They have a curious provision for fixing the first dorsal spine in an erect position or lowering it at the will of the fish. For this reason they are sometimes called trigger-fishes. One of the most remarkable species is the *Balistes vetulus,* or "unarmed trigger-fish," the flesh of which is regarded as poisonous. The dusky file-fish (*Balistes fuliginosus*) has been taken in N. Y. harbor; the

Unarmed Trigger-fish: *Balistes Vetulus* (found in the Nile).

other file-fish of the U. S. coast are now referred to other but kindred genera.

Balize, or **Belize** [a Spanish name corrupted from *Wallis* or *Wallace*, an English pirate who infested that region], also called **British Honduras,** a British colony in Central America, on the Bay of Honduras, and in the south-eastern part of the peninsula of Yucatan. Area, estimated at 13,500 square miles. Mahogany, fustic, logwood, etc. are exported from this colony. Pop. in 1861, 25,635.

Balize, or **Belize,** a town of Central America, is in the district noticed above, and on the Bay of Honduras, at the mouth of the Balize River. It is a dépôt of British goods destined for Central America. It contains a courthouse, a hospital, several chapels, and an iron markethouse. Pop. estimated at 5000.

Balize, a name sometimes given to a village at the North-eastern Pass, at the mouth of the Mississippi River, derived from the French *balise*, a "beacon." It is inhabited by pilots and their families.

Balkan' (the ancient *Hæ'mus*), a mountain-chain of European Turkey, extends from Sophia eastward to Cape Emineh on the Black Sea, and forms the southern boundary of the basin of the Danube. Some peaks of this range are over 5000 feet high. The Balkan is connected with the mountains of Middle Europe by the ranges of Montenegro and Herzegovina. It is an important natural barrier for the protection of Turkey against Russian invaders.

Balkash' (in the Calmuck language "large lake," is called by the Khirgiz **Ak Tenghiz,** *i. e.* "white sea," or simply **Tenghiz Sea**), a large lake of Central Asia having no visible outlet, is on the borders of Chinese Turkistan and the Russian government of Tomsk, between lat. 44° and 47° N., and lon. 77° and 81° E. Its length from N. E. to S. W. is 390 miles, and its greatest breadth 50 miles.

Balkh (the ancient *Bac'tria*), a province of Afghanistan. It is bounded on the N. by the river Oxus or Amoo, on the E. by Badakshan, on the S. by the Hindoo-Koosh Mountains, and on the W. by the desert. A large part of the soil is sterile. The natives are Usbek Tartars. Capital, Balkh.

Balkh (anc. *Zariaspa* and *Bac'tra*), the capital of the province of Balkh, is about 22 miles S. of the Amoo River, and 150 miles N. N. W. of Cabul. The ancient Bactra was an important city, the remains of which cover a space about twenty miles in circuit, and comprise eighteen aqueducts now in ruins. It was destroyed by Jengis Khan. The modern town is insignificant. Pop. about 2000.

Ball [from the Gr. βάλλω, "to throw"], a word used in various applications; a round body or globe; a dancing-party; a solid shot or bullet discharged from a cannon or other gun. Also the name of a game. (See BALL, GAME OF.)

Ball, in military affairs. See BULLET.

Ball, a township of Sangamon co., Ill. Pop. 986.

Ball, Game of. This was a favorite gymnastic exercise among the ancient Greeks and Romans, the latter of whom called it *pila*. At Rome it was played by persons of all ages and by men of high rank. The Greeks prized the game as a means of giving grace and elasticity to their figures and motions. In the sixteenth century this game was fashionable in the courts of French and Italian princes. The French *jeu de paume* and English *tennis* were modifications of the game of ball. The ball was struck with a mallet (Fr. *mail* or *maille;* Eng. *mall*), sometimes called pall-mall or pell-mell, from the Italian *palla*, a ball. A form of this game, called *cricket*, is much played by the English at the present time. The popular game of the U. S. is *base-ball*.

Ball (EPHRAIM), an inventor, born in Stark co., O., in 1812. He had few educational privileges in his youth. He began the manufacture of ploughs in 1840, patented the "Ohio mower" in 1856, and the well-known "Buckeye" machine in 1858. He was long at the head of a large manufactory of farming tools at Canton, O.

Ball (THOMAS), a distinguished American sculptor, born in Charlestown, Mass., June 3, 1819. His works of art are numerous and highly esteemed. Among them are busts of Webster and Choate, and statues of Webster, Everett, and Washington.

Ballad Poetry. The word *ballad* signifies in English a narrative song, a short tale in lyric verse, which sense it has come to have, probably through the English, in some other languages. It means, by derivation, a dance-song, but though dancing was formerly, and in some places still is, performed to song instead of instrumental music, the application of the word in English is quite accidental. The *popular* ballad, for which our language has no unequivocal name, is a distinct and very important species of poetry. Its historical and natural place is anterior to the appearance of the poetry of art, to which it has formed a step among every people that has produced an original literature, and by which it has been regularly displaced, and, in some cases, all but extinguished. Whenever a people in the course of its development reaches a certain intellectual and moral stage, it will feel an impulse to express itself in literature, and the form of expression to which it is first impelled is, as is well known, not prose but verse, and in fact narrative verse. The condition of society in which a truly national or popular poetry appears, explains the character of such poetry. It is a condition in which the people are not divided by political organization and book-culture into markedly distinct classes, in which consequently there is such community of ideas and feelings that the whole people form an individual. Such poetry, accordingly, while it is in its essence an expression of our common human nature, and so of universal and indestructible interest, will in each case be differenced by circumstances and idiosyncrasy. On the other hand, it will always be an expression of the mind and heart of the people as an individual, and never of the personality of individual men. The fundamental characteristic of popular ballads is therefore the absence of subjectivity and of self-consciousness. Though they do not "write themselves," as William Grimm has said, though a man and not a people has composed them, still the author counts for nothing, and it is not by mere accident, but with the best reason, that they have come down to us anonymous. Hence, too, they are extremely difficult to imitate by the highly-civilized modern man, and most of the attempts to reproduce this kind of poetry have been ridiculous failures.

The primitive ballad then is popular, not in the sense of something arising from and suited to the lower orders of a people. As yet, no sharp distinction of high and low exists, in respect to knowledge, desires, and tastes. An increased civilization, and especially the introduction of book-culture, gradually gives rise to such a division: the poetry of art appears; the popular poetry is no longer relished by a portion of the people, and is abandoned to an uncultivated or not over-cultivated class—a constantly diminishing number. But whatever may be the estimation in which it may be held by particular classes or at particular epochs, it cannot lose its value. Being founded on what is permanent and universal in the heart of man, and now by printing put beyond the danger of perishing, it will survive the fluctuations of taste, and may from time to time serve, as it notoriously did in England and Germany a hundred years ago, to recall a literature from false and artificial courses to nature and truth.

Of the Europeans nations, the Spaniards and those of Scandinavian-German stock have best preserved their early popular poetry. We have early notices of the poetry of the Germans. Their ballads, mythical or historical, are several times spoken of by Tacitus, who says that these were their only annals. The earth-born Tuisco and his son Mannus were celebrated in the one, and the hero Arminius in the other. The historian of the Goths, Jornandes, writing in the sixth century, says that these people were accustomed to sing the exploits of their fathers to the harp, and seems to have taken not a little of his history from such songs. The like is true of Paulus Diaconus, the Lombard historian, who wrote in the eighth century, and mentions songs about Alboin (who died in 563) as existing among all the nations of German speech. Charlemagne had the old traditional songs of his people collected and committed to writing, and even made them one of the subjects of school instruction. Side by side with heroic ballads, social, convivial, and funeral songs (which may, to be sure, have been pretty much the same thing) seem to have been in use from the earliest recorded times. To all this popular poetry, by reason of its heathen derivation and character, the Christian clergy opposed themselves with the most determined hostility. Not succeeding in extirpating it by the use of the spiritual and legal means at their command, the German churchmen of the ninth century conceived the idea of crowding it out by substituting poetry of a Christian subject and tone—an expedient which has been tried more than once since then. Though popular song lived on in obscure places, the foreground of history is filled for six hundred years with religious and courtly poetry and with the chivalrous and native epic. Nothing is left of the old heroic songs but a fragment of the Hildebrandslied, from the eighth century (best known in a modernized form of the fifteenth century); and of the Christianized song we have also but a single specimen, the Ludwigslied, of the year 881. The former is in the ancient alliterative metre, the latter in the then newly-introduced rhymed stanza. During the fifteenth and the early part of the sixteenth centuries a second growth of the genuine popular

song appears, some of it springing, doubtless, out of shoots from the old stock which had lived through this long interval, some of it a fresh product of the age. These ballads were popular in the large and strict sense; that is, they were the creation and the manifestation of the whole people, great and humble, who were still one in all essentials, having the same belief, the same ignorance, and the same tastes, and living in much closer relations than now. The diffusion of knowledge and the stimulation of thought through the art of printing, the religious and intellectual consequences of the Reformation, the intrusion of cold reflection into a world of sense and fancy, broke up the national unity. The educated classes took a direction of their own, and left, what had been a common treasure, to the people in the lower sense, the ignorant or unschooled mass. German ballads have been collected in considerable numbers. The sources have been "flying leaves," manuscripts, printed song-books (mostly of the sixteenth century), and oral tradition. In interest they are decidedly inferior to the Scandinavian and English.

Christianity and foreign culture, which in different ways have been equally destructive in their effects upon ancient national poetry, were introduced into the Scandinavian countries much later than into Germany and England. In the Scandinavian countries, too, the peasantry long maintained a much higher position. They were not an oppressed and ignorant class, but free men, who shared fully in the indigenous culture, and so were well fitted to keep and transmit their poetical heritage. While, therefore, the heroic ballads of Germany and England have been lost—those of England utterly, those of Germany being preserved only in epic conglomerates like the Nibelungenlied—and while the mythical cycle in both countries is but feebly, if at all, represented, Scandinavia has kept a great deal of both. The story of Thor's Hammer forms the subject of a ballad still known in all the Scandinavian countries; a volume of ballads concerning Sigurd has been gathered from tradition in the Faroe Isles within this century, and several ballads of this cycle and of that of Dietrich of Bern are found in Danish manuscript ballad-books. Svend Grundtvig, the editor of the still unfinished but truly magnificent collection of the old Danish ballads, has arranged them in four classes: first, the Heroic; second, the Trylleviser, or ballads of giants, dwarfs, nixes, elves, mountain spirits, enchantment, spells, and ghosts; third, the Historic; and fourth, ballads of Chivalry. The historic ballads (intending their original, not their actual, form) mostly fall within the period from 1150 to 1300; the chivalrous are later, and the two other classes belong to a still earlier term, which may extend over the first half of the twelfth century, and into, or perhaps through, the eleventh; that is, to the epoch of the introduction of Christianity. Ballads are best preserved by oral tradition in Norway and the Faroe Isles, but not at all, there, in old manuscripts; Sweden has a few manuscripts, and Denmark a great number, written mostly by noble ladies living on their estates, and giving the ballads as they were sung three or four hundred years ago, as well in the lord's castle as in the peasant's hut. The Danish ballads were collected in a printed form earlier than any others except the Spanish. Vedel published a hundred in 1591; another collection, called Tragica, or old Danish historic love-ballads, appeared at Copenhagen in 1657; and in 1695 Syv republished Vedel's ballads, with the addition of another hundred.

The English have preserved but a moderate number of very early ballads, and the date of many of these it is impossible to fix. There are some narrative poems in Anglo-Saxon which, without stretch of language, might be called ballads. The Norman Conquest, and the predominance of the French language for more than two hundred years, had of course momentous literary consequences, but there is no reason why the production of the native ballad should have stopped. The story of the Saxon outlaw Hereward, which begins with the second year after the Conquest, and has been handed down to us in Latin prose of the twelfth century, is full of such adventures as form the themes of ballads, and very likely was made up from popular songs. Such ballads, if they existed, are lost, but ballads concerning outlaws are among the earliest and best ones of the English. In place of Hereward of the Conqueror's time, and Fulk Fitz-Warin of John's time (whose history was also extremely popular), we have Robin Hood of uncertain time. Songs of Robin Hood and of Randolph, earl of Chester (probably the third earl, who died in 1232), we know, from Piers Ploughman, were current among the lower orders at the middle of the fourteenth century, and one Robin Hood ballad exists in a manuscript which may be as old as the first quarter of the next century. Another occurs in a manuscript dated at about 1500, others in the Percy manuscript. The Little Gest of Robin Hood, which is a miniature epic made up of half a dozen ballads, was printed by Wynken de Worde, "probably," says Ritson, "in 1489." We may reasonably place the origin of the Robin Hood ballads as early as the thirteenth century. To the thirteenth century may belong Hugh of Lincoln, which is founded on an incident that occurred in 1255. An Anglo-Norman ballad on the same subject twice refers to a King Henry, and is therefore put within the reign of Henry III., which ended 1276. Sir Patrick Spens, if the occasion of the ballad has been rightly understood, dates from 1281. After this there are only one or two ballads with dates till we come to the Battle of Otterbourn, 1388, from which time we have a succession of ballads founded on ascertained events, down to the middle of the eighteenth century. Ballads like those of Grundtvig's second class exist in a small number; one of them in a manuscript of the middle of the fifteenth century. The little that we have of ballads of the Arthur cycle, and many of the best of all kinds, we owe to the Percy manuscript, written just before 1650. A few ballads besides those named have been gleaned from manuscripts and early prints, but a large part of our whole stock has been recovered within the last hundred years from the oral tradition of Scotland. The first impulse to the collecting of this poetry was given by the publication of Percy's "Reliques" in 1765. The "Reliques" inspired Bürger and Herder, through whom, and especially through Herder's "Volkslieder" (1778–79), that interest in the literature of the people was awakened in Germany which has spread over the whole of Europe, and has led to the collecting and study of the traditional songs and tales of all the European, and some of the Asiatic, African, and American races.

The Spanish alone of the Latin nations can boast a ballad poetry of great compass and antiquity. Following the law of analogy where documents are wanting, the origin of these ballads would be put between the years 1000 and 1200, the period when the Spanish nationality and language had been developed to that degree which invariably incites and leads to expression in epic song. Some sort of popular poetry about the Cid (whose time is 1040–99) is known to have been sung as early as 1147; the poem of the Cid itself is placed about 1200. During the century that follows we find occasional mention of ballad-singers, but no ballads. As in Germany, the popular poetry, after the first bloom of the national genius, was supplanted by art-poetry, among the higher classes, and it passed out of notice for two or three hundred years. A reaction set in in the sixteenth century. This was the glorious period of Spanish history, and the return to the national poetry was a natural consequence of the powerful stirring of the national mind. Omitting "flying leaves" or broadsides, and a few ballads in the "Cancionero General" of 1511, the earliest collection of Spanish ballads is an undated "Cancionero de Romances," printed at Antwerp about 1546; and this, it must be observed, is the first ballad-book printed in any language, and was gathered in part from the memory of the people. Other similar collections followed, from which was made in 1600 the great "Romancero General." Towards the end of the seventeenth century the national ballads declined in favor, with a decline of national spirit, but since the beginning of the present century they have been restored to a high estimation at home, and have gained the admiration of the world. The oldest ballads are those which relate to the history and traditions of Spain, and recount the exploits of Bernardo del Carpio, Fernan Gonzalez, the Seven Lords of Lara, and the Cid. Then comes a variety of romantic and chivalrous ballads, and then ballads of the Carlovingian cycle. These oldest and most characteristic of the Spanish ballads have been excellently edited by Wolf and Hofmann, and the entire body of this literature, amounting to more than 1900 pieces, is included in the "Romancero General," edited by Duran in 1849–51, a work which surpasses every other in the same line, except the Danish collection of Grundtvig. The collections of ballads in the other Latin languages will be found below. The most important are the Portuguese "Romanceiro," by Almeida-Garrett, 1863; the Piedmontese ballads, by Nigra, 1858–63, and the "Songs and Tales of the Italian People," by Comparetti and D'Ancona, begun in 1870, both first-rate works; Arbaud's, Puymaigre's, and Bujeaud's French collections.

The ballads of other European nations are scarcely less interesting than those which have been noticed, and those of races which possess little or no other literature are peculiarly instructive, by reason of the light which they throw on the history of national poetry; for instance, the songs of the Slavic races, and, most of all, of the Servians. The Slavic songs as a class are distinguished from the Teutonic by the absence of the sentiment of *romantic* love and of *chivalrous* heroism. In their form, too, they are much less dramatic, and even the division of epic from lyric songs is not easy. Many songs begin with a few narrative verses,

and then become entirely lyric, and the narrative part is almost always descriptive. The Servians especially those of Turkish Servia, Bosnia, and Montenegro, who have not been much affected by civilization—afford a capital example of a race that has not outlived the ballad era. Vuk has collected five or six hundred of their songs, one third of them epic, and every one of them from the mouths of the people. A few of these are, in their actual form, as old as the fifteenth century, some belong to a remoter time, and indeed many retain marks of an ante-Christian origin. So far, the Servians are like the German nations: the distinction is that the fountain of popular poetry still flows, and that heroic poems have been produced among the Servians in this century which are essentially similar to the older ones, and not at all inferior. We find the national poetry, there, in a condition closely resembling that in which it was among the races of Northern and Eastern Europe many hundred years ago. New songs appear with new occasions, but do not supersede the ancient ones. The heroic ballads are chanted at taverns, in the public squares, in the halls of chiefs, to the accompaniment of a simple instrument. Sometimes they are only recited, and in this way are taught by the old to the young. All classes know them: the peasant, the merchant, the hayduk (the klepht of the modern Greek, a sort of Robin Hood), as well as the professional bard. No class scorns to sing them—not even the clergy or the chiefs.

One or two general remarks are required to prevent misconceptions and to supply omissions. From what has been said, it may be seen or inferred that the popular ballad is not originally the product or the property of the lower orders of the people. Nothing, in fact, is more obvious than that many of the ballads of the now most refined nations had their origin in that class whose acts and fortunes they depict—the upper class—though the growth of civilization has driven them from the memory of the highly-polished and instructed, and has left them as an exclusive possession to the uneducated. The genuine popular ballad had its rise in a time when the distinctions since brought about by education and other circumstances had practically no existence. The vulgar ballads of our day, the "broadsides" which were printed in such huge numbers in England and elsewhere in the sixteenth century or later, belong to a different genus; they are products of a low kind of *art*, and most of them are, from a literary point of view, thoroughly despicable and worthless.

Next it must be observed that ballads which have been handed down by long-repeated tradition have always departed considerably from their original form. If the transmission has been purely through the mouths of unlearned people, there is less probability of wilful change, but once in the hands of professional singers, there is no amount of change which they may not undergo. Last of all comes the modern editor, whose so-called improvements are more to be feared than the mischances of a thousand years. A very old ballad will often be found to have resolved itself in the course of what may be called its propagation into several distinct shapes, and each of these again to have received distinct modifications. When the fashion of verse has altered, we shall find a change of form as great as that in the Hildebrandslied, from alliteration without stanza to stanza with rhyme. In all cases the language drifts insensibly from ancient forms, though not at the same rate with the language of every-day life. The professional ballad-singer or minstrel, whose sole object is to please the audience before him, will alter, omit, or add, without scruple, and nothing is more common than to find different ballads blended together.

There remains the very curious question of the origin of the resemblances which are found in the ballads of different nations, the recurrence of the same incidents or even of the same story, among races distinct in blood and history, and geographically far separated. The Scottish ballad of May Colvin, for instance—the German Ulinger—is also found in the Swedish, Dutch, Spanish, Portuguese, Italian, French, Servian, Bohemian, Wendish, Esthonian, Breton, and perhaps other languages. Some have thought that to explain this phenomenon we must go back almost to the cradle of mankind, to a primeval common ancestry of all or most of the nations among whom it appears. But so august an hypothesis is scarcely necessary. The incidents of many ballads are such as might occur anywhere and at any time; and with regard to agreements that cannot be explained in this way, we have only to remember that tales and songs were the chief social amusement of all classes of people in all the nations of Europe during the Middle Ages, and that new stories would be eagerly sought for by those whose business it was to furnish this amusement, and be rapidly spread among the fraternity. A great effect was undoubtedly produced by the Crusades, which both brought the chief European nations into closer intercourse and made them acquainted with the East, thus facilitating the interchange of stories and greatly enlarging the stock.

The most important collections of ballads are—

English.—"Reliques of Ancient English Poetry," by Thomas Percy, fourth improved ed., London, 1794, and often since; "Ancient and Modern Scottish Songs," by David Herd, second ed., 2 vols., Edinburgh, 1776; "Minstrelsy of the Scottish Border," by Sir Walter Scott, 3 vols., Edinburgh, 1802–3, and often since; "Popular Ballads and Songs," by Robert Jamieson, 2 vols., Edinburgh, 1806; "Ancient Scottish Ballads," by George R. Kinloch, Edinburgh, 1827; "Minstrelsy, Ancient and Modern," by William Motherwell, Glasgow, 1827; "English and Scottish Ballads," by F. J. Child, 8 vols., Boston, 1860, which contains all but two or three of the ancient ballads, and a full list of collections; "Bishop Percy's Folio Manuscript," by J. W. Hales and F. J. Furnivall, 3 vols., London, 1867–68.

Scandinavian.—"Danmarks Gamle Folkeviser" ("The Ancient Ballads of Denmark"), by Svend Grundtvig, 3 vols., and part of a fourth, Copenhagen, 1853–72—by far the greatest work in this class of literature; "Ancient Danish Ballads," translated from the originals by R. C. Alex. Prior, 3 vols., London, 1860; "Norske Folkeviser" ("Norwegian Ballads"), by M. B. Landstad, Christiania, 1853; "Gamle Norske Folkeviser" ("Ancient Norwegian Ballads"), by Sophus Bugge, Christiania, 1858; "Svenska Folk-Visor" ("Swedish Ballads"), by Geijer and Afzelius, 3 vols., Stockholm, 1814–16; "Svenska Fornsånger," by A. I. Arwidsson, 3 vols., Stockholm, 1834–42; Rosa Warren's "Dänische Volkslieder," Hamburg, 1858, "Norwegische, etc. Volkslieder," Hamburg, 1866, "Schwedische Volkslieder," Hamburg, 1857; "Færöiske Kvæder" ("Ballads of the Faroe Isles"), by V. U. Hammershaimb, 2 parts, Copenhagen, 1851–55; "Islenzk Fornkvæði," by Grundtvig and Sigurðsson, 3 parts, Copenhagen, 1854–59.

High German.—"Des Knaben Wunderhorn," Arnim and Brentano, 3 vols., Heidelberg, 1806–08, 4 vols., Berlin, 1853–54; "Alte teutsche Volkslieder in der Mundart des Kuhländchens," Vienna and Hamburg, 1817; "Oesterreichische Volkslieder," Ziska and Schottky, Pesth, 1819; "Die Volkslieder der Deutschen," F. K. von Erlach, 5 vols., Mannheim, 1834–36; "Schlesische Volkslieder," Hoffmann von Fallersleben and Richter, Leipsic, 1842; "Alte hoch- und nieder-deutsche Volkslieder," L. Uhland, 2 vols., Stuttgart, 1844–45; "Deutsche Volkslieder," F. L. Mittler, Marburg and Leipsic, 1855; "Fränkische Volkslieder," F. M. von Ditfurth, 2 parts, Leipsic, 1855; "Deutscher Liederhort," L. Erk, Berlin, 1856; "Die historischen Volkslieder der Deutschen," R. von Liliencron, 4 vols., Leipsic, 1865–69.

Low-German, Netherlandish.—"Letterkundig overzigt en proeven van de Nederlandsche Volkszangen," J. C. W. le Jeune, Amsterdam, 1828; Uhland, as before; "Oude Vlaemsche Liederen," J. F. Willems, Ghent, 1848; "Niederländsche Volkslieder," Hoffmann von Fallersleben, second ed., Hannover, 1856; "Chants Populaires des Flamands de France," E. de Coussemaker, Ghent, 1856.

Spanish and Portuguese.—"Tesoro de los Romanceros," etc., Eug. de Ochoa, Paris, 1838, Barcelona, 1840; "Romancero Castellano," G. B. Depping and A. A. Galiano, 2 vols., Leipsic, 1844; "Romancero General" (vols. x. and xvi. of "Biblioteca de autores Españoles"), Madrid, 1849–51; "Observaciones sobra la poesia popular," etc., M. Milá y Fontanals, Barcelona, 1853; "Primavera y Flor de Romances," F. J. Wolf and C. Hoffmann, 2 vols., Berlin, 1856; "Romanzen Asturiens," u. s. w., José Amador de los Rios, in "Jahrbuch für romanische- u. englische Literatur," iii. 268, 1861; "Cancionero Popular," E. Lafuente y Alcantara, 2 vols., Madrid, 1866; "Cansons de la Terra, Cants populars Catalans," F. Pelay Briz y Candi Candi, 3 vols., Barcelona, 1866–71; "Romanceiro," Almeida-Garrett, 3 vols., Lisbon, 1863; Th. Braga, "Cancioneiro Popular," Coimbra, 1867; "Romanceiro Geral," Coimbra, 1867; "Cantos Populares do Archipelago Açoriano," Porto, 1869; "Ancient Spanish Ballads," J. G. Lockhart, London, 1823; "Portugiesische Volkslieder u. Romanzen," C. F. Bellermann, Leipsic, 1864; "Romanzero der Spanier u. Portugieser," Stuttgart, 1866.

Italian.—"Canti popolari Toscani, Corsi, Illirici, Greci," N. Tommaséo, 4 vols., Venice, 1841–42, second ed. of vol. i., 1848; "Canti pop. inediti Umbri, etc.," O. Marcoaldi, Genoa, 1856; "Canzoni pop. del Piemonte," C. Nigra in the "Rivista Contemporanea" of Turin, 1858–63; "Saggio di canti pop. Veronesi," E. S. Righi, Verona, 1863; "Volkslieder aus Venetien, gesammelt von G. Widter," 1864; "Canti pop. Siciliani," G. Pitrè, vol. i., Palermo, 1870, vol. ii., 1871; "Canti e Racconti del Popolo Italiano," D. Comparetti and A. d'Ancona, Turin and Florence, vol. i., 1870; vol. ii., 1871; vol. iii., 1872.

French.—"Instructions relatives aux Poésies Populaires de la France," J. J. Ampère, Paris, 1853; "Etude sur la poésie populaire en Normandie," Eug. de Beaurepaire, Avranches, 1856; "Chants populaires du pays castrais," A. Combes, Castres, 1862; "Chants pop. de la Provence," Damase Arbaud, 2 vols., Aix, 1862–64; "Romancero de Champagne,"

P. Tarbé, 5 vols., Reims, 1863–64; "Chants pop. recueillis dans le pays messin," Compte de Puymaigre, Metz, 1865; "Chants et chansons pop. des provinces de l'ouest, Poitou, etc.," J. Bujeaud, 2 vols., Niort, 1866; "Des chansons pop. chez les anciens et chez les Français," C. Nisard, 2 vols., Paris, 1867; "Recueil de chants historiques français," Leroux de Lincy, 2 vols., Paris, 1841–42.

Rouman and Wallachian.—"Ballade," B. Alexandri, 2 vols., Jassy, 1853–54; and "Poesiĕ Populare ale Românilor," Bucharest, 1866; "Ballades et chants pop. de la Roumanie, recueillis et traduits par Alexandri," Paris, 1855; "Rouman Anthology, National Ballads of Moldavia," etc., H. Stanley, Hertford, 1856; (Alexandri's) "Rumänische Volkspoesie," deutsch v. W. v. Kotzebue, Berlin, 1857; "Poesia Popurala, Balade," Marienescu, Pesth, 1859; "Romänische Volkslieder," Schuller, Hermannstadt, 1859.

Romaic.—"Chants populaires de la Grèce moderne," C. Fauriel, 2 vols., Paris, 1824–25; the same in German, by W. Müller, Leipsic, 1825; "Neugriechische Volksgesänge," J. M. Firmenich, Berlin, 1840; "Canti popolari Toscani, Corsi, Illirici, Greci," N. Tomassèo, 4 vols., Venice, 1841–42; "Neugriechische Volks- u. Freiheitslieder," D. H. Sanders, Leipsic, 1842; "Das Volksleben der Neugriechen," etc., D. H. Sanders, Mannheim, 1844; "Die neugriechischen Volkslieder," Th. Kind, Leipsic, 1849; "Chants du Peuple en Grèce," Compte de Marcellus, 2 vols., Paris, 1851; "Ἄισματα δημοτικὰ τῆς Ἑλλάδος" (Popular Songs of Greece), Spyr. Zambelios, Corcyra, 1852; "Carmina popularia Græciæ recentioris," A. Passow, Leipsic, 1860; "Anthologie neugriechischer Volkslieder," Th. Kind, Leipsic, 1861.

Slavic, Eastern Branch.—I. *a, Russian.*—"Piesni russkago, naroda" (Songs of the Russian People), J. Sakharof, 5 parts, St. Petersburg, 1838–39; "Piesni sobranniya, P. V. Kirieevskim" (Songs collected by P. V. Kirievsky), 8 parts, Moscow, 1850–68; "Piesni, etc." ("Songs collected by P. N. Rybnikof"), 5 vols., Moscow, 1861–70; "Russkiya Narodniya Piesni" (Russian Popular Songs), collected and arranged by P. V. Shein, vol. i., Moscow, 1870; "Stimmen des russischen Volks in Liedern," P. v. Götze, Stuttgart, 1828; "Die Balalaika" (Russian Popular Songs, in German translation), J. Altmann, Berlin, 1863; "The Songs of the Russian People, as illustrative of Slavonic Mythology and Russian Social Life," by W. R. S. Ralston, London, 1872. *b, Malorussian, Ruthenian.*—"Malorossiiskiya Piesni" (Little-Russian Songs), M. Maximovitch, Moscow, 1827; "Pieśni Ludu ruskiego w Galicyi" (Songs of the Russian People in Galicia), Z. Pauli, Lemberg, 1839–40; "Sbornik ukrainskikh Piesen" (Collection of Songs of the Ukraine), M. Maximovitch, Kief, 1849; "Pisni, Dumki," etc. ("Songs, Thoughts, and Jests of the Russian People in Podolia, Ukraine, and Little-Russia"), A. Kotzipinsky, Kief, 1862; "Volkslieder der Polen" (*i. e.*, of the Ruthenian people in Poland), gesammelt u. übersetzt von W. P., Leipsic, 1833; "Die poetische Ukraine," F. Bodenstedt, Stuttgart, 1845.—II. *Illyrico-Servian.*—1, *a, Servian.*—"Narodne srpske Pjesme" ("Songs of the Servian People"), Vuk Stephanovitch Karadshitch, third ed., 6 vols., Vienna, 1841–66; "Volkslieder der Serben," Talvj (Mrs. Robinson), second ed., 2 vols., Leipsic, 1853; "Die Gesänge der Serben," 2 parts, S. Kapper, Leipsic, 1852; "Poésies populaires Serbes," A. Dozon, Paris, 1859. *b, Bosnian.*—"Srpske Narodne Pjesme iz Bozne" ("Songs of the Servian People in Bosnia"), J. V. Petranovitch, Serajevo, 1867. *c, Montenegrin.*—"Pjevanija Tzernogorska," etc. ("Popular Poetry of Montenegro and Herzegovina"), collected by Tshubar Tshoikovitch, ed. by J. Milovuk, Ofen, 1833; another collection, ed. by himself, Leipsic, 1839. *d, Dalmatian.*—"Razgovor ugodni" ("Entertaining Conversations"), by A. Cacich Miossich, Venice, 1759, Agram, 1862; "Viaggio in Dalmazia," Alberto Fortis, 2 vols., Venice, 1774. 2, *Croatian.*—"Narodne Pjesme" etc. ("Popular Songs of the Croats, Dalmatians, Bosnians, and Servians"), Leopold Zupan, Agram, 1848. 3, *Slovenian* (Slaves of Carniola and Carinthia), "Slovenske Pesmi krajnskiga naroda" ("Songs of the Slovenzi in Carniola") [Achazel and Korytko], Laibach, 1839–44; "Narodne Pésni ilirske," etc., Stanko Vraz, Part I., Agram, 1839; "Volkslieder aus Krain," übersetzt von Anastasius Grün, Leipsic, 1850. 4, *Bulgarian.*—"Bulgarske Narodne Pèsni," D. and K. Miladinof, Agram, 1867. *Western Branch*, I. *Czekho-Slovakian.*—1, *a, Bohemian and Moravian.*—"Pjsně národnj w Čechach" ("Songs of the People in Bohemia"), J. Erben, 3 parts, Prague, 1842–45; "Morawské národnj Pjsně" ("Songs of the Moravian People"), F. Suschil, Brünn, 1835, 1840, also 1853–57; Böhmische Rosen," Ida v. Düringsfeld, Breslau, 1851; "Böhmische Granaten, Czechische Volkslieder," M. Waldau, 2 vols., Prague, 1858–60. *b, Slovak.*—"Slowanské Naródnj Pjsně," F. L. Czelakowsky (including, besides Slovak songs, Slovenian, Bohemian, etc.), 3 parts, Prague, 1822–27, and 1839–44; "Národnjé zpiewanky čili pjesně swietské Slowáků w Uhrach" ("Songs of the Slovaks in Hungary"), J. Kollar, 2 parts, Buda, 1823–27, 1834–35. 2, *Polish.*—"Pieśni polskie i ruskie Ludu galicyjskiego" ("Songs of the Polish and Russian people in Galicia"), W. z. Oleska, Lemberg, 1833; "Pieśni Ludu bialo-chrobatów, mazurów, i russinów z nad Bugu" ("Songs of the White Chrobatians, Massovians, and Russinians on the Bug"), K. W. Woicicki, Warsaw, 1836; "Pieśni Ludu polskiego w Galicyi" ("Songs of the Polish People in Galicia"), Z. Pauli, Lemberg, 1838; "Pieśni Ludu polskiego," P. Kolberg, Warsaw, 1857; "Pieśni Ludu polskiego w Górnym Szlasku" ("Songs of the Polish People in Silesia"), Juliusz Roger, Wrocław, 1863. 3, *Sorabian-Wendish.*—"Volkslieder der Wenden in der Ober- u. Nieder-Lausitz", L. Haupt and J. E. Schmaler, Grimma, 1841–43. *General Works.*—"Historical View of the Languages and Literature of the Slavic Nations," etc., Talvj (Mrs. Robinson), New York, 1850; "Slawische Volkslieder" (Russian, Bohemian, Slovak, Bulgarian), J. Wenzig, Halle, 1830; "Slawische Balalaika" (Russian, Little Russian, Carniolan, Polish), W. v. Waldbrühl, Leipsic, 1843.

Lithuanian.—"Littauische Volkslieder," collected and translated by G. H. F. Nesselmann, Berlin, 1859; "Litthauische Volkslieder u. Sagen," Wm. Jordan, Berlin, 1844.

Breton.—"Barzaz-Breiz, Chants populaires de la Bretagne," Th. Hersart de la Villemarqué, fourth ed., 2 vols., Paris, 1846; "Volkslieder aus der Bretagne," A. Keller u. E. Seckendorff, Tübingen, 1841; "Bretonische Volkslieder," M. Hartmann u. L. Pfau, Cologne, 1859; "Chants populaires de la Basse-Bretagne," F. M. Luzel, vol. i., L'Orient, 1868.

Of non-Indo-European races the more important collections are—

Finnish.—"Finnische Runen" (Finnish and German), by H. R. von Schröter, edited by G. H. v. Schröter, Stuttgart, 1834; "Suomen Kansan wanhoja Runoja" ("Ancient Songs of the Finnish People"), Oscar Topelius, 3 parts, Turussa, 1822–26; "Kanteletar," etc., "The Harp, or Ancient Songs and Hymns of the Finnish People," E. Lönnroth, 2 vols., Helsingfors, 1840. *Esthonian.*—"Ehstnische Volkslieder," original and translation, H. Neus, Reval, 1850–52. *Hungarian.*—"Népdalok és Mondák" ("Songs and Tales"), J. Erdélyi, 3 vols., Pesth, 1842–48; "Ausgewählte ungarische Volkslieder," translated and edited by K. M. Kertbeny, Darmstadt, 1851. *Turkish.*—"Proben der Volkslitteratur der türkischen Stämme Süd-Siberiens" ("Specimens of the Popular Literature of the Turkish Races of South Siberia"), W. Radlof, 3 vols., St. Petersburg, 1866–70.

Of comprehensive works and collections the most noticeable are—"Stimmen der Völker in Liedern," J. G. v. Herder, 1778, ed. by J. v. Müller, Tübingen, 1807; Talvj (Mrs. Robinson), "Versuch einer geschichtlichen Charakteristik der Volkslieder germanischen Nationen," etc., Leipsic, 1840; "Hausschatz der Volkspoesie," O. L. B. Wolff, Leipsic, 1853; "Volksdichtungen nord- u. südeuropäischer Völker alter u. neuer Zeit," J. M. Firmenich, 1867. F. J. Child.

Ballanche (Pierre Simon), a French social reformer, born at Lyons Aug. 4, 1776. He published "Antigone," an historical novel (1814), and "The Man Without a Name" (1820). He became a member of the French Academy in 1842, and was a friend of Chateaubriand and Madame Récamier. Among his works are an "Essay on Social Palingenesis" and "The Vision of Hebal." His philosophy is abstruse and mystical, but he is regarded as a profound thinker by some French critics. Died June 12, 1847. (See L. de Loménie, "M. Ballanche, par un homme de rien," 1841; J. J. Ampère, "Ballanche," 1849; Albert Aubert, "P. S. Ballanche," 1847.)

Bal'larat, an Australian town and gold-field in Victoria, 75 miles W. N. W. of Melbourne. The gold-mines of this place, which were opened in 1851, are among the richest in the colony of Victoria. Ballarat is unrivalled in the fineness of its gold, which averages twenty-three and a half carats, the pure metal being twenty-four carats. Pop. in 1871, including the suburbs, 64,260.

Bal'lard, a county in the W. of Kentucky, bordering on Illinois and Missouri. Area, 400 square miles. It is bounded on the N. W. by the Ohio River, and on the W. by the Mississippi. The surface is undulating. Indian corn and tobacco are the chief crops. Capital, Blandville. Pop. 12,576.

Bal'lard Vale, a post-village of Andover township, Essex co., Mass., on the Shawsheen River and the Boston and Maine R. R., 21 miles N. of Boston, has valuable water-power and extensive manufactories.

Bal'last [probably derived from *beal*, "sand," and the Ger. *last*, a "load;" Fr. *lest*], stone, sand, or other heavy substance which is placed in the bottom of a ship when her cargo is too light to give her sufficient hold of the water and

enable her to carry sail without danger of being upset. A vessel which does not carry enough ballast is said to be too crank. This condition renders her unsteady and topheavy. Iron, stone, and water are the principal substances used for ballast. Iron has the great advantage of taking up but little space. Water-ballast is sometimes contained in water-proof bags, or is confined beneath a false bottom in the vessel. A ship is said to be "in ballast" when she carries no cargo except the ballast, passengers, and the baggage and provisions of the passengers and crew. Balloons generally take up a quantity of sand as ballast, in order that the aëronaut may be able, by throwing it out, to increase the buoyancy of the balloon or arrest its too rapid descent. The term ballast is also applied to the broken stone or gravel which is laid as a packing between railway sleepers in order to give them solidity and prevent the rise of dust.

Ballet, bă'lă', a French word signifying a dramatic or theatrical exhibition of dancing and pantomime, with music; a species of dance usually forming an interlude in theatrical performances, but confined principally to operas. The ballet has some resemblance to the pantomimic sacrificial dances of the ancient Greeks, among whom were dancers who expressed actions and passions by rhythm applied to gesture. The ballet was introduced into France under the auspices of Catharine de' Médici about 1580. Noverre about 1770 made improvements in it, to which he gave an independent dramatic form. The Vestris family were celebrated as performers in ballets. In recent times the public favor is almost exclusively bestowed on female dancers. The ballet has degenerated in many respects of late years.

Ballina', a market-town and seaport of Ireland, partly in Mayo and partly in Sligo counties, and on the river Moy, 7 miles from its entrance into Killala Bay, and 18 miles N. N. E. of Castlebar. The part of the town on the E. bank of the Moy is called Ardnaree. Ballina has manufactures of coarse linens and snuff; also an active trade in fish, provisions, etc. Pop. in 1861, 5452.

Balliol. See BALIOL.

Ballis'ta, or **Balis'ta** [from the Gr. βάλλω, to "throw"], a military engine used before the invention of gunpowder to propel large stones or other heavy missiles. It probably originated with the ancient Romans, who used it in the siege and defence of fortified places. The construction of the ballista is not well understood. It appears that the elastic force with which a twisted rope uncoils itself was commonly used as the propelling power, with which other forces were perhaps combined. (For a vivid picture of the *effects* of the ballista see LUCAN'S "Pharsalia," lib. iii., l. 465 *et seq.*)

Ballis'tic Pen'dulum, an instrument used to ascertain the velocity of projectiles and to prove the quality of gunpowder. In its simplest form it consists of a large block of wood suspended, so as to turn very easily, before the mouth of the cannon, and having some means of measuring the angle through which the beam oscillates. When the magnitude of this angle (produced by the shot lodging in the mass) is known, together with the centres of suspension and oscillation of the mass, the velocity of the shot can be determined by calculation. The gun itself is also made a ballistic pendulum, being suspended, and its recoil observed. But these contrivances are both long since superseded by the several forms of electro-ballistic pendulums.

Bal'lium, or **Bai'ley,** the central part of the old Norman castle, sometimes called the donjon, or the whole space enclosed within the external walls of a castle except that covered by the keep. The walls of the lower stories were of great thickness. The entrance to the ballium was generally by a drawbridge over the ditch.

Ball Mountain, a township of Watauga co., N. C. Pop. 320.

Balloon. See AËRONAUTICS, by GEN. J. G. BARNARD.

Balloon-fish, a popular name of several marine fishes of the genera *Diodon*, *Tetraodon*, etc., of the family Gymnodontidæ and the order Plectognathes. They take their name from the power which they possess of inflating themselves with air. Many species are known, of which several are American. Our *Diodons* are all small.

Bal'lot [Fr. *ballotte*], originally a little ball used in secret voting. In modern times it is applied to the ticket or printed paper which the voter uses at an election, and the practice of secret voting is called "voting by ballot." The tickets are deposited in a wooden box called the ballot-box. The system of voting by ballot prevails in France and the U. S. The other mode of voting is called *viva voce* ("by the living voice"). The ancient Greeks elected their magistrates or decided political questions by secret vote, for which purpose they used beans of different colors. The English elections were conducted *viva voce*. The adoption of the ballot has for many years been advocated by the British radicals and advanced liberals. In 1871 the House of Commons, after a long contest, decided in favor of the ballot, but the House of Lords rejected the bill. In 1872 the Ballot act was passed by both houses, and at present all members of Parliament are chosen by ballot. In the election of members of social clubs ballots or balls are commonly used. A person who is rejected on such occasions is said to be *black-balled*, black balls being used by those who vote in the negative.

Ballou' (HOSEA), one of the fathers of the Universalist denomination in the U. S., was born at Richmond, N. H., April 30, 1771. His early education was acquired by his own efforts, though he had to contend with unusual obstacles. He began to preach when about twenty-one years of age, and labored in various places in New England. In 1807 he settled in Portsmouth, N. H., in 1815 in Salem, Mass., and in 1817 in Boston. In 1819 he became editor of the "Universalist Magazine," and in 1831–32 was connected with the "Expositor." Died June 7, 1852. Among his works are "Notes on the Parables" (1804), and an "Examination of the Doctrine of a Future Retribution" (1816). (See his "Life" by M. M. BALLOU, and another by T. WHITTEMORE, 1854.)

Ballou (HOSEA, second), D. D., was born in Halifax, Vt., Oct. 18, 1796. He was a nephew of the foregoing. He entered the Universalist ministry in his youth, and preached at Stafford, Conn., and Roxbury and Medford, Mass. In 1822 became an editor of the "Universalist Magazine," and was long connected with various journals of his denomination. He displayed much ability as editor of the "Universalist Quarterly." He was (1853–61) the first president of Tufts College. He published "Ancient History of Universalism" (1829), an edition of Sismondi's "History of the Crusades" (1833), and a hymn-book (1837). Died May 27, 1861.

Ballou (MATURIN M.), a son of Rev. Hosea Ballou, born in Boston, Mass., in 1822, has long been editor of "Ballou's Pictorial," "Ballou's Monthly," and other periodicals, and has published a "History of Cuba" (1854), "Biography of Hosea Ballou," "Life-work of Hosea Ballou," and a valuable compilation of quotations from a great number of writers.

Ballou (SULLIVAN), an American lawyer and officer of volunteers, born at Smithfield, R. I., Mar. 28, 1829, educated at Brown University, studied law at Ballston, and was admitted to the bar in 1853, clerk of the house of representatives of his native State 1854–56, and speaker 1857. He entered the army on the outbreak of the late war, and was engaged at the battle of Bull Run July 21, 1861, where he was killed, thus ending a life marked by distinguished ability; and his military career, though brief, was distinguished by conspicuous gallantry and patriotism.

Ball Play, a post-township of Etowah co., Ala. Pop. 327.

Ball's Bluff, Loudon co., Va., on the right bank of the Potomac, about 33 miles N. W. of Washington. The bank here rises about 150 feet above the level of the river. It was the scene of a disastrous defeat of the U. S. forces under Col. E. D. Baker, Oct. 21, 1861. The hostile forces of the North and South had for several months confronted each other on opposite banks of the Potomac. On the 19th and 20th of October reconnoissances were made in the direction of Dranesville and Leesburg by the Federal forces under Gen. McCall, without encountering any opposition. Gen. McClellan being anxious to ascertain the strength of the Confederates in these positions, on Oct. 20 (10½ P. M.), instructions were sent to Gen. Stone at Poolesville, Md., directing him to keep a good lookout on Leesburg, to note the effect of this movement, and adding that "perhaps a slight demonstration on your (Stone's) part might have the effect to move them." Accordingly, Gen. Stone ordered the Fifteenth Massachusetts, Col. Devens, to be moved to Harrison's Island in the Potomac, opposite the bluff, and about 100 yards distant from the Virginia shore; which was promptly effected in flatboats. At dark Devens sent a detachment of fifteen men under Capt. Philbrick to the Virginia shore, to ascertain the whereabouts of the Confederates. After ascending the bluff they had proceeded but a short distance when they discovered what was supposed to be a camp, apparently but poorly guarded, which situation Philbrick reported to Col. Devens on his return. Devens forwarded this report to Gen. Stone, who immediately issued an order directing Col. Devens to land with five companies of his regiment and proceed to surprise the discovered camp at daybreak, and, after having accomplished this, to pursue as far as he deemed prudent, destroy the camp, and return to his position on the island, unless he saw a favorable position on the Vir-

ginia side which he could hold until reinforced. At the same time Col. Lee (Twentieth Massachusetts) was ordered to occupy Harrison's Island with his regiment, and to throw one company across to the heights on the Virginia shore to cover Col. Devens's return. These orders were carried into effect, and at daylight Devens advanced only to find the reported camp to be, in fact, no camp, the detachment of the night before having been deceived in the moonlight, and mistaken the openings between the trees for tents. Col. Devens, however, advanced to within a mile of Leesburg, where he halted and, concealing his force in the woods, reported to Gen. Stone that he had met with no opposition, and asking for further orders. About 7 A. M. a body of Confederates appeared, but retired when approached, and cavalry were also seen on the Leesburg road; whereupon Col. Devens fell back to the bluff without interference, and reported to Gen. Stone, who directed him to remain, and that he would be reinforced. At this time his force of officers and men was about 650. The position he had taken up was surrounded on three sides by woods, and here about noon he was attacked, and fell back to a more secure position; being again attacked, he retired still farther, to the edge of the bluff, where he was reinforced by Col. Baker with his regiment of First California Volunteers, and who by seniority of rank took command. Col. Baker's instructions were discretionary whether to remain or withdraw, but on finding an attack already commenced he decided to remain. The force at his command amounted to about 1900 men; the Confederate force in the woods was reported at 1700, not including, however, a regiment of Mississippi volunteers so stationed as to prevent succor to Col. Baker from Edwards's Ferry. Col. Baker had no more than disposed his men in line when he received a vigorous attack on his right, extending soon to his left and centre. For two hours a desperate conflict was maintained, the Federals from their exposed position suffering by far the heaviest loss. Col. Baker, who displayed the greatest bravery, was killed about five o'clock, and the command devolved upon Col. Cogswell (New York Tammany Regiment). The severe fire to which the Federal troops had been subjected, and the fearful loss they had sustained, caused them to waver, and the only hope that appeared to be left was to endeavor to join Gen. Stone, who was known to have a strong force at Edwards's Ferry, about two miles away; but this movement was met by a body of fresh Mississippi infantry, and under their attack the disheartened and reduced troops were routed, and, flying in great disorder down the bluff, were subjected to a galling fire from all directions. The boats to which they fled were upset or sunk by the Confederates' fire, and the few that escaped either swam out into the stream or concealed themselves along the banks of the river, reaching the Federal lines under cover of the darkness. In the mean time, Gen. Stone had ordered an advance across Edwards's Ferry to their assistance, but as they did not arrive on the field, they furnished no aid. The Federal loss in killed, drowned and wounded exceeded, probably, 1000 men; Gen. Evans, in command of the Confederate forces, reported his loss at 155. Much blame was attached to Col. Baker for recklessness, and Gen. Stone was subsequently arrested and confined in Fort La Fayette in New York harbor, but was afterwards discharged, and at a later period again given a command.

Ball'ston, a township of Saratoga co., N. Y. P. 2180.

Ballston Spa, sometimes called simply **Ballston,** a post-village, capital of Saratoga co., N. Y., on the Rensselaer and Saratoga R. R., 30 miles N. of Albany and 6 miles S. W. of Saratoga Springs. Here are mineral springs, somewhat frequented in summer. These springs rise from the lower part of the Hudson River (Silurian) shales, and rank among the best acidulous chalybeate springs in the U. S. The village has two national banks, 2 weekly papers, 5 churches, and several manufactories. It is in Milton township. Pop. 2970.

Ball'ville, a township of Sandusky co., O. Pop. 1731.

Bally. See BALL.

Bally, a Celtic word or prefix signifying "town" or "dwelling," enters into the composition of the names of a great number of places in Ireland and Scotland.

Ballyme'na, a market-town of Ireland, in the county of Antrim, on the river Braid, 2 miles above its junction with the Maine and 33 miles by rail N. N. W. of Belfast. It has large public schools, a cotton-spinning mill, and extensive bleaching-grounds, and is one of the greatest linen and flax markets in Ireland. Pop. 6774.

Ballyshan'non, a seaport-town of Ireland, in the county of Donegal, on the river Erne at its entrance into Donegal Bay, 120 miles N. W. of Dublin. A bridge of fourteen arches here crosses the Erne. It has about six churches and chapels. Here is a valuable salmon-fishery in the Erne. Pop. in 1871, 6739.

Balm (*Melis'sa officina'lis*), a perennial herbaceous plant of the natural order Labiatæ, a native of the south of Europe, is cultivated in American gardens, and prized for its lemon-scented leaves. The leaves, which are ovate and crenate, and the stem, are occasionally used in medicine as a gentle aromatic, stimulant, and tonic. Its properties depend on an essential oil called oil of balm. An infusion of balm is an excellent beverage in febrile diseases.

Balmacz-Ujvaros, a market-town of Hungary, in the county of Szabolcs, 14 miles N. W. of Debreczin. Pop. in 1870, 9481.

Bal'més (JAYME LUCIO), a Spanish Catholic priest, born at Vich, in Catalonia, Aug. 28, 1810. He was a remarkably precocious scholar. He wrote in reply to Guizot an able work entitled "Protestantism Compared with Catholicism in its Relations to European Civilization" (3 vols., 1848), which was translated into English, French, Italian, and German. Among his other works is "Filosofia Fundamental," which was translated into English by H. F. Brownson, New York, 1857. Died July 9, 1848. (See ANTONIO SOLER, "Biografia de D. J. Balmés," 1850; GARCIA DE LOS SANTOS, "Vida de Balmés," 1848; BLANCHE-ROFFIN, "J. Balmés, sa Vie et ses Ouvrages," 1849.)

Balm of Gilead. See BALSAM; GILEAD, BALM OF.

Balmor'al Castle, the autumnal residence of Queen Victoria, is in a beautiful valley in Aberdeenshire, Scotland, on the river Dee, 48 miles W. S. W. of Aberdeen. It commands a magnificent prospect and comprises 40,000 acres of beautiful grounds. Prince Albert purchased this estate in 1852 for £32,000, and erected a granite castle in the Scottish baronial style. It consists of two blocks of buildings united by wings, and a massive tower thirty-five feet square, rising to the height of eighty feet, and surmounted by a turret twenty feet high.

Balna'ves, or **Balnavis** (HENRY), **of Halhill,** an eminent Scottish Reformer and writer, born in Fifeshire in 1520. He studied law, and became secretary of state in 1543. In 1547 he, with other Protestants, took refuge in the castle of St. Andrew's, and was declared a traitor. The castle was captured by the French, who took him, with Knox, to Rouen as prisoner. While in prison he wrote a "Confession of Faith." He returned to Scotland in 1554. Died in 1570.

Bal'sam [Lat. *bal'samum;* Gr. *βάλσαμον*], a name including in popular language many resinous substances and oils to which great medicinal virtues are ascribed; also certain medicines compounded of resins and oils. The name was originally limited to a single substance, the balm of Gilead, Mecca balsam, or balsam of Judea. Balsams are natural mixtures of resins and essential oils, the resins originating from the oxidation of the oils. They are viscid, aromatic liquids, varying greatly in consistence. They are of two kinds: (1) the simple oleo-resins, as crude turpentine, Canada balsam, Copaiba balsam, Mecca balsam, etc.; (2) balsams containing, besides oil and resin, the fragrant cinnamic acid, as liquidamber, Peru and Tolu balsams, storax, etc. (For further details see each of the above.) Certain pharmaceutical preparations were once called balsams, as *balsamum apoplecticum,* an alcoholic soap solution containing ammonia; *balsamum arcæi,* a salve containing elemi gum; *balsamum sulphuris,* a solution of sulphur in linseed oil.

Balsam, Canada, the thick, terebinthine sap of *Abies balsamea,* which collects in blisters beneath the epidermis on the trunks of young trees. These blisters are punctured, and the balsam gathered as an article of commerce. It is used in medicine, for varnishes, for mounting microscopic objects, etc. *Abies grandis* of the W. coast furnishes a similar fluid.

Balsam'ina, a genus of herbaceous plants of the order Balsaminaceæ, includes numerous species which are natives of the East Indies, and are mostly annuals. The *Balsamina hortensis* (or *Impatiens balsamina*), commonly called balsam, is a favorite garden flower in the U. S., with unsymmetrical corollas finely variegated with white, pink, red, and purple. It has five stamens, and a capsule of five valves, remarkable for the elastic force with which it bursts. The term *balsam* is also applied to the *Impatiens noli-me-tangere,* a native of Europe, and two species of *Impatiens* which grow wild in the U. S.

Balsamina'ceæ, or **Balsamin'eæ** (so called from *Balsamina,* its principal genus), a natural order of succulent herbaceous plants, natives of the East Indies, Europe, China, and America. By Jussieu, Asa Gray, and others it is regarded as a sub-order of the Geraniaceæ.

Balsam Lake, a township of Polk co., Wis. Pop. 192.

Bal'ta, a well-built town of Russian Poland, in Podo-

lia, on the Kodema River, 132 miles E. S. E. of Kamienice. It has over twenty factories of candles, soap, etc., and has an extensive trade in cattle, horses, hides, wool, and grain. Pop. in 1867, 14,528.

Bal'tic, or **Baltic Sea** [Ger. *Ostsee;* Lat. *Mare Balticum* and *Si'nus Cola'nus*], an inland sea or gulf of Northern Europe, is situated between Russia, Sweden, Germany, and Denmark, and connects with the German Ocean and the Cattegat by the Sound and the Great and Little Belts. It is 850 miles long. Its greatest width is 420 miles, and the area 154,570 square miles. On account of the small proportion of salt it contains (not over 2 per cent.), the Baltic freezes much more easily and early than the ocean. It is not affected by the tide. The numerous sand-banks and islands, and the violent storms with sudden changes of wind, render the navigation of the Baltic dangerous. It receives several large rivers—namely, the Oder, Vistula, Niemen, Düna, Narva, Neva, Torneå, Dal, etc. No sea has in proportion to its size so great an influx of fresh water. The largest islands in the Baltic are Seeland, Gothland, Rügen, Bornholm, and Oesel. The chief ports are St. Petersburg, Riga, Dantzig, Stralsund, Königsberg, Stockholm, and Copenhagen. A remarkable phenomenon connected with this sea is the slow and gradual rising of its shore in Sweden.

Baltic, a post-village of Sprague township, New London co., Conn., on the Hartford Providence and Fishkill R. R., 42 miles E. S. E. of Hartford. Here are important manufactures. The village contains one of the largest cotton mills in the world, running 60,000 spindles.

Bal'tic Ques'tion, the name given to the controversy between the Russian government and the Baltic provinces of Courland, Esthonia, and Livonia. These countries, which never stood in the relation of conquered provinces to Russia, were promised by Peter the Great the maintenance of their German administration and security for freedom of conscience. These rights and privileges were confirmed by Alexander II. in Feb., 1856, but the actions of the government appear to have contradicted these professions. The priests of the Greek Church have sought to make converts among the peasants by false promises of land and of exemption from military service. Many efforts have also been made to compel the German inhabitants to adopt the Russian language in public affairs and in their schools, and a strict censorship has been exercised over the German press. (See A. J. Schem, "Deutch-Amerikanisches conversations-Lexikon.")

Bal'timore, a county in the northern part of Maryland, bordering on Pennsylvania, has an area of about 700 square miles. It is bounded on the S. E. by Chesapeake Bay, and on the S. W. by the Patapsco River, and intersected by the Gunpowder River. The surface is pleasantly diversified by hills, some of which are 800 feet high. Granite, gneiss, and limestone underlie the county, which contains mines of copper, iron, and chrome. The soil is productive. Corn, wheat, tobacco, and garden and dairy products are the chief crops. This county, the most populous in the State, is intersected by the Northern Central R. R. Other railroads meet at the city of Baltimore. It has important manufactures. Capital, Towsontown. Pop. 330,741.

Baltimore, the chief city of Maryland, is situated in 39° 17′ N. lat. and 0° 26′ E. lon. (76° 37′ 30″ W. from Greenwich), at the head of tide-water and of navigation on the Patapsco River, about 14 miles from the Chesapeake Bay, and nearly 200 from the ocean by ship-channel. The Patapsco to this point is a broad estuary; above, a small and swift stream, furnishing water-power to many mills and manufactories. The harbor is spacious and secure, but with a depth of but little over 20 feet. Its depth is preserved and is being increased, and an improved ship-channel provided by extensive dredging, prosecuted at the expense of the U. S., the State, and the city governments. The city covers about 10,000 acres of land, and the surface of its site was originally very hilly, and notwithstanding all the grading rendered necessary by improvements, much of the original inequality still exists; and the surrounding country being of similar character, with swift streams, excellent drainage is secured, and the healthfulness of the location greatly promoted.

The first steps for "erecting a town" on the Patapsco, to be called Baltimore Town, were taken by a legislative act in 1729, and it was laid out in half-acre lots in 1730. In 1752 it contained 25 houses and 200 persons; in 1765 the number had increased to 50 houses. After this the growth was more rapid, and in 1775 there were 564 houses and 5934 persons. In Dec., 1776, the Continental Congress transferred its sittings from Philadelphia to Baltimore, and met here for about two months. In 1797 it was incorporated as a city. The population in 1790 was 13,503; in 1800, 26,514; in 1810, 35,583; in 1820, 62,738; in 1830, 80,625; in 1840, 102,313; in 1850, 169,054; in 1860, 212,418; and in 1870, 267,354.

The city is laid out, for the most part, at right angles, the streets having generally a width of about sixty feet, and the buildings are mostly built of red brick, many of them with white marble bases; granite and iron are, however, largely used in the construction of stores and warehouses, some of which are very fine. The bricks used for building are made from immense clay beds adjacent to the city, and are of unsurpassed quality. The white marble, of excellent quality, is procured from inexhaustible quarries about 10 miles N. of the city; the granite, from quarries about 15 miles W. Shipbuilding has always been one of the leading industries of the city, but it has greatly suffered, in common with the commerce of the country, during the last few years. There are several furnaces and foundries, producing iron in various forms from ores mined in the vicinity, one very extensive rolling mill, several manufactories of agricultural implements, and very large machine-shops, employing many hundred hands. There are also extensive manufactories of clothing, leather, shoes, tobacco, etc. (in all about 400 manufactories of different kinds), and about 100 establishments for packing oysters and fruits. This is a very important industry, and gives employment to several thousand hands. These industries find their outlet both by land and water communication. There are lines of steamships to Liverpool, Bremen, Boston, Providence, Wilmington (N. C.), Charleston, Savannah, Havana, New Orleans, etc., and steamboat lines to Norfolk, Richmond, Fredericksburg, Washington, and all points on the Chesapeake Bay and its many estuaries. It has several excellent railroads, and they are rapidly multiplying. The Baltimore and Potomac road (to Washington) has just completed (June, 1873) a tunnel 7400 feet in length under the north-western part of the city; and the Northern Central road (to Harrisburg) is just perfecting its connection with tide-water by a similar tunnel 3500 feet long, passing under the north-eastern section. Passenger railways also connect the city with all the thriving suburban villages that surround it, where many of the business men of the city reside.

Its sobriquet "Monumental City" was derived from the Washington Monument and Battle Monument, erected by the gratitude and patriotism of its citizens. The former, located at Mount Vernon Place, North Charles street, is a Doric shaft of white marble 180 feet high, surmounted by a statue of Washington sixteen feet high, built 1816–30. Access to the top is had by 220 winding stairs within the column, and it affords a charming view of the city and surrounding country. Battle Monument, in Monument Square, North Calvert street, is also of white marble, 52½ feet high. Wildey Monument on Broadway, of white marble, 52 feet high, was erected to Thomas Wildey, a citizen of Baltimore, who died in 1861, and was the founder of Odd Fellowship in America. There is also in Greenmount Cemetery a creditable but plain monument and statue to John McDonogh, who bequeathed to the city a large sum (amounting now to about $1,000,000) to establish the McDonogh Institute "for the education of poor children." Greenmount and Loudon Park are its two beautiful cemeteries, and there are several others creditable, but of less pretensions. The city has about 160 churches and 6 Jewish synagogues. The first church founded in the city was St. Paul's (Episcopal) in 1731. The first Presbyterian church was erected in 1756; the first Roman Catholic, in 1770; the first Wesleyan Methodist, in 1773; the first Baptist, in 1780; the first Friends' meeting-house, in 1781. Several of the churches are imposing and beautiful structures. Among the most noticeable are the cathedral, St. Alphonsus', and St. Martin's (Roman Catholic); Grace, St. Peter's, and Christ (Episcopal); Mount Vernon (Methodist); Westminster, Brown Memorial, and First (Presbyterian), and the Unitarian.

The water-supply of the city has hitherto been taken from Jones's Falls, about seven miles above the city, and is abundant and of good quality. To guard against the possible contingency of protracted drought the Gunpowder River is now being added, and this supply is practically inexhaustible. The reservoirs now in existence have a storage capacity of 857,000,000 gallons. This is distributed everywhere in abundance, and there are about 800 fire-plugs for use in case of fire. The fire department is well organized, directed by a police and fire-alarm telegraph, and notably efficient. It has eight steam fire-engines, with a complement of horses and twelve men to each, and three hook and ladder companies, thirteen men to each.

Numerous public squares add to the beauty and healthfulness of the city. The largest of these, Patterson Park, in the N. E. section of the city, contains 54 acres. Druid

* The name *Baltic* is supposed to be derived from the Latin *balteus*, a "belt," on account of the famous belts of this sea.

Hill Park, just outside the N. W. limits of the city, contains 704 acres of ground, with fine forests, lakes, and lawns, about twenty miles of good carriage-drives, and has no superior as a pleasure-ground.

First among the public buildings should be named the new city-hall (not quite completed), built of white marble, occupying an entire square, and costing $3,000,000; the Maryland Institute, of brick, 355 feet long; the custom-house, 240 feet long, with a dome 115 feet high; the court-house, and Odd Fellows' Hall, all of brick; the Masonic Temple, of white marble; the U. S. court-house and the jail, both of granite, are remarkable structures. Outside of the city limits, but a part of its institutions, should be noted Bay View Asylum (city almshouse), 714 feet in length; the house of refuge, retaining about 500 juvenile delinquents; Spring Grove Asylum, a State institution for the insane, of granite, with capacity for 300 patients; the Maryland Institution for the Blind, a beautiful white marble building, where about fifty of these unfortunates are instructed; and the Sheppard Asylum (for the insane), endowed by the will of Moses Sheppard with about $1,000,000. The Peabody Institute of Baltimore was the recipient of over $1,000,000 from the late George Peabody. It has, in its fine white marble building by the side of the Washington Monument, a free library of 60,000 books and pamphlets, an art-gallery, musical conservatoire, rooms for lectures, concerts, etc., and is one of the most thriving of the institutions endowed by that great philanthropist, which will "keep his memory green." The Hopkins Hospital has been but begun. It originated in Mar., 1873, when Johns Hopkins, a merchant of the city, placed in the hands of trustees selected by him 13 acres of land in the eastern part of the city, with directions to establish thereon a free hospital for the "indigent sick of the city and its environs, without regard to sex, age, or color," guaranteeing to them for the purpose $100,000 a year during his life, and endowing it with $2,000,000 for its support thereafter.

The general education of the city is provided for in about 125 graded public schools, in which about 40,000 pupils are taught by about 550 teachers. Loyola College, a Catholic institution under the general supervision of the Jesuits, and the seminary of St. Sulpice (St. Mary's College), a Catholic theological institution, are both in a flourishing condition, while the medical department of the University of Maryland takes very high rank, and the law department a respectable position among professional schools. The city has 14 national banks, 6 daily, 7 weekly, 8 monthly, and 1 semi-monthly newspaper.

The principal libraries of the city are—Peabody Institute, 59,000 books and pamphlets; Mercantile Library Association, 33,278 (both rapidly increasing); Maryland Institute, 15,600; Baltimore Bar Association, 7500; Young Men's Christian Association, 2500; Odd Fellows', 19,356; Maryland Historical Society, 13,366; Loyola College, 22,000. HENRY STOCKBRIDGE.

Baltimore, a post-village of Liberty township, Fairfield co., O. Pop. 489.

Baltimore, a township of Windsor co., Vt. Pop. 83.

Baltimore, Lord, a title (of the Calvert family) in the Irish peerage, created in 1624 by James I., who marked his confidence in Sir George Calvert by making him, though a Roman Catholic, baron of Baltimore (in Ireland). Calvert was born at Kipling, Yorkshire, England, in 1582. He graduated at Oxford, held several important public trusts, was knighted in 1617, became principal secretary of state in 1619, member of Parliament 1620–21, and first Lord Baltimore 1624. By grant of James I. he became proprietary of Avalon in Newfoundland, endeavored to plant a colony there, and went thither himself in 1625. Owing chiefly to the unfavorable soil and climate, the colony was a failure. He then (1628) visited Virginia, met an ungracious reception, and returned to England. He seems then to have petitioned the king (Charles I.) for a charter for founding a new colony, and to have met with favor; but before the charter was issued he died, April 15, 1632. The charter which his address had secured was issued in June, 1632, to his son Cecil, who became the second Lord Baltimore, and real founder of the colony of Maryland. The territory granted by the charter included the whole of the present State of Maryland. Cecil never visited it, but sent out an expedition in Nov., 1633, under the charge of his brother, Leonard Calvert, as governor. The Calverts have been much praised for their liberal and tolerant spirit, and their wise and equitable legislation in the colony. The successive Lords Baltimore were John (the third), Charles (fourth), Benedict (fifth), Charles (sixth), and Frederick (seventh). Frederick died in 1771, leaving no legitimate children, and with him the title Lord Baltimore became extinct. (See FULLER'S "Worthies of England;" BANCROFT'S and HILDRETH'S "Histories of the United States;" J. P. KENNEDY, "Character of George Calvert;" Proceedings of Maryland Historical Society; SPARKS'S American Biography," vol. ix. S. S.) HENRY STOCKBRIDGE.

Baltimore Bird, or **Baltimore Oriole** (*Icterus Baltimore*), sometimes called **Golden Robin,** a beautiful

Baltimore Bird.

bird which is found in all parts of the U. S., and migrates in winter to tropical or sub-tropical regions. The plumage of the male is brilliant, orange, vermilion, and black being the most conspicuous colors. This bird is very active, has an agreeable song of clear and mellow notes, and builds a curious nest, a pendulous pouch about six inches long, usually suspended from the drooping branch of a high tree. The name originated in the similarity of its colors to the livery of Lord Baltimore. The extended wings measure about twelve inches from tip to tip.

Baluze (ÉTIENNE), a French historian, born at Tulle Dec. 24, 1630, became in 1670 professor of canon law in Paris, and in 1707 director of the Royal College under Louis XIV. Among his works are "Lives of the Popes of Avignon," 1693, and "History of the House of Auvergne," in which he endeavored to show that the House of Bouillon was descended from the ancient dukes of Guienne, and therefore owed no allegiance to the king of France. The king suppressed this work, exiled the author, and confiscated his estates. He published forty-five works, among which were "Regum Francorum Capitularia" (1677), "Lives of the Avignon Popes" (1693), etc. Died in Paris July 28, 1718.

Balzac, de (HONORÉ), a popular French novelist, born at Tours May 16, 1799. After he had written several unsuccessful tales, he published in 1829 an historical romance called "The Last Chouans," which was received with favor. His reputation was increased by "The Physiology of Marriage" (1831), "Le Peau de Chagrin" (1831), "Scenes of Provincial Life" (1832), "Scenes of Parisian Life" (1832), "Le Père Goriot," and "Eugénie Grandet." He excelled in the analysis of emotions and in the delineation of individuality of character. He married the countess of Hanska, a Polish lady, in 1848. His works have been translated into many languages. Died in Paris Aug. 19, 1850. (See

G. Dessoiresterres, "Vie de Honoré de Balzac;" George Sand, "Notice biographique sur H. de Balzac," 1853; A. Baschet, "H. de Balzac," 1852.)

Balzac, de (Jean Louis Guez), Seigneur, a French writer, born in 1594. He was patronized by Cardinal Richelieu, and was admitted into the French Academy in 1634. He was considered the best French prose-writer of his time, and acquired a durable reputation by his successful efforts to improve and refine his native language. Among his works are "The Christian Socrates" (1652) and "Familiar Letters" (new ed., 1806). Died Feb. 15, 1654.

Bambar'ra, a state of Western Africa, in Soodan, lies on both sides of the river Niger or Joliba, which flows in a N. E. direction through the middle of this state. It is bounded on the S. by the Kong Mountains. The soil is well watered and fertile. The rainy season lasts from June to November. Two crops of maize, cotton, and yams are raised annually. The baobab, butter tree, and date-palm are found here. The wild animals are lions, elephants, leopards, panthers, etc. The population is composed mostly of Mandingoes. Area, about 21,300 square miles. Capital, Sego.

Bam'berg, a city of Bavaria, in Upper Franconia, is beautifully situated on the river Regnitz, 30 miles N. of Nuremberg and 3 miles from the river Main. It is connected by railway with Nuremberg and other towns. It is well built, and has spacious, well-lighted streets, which are lined with handsome houses. Among the remarkable public buildings are the magnificent cathedral (Domkirche) in the Byzantine style, founded in 1004 by the emperor Henry II.; the old palace of the bishops of Bamberg; and the Jesuit church of St. Martin's. Bamberg contains a theatre, a lyceum, a museum of natural history, and a royal library of about 50,000 volumes. Here are manufactures of porcelain, jewelry, musical instruments, gloves, etc.; also numerous breweries, which produce beer of superior quality. Pop. in 1871, 25,748.

Bamberg, a post-twp. of Barnwell co., S. C. P. 1907.

Bambi'no [the Italian for "infant"], a term applied to the swaddled figure of the infant Saviour which, carved or painted, forms the subject of many altar-pieces in Roman Catholic churches. The most celebrated of these is the Santissimo Bambino of the church Ara Cœli at Rome. This is a kind of wooden doll profusely adorned with jewels, said to have been carved from a tree which grew on the Mount of Olives. It is often carried in procession to the bedside of the sick. The festival of the Bambino occurs at Epiphany, Jan. 6.

Bamboccia'de [from the It. *bamboc'cio*, a "simpleton"], in painting, is a grotesque scene from common or low life, such as country fairs, rural sports and festivals, and boorish frolics. The name was derived from Bamboccio, the surname of Peter van Laer, who painted such subjects. He was born in 1613, and died in 1674.

Bam'boo' (*Bambu'sa*), [Fr. *bambou*], a genus of arborescent grasses which are natives of the tropical and warm parts of Asia and America, and grow to a large size. Some of the species are eighty feet high or more. The bamboo is a plant of great utility and importance. It has a jointed and hollow stem, which is very hard and light, and is externally coated with silex. It has been called the national plant of China, the natives of which make of it a great variety of articles, furniture, weapons, etc. It is sometimes used for building houses and bridges and for water-pipes. The smaller stems are converted into walking-sticks, and are employed in wickerwork and the seats of chairs. Some species of *Bambusa* secrete a silicious, phosphorescent substance called tabasheer, to which remarkable properties have been attributed. (See Tabasheer.)

Bam'borough (or **Bambrough**) **Castle,** one of the oldest castles in Great Britain, is on the coast of Northumberland, 16 miles S. E. of Berwick. It stands on a basaltic rock 150 feet high, and accessible only on the S. E. side. It was founded in 1070. Connected with this castle is an extensive public library, a dispensary, life-boats to save the crews of shipwrecked vessels, and other charitable institutions. Near the castle is a village of the same name.

Bambuk', a country of Western Africa, included between lat. 12° 30′ and 14° 30′ N., and between lon. 10° 30′ and 12° 15′ W., is bounded on the N. E. by the Senegal River, and on the S. W. by the Faleme. The surface is hilly, and the soil of the valleys fertile. It is inhabited by Mandingoes, who are said to be very ferocious. The baobab and other trees here attain an enormous size. Bambuk has long been celebrated for its rich gold-mines. Pop. about 800,000.

Ba'mian', a valley and pass of Afghanistan, on the route from Cabul to Turkistan, and between the central and western ranges of the Hindu-Kush Mountains, is at an elevation of 8496 feet, and is important as the only known pass over the Hindu-Kush Mountains that is practicable for artillery. The valley is covered with ruins of the city of Gulgula, which was destroyed by Jengis Khan about 1220. Bamian was one of the chief centres of the Boodhist worship, and presents numerous caves with gigantic idols cut out of the rock. One of these is 160 feet high.

Ba'mo, B'ha'mo, or **B'han-Mo,** the most important commercial town in the empire of Burmah, in Farther India, is situated on the Irrawaddy at the entrance of the Tamping. Large caravans laden with silk and other goods arrive here from October to May, during which time a large business is carried on. Large quantities of raw cotton are also exported from this place. The annual imports and exports amount to about $1,500,000 each. Pop. about 12,000.

Bamp'ton Lec'tures, so called after the name of their founder, the Rev. John Bampton (1689–1751), canon of Salisbury, who in 1751 left his "lands and estates" to the University of Oxford for "the endowment of eight divinity lecture sermons," to be preached annually at "St. Mary's in Oxford." The subjects specified were: (1) "To confirm and establish the Christian faith, and to confute all heretics and schismatics; (2) upon the divine authority of the Holy Scriptures; (3) upon the authority of the writings of the primitive Fathers as to the faith and practice of the primitive Church; (4) upon the divinity of our Lord and Saviour Jesus Christ; (5) upon the divinity of the Holy Ghost; (6) upon the articles of the Christian faith as comprehended in the Apostles' and Nicene Creeds." When the lectures commenced, in 1780, the income of the estate was £120 a year. Ever since then (except in the years 1834, 1835, and 1841) these lectures have been delivered. Some of the more noted of the earlier lecturers were Dr. White, in 1784, on "Christianity and Mohammedanism;" Dr. Nott, in 1802, on "Religious Enthusiasm;" Bishop Heber, in 1815, and Archbishop Whately, in 1822. Mansel, in 1858, on "The Limits of Religious Thought," opened a new era in the history of the lectures. Since then we have had, among others, George Rawlinson in 1859, Farrar in 1863, Mozely in 1865, Liddon in 1866, and Bernard in 1867. (For a complete list, down to 1852, see Darling's "Cyclopædia Bibliographica.")

Ban, a word which occurs in many modern languages, signifying an edict; a public order or prohibition; an interdiction; a notice of marriage; a curse or excommunication. In the former German empire to put a prince under the ban of the empire was to divest him of his dignities and pronounce on him a sentence of outlawry. The French *ban* signifies "exile," "banishment."

Ban, and Arrière Ban, military terms used in France under the feudal system. When the feudal barons were summoned to the service of the king in time of war, they were called the *ban*. Their tenants or inferior vassals formed the second levy, or *arrière ban*. The ban and arrière ban constituted the entire military force of France in feudal times.

Ban,* or **Ba'nus,** the title formerly given to military governors of certain districts, called *banats*, in the eastern part of Hungary. The ban was appointed by the king with the consent of the Diet, and had formerly very extensive powers. In political, judicial, and military affairs his authority was supreme. In time of war he commanded the troops of his banat. The most important banats were those of Dalmatia, Croatia, Slavonia, Bosnia, and Makovia (or Machow), but their boundaries often changed, and they were at length united into the double banat of Dalmatia and Croatia.

Bana'na (*Mu'sa sapien'tum*), an herbaceous plant of the natural order Musaceæ, is extensively cultivated in all tropical regions of both hemispheres. It is regarded by many botanists as a mere variety of the plantain (*Musa paradisiaca*). It grows to the height of from fifteen to twenty feet, and the stem terminates in a tuft of leaves which are from six to ten feet long, and about one foot wide. The fruit, which is generally five or six inches long, has a soft, luscious pulp, and is a nutritious and very important article of food. It is commonly eaten raw. It is stated that no other plant produces so great an amount of nutriment on the same space of ground. It is successfully cultivated in South Florida.

Bananal', an island of Brazil, also called **Nueva Beira,** is in the river Araguay, and in the province of Matto Grosso. Its length from N. to S. is 290 miles, and its width about 35 miles. The soil is fertile, and covered with a dense forest. There is a large lake near the middle of the island.

Banat-Komlas, a town of Hungary, in the county

* Ban in some of the Slavonic dialects is said to signify "master."

of Torontal, has beer-breweries and sheep-markets. Pop. in 1870, 5715.

Ban'ca, an island of the Malay Archipelago, belonging to Holland, about 10 miles E. of Sumatra, from which it is separated by the Strait of Banca. It is about 100 miles long, and has an area of 4664 square miles. The surface is hilly. It is celebrated for its mines of tin, of which about 4700 tons were produced in 1865. Copper, iron, and lead are also found here. Pop. in 1870, 59,740.

Ban'co, the standard money in which a bank keeps its accounts, as distinguished from current money. The term is chiefly applied to the money in which the Hamburg bank keeps its accounts, which is not coined money. The Hamburg mark banco (=1*s.* 5⅔*d.* sterling) is to the current mark (=1*s.* 2½*d.* sterling) as 20 to 17.

Ban'croft, a post-township of Freeborn co., Minn. Pop. 799.

Ban'croft (Aaron), D. D., a Unitarian minister, was born at Reading, Mass., Nov. 10, 1755. He graduated at Harvard in 1778, and became in 1785 pastor at Worcester, where he remained upwards of fifty years. Among his works, besides a great number of sermons, is a life of George Washington, which was very popular. He was the father of George Bancroft, noticed below. Died Aug. 19, 1839.

Bancroft (Edward), M. D., F. R. S., born at Westfield, Mass., Jan. 9, 1744, ran away from his native country in his youth, practised medicine in Guiana, and resided long in England. He was a friend of Dr. Franklin, and professed to labor in behalf of America, but is believed to have been a spy of the British government. He published several political works, a "Natural History of Guiana" (1769), "Charles Wentworth," a novel, and "Researches concerning the Philosophy of Permanent Colors" (2 vols., 1794–1813). He never visited America after her independence. Died Sept. 8, 1820.

Bancroft (George), Ph. D., LL.D., D. C. L., an eminent American historian, a son of Aaron, noticed above, was born at Worcester, Mass., Oct. 3, 1800. He graduated at Harvard College in 1817, and entered in 1818 the University of Göttingen, where he studied history and philology under Heeren, Bunsen, and others. In 1820 he took the degree of doctor of philosophy at Göttingen. Having returned home in 1822, he published a volume of poems (1823) and a translation of Heeren's "Reflections on the Politics of Ancient Greece" (1824). In 1834 he produced the first volume of his "History of the U. S." He was appointed secretary of the navy by President Polk in Mar., 1845, in which year he founded the U. S. Naval Academy, resigned that office in 1846, and was sent as minister plenipotentiary to England in the same year. He returned home in 1849, retired from the public service, and became a resident of the city of New York. His capital work is a "History of the U. S.," the tenth volume of which appeared in 1874. In a review of the third volume of this work, William H. Prescott observes: "The reader will find the pages of the present volume filled with matter not less interesting and important than the preceding. He will meet with the same brilliant and daring style, the same picturesque sketches of character and incident, the same acute reasoning and compass of erudition." (*North American Review* for January, 1841.) Mr. Bancroft was appointed minister to the court of Berlin in 1867, and negotiated a treaty by which Germans emigrating to the U. S. are released from their allegiance to the government of their native country. In 1871–74 he was minister plenipotentiary to the German empire, and rendered important services in settling the San Juan boundary question.

Bancroft Plantation, tp. of Aroostook co., Me. P. 177.

Band, in architecture, is the name given to any kind of ornament which is continued horizontally along a wall, or an ornament by which a building is encircled. Bands often consist of foliage, quatrefoils, or of simple bricks. A band of a shaft is the moulding or suits of mouldings by which the pillars and shafts are encircled in Gothic architecture.

Ban'dages [from the Anglo-Saxon *bin'dan*, to "bind;" literally, anything used for binding], applied to the bands or wrappers used by surgeons to keep in their places the dressings of wounds, to compress bleeding vessels, to rectify the deformity produced by fractures or other injuries, and to unite parts in which there is a solution of continuity. They are commonly composed of soft muslin, linen, or flannel. Sometimes they are made to become immovable after application by being first soaked in starch or glue. The great art in bandaging consists in applying pressure with exactly the required firmness, and *evenly*. Especially is it important to avoid interrupting too much the circulation of the blood. Unskilful bandaging has sometimes caused fatal mortification of a limb. For this reason the arm should never be tightly bandaged (unless temporarily, to arrest hæmorrhage) without the hand being subjected to an equal amount of pressure; and the same rule applies with regard to the leg and foot. To make a continuous bandage fit well upon a limb or other part, the roller should be drawn smoothly as far as it can be, and then, if needful, *reversed* by a turn of the hand from time to time; producing a spiral, by the overlapping of the successive turns, each time, about one-third of its width. A bandage for the arm may be from two to two and a quarter inches wide; for the lower extremity, two and a half inches; for the chest, three inches. The *figure-of-eight* bandage is often required for the elbow or knee-joint. The T bandage is available for the lower part of the trunk. A *many-tailed* bandage is used especially in fractures of the thigh. It is composed of about eighteen transverse strips, with or without a longitudinal band, to which they may be fastened by stitching. These being laid under the limb, the lowest is folded over, and then the next, and so on until the whole thigh is secured. This bandage has the advantage that it can be undone without disturbing the position of the limb. For a more particular account of bandages we must refer to works on minor surgery. Handkerchiefs are sometimes employed instead. In the treatment of wounds, however, and of stumps of amputated limbs, bandages are less resorted to now than formerly, many surgeons preferring lighter and cooler dressings, with adhesive strips, etc. One of the most useful of bandages for emergencies is the "Spanish windlass," to check serious bleeding from any part of either extremity. It is merely a strip of muslin or a pocket handkerchief passed around the upper part of the limb, tied in a knot, and then twisted firmly by a stick or bayonet passed under it, so as to press with sufficient force to arrest the arterial circulation. It must not be left on many hours, but its temporary application has often saved life. In like manner, free bleeding from a wound of the scalp may be controlled by a compress and bandage tightly applied around the head.

Revised by Willard Parker.

Ban'da, a town in British India, province of Allahâbâd, is on the Crane River, 80 miles W. of Allahâbâd. It has increased rapidly of late years, and acquired considerable note for its cotton.

Ban'da Isles, a group of islands, forming part of the Molucca Archipelago, belonging to the Dutch. They are lofty and volcanic. One of them, named Goonong Apee, rises 7880 feet above the sea, and is an active volcano. The larger of these islands are exclusively appropriated to the cultivation of nutmegs and mace, and produce annually about 450,000 pounds of nutmegs. These islands were discovered by a Portuguese, Antonio Abreus, in 1512. The Portuguese took possession of the islands in 1524, and in 1599 they passed under the dominion of the Dutch. Area, 8748 square miles. Pop. in 1869, 272,000.

Banda'na, or **Bandan'na,** a silk or cotton handkerchief of East Indian origin, though now extensively manufactured in Great Britain. The cloth is dyed Turkey red, and then the pattern is made by discharging the color with bleaching-liquor in a hydraulic press. The spreading of this liquor is prevented by an enormous pressure. The patterns of the real bandana are spots and diamond prints.

Banda Oriental. See Uruguay.

Bandel'lo (Matteo), an Italian novelist and Dominican monk, was born in Piedmont in 1480. He emigrated to France in the reign of Francis I., and was appointed bishop of Agen in 1550. He published in 1554, in Italian, three volumes of tales or novels (*novelle*) which are immoral, but remarkable for originality of conception and other literary merits. A fourth volume was published after his death, which occurred in 1562. Shakspeare borrowed from him the plots of several plays.

Bande'ra, a county of Western Texas. Area, 938 square miles. It is traversed by Medina River, a beautiful stream. Grain, cattle, sheep, and swine are exported. The climate is very healthy and pleasant. Pop. 649. Capital Bandera.

Bandera, a post-village, capital of the above county, is on the Medina River, 30 miles N. W. of San Antonio.

Ban'derole, a small streamer under the crook on the top of a bishop's staff, sometimes applied to a small streamer carried on military weapons or on masts. Also, the flat inscribed band used in Renaissance buildings.

Bandes Noires ("Black Bands"), an opprobrious term applied during the French Revolution to companies of capitalists who bought the confiscated estates and buildings which had belonged to the Church or to *émigrés*. They were accused of vandalism and the destruction of old relics, works of art, churches, etc.

Band-Fish, or **Snake-Fish** (*Cep'ola*), a genus of fishes related to the ribbon-fish, are remarkable for singularity of form and beauty of color. The body is much elongated and compressed. The red band-fish (*Cepola rubescens*) is about fifteen inches long, and is found in the Mediterranean.

Red Band-Fish.

Ban'dicoot (*Peram'eles*), a genus of marsupial quadrupeds, natives of Australia and Tasmania, having a long head and pointed muzzle. Their dentition is remarkable, as they have ten cutting teeth in the upper jaw, and only six in the lower. They devour grain in granaries and potatoes in the field. The *Perameles nasuta* is about eighteen inches long. The name is popularly extended to several kindred genera of marsupials.

Long-nosed Bandicoot.

Bandic'ra (Atilio and Emilio), two brothers and Italian patriots, born respectively in 1817 and 1819, were sons of a vice-admiral in the Austrian service. In 1842 they opened a correspondence with Mazzini, and formed a design to liberate Italy by a conspiracy. They failed, and escaped to Corfu about Mar., 1844, but hearing a false or exaggerated rumor of a revolt in Naples, they returned with a few friends and landed in Calabria in June. They were executed July 25, 1844, their letters to Mazzini having been opened by the British postmaster-general, and the contents communicated to the Austrian government.

Bandinel'li (Baccio), an Italian sculptor, was born in 1487. He was patronized by Cosimo de Medici, the emperor Charles V., and Pope Clement VII. As a sculptor he was considered as second only to Michael Angelo, of whom he was a jealous rival. He adorned the choir of the Duomo of Florence with bas-reliefs. Among his best works are a group of Adam and Eve, a statue of Orpheus, "The Descent from the Cross," and "Hercules and Cacus." Died in 1559.

Bandit'ti [It. *banditi*], bands of robbers in the mountainous parts of Italy and Greece, who fall upon travellers and hold them captive for a ransom. In former times there existed in the larger towns of Italy organized associations of bandits, whose stilettoes were ready for hire to accomplish any deadly scheme. They were called euphemistically *bravi* ("brave men"), and were not exterminated until the modern improvements in police organization. Hired assassination (*homicidium conductum, assassinatus*) was a worse crime than ordinary murder, and punished by the wheel.

Ban'don, Earls of, and Viscounts Bernard (1800), Viscounts Bandon (1795), Barons Bandon (1793, in the Irish peerage), a noble family of Great Britain.—Francis Bernard, the third earl, was born Jan. 3, 1810, and succeeded his father in 1856.

Ban'don, or **Ban'donbridge,** a town of Ireland, on the beautiful river Bandon, 20 miles S. W. of Cork. It is situated on both sides of the river, which enters the harbor of Kinsale. Bandon was formerly a prosperous manufacturing town, but its prosperity has considerably declined. Pop. in 1871, 6074.

Bands, Military, consist of a body of musicians attached to each army regiment or battalion. In the British service these bands generally comprise a band-master and about fifteen musicians, who are chiefly maintained at the cost of the officers of the regiment to which they belong. In the U. S. service the present law provides for a band at the Military Academy at West Point, and for each artillery, cavalry, and infantry regiment a chief musician, who shall be instructor of music, and for each artillery and infantry regiment two principal musicians; each cavalry regiment to have one chief trumpeter.

Ban'dy's, a township of Catawba co., N. C. Pop. 727.

Banér, written also **Bannier** or **Bannér** (Johan), a famous Swedish general, born near Stockholm June 23, 1595. He commanded the right wing under Gustavus Adolphus at the battle of Leipsic in Sept., 1631. His conduct in this action was highly applauded. On the death of Gustavus Adolphus (Nov., 1632) he became the commander-in-chief of the Swedish army. He gained a brilliant victory near Wittstock in Sept., 1636, and again defeated the imperial army near Chemnitz in 1639, after which he overran a large part of Germany. Died May 10, 1641. Schiller represents him as great in adversity, and formidable even after defeat. (See Schiller, "History of the Thirty Years' War;" Carl Manderfeldt, "Éloge de J. Banér," 1787.)

Banff, sometimes written and always pronounced **Bamf,** a seaport-town of Scotland, capital of Banffshire, at the mouth of the river Doveran, and on Moray Frith, about 40 miles N. N. W. of Aberdeen. A bridge over the river connects it with Macduff. Here is Duff House, the seat of the earl of Fife, with a park fourteen miles in circumference. Banff has manufactures of leather, soap, iron castings, linen, sails, and cordage, and has important fisheries of salmon, cod, and herring, which, with agricultural products, are exported from this town by sea. Banff has a lighthouse in lat. 57° 40′ N., lon. 2° 31′ W. The harbor is shallow and poor. The town has numerous and excellent schools and charitable institutions. The river is liable to floods, which have sometimes been destructive. Pop. in 1871, 7439.

Banff'shire, a county of Scotland, bounded on the N. by Moray Frith, on the E. and S. by Aberdeenshire, and on the W. by Elgin and Invernesshire, and partly by the river Spey, a very rapid stream. Area, 684 square miles. The surface is greatly diversified by mountains and valleys. Among its highest peaks is Cairngorm, 4090 feet high. Granite, slate, old red sandstone, limestone, and serpentine occur here. The soil of the valleys is fertile. The breeding of cattle is the chief occupation of the farmers. Capital, Banff. Pop. in 1871, 62,010.

Ban'galore', a strongly fortified town of India, the capital of Mysore, is on a high table-land 71 miles N. E. of Seringapatam; lat. 12° 58′ N., lon. 77° 38′ E. It is the chief British military station in Mysore, and is much frequented by Europeans, attracted by the salubrity of the air. The temperature seldom exceeds 90° F. Here are important manufactures of cotton and silk. It was taken by storm by Lord Cornwallis in 1791. Pop. 132,000.

Bang'kok', or **Bankok,** a large commercial city, the capital of Siam, is situated on the river Meinam, about 20 miles from its entrance into the Gulf of Siam; lat. 13° 38′ N., lon. 100° 34′ E. It is mostly built of wood, but has some brick and stone houses. Many of the houses are built on movable bamboo rafts on the river. The Chinese constitute a majority of the population, which is estimated at 400,000. Bangkok contains a large royal palace and numerous Booddhist temples, which are decorated in a gorgeous style. The stationary dwelling-houses are raised on piles six or eight feet from the ground, in order to protect them from inundations. The river is navigable for vessels of 250 tons from its mouth to Bangkok, which has an extensive trade. The chief articles of export are sugar, pepper, rice, ivory, cardamoms, hides, tin, etc. Iron-mines and forests of teak occur in the vicinity. It is the seat of Roman Catholic and of American Baptist and Presbyterian missions. It has some native Christians of Portuguese descent. (See Sir John Bowring's "Siam.")

Ban'gor, an episcopal city and seaport of North Wales, in the county of Caernarvon, on the S. E. shore of Menai Strait, 2½ miles from the Britannia Bridge, and 9 miles N. E. of Caernarvon. It is on the railway which

connects Chester and Holyhead, and is situated in a narrow, romantic valley. The grandeur and beauty of the scenery render it a favorite place of summer resort. Six miles from Bangor are slate-quarries which employ about 2000 men. This city is very ancient, having been raised to a bishopric in 550 A. D. The cathedral, founded in 525, was destroyed by the Saxons in 1071. Bangor has eight annual fairs, four of which are for cattle. They are visited by great throngs of buyers and sellers. The trade by sea is not important, the harbor not being accessible to large vessels. Pop. 6338.

Bangor, a post-township of Marshall co., Ia. Pop. 838.

Bangor, a city, port of entry, and capital of Penobscot co., Me., is on the right bank of the Penobscot River, about 60 miles from its mouth. It is 138 miles by the Maine Central R. R. N. E. of Portland, and 67 E. N. E. from Augusta, the present State capital. It is in lat. 44° 47′ 50″ N., lon. 68° 47′ W. from Greenwich. It is the northeastern terminus of the Maine Central R. R., the western terminus of the European and North American R. R., the southern terminus of the Bangor and Piscataquis R. R., the northern terminus of the Bucksport and Bangor R. R., the northern terminus of the projected Bay and River R. R., the north-western terminus of another surveyed railroad from Bangor to Calais, as well as the head of navigation on the Penobscot River. Bangor is thus easily the railroad and commercial, as it is nearly the geographical, centre of the State, of which it must ultimately become the capital. The Kenduskeag River, navigable to the centre of the city, runs directly through it, dividing the city into two nearly or quite equal parts. Both rivers, above the city, are broken by waterfalls for about 12 miles, thus furnishing water-power unequaled in New England. Brewer, a beautiful suburb of Bangor, lying on the easterly side of the Penobscot, and commonly known as the "Eighth Ward," is the city's shipyard, being connected with it by a ferry and a covered bridge, and is rapidly filling up with manufactories of different sorts. Bangor is one of the greatest lumber-dépôts in the U. S., nearly 3000 vessels being employed in exporting lumber, mostly pine, spruce, hemlock, and cedar, to every quarter of the globe. It is also largely engaged in other foreign commerce. Steamboats ply regularly, by three different lines, between Bangor and the several ports along the Penobscot, between Bangor and Portland, and between Bangor and Boston. Besides the city schools, which are excellent, it has a theological seminary with five or six professors, and a library of about 15,000 volumes, a city library of about 12,000 volumes, a mechanics' library of about 9000 volumes, a law library of about 1000 volumes; a conservatory of music, a board of trade, and other similar organizations. Of banks, it has two State, two savings, and seven national, besides several brokers who lend money and receive deposits. Bangor has fourteen churches and two daily and three weekly papers. Four large iron-foundries, with two of which are connected shops for manufacturing machinery, several planing-mills, three or four furniture-factories, three extensive carriage and sleigh factories, one large trunk-factory, besides many similar establishments, together with a burnettizing works, do a very heavy manufacturing business. The city is surrounded by an excellent agricultural country, which sends to Bangor large quantities of farming produce for export. It is also doing a heavy business in insurance. With its natural suburb, before mentioned, Bangor has a valuation of about $11,000,000. There is now a movement on foot for building a stone dam across the Penobscot, which, it is believed, will soon make Bangor the leading manufacturing city of New England.

The city is divided into seven wards, each of which elects annually one alderman and three common councilmen, the aldermen constituting the upper and the councilmen the lower branch of the city government. The government is presided over by a mayor, elected annually. In 1870 there were 3252 ratable polls in the city, and estates valued at $9,851,561. Bangor has a fine granite custom-house, with a U. S. collector and two deputies. Besides the superior, probate, and commissioner's courts for Penobscot county, and the regular nisi prius term of the supreme judicial court of the State, it has an annual law term of the latter court, and an annual sitting of the U. S. district court.

History.—The French erected here a fort before 1656, and named it Norombega. There prevailed in the seventeenth century a belief in Europe that a great and flourishing Indian city called Norombega stood near this point. The name, variously spelled, occurs in Milton's "Paradise Lost," in Burton's "Anatomy of Melancholy," and other works of that time. It was settled in 1769, and was then called Kenduskeag. Its name was changed to Bangor by Rev. Seth Noble, in honor of a well-known psalm-tune of that name. In 1791 it was incorporated as a town, and in 1834 as a city. Its rapid growth since that time has been the result of its position, which combines the advantages of a noble and navigable tidal river with a large and constant water-power. It has also in the upper waters of the Penobscot the means of very cheap transportation of logs from the boundless forests of Northern Maine. These advantages made it for a long time the greatest lumber-market in the world, and even now but one or two places excel it in the amount and value of lumber sawed and shipped.

Bangor had by the census of 1800, 277 inhabitants; in 1810, 850; in 1820, 1221; in 1830, 2868; in 1840, 8634; in 1850, 14,432; in 1860, 16,408; in 1870, 18,296.

B. F. Tefft, Ed. "Northern Border."

Bangor, a township of Bay co., Mich. Pop. 3606.

Bangor, a township and village of Van Buren co., Mich., on the Chicago and Michigan Lake Shore R. R., 27 miles N. E. of St. Joseph, in a good farming and fruit region. The village has an iron-smelting furnace, an "excelsior" manufactory, five saw-mills, two hotels, one weekly paper, a union school, etc. Pop. of township, 1525. C. W. Gillett, Ed. "Journal."

Bangor, a post-village and township of Franklin co., N. Y., on the Ogdensburg and Lake Champlain R. R., 55 miles E. N. E. of Ogdensburg. It has manufactories of starch, cheese, and hemlock extract. Pop. of township, 2431.

Bangor, a post-township of La Crosse co., Wis. Pop. 1151.

Bango'rian Con'troversy, a controversy which rose between the adherents and opponents of ecclesiastical authority in Great Britain. It was brought about by a sermon preached before George I. by Dr. Benjamin Hoadley, bishop of Bangor. (See Hoadley.)

Bangs (Heman), a Methodist preacher, born in Fairfield, Conn., in 1790, joined the New York Annual Conference in 1815. He labored effectively in the pulpits of his denomination in New York and Connecticut. He was one of the principal founders of the Wesleyan University at Middletown, Conn., and one of the most powerful preachers of Methodism. Died Nov. 2, 1869.

Bangs (Nathan), D. D., a Methodist minister, born in Stratford, Conn., May 2, 1778. He became editor of the "Christian Advocate and Journal," and president of the Wesleyan University at Middletown, Conn. He wrote, among other works, a "History of the Methodist Episcopal Church." Died May 3, 1862.

Bangs (William M'Kendree), son of Nathan Bangs, was born in New York City in 1810, graduated in the University of Ohio in 1829, and served one year in a professorship in Augusta College, Ky. He resigned his chair there to enter the itinerant ministry of the Methodist Episcopal Church. From 1831 to his death, in 1852, he was a member of the New York Conference. He was some time principal of the Wesleyan Academy at Wilbraham, Mass. He was distinguished by his culture and by the force of his controversial writings.

Ban'ialu'ka, or **Banjaluka,** a fortified town of European Turkey, in Bosnia, on the river Verbas, 94 miles S. W. of Bosna-Serai. It has numerous mosques, many bazaars, a manufactory of gunpowder, hot springs, and Roman antiquities. Pop. 15,000.

Baniya (pronounced in India, bŭn'e-yā), less correctly, **Baniyan** or **Banian,** a word used in Hindostan to denote a shopkeeper, especially a dealer in grain, but also applied to the wholesale dealers and importers of Bombay, Surat, and Cambay, carrying on a trade with the interior of Asia by caravans and with Africa by ships. They usually belong to the caste called Vaisyas, and strictly abstain from animal food.

Ba'nim (John), an Irish novelist, born at Kilkenny April 3, 1798, excelled in the delineation of the life and character of the Irish peasantry. He published in 1825 "Tales of the O'Hara Family," which was very popular. Among his other works are "The Battle of the Boyne" (1828), "The Smuggler" (1831), and "The Mayor of Windgap." Died Aug. 1, 1842. (See P. J. Murray, "Life of John Banim," 1857.)

Ban'ister, a township of Halifax co., Va. Pop. 3731.

Banister (village). See Halifax Court-house.

Baniwas, a tribe of South American Indians living on the Amazon and the Rio Negro. A vocabulary of their language is given by Alfred Wallace in "A Narrative of Travels on the Amazon and the Rio Negro" (1853, pp. 521–511).

Banjermas'sin, or **Benjar-Massen** (*i. e.* "the river of plenty"), the name of a river, state, and town on the S. coast of Borneo. Owing to the inundations of the

river, the town is completely built on floating logs, held by ropes. It has a considerable trade in gold-dust, precious stones, birds' nests, wax, resin, rubber, rattans, pepper, and steel of native manufacture and excellent quality. Many of the inhabitants are Chinese, and most of the trade is with China. The Dutch government is the dominant power here. Trade is obstructed by a bad bar at the mouth of the river. Pop. estimated at 30,000.

Bank [from It. *banco*, a "bench" or "table," on which the Venetian money-changers displayed their money]. In general, banks are credit institutions or dealers in credits. The exchanges of the modern world are barter, effected by the indirect agency of the credit system, and banks and bankers are its machinery. Metallic money and its representative, the circulating note, are together only the small change of trade, employed in the settlement of balances and in the smaller purchases and payments. The operations of the New York Clearing-house are a good illustration of the small amount of money required in the transaction of business; its exchanges during the last twenty-three years having been more than 435,000 millions, while the balances paid in money were but 18,000 millions, or about 4 per cent. only of the amount of the settlements.

The earliest banking institution in Europe was the Bank of Venice, founded A. D. 1171. It was based upon a forced loan of the republic. Funds deposited in it could not be withdrawn, but were transferable on the books at the pleasure of the owner—in this respect not unlike the perpetual annuities of the British debt. These inscriptions of credit were usually at a premium over current coins, which were worn and clipped and were of various countries and values. Except in so far as the transfers of credit on the books were concerned, the bank was only a fiscal agent of the government. It continued in operation until 1797, when it was overthrown by the Revolutionary army of France.

The Bank of Barcelona, founded in 1401, is said to have been the first bank that negotiated foreign bills of exchange. Jewish money-dealers, however, are entitled to the credit of the invention at a much earlier period.

The Bank of Genoa went into operation in 1407. For centuries it was one of the principal banks in Europe. It was the first to issue circulating notes, which were negotiated or passed only by endorsement, not made payable to bearer. It is not known whether or not they were issued in small denominations. They were probably made for considerable amounts, and employed only, or chiefly, in large transactions. This was a long step in advance of the earlier system of deposit transfers, which was also employed by this bank. In 1800, when its circulating notes were at a large premium, it was pillaged by the French army, and thenceforth ceased to perform the functions of a bank.

The Bank of Amsterdam, established in the year 1607, was the earliest considerable institution of the kind which looked to the promotion of commerce. Its predecessors of Venice and Genoa were chiefly devoted to the management of state finances. It was plundered by the French army in 1794, when it was found that, with the reputation of 50 millions of dollars in its vaults, it had nothing, its capital having been loaned to the States General, the East India Company, and to the city of Amsterdam. In this condition of its affairs it had done an immense business during the preceding fifty years.

The Bank of Hamburg, established in 1619, was a bank of deposit and circulation based upon fine silver bars. The deposits were confined to silver. This institution, like nearly all those of the time, had, as a principal object, the protection of the people from worn, sweated, clipped, and plugged coins, and from coins of the German empire secretly reduced in standard value. The remedy was that previously adopted by the Bank of Amsterdam—to lock up the debased and depreciated coins, and circulate the credit granted for them. The Bank of Rotterdam was established in 1635, and that of Stockholm in 1688, but there was nothing of principle in them, or in other banks in Europe organized previous to the establishment of the Bank of England, which differed materially from those here briefly sketched. The Banks of Venice and Genoa, the earliest in Europe, were simply fiscal agencies of their respective governments.

The Bank of England is a fiscal agent, but is also devoted to the service of domestic and foreign commerce. It was established in the year 1694, and there is no banking institution elsewhere in the world equal to it in the management of national finances. Its whole capital, which was then £1,200,000, and is now £14,553,000, was and is permanently loaned to the government. A notable event in its history was its suspension of specie payment in 1797, which continued for twenty-five years. Its charter has been frequently renewed, and, although considered as perpetual, is subject to amendment.

Previous to the passage of the bank-charter act of 1844, any bank or private person could issue bank-notes, subject to the condition that they must be paid in coin on demand. By that act the Bank of England was divided into two departments—the bank and the issue department. The bank department is as private as any bank corporation; the issue department is an office of the state. The bank receives from the state office 15 millions of pounds in currency, which amount is loaned or issued to the government, on which the bank receives 3 per cent. interest. The bank, however, pays to the government about £200,000 annually for this privilege, and the profit to the bank from this source, after deducting the expense of management, is estimated at only about £100,000 annually. The notes are a legal tender everywhere except in payments by the bank. Bank-notes in excess of 15 million pounds are furnished by the issue department upon the gold coin and bullion held by it; which amount is not included in the reserves and is not under the control of the bank. In 1847, 1857, and 1866 the act was suspended, and the bank issued notes without holding gold; but the amount issued has only once exceeded the amount required by the bank charter, and then the excess was but £800,000.

The bank rate of interest since 1865 has varied from 10 to 2 per cent. The average rate for 1866 was 7 per cent.; for 1875, 3½ per cent.; for the ten months previous to Mar., 1877, 2 per cent. Its usual dividends are 10 per cent. per annum. The total issues of the United Kingdom on Nov. 25, 1876, were—Bank of England, £28,281,938; 167 private and joint-stock banks, £4,824,900; Scotland, £7,015,743; Ireland, £8,144,169; total for the United Kingdom, £48,266,750.

There is a large number of joint-stock banks which are not banks of issue. The usual dividends of the London and Westminster, London and Joint-Stock, London and County, and the Union, which are leading joint-stock banks, are 20 per cent. per annum, and their average deposits are about twelve times the amount of their capital.

The *Economist* of July 1, 1876, states that three joint-stock banks in England, with a capital of £4,462,000, have 392 branches.

The number of banks in the provinces of Ontario and Quebec, in the Dominion of Canada, on Dec. 31, 1876, was 28; capital, 62 millions of dollars; loans, 134 millions; specie, 5 millions; circulation, 20 millions; deposits, 69 millions.

The Bank of France was authorized in 1800. Since 1803 it has had the exclusive privilege in Paris, and since 1857 in France, of issuing notes payable on demand. The bank in Mar., 1876, had 74 branches in the departments, and 14 others were in course of organization. Its present charter extends to the year 1897, and it is pledged to resume specie payments on Jan. 1, 1878. During the revolution of 1848 it was authorized to suspend specie payments and its notes were made a legal tender. The Bank of France is not a fiscal agent of the government, as is that of England. It does not collect or disburse the revenues of the exchequer, but lends to it largely in its exigencies, while its credits, in the form of circulating notes and other acceptances, have borne the government safely through extraordinary needs. During the late war with Prussia, which continued for ten months and terminated on May 10, 1871, it rendered unexampled service. According to the report of the minister of finance for 1873, the total expenditures arising out of the war to that date were 9288 millions of francs, or (at 20 cents to the franc) about 1857 millions of dollars—an amount equal to about two-thirds of the war-debt of the United States. When the war began the circulation of the bank was 251 millions of dollars, and its specie 229 millions, or 90 per cent. of its circulation. In June, 1871, the capital of the bank was 36½ million dollars, its circulation 442 millions, and its specie 110 millions, or about 25 per cent. of its circulation. In Nov., 1873, the circulation reached its maximum, and was 614 millions, while its specie had increased to 146 millions, or 24 per cent. of its circulation. In Dec., 1874, the ratio of specie to circulation was 52 per cent., and in Sept., 1875, 70 per cent. Since that date the amount of the circulation has fluctuated, standing on Nov. 2, 1876, at 515 millions, and on Feb. 8, 1877, at 533 millions. The stock of specie has risen rapidly since Dec., 1874. On Mar. 30, 1876, the bank held 350 millions of specie (of which 250 millions was in gold), being 76½ per cent. of its circulation and 63 per cent. of its deposits and circulation. In 1877, Feb. 22, it held 446 millions of specie, being 84½ per cent. of its circulation, which was 528 millions. The increase of the circulation from July, 1870, to Nov., 1873, was 351 millions, and the decrease in specie 83 millions. The decrease in circulation from Nov., 1873, to Sept., 1875, when it reached its lowest

point, was 135 millions, and the increase in specie during the same period was 179 millions.

In Aug., 1870, the bank was again authorized to suspend specie payments and its notes were made a legal tender, but it has nevertheless since then paid out a large amount of coin. In the year 1875 it paid out 126 millions in gold and 96 millions in silver, but notwithstanding this its stock of coin increased more than 67 millions. Since the declaration of war the bank has loaned to the government in various forms about 600 millions of dollars; and during the whole period since the suspension of specie payments in 1870 the notes of the bank have, except during a brief period, remained at par.

The first organized bank in the United States had its origin in the formation of a banking company without charter, which was proposed in a resolution passed June 17, 1780, by citizens of Philadelphia. The first action in the Congress of the United States looking to the establishment of a bank was taken June 21, 1780, in reference to this proposed association. In the spring of 1781, Robert Morris, then superintendent of finance, submitted to Congress a plan for the establishment of the Bank of North America at Philadelphia; which plan was approved, and on Dec. 31 following a perpetual charter was granted to that institution. The bank opened for business on Jan. 2, 1782, and on Apr. 1 following the legislature of Pennsylvania granted to the company a perpetual charter, which, though repealed in 1785, was subsequently renewed from time to time to the date of its last charter, on Dec. 3, 1854. On Feb. 7, 1784, the State of Massachusetts incorporated the Massachusetts Bank. The Bank of New York was chartered on Mar. 21, 1791, although it had since 1784 been doing business under "articles of association" drawn by Alexander Hamilton, who was a member of its first board of directors. All of the above-named institutions are still in a prosperous condition, and all have been converted into national banks.

The plan of establishing a Bank of the United States originated with Alexander Hamilton, then secretary of the treasury, and was first embodied in his report to Congress on Dec. 13, 1790. The capital of the proposed bank was fixed at $10,000,000, one-fourth of the private and corporate subscriptions to be paid in gold and silver, and three-fourths in United States stocks bearing 6 per cent. interest. Two millions, to be subscribed by the United States, were to be paid in ten equal annual instalments by loans from the bank, or, as Mr. Hamilton describes the operation, "by borrowing with one hand what is lent with the other." This plan was adopted without material alteration by Congress, and approved by Washington Feb. 25, 1791. During the years 1796–1802 the government disposed of its stock in the bank at a considerable profit, 2200 shares having been sold in the last-mentioned year at a premium of 45 per cent.

On Jan. 20, 1815, in accordance with the recommendation of Secretary Dallas, a bill was passed reorganizing the bank, many prominent members of both houses who had previously voted against a renewal of the charter now voting in its favor. Pres. Madison ten days later returned the bill with his objections, but on the 10th of Apr., 1816, he approved a bill of substantially the same import; and this was the second and last charter of the bank granted by the general government. The plan proposed by Mr. Dallas was modelled upon the charter of the first United States Bank, and the act of incorporation, as finally passed, did not differ materially from the plan proposed by him. The charter was limited to twenty years, expiring on Mar. 3, 1836. The capital was fixed at $35,000,000, seven millions of which was to be subscribed by the government, payable in coin or in stock of the United States bearing interest at 5 per cent., and redeemable at the pleasure of the government.

During the following year the currency was greatly depreciated; very many failures of State banks, corporations, and individuals had occurred, and the country had not yet recovered from the exhausting effects of its late war. In this emergency the bank attempted, by the importation of more than seven millions of dollars from Europe, at a cost of half a million, to restore soundness to the currency; but it became itself embarrassed, largely through the mismanagement of the branch at Baltimore, and was in danger of absolute failure. Its losses were reported to exceed three millions of dollars; but the bank, as well as the business of the country, eventually recovered. The industries of the people and the finances of the government prospered from 1820 to 1835. In this interval the national debt was paid, and the stock of the bank rose in the market until it commanded a premium of 20 per cent.

Congress having refused to recharter the bank, a bill was introduced in the legislature of Pennsylvania to charter a State bank, to be called the United States Bank; which bill became a law just thirteen days before the expiration of the original charter. The circulating notes and the deposits of the Bank of the United States were eventually paid in full, and the accounts of the assignees were finally settled in 1856. The shares of the bank were quoted in 1837 at 125, in 1839 at 111, and in 1843, after its failure, at $1\frac{7}{8}$ per cent. The shareholders received no returns on their stock in the final settlement, the whole twenty-eight millions invested by them having been a total loss. The treasury records show that the government realized a profit of $6,093,167 upon its investment in the stock of the bank.

State banks were organized in most of the States of the Union under special charters obtained from their several legislatures. Many of the States, chiefly Southern and Western, authorized banking corporations, with the State as part or sole stockholder. The amount of currency issued by them was frequently twice, and in many instances three times, the amount of their nominal capital. These charters were valuable, and the State legislatures were besieged by applicants for such special privileges. In 1814 a bill was passed, by a two-thirds vote over the second veto of Gov. Snyder of Pennsylvania, authorizing forty-one banks, with an aggregate capital of seventeen millions, of which only one-fifth part was required to be paid in. Charters of banks authorized by the New England and the Southern States in some instances were disposed of to non-residents, who organized banks of circulation with little or no capital, and the citizens of other remote States suffered great loss from the worthlessness of such bank issues. The charters of these banks were in the interest of individuals, and generally of the friends of the dominant political party in the legislature which granted them. In many instances they were corruptly obtained. Gov. Tompkins of New York in the year 1813, under authority of a clause in the constitution of 1777, prorogued the legislature of that State, assigning as one of the reasons for such action that bank applicants had used or attempted to use corrupt means to secure a charter; and a clause was inserted in the constitution of 1821 which required the assent of two-thirds of the legislature to the incorporation of a moneyed institution. In 1804 and in 1818 restraining acts were passed by the legislature of that State, the latter of which provided that no person or association, unless authorized by law, should open an office for the purpose of receiving deposits, discounting promissory notes, or issuing circulation. This act was not repealed until the year 1837. Specie payments were generally suspended in 1814, in 1837, and in 1857, but many of the banks, particularly in the Western and Southern States, which were authorized to issue currency without security, and without such judicious restrictions as should always accompany legislation of this kind, were in a continual state of suspension. The rates of exchange between the Eastern, Southern, and Western States were oppressive, and the losses to the bill-holders from this cause were estimated to be not less than 5 per cent. annually upon the circulation, and to equal in twenty years the entire amount of circulation outstanding.

In 1813 a movement toward a reform in bank currency began in Massachusetts. This system was more fully developed in 1825, when five Boston banks undertook its management. Its exclusive control was finally assumed by the Suffolk Bank, which association compelled the redemption at par in Boston of the notes of the New England banks by a system of assorting and returning the notes to the place of issue; and its operations were continued down to the establishment of the national bank system.

In 1829, Mr. Van Buren, then governor of New York, recommended a "safety-fund" system as affording greater security to the creditors and bill-holders of chartered banks; and during that year a bill which embodied his recommendation passed the legislature and became a law. The system continued in operation for nine years, and its chief features were subsequently copied by the State of Ohio and other States of the Union.

Suggestions regarding the expediency of requiring security to be given for bank issues were made by financial writers as early as 1815, and by Mr. Gallatin in 1831. The latter proposed that existing bank-notes be taxed out of existence, and suggested a system of currency which should be secured by stocks and real estate. The system of authorizing banks by special charter, with its attendant evils, continued, however, in all the States down to the passage by the New York legislature of the Free Bank act on Apr. 18, 1838. Under the provisions of this act any number of persons was authorized to form banking associations, upon the conditions and subject to the liabilities specified in the act. The law originally provided for the deposit of the stocks of the different States and bonds and mortgages as security for circulating notes. Previous to the year 1843 twenty-nine of these banks, with an aggregate circulation of $1,233,374, had failed, and their securi-

ties were sufficient to pay but 74 per cent. of the circulation alone. Losses to bill-holders occurred only in the cases of those banks which had deposited State stocks other than those of New York. The law was so amended in 1849 as to require that at least one-half of the securities so deposited should consist of New York State stocks, and that not more than one half should be in the stocks of the United States, the securities in all cases to be, or to be made, equal to a stock producing an interest of 6 per cent. per annum, and to be taken at a rate not above their par value, and at not more than their market value. The banks were under the supervision of a commissioner appointed under the Safety-Fund act until the year 1843, in which year they were required to report to the State comptroller; but in 1851 the present office of bank superintendent was established. In 1840 a law was passed requiring the banks of New York to redeem their notes at an agency of the bank, either in New York City, Albany, or Troy, at one-half of 1 per cent. discount. This discount was reduced in 1851 to one-fourth of 1 per cent. After the passage of this act two of the principal banks in the city of New York inaugurated a plan of redemption similar to the Suffolk system. The notes of such associations as kept a deposit with them were returned to the banks of issue, and the discount of one-fourth of 1 per cent. was divided between the redemption agent and the associations whose notes were redeemed. Those banks which did not provide the means for redemption were forced to close up their affairs.

The following table exhibits the amounts and kinds of paper currency outstanding on Aug 31, 1865, when the public debt reached its maximum, and for Jan. 1 of each year thereafter, and for July 1 of the present year:

Date.	Legal-tender notes.	Old de-mand notes.	Fraction-al cur-rency.	Totals.	National bank-notes.	Aggre-gate.	Currency price of gold.	Gold price of currency.

In the year 1832 a resolution of the national House of Representatives required the secretary of the treasury to compile statistics in reference to banks from the reports of State officials. The results, although the best that were attainable, are only approximately correct.

Secretary Chase, in his annual reports for 1861 and 1862, recommended the establishment of a national banking system.

The act of Congress which authorized the existing national system was approved on Feb. 25, 1863, but this law was subsequently superseded by the act of June 3, 1864, which provided for the establishment of a national bank bureau in the treasury department, the chief officer of which is the comptroller of the currency. Under this act national banks may be organized by any number of persons, not less than five, the capital in any instance to be not less than $100,000, except that in cities containing a population not exceeding 6000 banks may be established with a capital of not less than $50,000. The capital stock in cities having a population of 50,000 must not be less than $200,000. Not less than one-third of the capital was required to be invested in United States bonds, upon which circulating notes may be issued equal in amount to 90 per cent. of the current market value, but not exceeding 90 per cent. of the par value of the bonds deposited; the notes are receivable at par in the United States in all payments to and from the government, except for duties on imports, interest on the public debt, and in redemption of the national currency. On Mar. 3, 1865, an act was passed providing that every banking association should pay a tax of 10 per cent. on the notes of any person or State bank used for circulation and paid out by them; which act had the effect of taxing State bank circulation out of existence.

The national bank act authorized the issue of 300 millions of circulation; which amount was increased to 354 millions by the act of May 12, 1870. The act of June 20, 1874, provided for the deposit by any association of lawful money with the treasurer in sums of not less than $9000, and the withdrawal of a proportionate amount of the bonds on deposit as security for its circulating notes. The act of Jan. 14, 1875, authorized the unlimited issue of circulating notes, subject to the restrictions of then existing law, but made it the duty of the secretary of the treasury to retire legal-tender notes to the extent of 80 per cent. of the additional national bank-notes issued, and to continue such retirement until the legal-tender notes should be reduced to 300 millions. The greatest amount of national bank circulation outstanding at any one time was in Dec., 1874, when it reached $352,494,346, which was $1,605,654 less than the amount then authorized by law. Since the passage of the act of Jan. 14, 1875, and up to July 1, 1877, there has been a reduction of $36,241,203 in national bank-notes, and of $22,235,668 in legal-tender notes, the total reduction in the circulation of the country under the provisions of this act being $58,476,871. There was also on July 1, $13,938,802 of legal-tender notes on deposit with the treasurer for the purpose of retiring national bank-notes.

The National Bank act required that the national banks in the city of New York should hold in lawful money 25 per cent. of their deposits and circulation as a reserve fund, which fund should be retained in their own vaults; the banks in other principal or redeeming cities to hold the same percentage of reserve, but being allowed to keep one-half of this reserve in cash deposits in the city of New York. Other banks were required to hold a reserve of 15 per cent., three-fifths of which might consist of balances due from approved associations in the redemption cities. The act of June 20, 1874, repealed the provision requiring the national banks to hold a reserve on their circulation. The following table exhibits the amount of circulation, net deposits, and reserve of the national banks in the whole country at the dates named since 1870:

National banks are authorized to loan money at the rate of interest allowed by the laws of the State in which they are located. When no rate is fixed by the laws of the State, the banks may charge 7 per cent. Shareholders are held individually liable, equally and ratably, for all debts of the association to the extent of the amount of their stock, in addition to the amount invested therein. The banks are required, before the declaration of a dividend, to carry one-tenth part of their net profits of the preceding half year to a surplus fund until the same shall amount to 20 per cent. of the capital; and losses and bad debts must be deducted from net profits before any dividend is declared. In 1866 the surplus of the banks was 50 millions; in 1868, 70 millions; in 1872, 100 millions; and in 1877, 130 millions. State banks to the number of 612 have been converted into national banks, and have brought with them into the system accumulated profits amounting to nearly 40 millions.

The following table exhibits, by geographical divisions, the ratio to capital, and to capital and surplus, of the dividends of national banks for the last six years, and the average rates for the whole period:

A receiver may be appointed by the comptroller to close up, under his supervision, the affairs of any national bank which shall fail to keep good its lawful money reserve, to redeem its circulating notes, or which may become in-

solvent. From the date of the organization of the national banking system to Jan. 1, 1877, fifty banks have failed, with an aggregate capital of 10 millions, amount of creditors' claims proved 17 millions, and dividends paid 10 millions, while the total loss to creditors is estimated at 5 millions. There has been no loss whatever on circulation. A suit may be brought for the forfeiture of the charter of a bank if the directors shall knowingly violate the law; and in such cases they may be held liable for damages in their individual capacity.

There are other restrictions in the law—such as, for instance, the prohibition against loaning to any one borrower of more than 10 per cent. of the capital of the association, or the holding of any real estate except such as is required for banking purposes, or the granting of loans upon the security of the stock of the bank or upon United States or national bank-notes.

The total number of shares of national bank stock on July 1, 1876, was 6,505,930, and the number of shareholders was 208,486; the average amount of stock held by each shareholder being about $3100. Shareholders of national bank stock reside in every State of the Union, in eleven countries or provinces of this continent and adjacent islands, and in twenty-five countries in Europe, Asia, and Africa and the islands of the sea.

The banks are required to pay annually 1 per cent. tax upon their circulation, and ½ per cent. upon their average deposits and upon their average capital not invested in United States bonds. The total amount of this tax to Jan. 1, 1877, was on circulation, $35,379,217; deposits, $35,326,605; capital, $5,056,335; making an aggregate of $75,762,088. The total taxation, national and State, of the national banks, for the ten years ending in 1875, is shown in the following table:

Years.	Capital stock.	United States.	State.	Total.	U. S.	State.	Total.

The ratio of taxation, State and national, in the New England States, in 1874 and 1875, was 3 per cent.; in the Middle States, 3.8 per cent.; Southern States, 1874, 2.8 per cent.—1875, 2.7 per cent.; Western States, 1874, 3.5 per cent.—1875, 3.9 per cent. The rate of taxation in Boston for 1875 was 3.3 per cent.; in New York, 5.1 per cent.; Philadelphia, 2.8 per cent.; Baltimore, 3.3 per cent.; and in Chicago, 4.8 per cent.

In Oct., 1864, there were 508 national banks in operation, with a capital of 86 millions; in 1865, 1513 banks, with a capital of 393 millions; and in 1867, 1642 banks, with a capital of 420 millions. The following table exhibits the number and resources and liabilities of the national banks at corresponding dates for the last nine years, and for Jan. 20, 1877:

	Oct. 5, 1868.	Oct. 9, 1869.	Oct. 8, 1870.	Oct. 2, 1871.	Oct. 3, 1872.	Sept. 12, 1873.	Oct. 2, 1874.	Oct. 1, 1875.	Oct. 2, 1876.	Jan. 20, 1877.

National banks are required to make not less than five reports annually to the comptroller of the currency, showing their condition; and all State banks and private bankers report to the commissioner of internal revenue semi-annually, for purposes of taxation, the amounts of their capital and deposits. From these returns the following table has been compiled by the comptroller of the currency, showing by geographical divisions the capital and deposits of the national banks for May, 1876, and the average capital and deposits of State banks and private bankers for the six months ending May 31, 1876. From this table it will be seen that the total number of banks and bankers in the country at the date named was 6609, with a banking capital of $720,012,806, and with total deposits of $1,974,189,449.

The report of the comptroller of the currency for 1875 contains an historical sketch of the national banking system, and tables showing the condition of these banks yearly since the organization of the system; and the report for 1876, in addition to the usual national bank statistics, gives an historical sketch of the two Banks of the United States and of the State systems of banking, together with tables showing the resources and liabilities of these banks by geographical divisions and by States, from the earliest dates to the present time, so far as they could be obtained from official sources.

John Jay Knox.

Bank'head (John Pine), U. S. N., born in South Carolina Aug. 3, 1821, entered the navy as a midshipman Aug. 6, 1838, became a passed midshipman in 1844, a lieutenant in 1852, a commander in 1862, and a captain in 1866. Died at Aden, Arabia, on his way home from the East Indies, Apr. 27, 1869. He commanded the gunboat Pembina at the battle of Port Royal, Nov. 7, 1861, and during the subsequent operations on the coast of South Carolina; commanded the Monitor when she foundered off Hatteras on the night of Dec. 31, 1863, and displayed admirable coolness on that trying occasion. Rear-Admiral Lee, in his official report of the disaster, says: "The vessel filling rapidly, Commander Bankhead ordered the men then left on board to leave in the Rhode Island's boat, then cautiously approaching, as the sea was breaking violently over the Monitor's submerged deck. In this perilous position Commander Bankhead *held a boat's painter until as*

many men got in as the boat could carry. He did not leave his vessel so long as he could do anything towards saving his crew." He was a son of General James Bankhead, U. S. A. (1783–1856). FOXHALL A. PARKER, U. S. N.

Bank-Notes, Manufacture of. An important object in making bank notes is to guard against counterfeits. The engraving should be such that the public can distinguish the genuine note by its superiority of execution, and the officers of the bank by secret peculiarities of design. These ends are secured mainly by the use, in engraving, of rare and very expensive lathes. The writing, the emblems, and figures are so combined as to render forgery difficult. The ink is peculiar. The paper also is of peculiar manufacture, both in Europe and America. About 1837 a great improvement was made in the engraving of bank-notes. This was the production of designs by the mill and die, by mechanical pressure, invented by Jacob Perkins. The pattern is engraved on a soft steel plate, which is then hardened to transfer the pattern by pressure to a soft steel roller, on which, of course, the pattern is produced in relief. The roller is then hardened to reproduce the pattern in the plate on which the note is to be printed. In England a process of lithographic transfer is employed. (See ENGRAVING, BANK-NOTE, by C. L. VAN ZANDT.)

Bank'rupt [Lat. *bancus*, a "bench," and *ruptus*, "broken"], a term originally applied to a merchant whose bench or counter had been broken by reason of inability to pay his debts. In its popular sense the word is now nearly synonymous with *insolvent*, and denotes any person unable to meet his liabilities. In England its legal signification is well defined. It embraces only traders, or persons whose business it is to buy and sell for gain, and the various statutes which have been enacted there since the reign of Henry VIII. in relation to bankrupts have been applicable to that class alone. By the English laws a bankrupt is a trader who has committed an act of bankruptcy, as defined by statute. A trader may have committed an act of bankruptcy, and have been formally adjudged a bankrupt, and yet be entirely solvent—that is, eventually able to pay his debts in full; and he may be wholly unable to pay his debts, and yet have committed no act of bankruptcy. A bankrupt was at first regarded as an offender against the law, and bankrupt laws were intended for the benefit of creditors. But at present they are founded on the interests of trade, and intended to be beneficial to both debtor and creditor. If the conduct of the bankrupt has been such as to entitle him to the consideration of the court, he is discharged for ever from all debts owing by him at the time he became a bankrupt. The law is confined to traders, because they are regarded as possessing peculiar facilities for delaying and defrauding creditors; and, on the other hand, they are considered, generally speaking, the only class subject to heavy accidental losses, and to an inability to pay their debts without any fault on their part. The above statements must be qualified by the results of the statute 32 & 33 Vict. c. 71, taking effect January 1, 1870. For the details of this act see INSOLVENCY.

In the U. S., Congress possesses the power, under the Constitution, to establish uniform laws on the subject of bankruptcies. Pursuant to this power, in the year 1800 Congress passed a bankrupt law, which by its own terms was limited to five years, but it was repealed in 1803. This law preserved the leading features of the English laws relating to bankruptcy. It could be enforced only on the application of creditors, and embraced only the mercantile class.

In the year 1841 the second bankrupt act was enacted by Congress. It could be taken advantage of by all persons whomsoever residing in the U. S. owing debts not contracted in a fiduciary capacity, although it could be enforced at the instance of creditors only against merchants, bankers, brokers, factors, and underwriters. This extended exercise of the power over the subject of bankruptcy was violently opposed as unconstitutional, on the ground that Congress was confined to the well-recognized meaning of the term bankruptcies as understood in the English courts when the Constitution was formed. The law was repealed in Mar., 1843.

But by act approved Mar. 2, 1867, Congress passed a third bankrupt law, even more general in its scope than the preceding. Under it any person residing in the U. S. and owing debts to the amount of $300 can, on his own application showing his inability to pay his debts in full, and his desire to surrender his property for the benefit of his creditors, take advantage of the act and be declared a bankrupt. So a debtor owing a specified amount can be forced to become a bankrupt upon the application of creditors if he has committed any of certain offences or acts specified in the statute. The bankrupt, after the distribution of his property amounting to a fixed per centage of his debts, obtains a discharge from all his indebtedness existing at the time the petition was filed, except in certain instances specified in the act.

The distinguishing feature of a bankrupt act is the summary seizure of all the debtor's property, and its division among his creditors in proportion to their claims. The race of diligence among creditors is entirely at an end, and all legal proceedings, except such as are in conformity to the statute, are stayed. It is against the policy of the bankrupt law to allow the debtor, in contemplation of bankruptcy, to give preference to one creditor over another. All such preferences are void, and an attempt to make them is of itself an act of bankruptcy.

The various States also possess the power to pass bankrupt laws, but no State bankrupt or insolvent law can impair the obligations of contracts. Hence they cannot release a debtor from obligations incurred before the passage of such law, nor act upon the rights of citizens of other States. And when Congress sees fit to exercise the power over the subject of bankruptcies granted it by the Constitution, the State laws on the same subject are suspended. On the repeal of the Congressional law the State laws would revive. The power of Congress over the subject is plenary, and its law may affect existing debts as well as those which are contracted after its enactment.

The judicial business in bankruptcy is in the main transacted by the district court of the U. S., with officers called registers to conduct the administrative or non-contested business. The estate is managed by an assignee, who acts as a trustee, and is accountable to the court referred to. T. W. DWIGHT.

Banks, a county in the N. E. part of Georgia. Area, 280 square miles. It is drained by the sources of Broad River. The surface is hilly or uneven. Indian corn is an important crop. Some rice and cotton is raised. Capital, Homer. Pop. 4973.

Banks, a township of Fayette co., Ia. Pop. 223.

Banks, a township of Antrim co., Mich. Pop. 504.

Banks, a township of Carbon co., Pa. Pop. 3982.

Banks, a township of Indiana co., Pa. Pop. 747.

Banks, a township of Upshur co., West Va. P. 1272.

Banks (NATHANIEL PRENTISS), a statesman and general, born at Waltham, Mass., Jan. 30, 1816. He learned the trade of a machinist, afterwards studied law, was elected to the legislature as a Democrat in 1849, and was chosen speaker of the house of representatives of Massachusetts in 1851. Having been elected a member of the national Congress in 1852, he was separated from the Democratic party by his opposition to the extension of slavery, and in 1854 was returned to Congress by the Republicans and Know-Nothings. In Feb., 1856, after an exciting contest which occupied two months, he was chosen Speaker of the House on the one hundred and thirty-third ballot. He was elected governor of Massachusetts, in Nov., 1857, for one year, and was re-elected in 1858 and 1859. In May, 1861, he was appointed a major-general of volunteers, and soon obtained the command of an army on the Potomac. Having gained some advantage at Winchester in Mar., 1862, he pursued the enemy to Harrisonburg. On the 24th of May he was attacked by Stonewall Jackson, and retreated rapidly to the Potomac. In Dec., 1862, he succeeded General Butler as commander of the department of the Gulf. About the end of May, 1863, he invested Port Hudson, which was taken with about 6000 prisoners, July 9. In the spring of 1864 he conducted an expedition up the Red River, in which Rear-Admiral Porter co-operated with the gunboats. He ascended above Grand Ecore. After several battles at Pleasant Hill (April 9) and other places, being pressed by superior numbers, he retreated towards New Orleans, and was relieved from the command in May, 1864. He was chosen a member of Congress by the Republicans of Massachusetts in 1864, in 1866, in 1868, and in 1870. He served as chairman of the committee of foreign relations in the fortieth and forty-first Congresses.

Banks (Sir JOSEPH), LL.D., F.R.S., an eminent English naturalist, born in London Jan. 4, 1743, inherited an easy fortune. He was educated at Oxford, which he quitted in 1763, was elected a fellow of the Royal Society in 1766, and sailed with Captain Cook in his voyage round the world in 1768. He returned in 1771 with rich collections of plants, animals, etc. In 1777 he was chosen president of the Royal Society, over which he presided forty-two years. He was a liberal patron of naturalists and scientific men, who under his auspices performed several voyages of discovery. The colony of Botany Bay owed its origin mainly to him. He contributed memoirs to the "Philosophical Transactions" and other publications. Died June 19, 1820. (See CUVIER, "Eulogy on Sir

J. Banks," 1821; DUNCAN, "Short Account of the Life of Sir J. Banks," 1821.)

Banks (RICHARD), M. D. See APPENDIX.

Banks (THOMAS), the first great English sculptor, born at Lambeth Dec. 22, 1735. He gained the gold medal of the Royal Academy in 1770, and went to Rome in 1772. He remained for several years in Rome, and produced there "Caractacus pleading before Claudius," and an admirable statue of "Psyche and the Butterfly," which was purchased by Catharine II. of Russia. Among his masterpieces is the "Mourning Achilles." He excelled in imaginative works. He became a member of the Royal Academy. Died Feb. 2, 1805.

Bank'sia, a genus of Australian shrubs and trees of the order Proteaceæ (named in honor of Sir Joseph Banks), have hard dry leaves, and an umbellate arrangement of branches, which bear near the extremities oblong heads of numerous flowers. One species (*Banksia grandis*) grows to a height of fifty feet.

Banks, Savings. See SAVINGS BANKS.

Bank, The, a port of entry of Albert co., New Brunswick, on the Shepody River, 82 miles N. E. of St. John. Coal is found in the vicinity.

Ban'nack City, or **Bannock City,** a mining-town, capital of Beaver Head co., Mon., is on or near the Jefferson Fork of the Missouri River, about 50 miles W. of Virginia City. Gold and silver are found in this vicinity. The name is derived from the Bannack tribe of Indians, who are now much reduced in numbers.

Ban'natyne Club, a literary club deriving its name from George Bannatyne, who was born in Scotland about 1545. He compiled a collection of manuscripts called "Corpus Poeticum Scotorum." This club was founded at Edinburgh in 1823 by Sir Walter Scott, its design being to promote the knowledge of Scottish history and antiquities, and to print rare works which tend to illustrate those subjects. The club originally consisted of thirty-one members, and gradually increased to one hundred, to which number it was finally limited.

Ban'neker (BENJAMIN), a negro mathematician, born in Maryland Nov. 9, 1731. He was the author of an almanac (1792 sqq.), of which a copy was sent by Thomas Jefferson to the secretary of the Academy of Sciences at Paris. Banneker assisted in laying out Washington City and running the boundary-lines of the District of Columbia. Died at Baltimore in Oct., 1806.

Ban'ner [Fr. *bannière;* It. *bandie'ra:* Sp. *bande'ra;* so called, probably, because it was *bound* to the flag-staff: it is doubtless from the same root as the German *Band,* a "ribbon"], a military ensign or flag; the standard of a prince or state. Banners have been used in all ages and all countries for the purpose of directing the movements of armies. The banner of the ancient Romans was a square piece of drapery suspended from a transverse bar and supported on a staff. It was marked by the figure of an eagle and the initials S. P. Q. R.—*Senatus Populusque Romanus.* After Constantine became a patron of the Christian religion the Roman banners displayed the cross as the national emblem, and took the name of *labarum.* During the Middle Ages new forms of banners were adopted. From the banner royal, which bore the national emblem, to the pennon of the knight or the small streamer attached to a lance, there was a regular subordination. No one except a person of high rank was permitted to use the square banner. Bishops and abbots had the privilege of displaying banners in religious processions. Soldiers and patriots are warmly attached to the banner or flag of their country as a symbol of nationality and as a visible sign of the national unity and life.

Banner, a township of Fulton co., Ill. Pop. 1104.

Ban'neret, a title formerly given to a soldier for some heroic action. The banneret was higher in rank than a knight, and was so called because he had the privilege of displaying a square banner. When a knight was promoted to the rank of banneret the points of his pennon were cut off, and it was thus converted into a square form. The first English banneret was created by Edward I., and the last was Capt. John Smith, who rescued the banner of Charles I. at the battle of Edgehill.

Ban'nister, a township of Pittsylvania co., Va. Pop. 3347.

Bannister (HENRY), D. D., born Oct. 5, 1812, at Conway, Mass., graduated at the Wesleyan University, Conn., in 1836, studied at Auburn Theological Seminary, was principal of the Methodist academy at Cazenovia for some years, and in 1856 was appointed professor of exegetical theology in the Garrett Biblical Institute at Evanston, Ill. He is author of several able published sermons, addresses, and reviews.

Bannister (WILLIAM B.), born in Brookfield, Mass., Nov. 8, 1783, graduated at Dartmouth in 1797, was a successful lawyer and merchant, and a distinguished friend of learning. He married Miss Grant, a celebrated teacher of Ipswich. Died at Newburyport, Mass., July 1, 1853, leaving $40,000 to various charitable institutions.

Ban'nockburn, a village of Scotland, in the county of Stirling, on the Bannock rivulet, 3 miles S. of Stirling. It was the scene of a famous and complete victory gained by Robert Bruce over the English army, led by the king Edward II., on the 24th of June, 1314. The English lost about 30,000 men. Here are important manufactures of woollens, especially tartans and carpets. Pop. about 2600.

Bannock City. See BANNACK CITY and IDAHO CITY.

Banns (or **Bans**) **of Marriage** [for etymology see BAN], a public notice of an intended marriage, given in a church or other place prescribed by law. The law of England requires that all banns of matrimony shall be published in an audible manner, according to the rubric prefixed to the marriage service in the Book of Common Prayer, upon three Sundays preceding the ceremony. This rubric is in the following terms: "I publish the banns of marriage between A, of ——, and B, of ——. If any of you know cause or just impediment why these persons should not be joined together in holy matrimony, ye are to declare it." The English law, however, dispenses with this preliminary publication if the parties obtain a license from a person authorized to grant it. The custom of banns has been abolished in most of the U. S. The practice was first directed in the times of the Fathers, was enacted afterwards by Odo, bishop of Paris, about 1176, placed in the canon law in 1200 by the Synod of Westminster, and prescribed for the whole Latin Church by the Council of Lateran in 1215. It is still required by the canon law of England and Roman Catholic countries.

Bantam', an old town of Java, on the N. coast, 44 miles W. of Batavia. It was formerly a large city and great entrepôt of trade, but on account of the unhealthy climate is at present almost deserted. In the fifteenth century it was the chief town of a powerful Mohammedan empire of the same name, which at one time even comprised the southern part of Sumatra and the W. coast of Borneo. In 1683 the sultan of Bantam became a vassal of the Netherlands, and in the beginning of the present century the Dutch took possession of the sultanate. The town is in lat. 6° 2′ S., lon. 106° 50′ E.

Ban'tam Fowl, a variety of the common fowl, first brought from the Indies, and supposed to derive its name from Bantam, Java. It is remarkable for its small size and its courage. There are many sub-varieties, most of which have the legs feathered.

Ban'teng' (*Bos* or *Bibos banteng,* or *Ban'teng Sonda'icus*), a species of ox, a native of Java and Borneo, which in color, shape, horns, and want of dewlap bears some resemblance to the gaur of India. It has short hair, slender limbs, and a sharp muzzle. Though extremely wild, it is often domesticated by the natives, and becomes a very serviceable animal.

Ban'tingism, a regimen for the reduction of corpulence; so called after an English gentleman named Banting, who introduced it as the result of his own experience. It consists essentially in the avoidance of food containing fatty matter, and of materials which may make fat in the body, as starch and sugar. Lean meat predominates in this diet; vegetables are almost excluded; butter, milk, sugar, and malt liquors are prohibited. With active exercise this method is often successful in reducing excessive weight.

Ban'try, EARLS OF, and Viscounts Berehaven (1816), Viscounts Bantry (1800), Barons Bantry (1797, in the Irish peerage), a noble family of Great Britain.—WILLIAM HENRY HARE HEDGES WHITE, the third earl, was born Nov. 10, 1801, and succeeded his brother in 1868.

Bantry Bay, a deep inlet in the S. of Ireland, in Cork county, is 25 miles long and from 3 to 5 miles wide. It is one of the finest harbors in Europe, affording safe and commodious anchorage for ships of all sizes. The coast of the bay is high and rocky, consisting of Devonian strata, and exhibits some of the finest scenery in the island. Near the entrance of this bay occurred a naval action between the English and French in 1689.

Banvard' (JOSEPH), D. D., born in New York City in 1810, has held many prominent pastorates in the Baptist denomination, and is the author of numerous Sunday-school Question-books and other works, chiefly tales and histories for the young.

Banx'ring (*Tupai'a*), a genus of insectivorous quadrupeds, natives of Sumatra, India, Borneo, etc.; they climb trees with agility, like lemurs and squirrels. They have an elongated muzzle and a long bushy tail.

Ban'yan,* or **Banian** (*Ficus Indica*), an East Indian tree remarkable for its mode of propagation by means of aërial roots, which, on descending to the ground and penetrating it, become stems or trunks. These roots at first hang like loose cords, but after they take hold they are gradually tightened, till they become almost as firm as a rod of iron. In this manner a single tree spreads over a large extent of ground, and endures for many centuries. One of these trees has been described as having 350 large stems, and occupying so large a space that many thousand persons might stand under its shade. It is a species of fig, and produces a fruit about as large as a cherry, and of a rich scarlet color. An abundance of gum-lac is procured from

Banyan Tree.

this tree, the bark of which is esteemed as a tonic by Hindoo physicians. The above illustration may serve to give one an idea of a vigorous and comparatively young banyan tree. In very old trees many of the stems often become almost or quite as large as the original trunk.

Banyan, a township of Jefferson co., Ark. Pop. 615.

Banz, the name of one of the finest Benedictine abbeys known in history, is situated in Bavaria in the midst of a beautiful landscape. The monks of this abbey were noted for their learning and humane spirit. It was founded in 1058. The convent was abolished in 1802, and is now the summer residence of the princes of Bavaria. Here is a museum which is especially rich in petrifactions.

Baobab. See Adansonia.

Baour-Lormian (Pierre Marie François Louis), a French poet of the first empire, born Mar. 4, 1770, translator of Tasso and Ossian, and author of many tragedies in the severely classic style, which were greatly admired in their time. Died 1857.

Baph'omet, a mysterious symbol of the Knight Templars, was a small human figure cut out of stone, having two heads, male and female. It was environed with serpents and astrological attributes, and marked with inscriptions, mostly in Arabic. The word is supposed to be a corruption of Mohammed or Mahomet (called by the Portuguese, Bafoma), to whose religion the Templars were suspected of leaning. Others derive it from Βαφὴ Μήτεως, the "bath of wisdom," a reputed name of the Gnostic baptism, often called in old writings "baphometic baptism." Quite a number of baphomets are preserved in European archæological collections.

Bap'tism [Lat. *baptis'ma*; Gr. βάπτισμα, from βαπτίζω, to "baptize"], the act of initiating a person, by the application of water, into the visible Church of Christ. (See Baptists.

Bap'tist Church, a township of Cabarrus co., N. C. Pop. 1032.

Bap'tistery [Gr. βαπτιστήριον], a name sometimes given to the tank or vessel in which the ordinance of baptism is administered; sometimes to a portion of a church in which the ceremony of baptism is performed, or a separate building erected near the church for the performance of that rite. These buildings were either octagonal, polygonal, or circular. The baptistery of Florence, among the most celebrated, is an octagonal structure about 100 feet in diameter, standing in close proximity to the cathedral. It is built of black and white marble. The most remarkable features of this baptistery are the magnificent bronze doors, adorned with bas-reliefs by Ghiberti and others. In the centre of each of these buildings erected for baptismal purposes is a tank, which is often of considerable proportions—that at Ravenna being about nine feet square and that of the Lateran, at Rome, thirty-seven inches or more in depth.

Bap'tists, a body of Christians who maintain those views of Christian truth which are commonly regarded as "evangelical," but who differ from adherents of the Church of Rome and from most Protestants in the following respects:

1. They maintain that immersion is an essential condition of valid baptism—appealing, in support of their position, to the significance of the Greek word βαπτίζω and its Latin equivalents; to the circumstances in which the baptisms of the New Testament were administered; to the scriptural significance of the rite as a burial with Christ; to the practice of the Church in the early Christian centuries; and to the concessions of those who, while practically rejecting immersion, admit that it was practised by the apostles and the early churches. All pleas for a modification of the rite on the ground of indifference or expediency they meet by insisting on the duty of literal compliance with the precepts and example of Christ, and the importance of maintaining the emblematical significance of the rite.

2. They maintain that a visible Church should be composed of such only, and that such only should be admitted to baptism, as give credible evidence of regeneration—in opposition to those who would make the Church coterminous with a state or states, and those who would include in the Church the unregenerate members of Christian households. These views also they profess to derive from the New Testament, and enforce them on the ground of reason and common sense. They were the first among the various sects of modern Christendom to insist on "a spiritual church-membership;" and it is largely through their influence that that idea has gained such wide acceptance in this country, and is gradually spreading throughout Europe. (See Curtis's "Progress of Baptist Principles.")

3. They maintain that professed believers only should receive baptism. This position is a natural sequence of their view of the spiritual nature of the Church when coupled with the almost universally conceded doctrine that baptism is the initiatory rite of the Church. They point, however, to the baptisms of the New Testament as by explicit statement or fair inference the baptism of believers; and insist that the baptism of an unconscious infant, either on the responsibility of the Church, the State, or the religious household, is a violation of the rights of the individual conscience, which should, in their opinion, "give account of itself unto God" in all matters of religious faith and practice. They maintain, in short, that all the Christian ordinances are acts of faith, requiring the conscious consent of the subject. In reply to arguments drawn from the mention of the baptism of households in the New Testament, they reply that they would cheerfully baptize such households as that of Stephanas baptized by Paul (which is described as "the first-fruits of Achaia, and addicted to the ministry of the saints"), or the household of the Philippian jailer, of which it is explicitly affirmed that they were all believers; and point to the large number of believing households in membership with Baptist churches to show that household baptism does not necessarily imply infant baptism.

4. They maintain that there should be no organic connection between the Church and the State; and, further, that each individual church (by which they understand, "a body of baptized believers, with its pastor and deacons, covenanted together for religious worship and religious work") should be absolutely independent of any other body, whether ecclesiastical or political, being accountable for its doctrines and practices only to the great Head of the Church. As a consequence of this, though Baptist churches are frequently grouped together in "associations," and the "associations" of a State are further combined in "general associations" or "State conventions," though Baptists frequently call "councils" for the recognition of churches, the ordination of ministers, and the adjustment of difficulties, "associations," "conventions," and "councils" have with them no ecclesiastical authority whatever, save that with which the Christian comity of those constituting them invests them, and the moral weight which their conclusions carry.

In view of the facts just stated, the substantial homogeneity in doctrine and practice of a body of Christians which embraces, in the U. S. alone, more than 1,500,000 communicants, may be a matter of surprise; and that surprise will be enhanced when it is understood that the Baptists have no authoritative creeds or symbols, but appeal, in support of doctrine or practice, directly to the word of God. This homogeneity (as complete as that which exists in any denomination of Christians) is attributed by the Baptists to the fact that members enter their

* Probably derived from the Sanscrit *vânyâ* (pronounced *bânyâ* in Bengali), a "grove" or "thicket," a single banyan tree often forming a grove (or thicket) of itself.

churches consciously adopting a coherent, self-consistent, and scriptural system of Christian truth.

It is to reinforce their utterances in behalf of a spiritual church-membership and allegiance in religious matters to Christ alone, by an acted protest to what they believe to be a departure from the apostolic conception of the Christian Church, that the Baptists take a position with reference to the Lord's Supper similar to that taken by the Episcopalians with reference to ministers not episcopally ordained. While cordially co-operating with other religious denominations in all forms of moral and religious activity, they decline to invite them to participation in the Lord's Supper, taking the ground that there is an obvious and necessary distinction between Christian fellowship and church fellowship. Their position with reference to this matter is, briefly stated, that the Lord's Supper is an ordinance designed by Christ for his churches, and entrusted to their care; that baptism is the initiatory rite of the Christian Church; that valid baptism involves the immersion of a professed believer. In the first two particulars they agree with most Christian sects; and hence are accustomed to claim that they do not practise "close communion," but close baptism; that most of the other Christian sects are no more willing than they to invite to the Lord's Supper those whom they do not conscientiously regard as baptized.

In 1815, Robert Hall (one of the most gifted and influential Baptist ministers of England) published a treatise on the "Terms of Communion," in which he endeavored to satisfy himself and others that baptism was not a prerequisite to communion. His general conclusion has been accepted by many who reject the premise from which alone a Baptist could logically derive it; and since his day most of the Baptists of England, and a few in America, have been "open communionists."

History.—The name "Baptists" has been borne by the denomination whom it now designates only about 200 years. It was given to them, as is supposed, either during the Commonwealth in England or shortly afterwards. The name by which they were known previous to the Commonwealth was Anabaptist, and the same name in a German translation, "Wiedertäufer," had for more than a hundred years before been applied to the predecessors of English Baptists in Switzerland and Germany. But as in Switzerland, Germany, Moravia, and Holland these Christians had from the first denied the appropriateness of the name "Wiedertäufer" (Rebaptizer), so in England their first recorded Confession of Faith (A. D. 1644) is said to be of "churches of Christ in London which are commonly (but unjustly) called Anabaptists." In this historical sketch the name *Baptist* will be used to designate the German "Wiedertäufer," the Dutch "Doopsgezinden," and English "Anabaptists" and "Baptists," without intending by the name to assert a perfect similarity between them in all things. The German "Anabaptists" (see article ANABAPTISTS) more frequently practised pouring than immersion; and the same statement may be made (see below) respecting the Dutch "Mennonites." These bodies of Christians agreed with our modern Baptists, however, in admitting only professed believers to baptism, and in maintaining the independence of a gospel Church of ecclesiastical or political control. They are, in some sense, the progenitors of the Baptists of to-day, though the historical connection between the two cannot be easily traced.

Over the continental Baptists of the time of the Reformation has hung a cloud of misrepresentation for three centuries. The Peasant War (1525) and the Münster Rebellion (1535) have been laid at their door. That there were some renegade Baptists at Münster no one would deny, as there were more renegade Lutherans. But Baptists were no more responsible for that rebellion and its results than English missionaries were responsible for the Sepoy rebellion, or than Baptists of America are now responsible for Mormonism because Joseph Smith was a renegade Baptist and Mormons practise immersion. With respect to the Peasant War, Münzer, its leader, never was a Baptist, and never acted in concert with Baptists. In proof of this the letter of Baptist ministers of Switzerland (dated Oct., 1524) is still preserved at St. Gall, in which, while they express sympathy with some of his views (*i. e.* rejection of the mass and infant baptism), they rebuke him for taking the sword. In the discussions with Zwingle before 1525, the Baptists of Switzerland had maintained the view held by many of their descendants in Europe, that Christians had no right to use arms for self-defence or the defence of the land; and this view was maintained by the Swiss and German Baptists at their convention at Schleitheim, near Schaffhausen, Sept., 1527.

The Baptists in the earliest years of the Reformation consisted of the poor and obscure. The persecutions of centuries had taught them concealment. After 1522 there was in Switzerland a band of scholars who had been converted by means of these obscure men, and who literally gave their lives for the defence of the faith. Balthazar Hubmaier had been pro-rector of the University of Ingoldstadt, and was said by Eck to be the most eloquent man in Europe; Conrad Grebel was the scion of a noble house, and one of the first scholars of Vienna and Paris; Felix Mantz as a Hebraist occupied a high rank; Johann Denk and Ludwig Hetzer made a translation of the Prophets that compelled the praise of their enemies. These were the men whose names appear most frequently in the conflict which Zwingle provoked with the Baptists. There is not one of them who before becoming a Baptist was not the friend and associate of Zwingle and his fellow-workers.

Baptists, Zwinglians, and Lutherans agreed, in substance, in holding the doctrines of justification by faith and regeneration by the Holy Spirit, but they differed most widely in their view of the connection of these doctrines with the doctrine of the Church. Luther and Zwingle, though preaching the great doctrine of justification by faith, hesitated to institute radical changes either in the constitution or the worship of the Church. While they both in the earlier part of their work asserted that the Church should consist only of believers, and should be independent of the state, they both very soon came to consider the whole state Christian, and gave all power over the Church into the hands of the civil government, and infractions of the ecclesiastical laws, passed by the states for the protection of the Lutheran and Zwinglian reformations, were punished by fine, imprisonment, and death, with their approval. Baptists, on the contrary, held that the only churches spoken of in the New Testament are churches of believers, and claimed that to bring in as members of a Church those who give no evidence of regeneration is to institute a practice for which there is not the least scriptural warrant, and to subvert the fundamental principles of the Reformation itself.

The claims of Baptists were—freedom to form churches which should be separate from the world, to exercise church-discipline over their members, and to have the entire control of their own ecclesiastical affairs without interference of the state. As citizens they declared that they owed dutiful obedience to the state in all things not in conflict with God's laws, but the state had no right to compel to any religious faith or to punish men for their faith. By this position, which they held most firmly, they stood not only in antagonism to the Reformers, but to the states which had passed laws to enforce the Reformed views, and hence arose the cry which pursued them for three hundred years, of being both heretics and rebels.

The liberty of private judgment, which both Luther and Zwingle claimed in their discussions with Romanists, they were unwilling to grant to Baptists, and Protestant and Romanist joined hands in persecuting them unto death.

It is claimed by some writers that the Baptists of the period of the Reformation were wild and fanatical, and that Menno Simons of Holland (A. D. 1536–61) first introduced order and milder views among them. The writings of Grebel, Denk, Hetzer, Hubmaier, the confessions of Baptists before the Protestant inquisitors of Switzerland—all given before 1530—disprove the assertion. Fanaticism cannot be justly charged upon the early Baptists of Switzerland.

How furious the persecution was against Baptists from 1525 to 1530 may be learned from the fact that within these years all the great leaders had been either killed or banished from Switzerland, from what is now Elsass, Baden, Würtemberg, and Germany, and churches, many of them of large membership, were dispersed by fire and sword.

Hubmaier, during the two years of his banishment from Switzerland, under the protection of the counts of Liechtenstein at Nicolsburg, became the apostle of Moravia, and soon that land was filled with Baptists, and made the refuge of Baptists fleeing from other countries where the persecution was more severe. For a hundred years great numbers of the Swiss braved the loss of their goods, and the long journey through hostile territory, and the price set upon their heads by the Bavarian dukes, to reach Moravia, where they might enjoy some little religious freedom. From Moravia they sent out their missionaries to all parts of Germany, the Tyrol, and Switzerland, to Hungary, Silesia, and Poland. The Romish historians say that these missionaries were very successful in their efforts "to delude the people." The "Chronicle" of the Moravian brethren in manuscript in the town-library of Hamburg, the lately discovered complete works of Hubmaier, and Rycdeman's "Account," set before us the scriptural views and the steadfastness of these Moravian Baptists.

Until 1531–32, Baptists had been most numerous in Switzerland, in Southern Germany, the Tyrol, Austria, and

Moravia; after this date they appear in large numbers in the Netherlands, and in the countries bordering the Baltic up to the boundary of Russia. When they first appeared in the Netherlands cannot be decided. Ypeij and Dermout say Anabaptists were, according to the archives of Groningen, expelled in 1517. Professor van Oostersee (*Herzog's Encyclopadie*, vol. ix., 346) says of the Mennonites or Netherlands Baptists: "They are peculiar to the Netherlands, and are older than the Reformation, and must therefore by no means be confounded with the Protestantism of the sixteenth century, for it can be shown that the origin of the Baptists reaches much farther back and is more venerable. . . . The history of the Netherlands Baptists, particularly at first, is written in blood and tears. Unceasingly confounded with the fanatical party at Münster, they were persecuted in the most horrible manner by Catholics and non-Catholics. Their Church has given a great host of martyrs for the cause of Christ. The doctrines of baptism and of oaths raised up between them and their opponents walls of division as high as those between the defenders and opponents of the mass."

The Netherlands were the inheritance of Charles V., while in Germany he was emperor only by election, and the local government was largely in other hands. This accounts for the difference in the means used by him in resisting the Reformation. In Germany, till 1546, he temporized, but in the Netherlands he opposed fire and sword to the spread of the new doctrines. The history of the heroic contest here between the Protestants and Romanists is one of the most glorious in the history of the Church. Long before Menno, who is commonly regarded as the founder of the Netherlands Baptists, was converted and became a Baptist, Baptists were found in the Netherlands, and were united in churches from the borders of France to the northern bounds of Friesland, and proved steadfast unto death in the maintenance of their principles. In 1527, at The Hague, the daughter of Weynken Claes of Monickendam was strangled and burnt; also Jan Walen and two companions at Haarlem. In 1532, Kraen of Harzenswoude, his wife, and two others, were put to death at Haarlem. In the same year nine citizens of Amsterdam suffered martyrdom at The Hague. Between the Baptists of the Netherlands and those in the Rhine Provinces and in Switzerland there was an intimate union. In the writings of Menno and Philips we find the same views respecting Scripture doctrines which were held by the Swiss Baptists in 1524. Their church-government was the same, and they also agreed with respect to the unlawfulness of taking an oath or bearing arms or accepting civil office. The Moravian "Chronicle" and the Dutch martyrologies include the Swiss, German, and Netherlands Baptists as brethren together in their witness for the truth of God.

The Baptists in the Netherlands have been for a long time generally termed Mennonites, from Menno, one of their chief teachers. Menno Simons was a priest in the Roman Catholic Church in Friesland, who underwent a change of religious opinions and preached evangelical doctrines (though, as he afterwards asserted, without a change of heart) while still a priest. Influenced by the courageous martyrdom of a young Baptist, he examined and espoused Baptist principles, though he did not openly avow them until 1537, when the revolt at Münster had led him to realize that his influence ought to be felt as a Baptist on the side of order and humanity. From that time till his death (1561) he labored fearlessly and incessantly (though a price was set upon his head) to disseminate the principles which he had adopted; and with such pre-eminent success as to give his name to the Netherlands Baptists. The minister of no particular congregation, Menno's life was spent in travelling through the countries between the Rhine and the Elbe, from Cologne to Liefland. It is a great mistake, however, to suppose that he was their only prominent man at this time. He has left his impress upon his people by means of his writings, as well as his fearless and unceasing labors, but there were others who stood with him in the front rank as ministers. Dirk Philips found his field of activity mostly in Prussia and the lands bordering the Baltic, and Leenert Bouwens was the apostle of Friesland. Philips, like Menno, was a writer as well as a preacher and worker, and has left his interpretation of Baptist belief in his works. Leenert Bouwens deserves to be remembered for his marvellous exertions and almost unparalleled success in winning souls to God. His diary is still preserved, and reaches from 1551 to 1578, in which latter year he died. When we remember that these years are covered by the inhuman decrees of Charles V. and Philip II. against the Baptists, that during a portion of these years Alva ruled in the Netherlands, that a price was set on Bouwen's head, and every one in the land ordered on pain of death to arrest him if found, it is little short of the incredible that he should have during all these years been steadily at work, and should have baptized ten thousand persons as the fruit of his labors; yet the places where, and the persons whom, he baptized are set down with so much particularity that there seems to be no room for doubting the truthfulness of the record.

Is it any wonder that men like Menno, Philips, and Bouwens, who sought only to conform their faith and life to the word of God, and to gain others to the same living faith, should be stung into strong expressions against Catholic and Protestant preachers, who urged on, with all the arguments in their power, the civil authority to take the lives of Baptists? Like their brethren in Central Europe, they sought only freedom to serve God according to their understanding of the Scriptures, while they acknowledged their full duty of obedience to the civil power in all matters not contrary to God's word. Their church-discipline was strict even to severity, and wherever they were allowed to remain in peace they created centres of temporal as well as spiritual prosperity around them, were renowned for the probity of their dealings and for the purity of their domestic relations and life, and in their confessions and practices they urged the duty of complete religious liberty for all. Yet they were denounced from the pulpits of other confessions as "Münsterites, who if they could would seize land and city, draw the sword, steal, not only practise polygamy, but community of women and of property, revolt against the government, slay their children in body and soul," etc.

While William the Silent was a devoted courtier of Charles V., while he was a boon-companion of Egmont and Horn in their Belshazzar feasts, defenceless men and women were facing terrors more dreadful than death in battle for the sake of religious liberty. When, long years afterwards, William became the Christian hero and champion of the precious rights of liberty of conscience, at one of the darkest hours of his history, at Roermonde, he came to know the Baptists as fast friends of the cause. Opposed to the bearing of arms and to war, they yet recognized the duty they owed to their country to assist her in the hour of need, and when William despaired of help from other quarters he appealed to them, and they out of their poverty contributed a sum which was the token of their sympathy. His receipt for this money freely given, not lent, is still extant. He never forgot that act. Far in advance of his coreligionists, he was true as steel to the liberty of religious thought, and again and again lifted his arm against the tyranny which the hardly-emancipated Reformed sought to exercise over the Baptists. Motley's account has shown us with what disdain and indignation William rejected the request of the Reformed, through Aldegonde, in 1577, that Baptists should be excluded from citizenship because of their faith, and how he then indicated his high esteem of them by saying "their yea was equal to the oath" of the Reformed. He repeats this in his rebuke of the magistrates of Middleburg in 1578 for persecuting the Baptists, and praises their peaceful character.

From 1520 to 1575, Baptists had preceded the Reformed in all parts of the Netherlands, and in the long lists of martyrs for the faith ten Baptists suffered to one of the Reformed.

Though never opposed to general culture, and cordially welcoming to the ranks of the ministry men of the profoundest scholarship who felt it a duty to preach the gospel, the early Baptists held that mere education could not supply the lack of spiritual gifts, and maintained that any brother of good report, with sound knowledge of the Scriptures and evincing aptness to teach, should be licensed to preach the gospel. Shut out from all the higher institutions of learning in the sixteenth century, and observing that ministerial education was not incompatible with corruption in morals and bigotry in religion, they gradually fell into the tenet that special education was a disadvantage for the office of the ministry, and looked with disfavor on any attempt to prepare for it otherwise than by private reading of the Bible. The injurious effects of this view became apparent when, in the middle of the seventeenth century, the Socinians, expelled from Poland, came to Holland, and began to infect the churches with their views. In many churches the tares grew and choked the wheat. While full freedom under the law had not come for the Baptists, the time of severe persecution had passed. They pursued their callings in peace and with frugality, and riches flowed in upon them apace. They were largely concerned in commerce with foreign nations, and when Holland was in straits for money to carry on the war with England (1666-72) the Baptists lent the government large sums of money at a low rate of interest, and were rewarded with full religious and political liberty. But from that time to the present their numbers have steadily declined in Holland. The causes are not difficult to explain—the spread of Socinian doctrines among them, by which all the fervor

of life and missionary enterprise was lost: their church constitution altered, so that children who reached a certain age, whether converted or not, were baptized and made members of the Church: an uneducated ministry, with the members of churches far in advance of their pastors; the exclusion of all who married one of another religious confession; and last, but not least, riches not used for God.

Commerce, manufactures, and neighborhood had long bound England with many ties to the Netherlands. Those persecuted in the one country would flee to the other. During the sixteenth century there is frequent mention made in documents of state, as well as in the writings of private persons, of the presence of Anabaptists in England. The same cry was raised against them which was common in Europe, and they were exposed to the same persecutions. Some of those punished most severely were Hollanders who had fled to escape death in their own land. The English "Anabaptists" of the sixteenth century are shown by their statements, when on trial, to have been brethren of the Dutch Baptists. No persecution was severe enough to extirpate the Baptists from England, though it caused them to keep their meetings and their views very quiet. Banishishment, whipping, or death at the stake awaited any public "conventicles." Before a hand was laid to the reformation of the Established Church in England, Baptists were numerous in the kingdom, and the reigns of Henry VIII., Edward VI., Mary, and Elizabeth are blotted with the blood of martyred Baptists.

The same differences which existed among the continental Baptists on the schemes of doctrine, since termed Calvinism and Arminianism, were found among the English Baptists. Before and after the Synod of Dort these discussions in England and on the Continent increased in heat, and caused separation among confessors of the same views on other points. In the early part of the seventeenth century, in the reign of James I., the Arminian Baptists were numerous in England. But as in Holland, so in England, the Arminian Baptists gradually withered under the influence of Socinianism.

In Switzerland, in Germany, and in Holland it has been found impossible to decide when Baptists first appeared, or which were the first churches of Baptists in those lands (their simultaneous appearance on every hand being a natural result of that appeal to the Scriptures, in contradistinction to tradition, made by Luther, Zwingle, and Melanchthon); and it is quite as difficult to decide the question about the Baptists of England. If one would make the first Baptist church to appear under Helwisse in 1614, then we must deny the historical evidence for the conventicles of Baptists in the preceding century. If we make the church formed in London in 1633 the first Calvinistic Baptist church in England, we assume that all the Baptists and the Baptist churches of the sixteenth century were Arminian in their views, which has never been shown, and is contrary to all probability. Baptists were found in the north, in the west, but principally in the east, of England. Under the dreadful persecutions of the Tudors the churches knew little of each other unless they were situated near together. We hear more of the Calvinistic church formed in 1633, because it was situated in London, and performed an important work in the following years.

On the Continent some who have been classed with the Baptists, but who agree with them only in restricting baptism to believers, and in maintaining the independence of a Christian Church, regarded pouring as valid baptism, while others practised immersion. Pouring was most common among the Mennonites, though some among them held to immersion, and from those who practised immersion it was received by the English brethren, and has continued to be their practice to the present day. Crosby relates, on the authority of an old manuscript, said to be written by Kiffin, that a certain Richard Blount was sent from England to Holland to receive immersion from the hands of a regularly baptized minister, because the brethren did not know of any regularly baptized minister in England. Richard Blount was baptized in Holland, and returned and baptized others in England. It has been held that no Mennonites ever practised immersion, but facts are against the statement. The truth seems to be, that pouring or sprinkling was most common among the Mennonites, but there were some, and those who held Calvinistic views, who practised immersion in the seventeenth century, and by some one of these pastors Blount was baptized.

As the Dutch Baptists differed in some minor tenets from the Swiss, so the English differed from the Dutch and Swiss, while holding firmly to the principle common to them all, that the visible Church should be composed only of those who are baptized upon credible evidence of their being regenerated by the Spirit. The English Baptists did not regard it unlawful to take a solemn oath in court or to serve in the army. Like their brethren on the Continent, they were from the time of Henry VIII. the unflinching, unwearied witnesses and advocates of religious liberty—not for themselves only, but for all men, for the Turk as well as for the Christian; and when the upheaval of the English nation under Cromwell took place, by the pen and by the sword they strove to accomplish their ideal. They were found in the council of state, in the army, in the navy, while their ministers redoubled their labors, and God bore witness to their work by a rich harvest of converts. Raised to a height of influence and power, it is the striking manifestation of the grace of God in them that in prosperity as in adversity they advocated unlimited religious freedom for all men—"a free Church in a free State."

It is not a mere chance that the two greatest pleaders for the rights of conscience whom the centuries have produced—Milton in England and Roger Williams in Rhode Island—held, after mature consideration, those opinions for which Bunyan, the Baptist preacher, suffered fine and imprisonment. In simple devotion to God's word, in pleading for that word before the masses of men, in pleading for the highest and inalienable right of man against all spiritual and political tyranny, the entire denomination, in fact, have led the van of all Christian denominations and borne the brunt of the battle.

Under the Restoration, from Charles II. to William III., they suffered bitterly, as did all dissenters, and then with peace came the time of rest, degenerating to sloth. Calvinism hardened into hyper-Calvinism (only to be rationalized—humanized—scripturalized, through the influence of Andrew Fuller). Arminianism deliquesced into Socinianism, divisions separated the orthodox churches, and the eighteenth century was a period of stagnation in growth. But God had not forgotten them. Near the close of the century (when only the Moravians had preceded the English Baptists in the work of foreign missions), Carey, "the consecrated cobbler," as he was sneeringly called by Sydney Smith, went forth to India to overthrow heathenism, and then arose the Baptist Missionary Society (1792). Marshman and Ward soon followed and joined Carey, forming a triumvirate of Christian missionaries unexcelled in labor and results of work; while at the same time they made contributions of no slight importance to Oriental scholarship. Baptist missionaries from England have labored in India, Ceylon, China, Africa, and the West Indies, and with almost equal success.

The English Separatists who fled to Holland in the last part of the sixteenth century became very largely leavened with the views of the Baptists, who were numerous in Holland. When the tide of emigration set towards the bleak shores of North America, many who felt the strength of these views joined the emigration and came out boldly on the side of the Baptists after reaching America. The sorrowful history of the early continental Reformation was repeated in the New World. Those who had just escaped from oppressive ecclesiastical thraldom fitted a yoke for the necks of men guilty of no crime but devotion to God's word. The Church became political and the state ecclesiastical, and the union produced the unavoidable bastard fruit of persecution. In opposition to this error of the centuries, Roger Williams and a small band of Baptists, driven from Massachusetts, founded the colony which afterwards became Rhode Island, the type of all true democratic government, on the principle which Baptists had professed for more than a century—of freedom for God's word and freedom for man's conscience. From New England, Baptists emigrated to New York and to Virginia. They experienced in both colonies the lot of a proscribed people until the agitation of the country just preceding the Revolution turned the attention of the dominant parties to other issues than the persecution of their own people. During the Revolution the Baptists rendered effective service to the infant republic, and at its close were instrumental in securing the recognition of complete religious liberty in the Constitution of the U. S.

The nineteenth century has witnessed a marvellous increase in the Baptists of the U. S. From 77 churches, with hardly more than 5000 members, in 1770, they had increased in 1872 to 19,720 churches, with 1,585,232 members and 11,892 ordained ministers. For the latter year (1872) they reported 84,625 baptisms, 741,777 officers, teachers, and scholars in Sunday-schools, and $4,926,527.04 for benevolent contributions. In the same year the Baptists in England reported 1940 churches, 178,183 members, 1569 ordained ministers, and 4255 baptisms. The following table gives the statistics of the Baptists, by continents, for 1872:

	Churches.	Baptisms.	Members.
North America	20,469	87,482	1,676,937
Europe	2,960	8,663	272,437
Asia	408	1,888	26,814
Africa	31	.....	1,930
Australasia	144	.....	5,112
	24,012	98,033	1,983,230

In this statement no account is taken of the many religious sects in the U. S. which hold similar opinions to the "regular" Baptists with reference to the ordinance of baptism, though differing from them in other essential particulars. Among these may be mentioned the Free-Will Baptists (Arminian), with 1463 churches, 1145 ministers, and 69,910 members (mostly in the New England States); the Seventh-Day Baptists, with 7000 members; the Dunkers, with 50,000 members; the Disciples or "Campbellites" (found mostly in the Southern States), with 350,000 members. (See these denominations under their names.)

Allusion has already been made to the missionary-work of the English Baptists. Stimulated by the example of their English brethren, and providentially impelled to the work by Dr. Judson's adoption of Baptist views, the Baptists of the U. S. organized in 1814 the Baptist Foreign Mission Society (now the American Baptist Missionary Union), which had in 1872 eight missions in Asia, five in Europe, and one in Africa. In these missions there are 766 churches, 988 laborers of all classes, 1664 stations and outstations, with 52,700 church-members. The receipts of the "Union" in 1872 were $210,199. It has met with the most marked success in its missions among the Karens in India; in Germany (where 73 churches, numbering 13,970 members, have been gathered under the supervision of Rev. J. G. Oncken); and in Sweden, which now reports 220 churches and 8807 members. Under the auspices of this society 203,382,898 pages had, in 1864, been published in 33 languages and dialects, several of which were first reduced to writing by its missionaries. The Southern Baptist Convention sustains missions in China, Africa, and Italy. The American Baptist Home Mission Society, organized in 1832, supported, in 1872, 425 missionaries, and received into its treasury $256,182. It had received and expended since its organization $1,958,901, and reported 67,020 baptisms. The work of this society is prosecuted mainly among the feeble churches of the West and the freedmen of the South. The Baptist Bible and Publication Society, organized in 1824, received, in 1872, $386,368, and issued 369,124,076 pages.

It has already been said that the early Baptists were not especially interested in ministerial education, and reasons have been given why their indifference was natural. From the fact, however, that they appeal so constantly to the original Scripture in support of their opinions, education soon became a necessity with them, and for more than a century, both in England and America, they have given to this subject that attention which its importance demands. In 1764, when the Baptists of the U. S. numbered barely 5000, they established Rhode Island College (now Brown University). In 1872 they numbered 9 theological seminaries, with 40 instructors, 419 students, property to the amount of $866,000, endowment to the amount of $958,000, and 62,454 volumes in their libraries; 34 colleges, with 256 instructors, 1141 students, property to the amount of $4,492,000, endowment to the amount of $2,228,058, and 136,806 volumes in their libraries; and 51 academies, with 264 instructors, 4247 students, and property to the value of $1,203,700—making a total (according to the very imperfect return which we condense) of 560 instructors, 8807 students, and property and endowments to the amount of $9,849,558. The best of these institutions (which are noticed under their appropriate titles) will compare favorably with those of any other denomination; and efforts are being made, through the National Baptist Educational Commission, to excite a yet deeper interest in education among the masses of the denomination, and secure for its institutions of learning a more generous patronage. The mention of such names as those of Francis Wayland, Barnas Sears, Horatio B. Hackett, Thomas J. Conant, Ezekiel G. Robinson, and Asahel C. Kendrick may serve as types of the Baptist educators of the present day. (With reference to Baptist history, reference may be made to the tracts of Denk; the works of Hubmaier; Ten Cate's "Geschiedenis der Doopsgezinden," etc.: Schyn, "Historia Mennonitarum," ed. Matschoen: Thomas Crosby, "History of the English Baptists from the Reformation to the Reign of George I." (1738–40); Ivimey, "History of the English Baptists" (1811–25); Taylor, "History of the General Baptists;" I. Backus, "History of Baptists of New England;" "The Publications of the Hansard Knollys Society;" Cramp's "Baptist History" (the best popular work); and Cutting's "Historic Vindications." For works in exposition and defence of Baptist principles and practices, see Wayland's "Principles and Practices of the Baptists;" Dagg's "Church Order;" Hiscox's "Baptist Church Directory;" Chase, Ripley, Judson, and Wheelr on Baptism; Arnold, Pepper, and Hovey on the Lord's Supper.)

Revised by M. B. Anderson.

Bar, a long and narrow piece of wood, metal, or other solid substance, generally round, quadrangular, and other uniform section. Bar in hydrography, an accumulation of mud or sand in any navigable channel by which navigation is obstructed, but more particularly a similar formation almost universally found across and exterior to the mouths of rivers and harbors, by which the draught of vessels entering is limited. Bar in music is a straight line drawn across the staff to divide the music into small portions of equal duration, and also comprises the musical notes written or played between such lines. Bar, in heraldry, is one of the important charges known as ordinaries. The bar is formed by two horizontal lines passing over the shield; it differs from the fess in size, the bar occupying only one-fifth of the shield.

Bar, in law. 1st, that part of the court-room in which prisoners are arraigned or sentenced, and in which the members of the legal profession usually sit. It takes its name from the bar or railing which generally separates it from the rest of the room. Hence the word often signifies lawyers, or persons admitted to practise in the courts; and in some cases it refers to or implies the presence of the court itself. A trial at bar is a trial before a full bench of judges, as distinguished from a *nisi prius* trial—that is, a trial before a single judge. 2d, a complete defence to an action in law. A plea in bar is a plea which, if true, completely defeats the plaintiff's action.

Bar, a town of Russia, in the government of Podolia. In 1768 the Confederation of Bar was formed here, by the nobility of Poland, to counteract the influence of Russia on the king, Stanislas Augustus. Bar was taken by the Russians in the same year, and the confederates were compelled to go to Wallachia. Here they declared the king dethroned, and had him carried off from Warsaw in 1771, and were only suppressed by Russia after four years' hard fighting. Pop. in 1867, 8077.

Bar'aba', a vast steppe of Siberia, extending between the rivers Obi and Irtish on the W. and the Altai Mountains on the N. W., occupies more than 100,000 square miles. Many salt lakes and marshes occur in it. It was colonized by the Russians in 1730.

Baraboo', capital of Sauk co., Wis., is noted for its wild and beautiful scenery. It is situated on Baraboo River, and on the North western R. R., 33 miles N. W. of Madison. It is the centre of the Wisconsin hop-producing district, and contains seven or more churches, good schools, a weekly paper, woollen-mills, yarn-factory, furniture-factory, planing-mills, and an iron-foundry, and is in the neighborhood of valuable iron-mines. Altitude, about 900 feet above the level of the sea. It is in a good fruit, grain, and stock-producing region. It has one national bank. Pop. 1528; of Baraboo township, 2758.

J. J. Weirich, Ed. "Republic."

Barab'ra, or **Berab'era,** the name applied by the Egyptians to the inhabitants of a small district in Upper Nubia. They are not the same as the Berbers, the latter having derived their name from the Arabians. They trade with the Egyptians in cattle, which they pasture among the mountains beyond the Atbara and near the Red Sea.

Baraco'a, a seaport-town on the N. E. coast of Cuba, has considerable trade. In its vicinity is a remarkable mountain called the "Anvil of Baracoa."

Bara'da, a river of Syria, probably the Abana of the Old Testament. Its remotest, though not its largest, source is a lake, some 300 yards by 50, in the plain of Zebdany (8 miles by 3), 3349 feet above the level of the sea, in the heart of Anti-Lebanon. It flows south-eastward, passing the ruins of the ancient city of Abila, breaking through three ridges of the mountain, and reaching Damascus (23 miles from its source) after a descent of 1149 feet. Then it flows on eastward some 17 or 18 miles farther, emptying itself into two marshy lakes, each about 20 miles in circumference. In going through the city and gardens of Damascus it is parted into at least seven streams, which afterwards reunite. (See Porter's "Damascus.")

Bara'ga, a new county of Michigan, in the upper peninsula, taken from Houghton co.; organized 1875.

Baraga, post-tp. of Houghton co., Mich. Pop. 160.

Baraga (Friedrich), D. D., a Catholic missionary, born near Dobernik, in Carniola, in 1797. He visited America in 1831, devoted himself to missionary labor among the Indians of the Lake Superior region, and was made bishop of Sault St. Mary and Marquette. He published numerous works in the Ojibbeway (or Chippeway) dialect, a "Grammar of the Otchipwe Language" (1851), and a "Dictionary of the Otchipwe Language" (1853). Died Jan. 19, 1868.

Baraguey d'Hilliers (Achille), Count, a French general, born Sept. 6, 1795. Having served with distinction in Algeria, he obtained the rank of general of division in 1843. In the autumn of 1849 he became commander of the army that occupied Rome. He returned to France in

1850, and in the Crimean war commanded a corps which co-operated with the British fleet in the Baltic. He was made a marshal of France in 1854.

Baraguey d'Hilliers (Louis), a French general, the father of the preceding, was born in Paris Aug. 13, 1764. He served in the Italian campaigns of 1796–97, soon after which he became a general of division. He commanded the dragoons of the grand army in Austria in 1805, and was appointed governor of Venice in 1808. In the Russian campaign of 1812 he was taken prisoner with all his division. He died in Berlin Dec., 1812.

Barante, de (Amable Guillaume Prosper Brugière), a French statesman and historian of great merit, was born at Riom June 10, 1782. He came of a literary stock, his father and his great-grandfather having distinguished themselves as writers. He was appointed collector-in-chief of customs in 1818, and became a peer of France in 1819. His chief works are a "History of the Dukes of Burgundy" (13 vols., 1826), and a "History of the National Convention" (1853). Died Nov. 22, 1866. (See Guizot, "Memoir of Prosper de Barante," 1867.)

Baran'ya, one of the most populous counties of Hungary, is bounded on the N. by Tolna, on the E. by Bacs, on the S. by Slavonia, on the W. by Somogy, and has an area of 1966 square miles. It is partly mountainous, but is very fertile. The Danube forms part of the western boundary. Capital, Fünfkirchen. Pop. 283,506.

Barataria Bay, Louisiana, an inlet of the Gulf of Mexico, lying between the Mississippi and the Bayou la Fourche, is about 12 miles long from N. to S., and 5 or 6 miles broad, communicating with bayous and lakes of the interior. Its shores are marshes little elevated above the tides, which extend to the cypress swamps. Grande Terre Island, a ridge of sand which lies across the mouth, was the head-quarters of the brothers Laffite, the so-called "pirates." (See Laffite.) The entrance to the bay has been fortified by the U. S. in 1840–50, by the construction of Fort Livingston on the W. end of Grande Terre Island. The bar has seven feet of water. Barataria lighthouse, on Grande Terre Island, is in lat. 29° 16′ 47″ N., lon. 89° 54′ 33″ W. It is of brick, and is 60 feet high.

Baratier (Johann Philipp), born of French ancestry at Swabach, near Nuremberg, Jan. 19, 1721, when five years old spoke French, German, and Latin; when seven could repeat the Psalms in Hebrew; and when nine composed a Hebrew dictionary; when thirteen years old translated the "Itinerary" of Benjamin of Tudela. He wrote a reply to Crellius's "Artemonius," called "Antiartemonius" (1735), and a "Disquisition on the Succession of the Roman Pontiffs in very Ancient Times" (1749). He was a Protestant, studied theology and law, and died at Halle Oct. 5, 1740, aged nineteen.

Barb [probably derived from *Barbary*], the name of a noble breed of horses which originated among the Moors of Barbary, who introduced it into Spain. Barbs are remarkable for their endurance, docility, and gentleness. The Carthaginian cavalry, which decided several victories over the Romans, are said to have been mounted on horses of this breed, which is a variety of the Arabian horse. The celebrated "Godolphin Arabian" was a barb, as were most of the progenitors of the thoroughbred horse of the present day.

Barbace'na (F. Caldeira Brant), Marquis of, a Brazilian soldier and diplomatist, born at Sabora in 1772. He was appointed by the emperor of Brazil to negotiate concerning the independence of that country with Portugal, and for his success was created a marquis. He was afterwards twice minister of finance. He introduced steam-engines, steamboats, and the printing-press into Brazil. Died in 1842.

Barba'does Cher'ry, the edible fruit of two small West Indian trees (the *Malpighia urens* and *Malpighia glabra*). Each fruit contains three seeds. The leaves of *Malpighia urens* have stinging hairs on the lower side.

Barbadoes Gooseberry, the edible fruit of *Pereskia aculeata*, a plant of the order Cactaceæ, having a round stem, thick, alternate leaves, and large spines. The fruit has expectorant properties. It grows in the West Indies.

Barbadoes Leg. See Elephantiasis.

Barbadoes Tar, or petroleum, is a black, opaque, inflammable liquid of the consistence of molasses. By distillation it yields naphtha, leaving a residuum of asphaltum.

Barba'dos,* or **Barba'does,** the most eastern of the Caribbee Islands, belongs to the British. Its capital, Bridgetown, is situated in lat. 13° 4′ N. and lon. 59° 37′ W. The island is 21 miles long, 14 miles wide, and has an area of 166 square miles. It is nearly encircled by coral reefs, which are dangerous to navigation. The highest point of the island has an altitude of 1140 feet. Destructive hurricanes often occur here. The soil is fertile, and produces sugar, cotton, arrow-root, etc. The population and prosperity of Barbados have increased since the abolition of slavery (Aug. 1, 1834). In 1870 the imports were £1,070,000, and the exports £973,000. P. in 1871, 162,042.

Bar'bara, Saint, a virgin martyr of the ancient Church, in regard to whom traditions clash. Baronius accepts the story of her martyrdom at Nicomedia in the reign of Maximinus (235–238), and says that she had been a pupil of Origen. Assemani thinks she suffered martyrdom under Galerius, about 306, at Heliopolis in Cœle-Syria. She is commemorated Dec. 4.

Barba'rian [Gr. βάρβαρος; Lat. *bar'barus*], a term applied by the ancient Greeks to all foreigners and all who could not speak the Greek language. Plato divided the human family into two great classes—*Hellenes* ("Greeks") and *Barbaroi* ("barbarians"). After the Persian invasion the Greeks used the word as a term of reproach, implying hostility to their own freedom and civilization. After the Romans had conquered Greece, and had become in some measure Hellenized, the word barbarian was applied to all nations except Greeks and Romans. Saint Paul uses the word in this sense in Romans i. 14 (see also Acts xxviii. 4).

Barbaros'sa, the name of two brothers, renegade Greeks and natives of Mitylene, who became Turkish corsairs, and were the scourge of Christendom for many years (1510–46). The elder, Arooj (Horush or Horuc), made himself master of Algiers in 1516. He was defeated and slain by the army of Charles V. in that year. He was succeeded in 1518 as ruler of Algiers by his brother, Hadher, or Khair-ed-Deen. He obtained Tunis by conquest in 1532, and became the chief admiral of Sultan Solyman. Died July 4, 1546.

Barbaroux (Charles Jean Marie), an eminent French Girondist and eloquent advocate, born at Marseilles Mar. 6, 1767. He was chosen a deputy to the Legislative Assembly in 1791, and a member of the National Convention in 1792. He denounced Robespierre, and on the trial of the king voted for an appeal to the people. He was distinguished for his energy and personal beauty. Having been proscribed by the Jacobins in May, 1793, he fled from Paris. He was guillotined at Bordeaux June 25, 1794. (See his "Mémoires," 1822.)

Bar'bary [derived from *Berber*, the name of a native race], an extensive region of Northern Africa, comprising the modern Barca, Tripoli, Tunis, Fezzan, Algeria, and Morocco, and extending from Egypt to the Atlantic Ocean. It is included between lat. 25° and 37° N., and lon. 10° W. and 25° E. It included the ancient *Mauritania, Numidia, Africa propria,* and *Cyrenaica.* Barbary is divided by the Atlas Mountains. The N. side comprises Tunis, Tripoli, Morocco, and Algeria. The S. is called Beled-el-Jereed (*i. e.* "the country of dates"). The soil is generally fertile. It was very rich and populous under the rule of the Carthaginians and of the ancient Romans, who became masters of this region about 146 B. C. It was conquered about 430 A. D. by the Vandals, who misgoverned it for a hundred years, and it fell under the domination of the Arabs in 647 A. D. The inhabitants are mostly Mohammedans.

Barbary Ape, Pigmy Ape, or **Magot,** a small species of tailless monkey, is a native of Europe, but is found in only one place in Europe—that is, the Rock of Gibraltar. It also abounds in Northern Africa, especially among rocky mountains and forests. It is gregarious, displays great agility in passing from tree to tree, and usually walks on four feet. It is of a greenish-gray color, and rather larger than a large cat. It belongs to the genus *Inuus.* The tail is reduced to a mere tubercle. Bands of these apes often plunder gardens. This species of monkey is frequently seen in captivity, and is capable of being trained to many tricks. It is not regarded as a true ape.

Barbas'tro, a walled town of Spain, in the province of Huesca, on the river Cinca, 57 miles N. E. of Saragossa. It has a cathedral and several convents. Pop. 7800.

Bar'bauld (Anna Letitia), an English authoress, born in Leicestershire June 20, 1743, was a daughter of Rev. John Aikin. She published a volume of poems in 1773, and was married in 1774 to Rochemont Barbauld, a dissenting minister, with whom she lived at Palgrave, in Suffolk, and taught a boarding-school for ten years. She published, besides other works, "Devotional Pieces" (1775) and "Early Lessons for Children," which are highly commended, and assisted her brother, Dr. John Aikin, in the composition of

* *Barbados* is a Spanish word signifying the "bearded:" it is said that as the Spaniards approached the island they saw a certain plant growing abundantly on the banks, which resembled (as they fancied) men with long beards, hence the name.

a popular work called "Evenings at Home." Her writings are characterized by an easy, flowing style and pure and elevated sentiment. Died Mar. 9, 1825. (See a "Life of Mrs. Barbauld," prefixed to her works, by LUCY AIKIN, 2 vols., 1825.)

Bar'becue, a township of Harnett co., N. C. P. 1111.

Bar'bee (Rev. WILLIAM J.), M. D., born in Winchester, Ky., in 1816, was educated at Miami University, O., practised medicine ten years in Cincinnati, O., and became widely known as a teacher, author, and preacher of the Christian ("Campbellite") denomination. He has published "Physical and Moral Aspects of Geology," "The Cotton Question," and various religious and scientific and other works.

Bar'bel (*Bar'bus*), a genus of fishes of the family of Cyprinidæ, having short dorsal and anal fins, and the mouth

European Barbel.

furnished with four soft barbules, suggesting the name, which is derived from the Latin *barba*, "beard." The upper jaw extends beyond the lower. The numerous species of barbel are all inhabitants of fresh water, and seek their food by inserting their snouts into the mud like swine. The *Barbus vulgaris* is abundant in the Thames, and affords sport to anglers, but is not much esteemed for food. It sometimes measures three feet long, and weighs about sixteen pounds. Another species, called binny or barbel, is abundant in the Nile and the Jordan, and is much esteemed for food. It grows to a large size, and sometimes weighs seventy pounds. The barbel of the U. S. is the horned sucker or dace (*Catostomus tuberculatus*), which is readily taken by the hook. It belongs to the same family with the true barbel.

Barbé-Marbois, de (FRANÇOIS), MARQUIS, a French statesman, born in 1745, was consul to the U. S. under Louis XVI., director of the treasury under Napoleon, and was made a senator in 1813. Died in 1837. He wrote a "History of Louisiana" (1829).

Bar'ber [Fr. *barbier*, from the Lat. *bar'ba*, "beard"], a person who shaves others and cuts their hair. This trade or profession is very ancient, and is mentioned by the prophet Ezekiel (chap. v. 1). In China and other Oriental countries barbers shave the whole or part of the head. The practice of shaving the beard was common among the ancient Egyptians, Greeks, and Romans. Among the ancient Israelites the removal of the beard by shaving or plucking it out was a sign of mourning. In former times barbers served the public in the capacity of surgeons, and performed the operation of bleeding. The spiral red stripe often seen on the barber's pole is said to symbolize the winding of a ribbon round the arm previous to letting blood. In London the barber-surgeons formed a corporation with certain privileges. They were incorporated in England in 1461, and were united with the surgeons in the reign of Henry VIII. The connection was dissolved in the reign of George II. by an act the preamble of which affirms that the trade of a barber is "foreign to and independent of the practice of surgery." Quite recently the surgeons of the Swedish navy were also barbers for the crews.

Barber, a post-township of Faribault co., Minn. Pop. 561.

Barber (FRANCIS), an American officer and teacher, born at Princeton, N. J., in 1751, graduated at Princeton in 1767. He entered the army in 1776 with the rank of major, and took part in the battles of Trenton, Princeton, Brandywine, Germantown, and Monmouth. He was afterwards raised to the rank of colonel, and in 1781 was selected by General Washington for the delicate duty of suppressing a mutiny of the troops, which he performed with success. He was killed accidentally by the fall of a tree at Newburg Jan. 11, 1783.

Barber (JOHN WARNER) was born at Windsor, Conn., in 1798. He published a "History of New Haven" (1831), "Historical Collections" of Connecticut (1836), Massachusetts (1839), New Jersey (1844), Virginia (1844), Ohio (1847), "Incidents of American History" (1847), "Elements of General History" (1844), "Our Whole Country" (1861), and several other works.

Barberi'ni (FRANCESCO), an Italian cardinal, a nephew of Pope Urban VIII., was born in 1597. He became librarian of the Vatican, and translated the twelve books of Marcus Aurelius from Greek into Italian. He was the founder of the great Barberini Library. Died in 1679.

Bar'berry (*Ber'beris*), a genus of plants of the natural order Berberidaceæ, comprises many species, which are all shrubs and natives of temperate climates in both hemispheres. They have six stamens, which, when touched at the base, show signs of irritability. The fruit is a berry with two or three seeds. They are divided into two sub-genera, sometimes ranked as genera; those with simple leaves forming the *Berberis*, and those with pinnate leaves the sub-genus *Mahonia*. The barberries of Asia are numerous and important for their fruits. Those of our Pacific slope are *Mahonias*. The common barberry (*Berberis vulgaris*) is a native of Europe, sparingly naturalized in the U. S., a shrub armed with spines, and produces small oval red berries in pendulous clusters, which contain free malic acid, and are valuable for preserves and jelly. The bark is astringent, and is used in medicine, and the inner bark and root furnish a good yellow dye. On account of its yellow color the inner bark was formerly in much repute as a remedy for jaundice. Several fine species of *Berberis* grow in the central and western portions of North America. *B. aquifolium*, with spiny leaves and yellow flowers, is generally cultivated as an ornamental shrub. *B. pinnata* of Oregon bears blue acid berries, and is sometimes called the *Oregon grape*. *B. Canadensis* is a native of the Alleghanies. Parts of South America abound in native species of the barberry.

Barbès (ARMAND), a French conspirator and Red Republican, born in Guadaloupe Sept. 18, 1809. He was imprisoned in France for political reasons in 1834–35. As an accomplice of Blanqui and others in a seditious plot in 1839, he was condemned to imprisonment for life, but was released in 1848. Having conspired against the new régime in May, 1848, he was again confined for several years.

Bar'bet (*Laimodon*), a genus of birds related to the Picidæ or woodpeckers. They have a large conical beak surrounded with tufts of bristles, suggesting the name, which is derived from the Latin *barba*, "beard." They inhabit warm countries, particularly tropical Africa. They feed on insects.

BARBET is also the name given to birds of various genera, chiefly South American and Asiatic, together forming a connecting link between the kingfishers and the trogons. Among the numerous species are the *Bucco ver-*

Red-Throated Barbet

sicolor of Sumatra and the *Tamatia maculata*, the red-throated barbet of Guiana.

Barbet, a small variety of the poodle-dog, remarkable for its activity, intelligence, and fidelity to its master, but equally distinguished for its ill-temper and its dislike of

all strangers. It is also very liable to disease, and hence is not a general favorite.

Barbette, a platform of earth on which guns are mounted to fire over a parapet.

Bar'bican, or **Barbacan,** a watch-tower or advanced work before the gate of a castle or town. The term was especially applied to the outwork intended to defend the drawbridge, which in modern fortifications corresponds to the *tête-du-pont.* Several perfect barbicans remain in England at Alnwick, Warwick, etc.

Barbier (Antoine Alexandre), a French bibliographer, born Jan. 11, 1765, became private librarian to Napoleon in 1807, and after the restoration of 1815 was superintendent of the private libraries of the king. His chief production is a "Dictionary of Anonymous and Pseudonymous Works" (4 vols. 8vo, 1806–08), which is highly commended. Died Dec. 6, 1825.

Barbour, a county of Alabama, bordering on Georgia. Area, 825 square miles. It is bounded on the E. by the Chattahoochee River and on the W. by Pea River. The surface is undulating; the soil in some parts is fertile. The county is partly covered by forests of pine. Cotton and corn are raised. It is intersected by the Montgomery and Eufaula R. R. Capital, Clayton. Pop. 29,309.

Barbour, a new county of Kansas, bordering on the Indian Territory. Area, 810 square miles. It is bounded on the E. by Harper, on the N. by Pratt, and on the W. by Comanche cos.

Barbour, a county of the N. part of West Virginia. Area, 330 square miles. It is intersected by the Tygart's Valley River, and also drained by Buchanan River. The surface is hilly or mountainous; the soil is very fertile. Grain and wool are largely raised. Coal and iron abound here. Capital, Philippi. Pop. 10,312.

Barbour, a township of Orange co., Va. Pop. 1323.

Barbour (James), an American statesman, born in Orange co., Va., June 10, 1775. He was governor of Virginia 1812–14, and a Senator of the U. S. 1815–25. He voted for a U. S. bank, and became president of the Senate *pro tem.* He was secretary of war in the Cabinet of J. Quincy Adams (1825–27), and was sent as minister to England in 1828, but was recalled in 1829. In 1839 he was president of the Whig national convention. Died in 1842.

Barbour, or **Barber** (John), an eminent Scottish poet, a contemporary of Chaucer, was born about 1320. He became archdeacon of Aberdeen in 1356, and went to Oxford in 1357 to complete his education. About 1374 he was appointed one of the auditors of the exchequer. His chief work is a national epic called "The Bruce," a history of Robert Bruce, which, in addition to its poetical merit, has much historical value. Died Mar. 13, 1396.

Barbour (John S.), born in Culpeper co., Va., Aug. 8, 1790, was educated at William and Mary College, was a staff officer in the war of 1812, and a prominent State Rights member of Congress, 1823–33. Died Jan. 12, 1855.

Barbour (Philip Pendleton), a jurist, born in Orange co., Va., May 25, 1783, was a brother of James, noticed above. He gained distinction as a criminal lawyer, and became a member of Congress in 1814. He was afterwards chosen Speaker of the House, and remained in that body until 1825. He was appointed an associate judge of the Supreme Court of the U. S. in 1836. Died Feb. 24, 1841.

Bar'boursville, a post-village, capital of Knox co., Ky., on the Cumberland River, 116 miles S. E. of Frankfort. Pop. 438.

Barboursville, or **Cabell Court-house,** the capital of Cabell co., West Va., on the Guyandotte River, 154 miles S. W. of Wheeling. It is the seat of a State normal school, and has one weekly paper. July 13, 1861, it was the scene of a brilliant action in which the Federal troops were successful. P. 371; of Barboursville township, 1228.

Barbu'da [Fr. *La Barbonde*], one of the British West India Islands, 22 miles N. of Antigua. Its area is 75 square miles. It is of coral formation, has no harbor, and is partly covered with forests. Pop. in 1861, 713.

Bar'by, a walled town of Prussian Saxony, on the left bank of the Elbe, 15 miles S. E. of Magdeburg. It has an old castle and manufactures of woollen and linen stuffs. Pop. in 1871, 5212.

Bar'ca (anc. *Cyrena'ica*), a region of Northern Africa, bounded on the N. by the Mediterranean, on the E. by Egypt, on the S. by the Libyan desert, and on the W. by Tripoli and the Gulf of Sidra. It is deficient in permanent streams, and the southern part is a desert, but the soil near the sea is fertile. On the mountain-sides are pines, date-palms, and olive trees. The inhabitants are Arabs and Berbers, who are Mohammedans, and are subject to Tripoli. Capital, Benghazi. Pop. estimated at 302,000.

Barcello'na, a town of Sicily, in the province of Messina, 21 miles W. S. W. of Messina, near the coast. It has a gymnasium, and large vineyards in the neighborhood. Pop. in 1872, 20,464.

Barcelo'na, a province of Spain, comprising the south-eastern part of Catalonia, and sloping down towards the Mediterranean. It has an area of 2983 square miles, and a population of 749,143. It is one of the most fertile and best-cultivated provinces of Spain.

Barcelo'na [Lat. *Bar'cino*; Gr. Βαρκινών], the most important manufacturing city of Spain, and the capital of the province of the same name, in Catalonia, is beautifully situated on the Mediterranean, 113 miles E. of Lerida; lat. 41° 23′ N., lon. 2° 11′ E. Next to Cadiz, it is the most important seaport of Spain. Pop. in 1860, 189,948. It is surrounded by a wall, and defended by a citadel and the strong fort of Montjoi. The city is divided into two parts, the old and the new town, by a beautiful promenade called La Rambla. The streets of the new town are more spacious and regular than those of the old. Many of the houses are built of hewn stone, and have an imposing appearance. The most remarkable public edifices are the Gothic cathedral, which is about 600 years old, and the Audiencia, or Palacio de la Deputacion, which is now occupied by the courts of law. Barcelona has a university, several public libraries, a fine theatre, an academy of arts and sciences, and two museums. Here are extensive manufactures of silks, woollen stuffs, calicoes or figured cotton stuffs, lace, shoes, and firearms, which, with copper, wine, and brandy, constitute the principal exports of the city. The harbor is commodious, but is obstructed by a bar which excludes vessels drawing more than twelve feet of water. This is the most populous city of Spain, except Madrid. Barcelona is supposed to have been founded by Hamilcar Barca. The Romans became masters of it at the end of the third Punic war (146 B. C.). It was taken by the Saracens or Moors about 714 A. D., and became in 878 an independent state. In the twelfth century it was annexed to Aragon. In 1714 it was taken by the duke of Berwick after a long and heroic defence.

Barcelona, a province of Venezuela, is bounded on the N. by the Caribbean Sea, on the E. by Cumana, on the S. by Guiana, and on the W. by Guarica and Caracas. Area, 13,800 square miles. The country consists almost entirely of plains and low plateaux, and is crossed only in the N. by the Coast Range, which also is not very high. It has but very little commerce. Chief town, Barcelona. Pop. 78,634.

Barcelona, a town and seaport of Venezuela, and capital of the province of the same name, on the Caribbean Sea, at the mouth of the river Neveri; lat. 10° 10′ N., lon. 64° 48′ W. It is an unhealthy place. The houses are built of mud. Pop. about 6000.

Bar'clay, a post-village and township of Black Hawk co., Ia., 110 miles N. E. of Des Moines. Pop. 861.

Barclay, a post-village and township of Bradford co., Pa., on the Sullivan and Erie R. R., 110 miles N. W. of Easton. It has important mines of semi-bituminous coal. Pop. of township, 2009.

Barclay, or **Barklay** (Alexander), an eminent British writer and translator, supposed to have been born in Scotland about 1480. He wrote the lives of several saints, and translated Sallust's "Jugurthine War," and a French poem called "The Castle of Labor." His most popular work is his "Ship of Fools," a free translation from the German of Sebastian Brandt. Died in 1552.

Barclay (Robert), an eminent reformer and apologist for the Society of Friends, was born at Gordonstown, in Morayshire, Scotland, Dec. 23, 1648. He was educated in Paris at the Scottish College, of which his uncle was rector, and learned to write and speak Latin correctly and fluently. He returned to Scotland in 1664, and became a member and minister of the Society of Friends in 1666. In 1670 he published a defence of his religion, entitled "Truth Cleared of Calumnies." He married Christian Mollison in his early life. He afterwards published a "Catechism and Confession of Faith" (1675) and the "Anarchy of the Ranters" (1676). In 1677 he visited Germany on a religious mission, in company with George Fox and William Penn. In addition to superior talents, he had moral courage, which qualified him for the part of a reformer. His principal work is "An Apology for the True Christian Divinity, as the same is held forth and preached by the People called in scorn Quakers" (1676), written and published in Latin, and afterwards translated by the author into English. This work exhibits great logical acumen, and has been commended by eminent persons of different creeds. In 1679 he published a "Vindication" of his Apology, which had been criticised

by several writers. He was appointed governor of the province of East Jersey in 1682, but he never went to America. He died at Ury Oct. 13, 1690. (See Joseph G. Bevan, "Life of Robert Barclay," 1802; W. Sewell, "History of the Quakers.")

Bar'clay de Tolly (Michael), Prince, a celebrated Russian general of Scottish extraction, was born in Livonia in 1759. He fought against the Swedes in 1790, and against the Poles in 1792 and 1794. With the rank of major-general he led Benningsen's advanced guard in 1806. In 1809, at the head of 10,000 men, he crossed the frozen Gulf of Bothnia, and advanced as far as Stockholm. In 1810 he was appointed minister of war. He became in 1812 commander-in-chief of the Army of the West, but having been defeated by the French at Smolensko in August of that year, he was soon removed. After the death of Kutuzof (1813) he again obtained the chief command of the army, which he directed at Bautzen, Culm, and Leipsic. He was raised to the rank of field-marshal in 1814. Died May 25, 1818.

Barcokh'eba, or Barcoch'ebas ("son of a star"), (Simon), a famous Jewish impostor, claiming to be the Messiah. His real name was Akiba. In the reign of Hadrian (A. D. 132) he excited an insurrection among the Jews, and seized Jerusalem and many fortified places. After a long and bloody contest the city was retaken by the Roman general Julius Severus, and Barcokheba was killed in the fortress of Bethar on the 9th of Ab (August), 135. His disappointed countrymen afterwards changed his name to Bar-cosba ("son of a lie").

Bard, the term originally applied to the ancient poets of the Celtic tribes, who composed and sang verses in honor of the exploits of brave men. In poetical language it is often applied by modern usage to any poet.

Bard (Samuel), M. D., LL.D., an American physician, born in Philadelphia April 1, 1742, was educated at Edinburgh, where he was an inmate in the family of Doctor Robertson, the historian. He practised in New York City, and was the family physician of General Washington. He published several medical works, and became president of the College of Physicians and Surgeons of New York. He was an active promoter of benevolent enterprises. Died May 24, 1821. (See Rev. J. McVicker's "Life of Samuel Bard," 1822.)

Bardesa'nes (Bar-Deisan) of Edessa, founder of a Gnostic sect called Bardesanians. His treatise "On Fate," or "The Laws of Countries," was written during the last half of the second century. We had only a few fragments of it till in 1843 the entire treatise, in the original Syriac (the manuscript belonging to the sixth or seventh century), was obtained by Archdeacon Tatham from the Syrian convent in the desert of Nitria, and was published, with an English translation, by Rev. William Cureton in 1855. Ephraem Syrus, who flourished about two centuries later, says Bardesanes wrote also 150 hymns, which appear to have been more dualistic than the treatise just spoken of. The best compendious notice of Bardesanes is that by Gallandi, "Bibliotheca Veterum Patrum," 1765. (See also Strunzius, "Historia Bardesanis," 1710; Hahn, "Bardesanes Gnosticus," 1819.)

Bard'ings, or Bard, the name applied to the horse-armor of the Middle Ages, which consisted of four pieces: 1, the chamfront (Norman-French, *cheveron*), protecting the forehead and face, and having a steel spike like the horn of a unicorn between the eyes; 2, the manifaire, which was made of articulated plates, and covered the crest and neck; 3, the poitrel, a solid piece of plate-armor, guarding the entire shoulders and chest; the bard proper, defending the croup of the charger from the cantle of the saddle to the tail. A steed thus armed was said to be "barded."

Bards'town, the capital of Nelson co., Ky., is situated on an elevated plain and on a branch of the Louisville and Nashville R. R., 39 miles S. E. of Louisville. Here are several academies, and St. Joseph's Roman Catholic college. Pop. 1855.

Bare'bones, or Bar'bone (Praise God), a fanatic who was a member of Cromwell's Parliament in 1653, which was named after him the "Barebones' Parliament." When General Monk came to London, Barebones headed a procession of the people, and presented a remonstrance to Parliament against the restoration of Charles II.

Barefooted Friars [Lat. *Discalceati*], an appellation of certain Roman Catholic monks who either wear sandals or go entirely barefoot. They are connected with various congregations of the strict observance in nearly all the orders. There are also barefooted nuns. In some places they wear shoes in severe weather.

Bar'egine, a mucus-like substance produced by the algæ which grow in mineral springs. It abounds in the hot springs of Barrèges in France; hence the name. It imparts a flesh-broth flavor and odor to the water, and is prized for that reason.

Bare House, a township of Drew co., Ark. Pop. 458.

Bareil'y, a city of British India, in the North-west Provinces, is on the river Jooa, 151 miles E. of Delhi. It contains a number of mosques, a college, and many Hindoo schools. Here are manufactures of cutlery, carpets, brazen water-pots, tables, and ornamental chairs. Bareily was a scene of outrage and rapine during the mutiny of 1857, when the Sepoys murdered a number of Europeans. Pop. 111,332.

Barère de Vieuzac (Bertrand), a French demagogue and lawyer, born at Tarbes Sept. 10, 1755. He was elected in 1792 to the Convention, in which he voted for the death of the king. In April, 1793, he was chosen a member of the Committee of Public Safety. He supported the Jacobins in their contest with the Girondists, and became the reporter of the committee which usurped supreme power in July, 1793. He was the first who proposed that "terror should be the order of the day," and he dressed the atrocious decrees of the committee in such flowery language that he was called the "Anacreon of the guillotine." On the 9th Thermidor, 1794, he acted with the enemies of Robespierre. He was banished as a regicide in 1816, but was permitted to return in 1830. Died Jan. 14, 1841. (See "Mémoires de Barère," 4 vols., 1843, and the notice of Barère in Macaulay's "Essays.")

Baret'ti (Giuseppe), an Italian writer, born at Turin Mar. 22, 1716. He removed to London in 1751, and became a teacher of Italian and a friend of Dr. Johnson. He published an Italian-and-English dictionary (1760), and "Travels through Spain, Portugal, and France" (1770), which is highly commended by Dr. Johnson, and other works. Died in London May 5, 1789. (See G. Franchi, "Notizie intorno alla Vita di G. Baretti," 1790.)

Bar'gain [Old Fr. *bargaine*, "trade," from *barca*, a "bark," a "boat"] **and Sale,** the act of conveying and transferring real or personal property for a valuable consideration. The term is also employed to indicate the instrument by which the transfer is made. In the law of real estate this form of conveyance is in extensive use. The original mode of conveying corporeal real estate was by means of a ceremony termed livery of seisin, in which the seller delivered to the purchaser some visible symbol, such as a clod of earth or twig of a tree, in the name of the property to be conveyed. This method of conveyance came to be regarded as cumbersome and inconvenient. It was governed by strict and technical rules, and the estates that could be created by it were inelastic—not readily moulded to the demands of a growing civilization. The attention of conveyancers was attracted to other methods more suited to modern necessities. These methods were found in the doctrine of uses. A use in land was a notion derived from the Roman law, by means of which the formal title remained in one person, while the beneficial estate or enjoyment of the profits appertained to another. It corresponded in the main to the idea of trusts in modern law. A use could be created by a pecuniary or other legal consideration. For example, if an owner of land for a pecuniary consideration purported by present words to sell it, he would be at once converted into a formal owner, and the person advancing the money would be the beneficial owner, or, in technical language, would have "a use" in the land. He could become formal or legal owner by the action of a court of equity, which would, on application, direct that a conveyance should be made. While the law was in this condition an important statute was passed, 27 Hen. VIII., c. 10, called the "Statute of Uses," the effect of which, in substance, was to declare that one who had acquired a use under certain prescribed conditions in an estate in land should be the legal or formal, as well as the beneficial, owner. One great consequence of this statute was to introduce new conveyances. The principal one was "bargain and sale." The sale of land for a consideration, as already explained, created a use, and the statute gave the owner of the use the title. A subsequent statute (known as the statute of Frauds) requires conveyances to be in writing. This is the foundation of the modern system of conveyancing, both in England and the U. S. Other conveyances, proceeding either wholly or in part on the same theory, are "covenant to stand seised" and "lease and release." In the first of these the consideration is the affection between near relatives, technically called a "good" consideration, as distinguished from "valuable." In the second, the doctrine of uses is resorted to to put the purchaser in constructive possession of an estate for years in the land, whereupon he may receive a release, and thus become complete owner. T. W. Dwight.

Barge, a pleasure-boat, a boat of state elegantly furnished and propelled by oars; these are used on ceremonial occasions by princes and men of high station. Also a flat-bottomed vessel of burden employed in loading and unloading ships or in conveying freight from one town to another.

Ba'ri (anc. *Ba'rium*), a fortified city and seaport of Italy, capital of the province of Bari, is situated on the Adriatic Sea, 56 miles by rail N. W. of Brindisi; lat. 41° 9′ N., lon. 16° 54′ E. It is defended by a massive old castle of Norman origin. The harbor admits only small vessels. Bari is the see of an archbishop, and has some fine ecclesiastical buildings, among which is the priory of St. Nicholas, founded in 1087. It contains a cathedral, two theatres, an arsenal, etc.; also manufactures of silk, cotton, linen, and glass. *Barium* was a very ancient city, and was flourishing as early as 200 B. C. Pop. in 1872, 50,524.

Bari, a province of Italy, bounded on the N. E. by the Adriatic Sea, on the S. by Lecce and Potenza, on the W. by Potenza, and on the N. W. by Foggia. Area, 2293 square miles. The surface is mostly level; the soil is very fertile, producing wheat, fruits, and wine. The climate is very hot in summer. This province formed a part of ancient *Apulia*. Capital, Bari. Pop. in 1871, 604,365.

Bari, the name of a negro tribe on the White Nile, between lat. 3½° and 6½° N., are well built and often attain a height of six feet. They are fetish worshippers and practise polygamy. The men go entirely naked and paint themselves with ochre, while the women only wear short aprons.

Baril'la [Fr. *barille*], a crude, impure carbonate of soda, which is a considerable article of commerce, and is used in the manufacture of soap and glass. It is procured by burning plants of the genus *Salsola* or other plants which grow near the sea. Large quantities of it are exported from Spain and the Balearic Isles. The *Salsola sativa* is cultivated on ground adjacent to the sea, by which it is occasionally submerged, the sea being admitted by floodgates through an embankment. The *Salsola* is cut in September, is dried, and burned in a hole in the ground.

Bari'nas, a province of Venezuela, between Truxillo, Portugueza, and Merida on the N. and W., Guarico on the E., and Apure on the S. Area, 17,008 square miles. It consists of fertile plains drained by numerous streams. The S. boundary is the river Apule. The chief products are hides, cacao, coffee, and tobacco. Capital, Barinas. Pop. 126,925.

Bar'inas, or **Vari'nas,** capital of the above province, near the river Santo Domingo. The city, founded in the sixteenth century, has suffered devastation twice within a century. It is noted for the exportation of the tobacco which bears its name. Pop. 14,000.

Bar'ing, a post-township of Washington co., Me. It is on the St. Croix and Penobscot R. R., and has manufactures of lumber, sash and blinds, boots and shoes, etc. Pop. 364.

Baring (Sir Francis), an English financier, born near Exeter in 1740, was the father of Lord Ashburton, and the principal founder of the great banking-house of Baring Brothers & Co. of London. Died in 1810.

Bari'tah, the name of certain large Australian birds

Baritah, or Piping Crow.

belonging to the Corvidæ (crow family). The bill is large and conical, the base of it extending far backward on the forehead. The *Gymnorhina tibicen* (piping crow or piping grakle) has a melodious voice, is easily tamed, and learns to whistle tunes. There are several genera of these birds.

Ba'rium [from the Gr. *βαρύς*, "heavy," as it is an ingredient of "heavy spar"], one of the alkaline earthy metals. It occurs in nature chiefly in the forms of sulphate, barite, barytes, or heavy spar, of carbonate, witherite, and of silicate, harmotome. Its symbol is Ba, and its atomic weight 137. It is very rarely prepared in the metallic state. Barium salts are prepared either from the native carbonate by the action of acids, or from the native sulphate by first reducing it to sulphide by treating with sawdust or some other reducing agent, then acting upon this with the proper acids. The most important salts are the chloride and nitrate; both are used as tests for sulphuric acid and soluble sulphates. The chloride is used as a preventive of boiler incrustations, owing to its action on the sulphate of lime of the feed-water. It is also extensively used for the preparation of an artificial sulphate known as *blanc fix*, which is used in enamelling paper. Barium forms a protoxide, BaO, called baryta, and a dioxide, BaO_2. The latter is employed in the preparation of hydrogen dioxide, HO_2. Baric hydrate, BaH_2O_4, is the most soluble of the alkaline earthy hydrates; it is used in the laboratory as a test for carbonic acid, with which it forms a white precipitate. Baric sulphate is one of the most insoluble salts known. In its native form, barytes or heavy spar, it is extensively mined and used to adulterate white lead, an application for which it is specially adapted by its high specific gravity. The soluble barium salts are all poisonous. Any soluble sulphate, as sodic, Glauber's salt, or magnesic sulphate, Epsom salt, is an antidote.

C. F. Chandler.

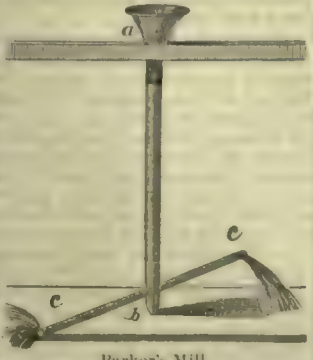
Bark [Lat. *cor'tex*], the external covering of a tree, is composed of cellular tissue. The development of bark is most perfect in exogenous plants with perennial woody stems, in which only the distinction between wood and bark is plainly marked. The outermost layer of bark is called *epider'mis*, which, however, is generally seen only in annual stems or in the youngest parts of woody stems. Beneath the epidermis is the true bark, the outer layer of which is called *epiphlœ'um*, and the inner layer *mesophlœ'um*. Within the mesophlœum is a distinct layer named *liber* or *endophlœum* (*i. e.* "inner bark"), which is composed of bundles of woody fibre or vascular tissue, mixed with cellular tissue. The last layer of bark is contiguous to the *alburnum* or sap-wood. The bark increases by the addition of an annual layer on its inner surface, next to the alburnum or cambium, through which the sap circulates. The annual layers cannot long be distinctly recognized in the bark, and in the older portions of trees the outer layers of bark, becoming dry and lifeless, are gradually shed or thrown off. The peculiar juices and characteristic properties of a plant are often most abundant in the true bark, which is the most important part of many medicinal plants, especially of Cinchona (which see). In making leather, tanners prefer those kinds of bark which contain most tannic acid. Oak bark is chiefly used in the tanneries of Europe. In the U. S. the bark of several species of oak, and also that of the hemlock, is used. The Spaniards employ the inner layer of the bark of the cork tree (*Quercus suber*), and the Australians that of the *Eucalyptus*. The bark can be separated with facility from the wood only when the sap is flowing. It should be carefully dried, as it is liable to be injured by mould.

Bark Beetle, or **Bark Chafer,** a name of several genera of coleopterous insects, belonging to the family Scolylide. They bore holes in bark, deposit their eggs in the inner bark, and often kill the tree. One species (*Tom'icus typog'raphus*) infests the forests of Germany in great numbers. In 1783 it caused the death of a million pines or more in the Hartz Forest. The U. S. have several destructive species.

Bar'ker, a township of Broome co., N. Y. Pop. 1396.

Barker, a township of Barbour co., West Va. Pop. 1961.

Barker (A. J.), U. S. N., born Mar. 13, 1843, in Massachusetts, graduated at the Naval Academy in 1861, became an ensign in 1862, a lieutenant in 1864, and a lieutenant-commander in 1866. He served in the steamer Mississippi at the passage of Forts Jackson and St. Philip and capture of New Orleans, April 24, 1862, and in the attack on Port Hudson, Mar. 14, 1863, where the Mississippi grounded and was destroyed; and afterwards in the steam-sloop Monongahela at the siege of Port Hudson, and was in various engagements in her with batteries on the Mississippi River. Foxhall A. Parker, U. S. N.



Barker (Edmund Henry), an English philologist, born in Yorkshire Dec. 22, 1788. He published a revised edition of Stephens's "Thesaurus Linguæ Græcæ" (13 vols., 1816-28). Among his works are "Classical Recreations" (1812) and "Parriana" (2 vols., 1829), which contains anecdotes, etc., relating to Dr. Parr. Died Mar. 21, 1839.

Barker (Fordyce), M. D., born May 2, 1819, at Wilton, Me., was educated at Bowdoin College, and studied medicine in Boston and Paris. He became in 1845 professor of midwifery in the medical school at Brunswick, Me., held the same position in the N. Y. Medical College (1850-57), and in 1860 became obstetric physician and professor of midwifery at the Bellevue Hospital, N. Y. He has published numerous papers on obstetrical and other kindred subjects, a treatise on "Sea-sickness," and one on "Puerperal Diseases."

Barker (George F.), M. D., an American chemist and physicist, born in Charlestown, Mass., July 14, 1835. He became an apprentice in 1851 in a philosophical instrument manufactory in Boston, where he remained until 1856, in which year he entered the Yale Scientific School, and graduated as bachelor of philosophy in 1858. He was chemical assistant for two winters (1858-61) in the Harvard medical school. In 1861 he was appointed professor of chemistry and geology in Wheaton College, Ill., and was acting professor of chemistry in 1862-63 in the Albany Medical College, where he graduated as M. D. in 1863. Early in 1864 he became professor of natural sciences in the Western University of Pennsylvania at Pittsburg, was instructor (1865) in the Yale Medical College, and was appointed professor of physiological chemistry and toxicology at Yale in 1867. In 1871 he was chosen vice-president of the American Association for the Advancement of Science. In 1873 he became professor of chemistry in the University of Pennsylvania. Among his various productions may be named a "Lecture on the Force of Nature," delivered (1863) before the Chemical Society of Union College, by whom it was published: and one on the "Correlation of Vital and Physical Forces," delivered (Dec. 31, 1869) before the American Institute in New York; republished in France. He is author of a "Text-book of Elementary Chemistry" (1870), which has already passed through eight editions, and of the general article on chemistry in the present work.

Barker (Jacob), an American financier, born in Maine Dec. 7, 1779. He was a relative of Dr. Franklin. He went to New York in early youth, and engaged in business on his own account with great success. Before 1812 he was one of the prominent politicians of New York. For many years he was regarded as among the soundest merchants of that city; but he became involved financially, and his reputation for business integrity having suffered, he removed to New Orleans in 1834, where as a banker he acquired wealth and influence. He took a prominent political part in the affairs of New Orleans and Louisiana during the civil war, loyally to the U. S. Died Dec. 27, 1871.

Barker's Mill, or **Segner's Wheel,** an hydraulic machine invented by Dr. Barker towards the close of the seventeenth century. The following description may serve to exhibit the principle of this machine in its simplest form. To those who have any knowledge of hydrostatics it is scarcely necessary to observe that every equal unit of surface of a vessel full of water is subject to a pressure proportional to the depth of the unit below the surface (see Lateral Pressure of Liquids); every unit of surface at the same depth is equally pushed outward. For each such pressure on one side of a vessel there is an equal and opposite pressure on the other, whereby the whole vessel is kept in equilibrium. If one such unit of area be removed—that is, if a hole be cut in the side of a vessel of water—the water in flowing out will no longer be able to press upon the surface which has been removed, but will nevertheless continue to press with equal force on the opposite unit of area. The consequence will be that the vessel will be urged in the direction opposite to that in which the water flows out. Barker's mill in its simplest form is shown in the annexed figure. A tube *a c c* with lateral arms below, shaped somewhat like an inverted T, rests upon a pivot at *b*. Now, suppose this tube to be supplied with water at the top, and an opening be made on opposite sides of the horizontal arms *c c*; the water, of course, ceases to press on the tube at the opening, while it continues to press on the opposite side; and if the wheel be so constructed as to turn with but little friction at *a* and *b*, the arms of the tube will be moved round in a direction opposite to that in which the water flows. It is obviously necessary that the opening in the two arms should be on opposite sides, for if they were on the same side the pressure on the one (supposing the openings to be of equal size) would exactly counterbalance the pressure on the other, and the wheel would remain stationary. But being on opposite sides, the arms are moved round in the same direction, the pressure on each co-operating with that on the other. As the rotation proceeds, the pressure at the extremities of the arms, *c c*, generated by centrifugal force is added to that due to the head, increasing correspondingly the driving power. Hence the machine is often called "the centrifugal mill." Various contrivances may be adopted to facilitate the supply of water, to lessen the friction, etc., but the above explanation may serve to show the general principle on which such a machine operates.

Barker's Mill.

F. A. P. Barnard.

Barker's Ridge, a township of Wyoming co., W. Va. Pop. 407.

Barkham'sted, a post-township of Litchfield co., Conn. Pop. 1439.

Bark'ing, an English town, county of Essex, on the Roding, 8 miles E. of London. The inhabitants pursue fishing or traffic with London in barges and market-carts. Pop. 5076.

Bark'ley, a township of Jasper co., Ind. Pop. 832.

Barks'dale (William), a brigadier-general in the Confederate service, born in Rutherford co., Tenn., Aug. 21, 1821, killed July 2, 1863, at Gettysburg, Pa. He was educated at Nashville University, removed to Mississippi, studied law, and was admitted to the bar. He served in the Mexican war. In 1853 he was elected to Congress from Mississippi, and resigned his congressional seat and became a brigadier-general in the Confederate army; and it was at the head of his brigade that he was killed on the second day of the battle of Gettysburg.

Bar-le-Duc, or **Bar-sur-Ornain,** a town of France, capital of the department of Meuse, is on the river Ornain, and on the railway which connects Paris with Nancy, 159 miles by rail E. of Paris. It has a communal college, a normal school, and a public library; also manufactures of cotton stuffs, hosiery, and calicoes. Its trade is facilitated by a canal which connects the Marne with the Rhine. Pop. in 1866, 15,334.

Barlet'ta (anc. *Barduli*), a fortified seaport of Italy, in the province of Bari, on the Adriatic, and on a rocky island 34 miles by rail W. N. W. of Bari; lat. 41° 20′ N., lon. 16° 19′ E. It is well built, has handsome stone houses, and wide, well-paved streets. It contains a fine cathedral, a college, a strong citadel or castle, and a colossal statue of the emperor Heraclius, said to have been found in the sea. Grain, wine, oil, and fruits are exported from this town. Pop. in 1872, 28,163.

Bar'ley [Lat. *hor'deum*], a plant of the order Graminæ, is a valuable cereal, said to be more widely distributed than any other grain. It was cultivated by the ancient Hebrews, Greeks, and Romans, and was an important article of food in a remote antiquity. First mentioned in Exodus ix. 31. It is adapted to both cold and warm climates. The genus *Hordeum* is distinguished by a spiked inflorescence, has three spikelets at each joint of the rachis, and has three stamens. The lower palea or palet is long-awned. The species are mostly annual. Barley meal is used for bread in Northern Europe, but in many parts of the world this grain is mostly malted (*germinated*) for the manufacture of beer. It is also valuable as food for horses. When the pellicle of the grain is removed and the grain is rounded, it is called pearl barley, which is used as food for invalids. Two species or varieties of barley are cultivated in the U. S.—namely, *Hordeum vulgare*, with its grains arranged in four rows; and *Hordeum distichon*, in which there are only two rows. The farmers of Europe also cultivate the *Hordeum hexastichon*, the six-rowed barley. The sprat or battledore barley (sometimes called German rice) is much esteemed in Germany. It has only two rows, and has widely-spreading awns. The Nepaul or Himalaya barley is well adapted for cold and mountainous regions, as it produces good crops at the height of 14,000 feet above the level of the sea.

Bar'leycorn (John), a personification of the spirit of barley or malt liquor, used in humorous poetical composition and in jocular parlance. There is an old whimsical English tract entitled "The Arraigning and Indicting of

Sir John Barleycorn, printed for Timothy Tosspot," but John Barleycorn is best known by Burns's humorous poem of that name.

Bar'low, a post-tp. of Washington co., O. Pop. 1194.

Barlow (Francis Channing), Major-General, born at Brooklyn, N. Y., Oct. 19, 1834, graduated first in his class at Harvard College in 1855, served in the Union army 1862–65. He was at Fair Oaks and in almost every subsequent battle of the army of the Potomac, and won a distinguished reputation as a brave and able officer. He was secretary of state for New York in 1866–68, and was elected attorney-general of New York in 1871.

Barlow (Joel), an American poet, born at Reading, Conn., Mar. 24, 1755, graduated at Yale College in 1778. He served as chaplain in the army in the Revolutionary war, after which he studied law. He produced in 1787 "The Vision of Columbus," a poem which was very popular. Having visited Europe on business in 1788, he passed some years in Paris during the French Revolution, and amassed a competence by trade or speculation. He returned to the U. S. in 1805, and published in 1808 "The Columbiad," a mediocre epic poem. He was sent as ambassador to France in 1811, and died near Cracow Dec. 22, 1812, while on his way to Wilna, whither he had been invited to meet Napoleon. (See C. E. Oelsner, "Notice sur la Vie de J. Barlow," 1813; Griswold's "Poets and Poetry of America.")

Barlow (Samuel Lathan Mitchill). See Appendix.

Bar'mecides (sing. **Bar'mecide**), a distinguished and powerful Persian family, whose name was derived from Barmak or Barmek. His son, Khâled-ben-Barmak, became the prime minister of the caliph Al-Mansur, and also of Al-Mahdi, who appointed him tutor to Haroun-al-Raschid. Yahya, the son of Khâled, was vizier under Haroun-al-Raschid, to whom he rendered important services. Yahya had three sons, named Yahya, Fadhl, and Jaafar, who enjoyed the favor of the sovereign. Fadhl was vizier for some time. Haroun-al-Raschid, who was jealous of their power and popularity, ordered them to be put to death about 802 A. D. (See Jaafar.) The virtues and misfortunes of the Barmecides have been celebrated by many Oriental poets and historians.

Barmecide's Feast, a celebrated tale from the "Arabian Nights;" a term often applied to an ostentatious display of worthless bounty. The tale is as follows: Schacabac being reduced to great poverty, and having eaten nothing for two days together, made a visit to a noble Barmecide in Persia who was very hospitable, but withal a great humorist. The Barmecide was sitting at his table, that seemed ready covered for an entertainment. Upon hearing Schacabac's complaint, he desired him to sit down and fall to. He then gave him an empty plate, and asked him how he liked his rice-soup. Schacabac, who was a man of wit, and resolved to comply with the Barmecide in all his humors, told him it was admirable, and at the same time lifted up the empty spoon to his mouth [apparently] with great pleasure. The Barmecide then asked him if he ever saw whiter bread. Schacabac, who saw neither bread nor meat, answered, "If I did not like it, you may be sure I should not eat so heartily of it." Several other fine dishes were served up in idea, which both of them commended and feasted on after the same manner. This was followed by an invisible dessert; and Schacabac, at length being tired of moving his jaws up and down to no purpose, desired to be excused, for that really he was so full he could not eat a bit more. "Come, then," said the Barmecide, "you shall taste of my wines, which, I may say without vanity, are the best in Persia." He then filled their glasses out of an empty decanter. Schacabac would have excused himself from drinking so much at once, because he said he was a little quarrelsome in his liquor; however, being pressed to it, he pretended to take it off, having beforehand praised the color and afterwards the flavor. Being plied with other imaginary bumpers of different wines, he pretended to grow flustered, and gave the Barmecide a box on the ear; but immediately recovering himself, "Sir," said he, "I beg ten thousand pardons, but I told you before that it was my misfortune to be quarrelsome in my drink." The Barmecide, who was pleased with the complaisance of his guest, then ordered a good substantial dinner to be served up.

Bar'men, a town and beautiful valley of Rhenish Prussia, is on the river Whipper, 17 miles by rail E. N. E. of Barmen. The town is 3 miles E. of Elberfeld, or, according to one statement, is a continuation of Elberfeld, with which it forms one uninterrupted street six miles long. Barmen is the principal seat of the ribbon manufacture on the Continent, and its fabrics are distributed to all parts of the world. Here are also manufactures of cotton and linen goods, velvet, lace, hardware, and chemical products. The district which contains Barmen and Elberfeld is the most populous, industrious, and thriving in Germany. Barmen has a handsome church, an asylum for the deaf and dumb, several banks, an exchange, etc. Pop. in 1871, 74,496.

Bar'nabas [G:. Βαρνάβας], Saint, an early Christian and apostle, originally named Joseph, was born in the island of Cyprus. He was a companion and fellow-laborer of the apostle Paul, and appears to have been the principal founder of the church of Antioch, to which he was sent by the church of Jerusalem. "He was a good man, and full of the Holy Ghost and of faith" (Acts xi. 24). According to one tradition, he was the first bishop of Milan. (See Acts xiii.–xv.; P. Puccinelli, "Vita di S. Barnaba," 1649.)

Barnabas, Epistle of, an epistle of twenty-one chapters, which is supposed by Hefele to have been written between 107–120 A. D. After having been lost sight of for several centuries, this epistle was first published in 1645, but the first four chapters and a part of the fifth were only in Latin. In 1859, Tischendorf discovered the whole in Greek at Mount Sinai, and it was published in 1863. It was formerly ascribed to the apostle Barnabas, but it is evidently the work of another and later hand. It is frequently cited by the Fathers, and was by many regarded as being of authority in the Church; some even claiming for it a place in the sacred canon. It is chiefly directed against the Judaizing Christians, and its principal value now is in the light it throws upon the customs and doctrines of the Christians of that time. Several English translations have been published. (See Neander, "Church History," i., 381; Kitto, "Cyclopædia;" "American Presbyterian Review," Jan. and July, 1864.)

Bar'nabites, an order of monks which originated at Milan in 1533, and were so called because they preached in the church of St. Barnabas. Their duties were to attend the sick, to preach, to instruct the young, etc. They became numerous, and established monasteries or colleges in Italy, France, Austria, and Spain.

Barnacle. See Cirripedia.

Bar'nacle Goose (*An'ser ber'nicla* or *Ber'nicla leucop'sis*), a bird which frequents the coasts of Britain in winter, and migrates northward in spring. It is smaller than the common wild-goose, and is esteemed for food. The plumage of the upper part of its body is ash-gray and black, and that of the lower part white. The name of barnacle is sometimes applied to the brent goose (*An'ser bren'ta* or *torqua'tus*), which is smaller than the preceding, and has a darker plumage, which is nearly all black except the lower part of the body. It is remarkable for powerful flight and distant migrations, and is prized for the table. It is a winter bird of passage in the U. S. It takes its name from the old belief that barnacles were often transmuted into geese—a superstition which was once shared by learned and unlearned alike.

Barnacles, in heraldry, are frequently introduced into coats-of-arms as a charge. They were instruments used by farriers to curb and command unruly horses, and resembled what are now called twitchers.

Bar'nard, a post-township of Piscataquis co., Me. It has manufactures of roofing slate. Pop. 149.

Barnard, a post-township of Windsor co., Vt. It has manufactures of carriages, lumber, tubs, etc. Pop. 1208.

Barnard (Daniel Dewey), LL.D., a lawyer and Whig politician, born at Sheffield, Mass., in 1797, graduated at Williams College in 1818, was admitted to the bar at Rochester, N. Y., and in 1821 was a member of Congress from New York (1828–30 and 1839–45). He removed to Albany in 1832, and was U. S. minister to Prussia (1849–53). He was the author of many published reviews, speeches, etc. Died April 24, 1861.

Barnard (Frederick Augustus Porter), S. T. D., LL.D., L. H. D., mathematician, physicist, and educator, born in Sheffield, Mass., May 5, 1809, graduated at Yale College in 1828, tutor in Yale College 1830, professor of mathematics and natural philosophy in the University of Alabama 1837–48, professor of chemistry and natural history in the same 1848–54, professor of mathematics, natural philosophy, and civil engineering in the University of Mississippi 1854–61, president of the University of Mississippi 1856–58, and chancellor of the same 1858–61. In 1854 he took orders in the Protestant Episcopal Church, resigned his chancellorship and his chair in the university in 1861, and in 1863–64 was connected with the U. S. coast survey, in charge of chart-printing and lithography. In May, 1864, was elected president of Columbia College, New York City, which post he still holds. He received the honorary degree of LL.D. from Jefferson College, Miss., in 1855, and from Yale College in 1859; also the degree of S. T. D. from the University of Mississippi in 1861, and that of L. H. D. from the regents of the University of

the State of New York in 1872. In 1860 he was a member of the eclipse expedition sent to Labrador (Cape Chudleigh) by the U. S. coast survey; and during this absence was elected president of the American Association for the Advancement of Science. In the act of Congress establishing the National Academy of Sciences (1863) he was named as one of the original corporators, in 1867 he was one of the U. S. commissioners to the Paris Exposition, and was chairman of the physical section, 1870–72. He is also a member of the American Philosophical Society, an associate member of the American Academy of Arts and Sciences, corresponding member of the Royal Society of Liège, and member of many other scientific and literary associations. During his long residence in the South, Dr. Barnard was actively engaged in promoting public education, both primary and higher, encouraging and assisting in all departments of scientific research and literary culture. His publications have related chiefly to scientific and educational subjects. Among these may be mentioned "Letters on College Government" (1854), "Report on Collegiate Education" (1854), "Art Culture" (1854), "History of the American Coast Survey" (an extended Report to the American Association for the Advancement of Science, 1857), "University Education" (1858), "Undulatory Theory of Light" (1862), "Machinery and Processes of the Industrial Arts, and Apparatus of the Exact Sciences" (1868), "Metric System of Weights and Measures" (1871).

Barnard (Henry), LL.D., an eminent educator, born at Hartford, Conn., Jan. 24, 1811, graduated at Yale College in 1830, and was called to the bar in 1836. Having been elected to the legislature of Connecticut in 1837, he reorganized the public schools. He was superintendent of schools in Connecticut (1838–42 and 1850–54), in Rhode Island (1843–49), president State University of Wisconsin (1856–59), and of St. John's College (1865–67). He published, besides other works, the "Connecticut Common School Journal," which had reached several volumes in 1855; "Normal Schools in the U. S. and Europe" (1851); "Education in Factories" (1842); "School Libraries" (1854); "Hints and Methods for the Use of Teachers" (1857); and "National Education in Europe" (1851), when he commenced the publication of the "American Journal of Education." He was appointed in 1867 U. S. commissioner of education, but resigned in 1871.

Barnard (John), a famous minister of Marblehead, Mass., was born in Boston Nov. 6, 1681, and graduated at Harvard in 1700. He was a chaplain in the Port Royal expedition of 1707, of which he wrote an unpublished account. Visiting England, he was offered a chaplaincy to Lord Wharton, but refused to conform. He was ordained colleague minister of Marblehead in 1716, and there remained for life. He took great pains in establishing the fisheries and commerce of his people. He published a version of the Psalms, sermons, etc. Died Jan. 24, 1770.

Barnard (John G.), LL.D., was born May 19, 1815, in Sheffield, Mass., graduated at the U. S. Military Academy 1833, and was commissioned as brevet second lieutenant in the corps of engineers. In 1835 was sent to the Gulf coast, where he served seventeen years as an assistant or principal engineer for the fortifications of Pensacola and New Orleans, and on works of harbor improvement. During the war with Mexico he was twice called to the field, and received the brevet of major "for meritorious services while serving in the enemy's country." In 1850 he was named by the President (Taylor) as chief of a scientific commission for the survey of the Isthmus of Tehuantepec, with the view of establishing a route of commerce and travel to our newly-acquired Pacific possessions. The report drawn up by J. J. Williams (1852) gives the first full account of that isthmus ever published. In 1854 he was in charge of the construction of the new fortifications of San Francisco, Cal., in 1855–56 superintendent of the U. S. Military Academy. Subsequently, till 1861, he was in charge of the fortifications of New York harbor. Serving as chief engineer under Gen. McDowell in the first Bull Run campaign, he was present on the field of that battle, as also at the earlier combat at Blackburn's Ford, the very first of the inchoate "Army of the Potomac." As chief engineer (with the rank of brigadier-general) of the Army of the Potomac in the Virginia Peninsular campaign of 1862, he directed the siege operations at Yorktown and before Richmond; and subsequently, as "Chief engineer of the defences of Washington," the extensive works for the defence of the national capital. In the campaign of 1864–65 he served on the staff of Lieut.-Gen. Grant as "Chief engineer of the armies in the field," until the surrender of Lee's army at Appomattox Courthouse, at which he was present. He was brevetted through several grades, and finally received the brevet of major-general U. S. army "for gallant and meritorious services in the field;" also brevetted July 4, 1864, major-general U. S. volunteers "for meritorious and distinguished services." Since the close of the civil war he has served as senior member of the board of engineers for permanent fortifications, and as a member of the U. S. lighthouse board. He is a member and an original corporator of the National Academy of Sciences. The degree of A. M. was conferred upon him by the University of Alabama in 1838, and of LL.D. by Yale College 1864. He is a member of the American Institute of Architects, and an honorary member of the American Society of Civil Engineers. His principal publications are "The Phenomena of the Gyroscope analytically examined" (1858), "Notes on Sea Coast Defence" (1861), "Reports of the Engineer and Artillery Operations of the Army of the Potomac" (1865), in conjunction with Gen. W. F. Barry, chief of artillery; "Report on the Defences of Washington" (1871), "Report on the Fabrication of Iron for Defensive Purposes," etc. (1871), made in conjunction with Gen. H. G. Wright and Col. P. S. Michie; "The North Sea Canal of Holland, and Improvement of Navigation from Rotterdam to the Sea," "Problems of Rotary Motion presented by the Gyroscope, the Precession of the Equinoxes, and the Pendulum" (1872). In May, 1864, he was nominated brigadier-general and chief of engineers. The nomination was withdrawn at his own request.

Barnaul', a town of Siberia, in the government of Tomsk, at the junction of the Barnaul with the river Obi, 230 miles S. S. W. of Tomsk. It has a mining school, four churches, and several hospitals. All the gold of the Altai Mountains is brought here to be smelted, and three large gold and silver trains leave here every winter for St. Petersburg. A magnetic and meteorological observatory was established here about 1841. Pop. in 1867, 12,928.

Barnave (Antoine Pierre Joseph Marie), a French revolutionist and able advocate, was born at Grenoble in 1761. He was elected in 1789 to the States-General, and became a leader of the popular party. As a member of the National Assembly he opposed the absolute veto, and advocated the confiscation of church lands and the abolition of convents. He was a member of the committee appointed to attend the king on his return from Varennes to Paris in 1791, after which he became a more moderate reformer, and even defended the royal cause. This change of course rendered him unpopular. He retired to private life in Sept., 1791, and was guillotined Nov. 29, 1793. According to Macaulay, he was "the best debater in the National Assembly, but he flinched before the energy of Mirabeau."

Barn'burners, a nickname given to that portion of the Democratic party of the State of New York which opposed the extension of slavery and supported Van Buren against Cass for President in 1848. They were esteemed too radical by their adversaries, one of whom illustrated his meaning by a story of a farmer who was so greatly annoyed by the rats who devoured his grain that he burned his barn to get rid of them. The Barnburners, led by Col. Samuel Young, Hon. Silas Wright, Michael Hoffman, etc., opposed further borrowing for the improvement or extension of their State canals, and were hostile generally to public debts, corporate privileges, etc.

Bar'negat, a post-village of Union township, Ocean co., N. J., on Double Creek and on the Tuckerton R. R., 1 mile from Barnegat Bay. It has an academy, and is a place of resort for sportsmen on account of the abundance of wildfowl. Its inhabitants are mainly engaged in navigation.

Barnegat Bay, in Ocean co., N. J., connects with the Atlantic by an inlet over a mile wide. The bay extends 23 miles N. to the mouth of Metetecunk River. There is a lighthouse 150 feet high on the S. side of the inlet, with a flashing white light; lat. 39° 45′ 48″ N., lon. 74° 0′ 3″ W.

Barnes, a township of Buena Vista co., Ia. Pop. 233.

Barnes (Albert), an eminent American divine, born at Rome, N. Y., Dec. 1, 1798. He graduated at Hamilton College in 1820. He became, in 1830, pastor of the First Presbyterian church at Philadelphia, where he preached upwards of thirty years. As a commentator on the Scriptures, Mr. Barnes has a high reputation, and his scriptural commentaries are popular with the religious community on both sides of the Atlantic. The circulation of his "Notes on the New Testament" (in eleven volumes) is said to have reached more than a million volumes. He commented also on Isaiah (1840), Job (1844), Daniel (1853), and the Psalms (1871). Among his other works may be named "The Church and Slavery" (1857), "The Atonement in its Relations to Law and Moral Government" (1859), "Lectures on the Evidences of Christianity" (1868), "Life at Threescore and Ten" (1868), and "Scenes and Incidents in the Life of the Apostle Paul" (1869). Mr. Barnes took a leading part in the controversy which divided the Presbyterian Church, and in 1837 was one of the most prominent advocates of the New School doctrines. Died Dec. 24, 1870.

Barnes (JAMES), an American officer and engineer, born in 1806 at Boston, Mass., graduated at West Point in 1829, was a lieutenant of artillery till he resigned from the army July 31, 1836, serving at Military Academy as assistant instructor 1829–30 and 1833–36, at Fort McHenry, Md., 1830–32, in Black Hawk expedition 1832, and at Charleston harbor 1832–33, during the threatened nullification of South Carolina. He was a prominent civil engineer (1836–57), and constructed many important railroads. At the beginning of the civil war he resumed the military profession as colonel Eighteenth Massachusetts volunteers, was appointed Nov. 29, 1862, brigadier-general U. S. volunteers, and served in the Virginia peninsula 1862, Northern Virginia campaign 1862, in Maryland campaign 1862, and at Antietam; in Rappahannock campaign 1862–63, at Fredericksburg and Chancellorsville, in Pennsylvania campaign, in several skirmishes, and at the battle of Gettysburg (wounded), and was in command of the defences of Norfolk and Portsmouth, Va., 1863–64, of St. Mary's district 1864–65, and Point Lookout camp for prisoners of war 1864–65. Brevet major-general U. S. volunteers Mar. 13, 1865, for meritorious services, and mustered out of service Jan. 15, 1866. With health destroyed he remained at his home in Springfield, Mass., where he died Feb. 12, 1869.

GEORGE W. CULLUM, *U. S. Army.*

Barnes (JOSEPH K.), brigadier-general and surgeon-general U. S. army, born in Philadelphia July 21, 1817, educated in Philadelphia, receiving his degree of M. D. from the medical department of the University of Pennsylvania, class of 1837–38. He followed the practice of his profession in the hospitals and as physician to the out-door poor of Philadelphia till June 15, 1840, when he was appointed an assistant surgeon in the army, and a surgeon Aug. 29, 1856. In 1863 (Feb. 9) he was appointed medical inspector, and Aug. 10 medical inspector-general with the rank of colonel. On Aug. 25 he was placed in charge of the surgeon-general's office, and Aug. 22, 1864, received the appointment of surgeon-general, which distinguished position he still retains, administering the responsible duties of his department with marked ability.

Barnes (PHINEAS), a politician of Maine, born in 1811, graduated at Bowdoin College in 1829, was professor of Greek and Latin at Waterville (1834–39), and afterwards editor of the "Portland Advertiser," and held many responsible offices in Maine. In 1860 he was nominated for governor on the Bell and Everett ticket. Died Aug. 21, 1871.

Barnes's, a township of Montgomery co., Ala. Pop. 3680.

Barnes's Cross-Roads, a post-township of Dale co., Ala. Pop. 800.

Barnesville, a post-village of Pike co., Ga., is situated on the Macon and Western R. R., 40 miles N. W. of Macon, and has one weekly newspaper. Pop. 754.

Barnesville, a post-town in the S. W. part of Belmont co., O., 32 miles W. of Wheeling, on the Baltimore and Ohio R. R. It has a machine-shop, foundry, planing-mill, woollen mill, carriage factory, national bank, and one newspaper, and is the commercial centre of a large and wealthy agricultural district. It is noted for its superior strawberries and tobacco. Pop. 2063.

ED. "ENTERPRISE."

Bar'net, a post-township of Caledonia co., Vt., on the Connecticut and Passumpsic Rivers R. R., 51 miles N. of White River Junction. It has manufactures of lumber, leather, etc. There is an academy at McIndoe's Falls. The township contains several manufacturing villages. P. 1945.

Bar'nett, a township of De Witt co., Ill. Pop. 1078.

Barnett, a township of Forest co., Pa. Pop. 504.

Barnett, a township of Jefferson co., Pa. Pop. 223.

Bar'neveld, a town in Holland, 6 miles S. S. E. of Nykerk, in the province of Gelders. There are fine monuments in one of the churches. Pop. 6167.

Bar'neveldt (JOHN VAN OLDEN), an eminent Dutch statesman, born at Ameersfoort in 1549. He was a member of an important embassy sent to England in 1585, and after his return was appointed advocate-general of Holland. He was an adversary of the earl of Leicester, and became the head of the republican party, while Maurice of Nassau was the chief of its opponents. Barneveldt opposed the ambitious designs and warlike policy of Maurice, and in 1609 concluded a truce with Spain for twelve years. He was for many years grand-pensionary of Holland. The animosity between the two parties was aggravated by religious dissension. Barneveldt favored the Arminians or Remonstrants, while Maurice patronized the intolerant Gomarists, who were also supported by the majority of the army, the clergy, and the populace. The Synod of Dort having condemned the Arminians in 1618, Barneveldt was accused of treason, unjustly convicted, and beheaded May 13, 1619. (See MOTLEY, "History of the United Netherlands.")

Bar'ney (JOSHUA), an American commodore, born in Baltimore July 6, 1759. Having passed through the inferior grades, he obtained command of the Hyder Ali, and captured the General Monk in 1782. He commanded a flotilla in 1813, and was wounded at the battle of Bladensburg in 1814. Died Dec. 1, 1818.

Barn'hill, a township of Wayne co., Ill. Pop. 2632.

Barns'ley, a market-town of England, in the West Riding of Yorkshire, on the river Dearne, 18 miles by rail N. of Sheffield, on the North Midland Railway. It is situated on a hill, has coal and iron mines, and manufactures of linen, glass, etc. The damasks and drills of Barnsley were considered to be unrivalled. Here are also bleaching and dye works and iron foundries. Pop. in 1871, 23,021.

Barns'ness, a township of Pope co., Minn. Pop. 153.

Barn'stable, the easternmost county of Massachusetts. Area, 290 square miles. It consists of a peninsula which is about 60 miles long and terminates in Cape Cod. It is bounded on the E. and S. by the Atlantic Ocean, and on the W. by Buzzard's Bay. The soil is mostly light and sandy. Dairy products, corn, and wool are raised to some extent. Many of the inhabitants are engaged in the fisheries and in navigation. Capital, Barnstable. Pop. 32,774.

Barnstable, a port of entry and shire-town of Barnstable co., Mass., is on Barnstable Bay and on the Old Colony R. R., 72 miles S. S. E. of Boston. The inhabitants are principally engaged in maritime pursuits. The southerly portion of the town, on Vineyard Sound, is largely frequented as a place of summer resort. Hyannis, Cotuit Port, Osterville, and other villages are in this township, which has eleven churches, a court-house, jail, and a weekly paper. Pop. of township, 4793.

ED. "PATRIOT."

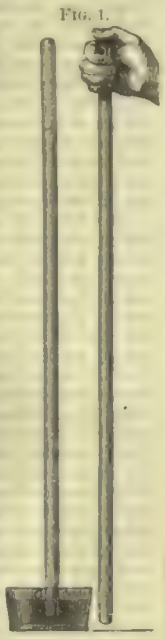
Barn'staple, a town and seaport of England, in Devonshire, on the river Taw, 6 miles from its mouth, and 40 miles by rail N. W. of Exeter. The Taw is here crossed by an old bridge of sixteen arches. Barnstaple is pleasantly situated and well built, and has manufactures of pottery, lace, etc. It sends two members to Parliament. The harbor has been filled with sand, so that it will not admit large vessels. Pop. in 1871, 11,636.

Barn'stead, a post-township of Belknap co., N. H. It has manufactures of lumber, woollen goods, etc. P. 1543.

Bar'num (PHINEAS TAYLOR), born in Bethel, Conn., July 5, 1810. He became an editor, a trader, and afterwards a public showman. In 1841 he established in the city of New York a museum which was very successful. In 1849 he engaged Jenny Lind to sing in America, and paid her $1000 per night for 150 nights. He afterwards experienced severe reverses of fortune, but his perseverance and energy overcame the difficulties. He also has some fame as a temperance lecturer, gives freely to philanthropic enterprises, and has been elected several times mayor of Bridgeport. (See his "Life," written by himself, 1855.)

Barn'well, a county of South Carolina, bordering on Georgia. It is bounded on the N. E. by the Edisto, and on the S. W. by the Savannah River. The surface is undulating, the soil productive. Rice, corn, and cotton are the chief crops. The county is intersected by the South Carolina and Port Royal R. Rs. Capital, Blackville. Pop. 35,724.

Barnwell, a post-village of Barnwell co., S. C., 60 miles S. S. W. of Columbia. Pop. of township, 1181.



Barnwell (ROBERT WOODWARD), LL.D., a statesman, born at Beaufort, S. C., Aug. 10, 1801, and graduated at Harvard in 1821. He studied law, was a member of Congress from South Carolina (1829–33), U. S. Senator in 1850, and afterwards a member of the Confederate Congress. He was president of South Carolina College (now University of South Carolina) (1835–43), and after the civil war held the same position until 1873.

Baroach', a town of British India, in the province of Bombay, is on the Nerbudda, 40 miles N. N. E. of Surat. Here is a hospital for animals, receiving even insects, which is endowed by the Brahmanists. On an island near this town is the largest banyan tree in India, which is said to have sheltered an army of 7000 men.

Baro'da, a city of Hindostan, in Guzerat, about 90 miles by rail N. N. E. of Surat; lat. 22° 16′ N., lon. 73° 14′ E. It is the residence of the guicowar, a Mahratta prince, and has an extensive trade, for which its position is advantageous. A railroad extends from Baroda *viâ* Surat to Bombay, 231 miles. It is a rich city in proportion to its size. Pop. estimated at 140,000.

Barom'eter [Gr. βάρος, "weight," and μετρον, "measure"], an instrument for measuring the weight or pressure of the atmosphere. If a tube of uniform bore be bent into the form of the letter U, and partially filled with a liquid, the height of the liquid column, as measured above the bend, will be found to be the same in both branches. This will continue to be true though the air be withdrawn from above the liquid on both sides—a thing which may easily be effected by suitably connecting the two extremities of the tube with an air-pump. But if, while things are in this condition, the air be gradually readmitted to one of the branches and not to the other, the column in that branch will steadily sink, and that in the other will correspondingly rise. Arresting this process at any moment, we may say that the difference of height of the two liquid columns is a measure of the pressure of the air on the surface of the lower; or that the *weight* of a column of the liquid having a height equal to this difference is just equal to the pressure on that surface. In this experiment it would be easy to expel the liquid entirely from one branch of the tube, without establishing an equilibrium with the column in the other, unless the apparatus should be of inconveniently large dimensions, or the liquid employed should be one having great specific gravity. Mercury, in fact, which is nearly fourteen times (13.6) heavier than water, is the only liquid convenient for the purpose of the experiment: and if this be used, the difference of height of the columns in the two branches will be found to be about 30 inches when the full pressure of the atmosphere is admitted to one branch, while it is wholly withdrawn from the other. The weight of a vertical column of mercury, therefore, of uniform horizontal section, 30 inches in height, is equal to the mean pressure of the atmosphere at the surface of the earth on an area equal to the base of the column. The same fact is demonstrated more expeditiously by simply taking a straight tube 32 or 33 inches in length (Fig. 1), closed at one extremity and open at the other, filling it entirely full of mercury, placing the thumb firmly on the open end, inverting it and plunging this extremity beneath the surface of mercury in a basin, and finally removing the thumb. The column will fall, and stand as before at about 30 inches above the level of the mercury in the basin. This is the original experiment of Torricelli, made early in the seventeenth century, by which he furnished the first satisfactory explanation of the phenomena which the old philosophers vaguely ascribed to Nature's abhorrence of a vacuum.

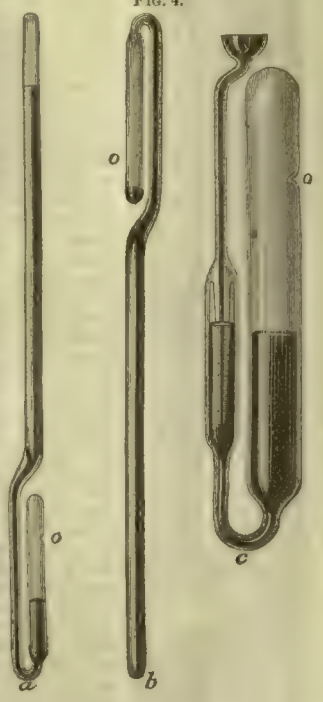
Fig. 1.

If the pressure of the atmosphere were invariable, the barometer would be an instrument of no practical use, and would simply serve to illustrate an interesting physical truth. But this pressure is constantly fluctuating, and its fluctuations are measured by the varying heights of the Torricellian column. All that is necessary to form a barometer, therefore, is to connect with the tube and basin of Torricelli some kind of scale suitable to measure these variations. In English and American barometers this scale is divided into inches and decimals; in France and in continental Europe generally, into millimètres. If the instrument is to be stationary, the scale need only have a range of three or four inches, since even in localities where the fluctuations are largest, they never transcend these limits. The divisions directly marked on the scale are made sufficiently large to be read by the unassisted eye. For smaller divisions a vernier must be employed. (See Vernier.) In the best instruments the height of the column may be read by means of the vernier to the $\frac{1}{1000}$th of an inch. Some little practice is required in order to learn to read with accuracy. The vernier carries a horizontal index which moves close to the glass tube containing the mercurial column; but the top of the column is rounded, so that the highest point is distant from the index by half the exterior diameter of the tube. Ordinarily, the bore of the tube is small, not exceeding three-sixteenths to three-eighths of an inch; but in large standards a tube an entire inch in bore is often employed, and in such instruments the index is a ring or thimble surrounding the tube entirely.

Fig. 2.

The height of the column must be measured from the surface of the mercury in the basin; but the level of this surface itself varies with the rising and falling of the column in the tube. To provide against error from this cause, the whole scale is, in some barometers, made movable, and is raised or depressed as may be necessary, by means of a thumb-screw, before observation. An ivory point directed downward from a short projecting arm carried by the scale is brought so as exactly to meet its image reflected in the mercury of the basin, and this indicates that the zero of the scale is in its true position. In other instruments, and generally in those in common use, the adjustment is made by raising or depressing the level of the mercury itself while the scale remains fixed. Instead of the ivory point, an ivory float is sometimes used, carrying an upright stem on which is a fiducial mark designed to be brought, in the adjustment, into coincidence with a similar fixed mark.

Fig. 3.



In tubes of small bore the mercurial column does not reach the full height due to the pressure, owing to the effect of Capillary Action (which see). A small correction is therefore necessary on this account, which depends on the diameter of the tube. With tubes of large dimensions this effect is insensible; and it may in any case be completely eliminated by giving to the barometer the form shown in Fig. 2, called a siphon barometer, in which the basin is dispensed with, and the tube is bent upward at the bottom, the recurved part serving as a substitute for the basin. In this form of the instrument, if the bore be uniform throughout, every fluctuation of pressure occasions equal and opposite movements of the two surfaces of mercury; and the reading on a fixed scale will change only half as much as in the common instrument. The whole scale should therefore be movable; or if a fixed scale only be used, the divisions should be made of only half their nominal magnitude. An attempt has been made to magnify the barometric indications of fluctuating atmospheric pressure, by transforming the vertical movements of the mercurial column into rotary movements of a long index upon a dial. The siphon barometer presents a convenient means of doing this. A float introduced into the open short arm of the siphon, and connected by a silk thread with a small pulley on the axis of the index, will render conspicuous even a very minute change in the altitude of the column. The uncertain action of this apparatus, however, owing to friction and other causes, is such as to deprive it of any scientific value.

The form of barometer now most generally approved, constructed originally by Fortin of Paris, and since adopted by Casella, Beck, and others of London, and by James Green of New York, who has made in it important improvements, is shown in Fig. 3. In this, the glass tube is entirely surrounded by a protecting tube of brass, somewhat enlarged at the top, for convenience in applying a scale and vernier, and having a vertical opening at the same part to allow the summit of the mercurial column to be seen. The cistern at the bottom, which is of boxwood,

except the upper portion, which is a short glass cylinder, is similarly protected—the glass portion, however, being uncovered, in order to allow the surface of the mercury in the cistern to be visible. The cistern has a bottom of flexible leather, which rests on a broad disk of metal supported by a vertical screw, of which the milled head is represented in the figure below the instrument. By turning this screw, the level of the mercury in the cistern is brought to the true zero of the scale, indicated by a fixed fiducial point of steel or ivory seen within the cistern.

Since the barometer measures the pressure of the atmosphere, and since this pressure is simply the weight of a vertical column of the aërial ocean above the level of the place of observation, it follows that, if we carry the instrument from a lower to a higher level, the barometric column will fall. One of the most important uses of the barometer, therefore, is as a means of determining heights. (See HYPSOMETRY.) But a barometer intended for this purpose, or a so-called "mountain-barometer," must have a construction in a number of respects differing from the barometer in common use. It must have, of course, a much larger range of scale, and especial care must be taken to guard it against the danger of fracture in transportation. If it is a cistern barometer, the cistern should be air-tight, and should have no communication with the atmosphere, except through an aperture which may be stopped by a closely-fitting screw or cock; and the adjusting screw at the bottom should have so large a range of movement as to allow all the air of the cistern to be expelled by raising the leather bottom, so that the cistern and tube may be both entirely filled with the mercury. The danger of fracture from the oscillations of this dense liquid may thus be avoided. The best mercurial mountain barometer, however, is the siphon barometer of Gay-Lussac, shown in Fig. 4, *a*, without its scale or mounting. In this instrument a tube bent in the manner shown, and closed at both ends, has two straight portions, of small but equal bore, connected by an intermediate portion so much smaller that when, after being filled with mercury, it is reversed, as shown in Fig. 4, *b*, the mercury will be held in the bend by capillarity. The only communication with the air is by the aperture *o*, which is so small that any drops of mercury which may fall into the short arm from the bend, when the instrument is reversed, cannot escape. The design, however, is to have no excess of mercury beyond what will be held by capillarity in the position *b*. This tube is suitably supported throughout its whole length, and protected by a surrounding tube of brass. The zero of its scale is at the middle of the length, and it reads from this zero both upward and downward. The readings are taken at both surfaces of the mercury, and their sum gives the true barometric height. The scale is usually inscribed on the tube itself. In transporting the instrument it is carried in the inverted position, where the mercury, filling the whole tube, is necessarily prevented from oscillating. It is usually carried by the mountaineer in a leather case swung over his back, and when set up for observation is suspended in gimbal rings, supported by a tripod.

FIG. 4.

When a barometer of this kind is carried from place to place, subject to occasional jars and concussions, sometimes perhaps in a horizontal position, there is a possibility that minute portions of air may now and then intrude into the tube, between the mercury and the glass. An effectual contrivance for preventing these from making their way into the Torricellian vacuum was devised by M. Bunten, which is represented in Fig. 4, *c*. The capillary part of the tube is divided; the extremity of the upper portion is drawn out to a minute orifice; that of the lower is widened, so as to form a globular or cylindrical chamber contracted at the mouth; and then the two are united again by fusion in the manner shown in the figure. Any air which may make its way into the tube from below is caught in this chamber, and afterwards, when the instrument is inverted for transportation, it escapes by the way it entered. The invention evinces a high degree of ingenuity.

An interesting form of the mercurial barometer, though one which wants the important property of portability, is the balance barometer, employed by Father Secchi of Rome in his "Meteorograph," or instrument for automatically recording the varying conditions of the atmosphere as to temperature, pressure, moisture, movement, etc. from day to day and from hour to hour. In this, the barometric tube is suspended from the short end of a lever or balance-beam, while the longer end may serve as an index, or may control, as in Father Secchi's apparatus, the registering pens. Of course, when the column rises, the weight is increased, and the arm of the lever which carries the tube descends. In Father Secchi's barometer the tube is of forged iron, bored truly to a diameter of two centimètres (0.8 inch), but in the superior part having the bore enlarged to six centimètres (2.4 inches) in order to increase the difference of weight caused by small variations of atmospheric pressure, and thus render the instrument more sensitive. Such a barometer requires, of course, a large cistern of mercury; especially since, in order to relieve the pressure on the pivot of the balance, it is advisable to connect with the lower end of the tube a cylinder of wood of some size, which, plunging into the mercury, sustains by its buoyancy the greater part of the weight.

Another very interesting form of mercurial barometer, which has in the highest degree the characteristic wanting in the last, of extreme portability, is one recently introduced by Mr. L. Casella, instrument-maker to the Admiralty, London, which may be called a measurer of the elasticity, rather than of the pressure, of the air—a distinction which is real, though the numerical results obtained are identical. In this instrument a glass cylinder two or three inches in height, resembling somewhat a Fortin's barometer cistern, closed at top, has a small and short glass tube descending into it to a point near the bottom. Mercury is contained in a chamber beneath this glass cylinder, and may be forced up into the cylinder by a screw acting on a flexible bottom, in the same manner as in Fortin's barometer. When the surface of the mercury reaches the extremity of the descending tube, it imprisons a certain quantity of air within the glass cylinder, and as the surface is raised higher, this air is compressed, and causes a column of mercury to rise in the tube. A scale and vernier connected with this tube enables the observer to read the height of this column, and when the level of the mercury in the cylinder reaches a certain fixed fiducial point, the reading is taken. The height of the column is really the measure of the difference between the elasticity of the compressed air and that of the free air of the atmosphere; but inasmuch as the first of these values is a simple function of the second, it is easy so to construct the scale that the readings may be the true barometric readings due to the pressure of the atmosphere at the time. This instrument possesses two important advantages: first, its very moderate dimensions; and secondly, its exemption from liability to fracture in transportation, since the quantity of mercury necessary in its construction is very small; and when this is withdrawn into the lower chamber, it may be confined there by turning a stopcock, and kept perfectly motionless. On all accounts, therefore, the instrument is admirably suited to the purposes of a mountain-barometer.

When scientific accuracy is necessary in barometric observations, all mercurial barometers require that their readings should be corrected for temperature. According to Regnault, the absolute dilatation of mercury between 0° and 100° C. = 32° and 212° F., is 0.01813, or about $\frac{1}{55}$th of its bulk. This corresponds to $\frac{1}{9900}$th of the bulk for each degree of Fahrenheit's thermometer, which would be equal, for the mean column of 30 inches, to an increase of altitude of about $\frac{3}{990}$ths, or $\frac{1}{330}$th per degree. Assuming the height at 32° F., therefore, to be the normal height, the reading at 54° F. will be $\frac{22}{330}$ths, or $\frac{1}{15}$th inch too great; at 76° F., or so-called "summer-heat," $\frac{44}{330}$ths, or $\frac{2}{15}$ths inch too great; and at 98° F., $\frac{66}{330}$ths, or 0.2 inch too great. The correction for any temperature may be made by calculation from the data here given; but it is more convenient to be provided with a table which has been calculated in advance for all the temperatures to which the observation is likely to extend.

The process of filling the mercurial barometer is one which requires great care. In pouring mercury into a

long and narrow tube it is almost impossible to avoid introducing along with it some bubbles of air, which adhere with tenacity to the sides of the tube, but which, after the tube is inverted, gradually find their way into the space above the column and vitiate the vacuum. These may be expelled by boiling the mercury in the tube before inversion, when they will be carried off with the vapor. The operation is attended with some danger to the tube, the boiling-point of mercury being above 660° F., and the concussions of the heavy column in ebullition violent. It is expedient, therefore, to introduce at first only a small quantity, and after boiling that to add more, and so proceed till the tube is filled, always applying the heat at a point but a few inches below the top of the column. Mr. Green, however, recommends filling the tube completely before beginning the operation, then boiling downward from the top, and finally upward from the bottom. There is a method of getting rid of air-bubbles, however, which is much less hazardous, and hardly less effectual, than this, and which only requires a little dexterity of manipulation to be successfully employed. In the process here referred to the tube is filled at first to within two or three inches of the open end, without any special precaution against the introduction of air. A piece of buckskin is then placed over this end and held firmly there, while the tube is carefully brought into the horizontal position, when the confined air will of course occupy the upper part of the bore throughout. If the tube in this position be slowly rotated around its own axis, the great bubble which extends along its whole length will swallow up all the small ones; so that, when it is once more made vertical they will be removed along with it. The filling is then to be carefully completed, and if any additional bubbles be noticed they will be near the mouth, and may be detached by the aid of a steel wire. Professional instrument-makers often, after employing this method, boil the mercury in the tube also for greater security.

It is of the highest importance that the mercury used in barometers should be quite pure. To be entirely safe on this score, it is best that the metal should be distilled before using, but it may also be purified by chemical means. The effect of the presence of impurities is to diminish the specific gravity of the fluid, and therefore to make its indications uncertain; but it is also to tarnish the tube, and to render observation after a time difficult or impossible.

Other fluids besides mercury may, of course, be employed in the construction of barometers, but the height of the column will in every case be greater in proportion as the specific gravity of the liquid is less. Water, for example, requires a column of 34 feet, mean height. On the other hand, the fluctuations of height of the water column are proportionally large, and serve to render conspicuous slight changes of pressure, which, in the mercurial barometer, are nearly or quite imperceptible. It is an objection, however, to the water barometer that its indications are largely affected by the vapor from the liquid which occupies the space above the column, and that the error thus arising varies with the temperature. Thus, at 70° F. the column is depressed by this cause 10 inches; at 80° F., 14 inches; and at 90° F., nearly 20 inches; while even at 32° F., the freezing-point, below which the water barometer is unavailable, the depression from the same cause is no less than 2½ inches. To all observations of such a barometer, therefore, a tabular correction must be applied, depending on the state of the attached thermometer. Another source of error in these barometers is found in the fact that all natural waters contain more or less air, which, when the atmospheric pressure is removed, makes its escape; so that, if the water for such a barometer be taken directly from a natural source, the vacuum above the column will soon be to some extent vitiated by the pressure of permanent gases as well as of vapor. This evil may be prevented, at least for a time, by thoroughly boiling the water immediately before its introduction into the tube; but it will return in consequence of the absorption of air through the surface of the fluid which is exposed to the atmospheric pressure, unless that be protected by some covering impervious to air. In the water barometer erected in the rooms of the Royal Society in London, such a protection is provided in a stratum of solution of caoutchouc in glycerine. Very few water barometers have ever been constructed. The first of the kind was erected by Otto Guericke, the inventor of the air-pump, in his house at Magdeburg. The upper portion of the tube only, to an extent of about six feet, was of glass, and this was but partially exposed to view, the rest being concealed behind the woodwork of the apartment. Floating on the top of the liquid the inventor had introduced a diminutive figure of a man, which, with the rising of the column in fair weather, presented itself to view, but with the approach of foul weather retreated out of sight. The water barometer in the rooms of the Royal Society has just been mentioned. There is such a barometer also in the theatre of the natural philosophy class in the University of Edinburgh. At the Smithsonian Institution in Washington there was set up, some twenty-five years ago, by Mr. James Green of New York, under the direction of Prof. Henry, a barometer of large dimensions in which the fluid used was sulphuric acid. This liquid is free from the objection of forming vapor in the Torricellian void; and owing to its large specific gravity a column of it less than 20 feet high suffices to balance the mean atmospheric pressure. Such, however, is the avidity with which this acid absorbs watery vapor, that its exposed surface must be in some manner protected from direct contact with the atmosphere. The protection used in this case was a balloon of India-rubber firmly secured to the short arm of the siphon barometric tube. But, though moisture was thus excluded, air was found to make its way gradually into the void above the column, and the instrument was finally disused and taken down.

A description of barometer employing no liquid has, in recent years, come extensively into use, known as the Aneroid Barometer, the invention of M. Vidi, a physicist of France. The etymology of this word has been variously given. The inventor appears to have derived it from the verb ἀνέρομαι, "I inquire," but the books commonly give it as from ἀ, privative (*i. e.* signifying negation), νηρός, "wet," and εἶδος, "form;" understanding from the combination "a form without liquid," which seems to be an interpretation sufficiently far-fetched. A third derivation is presented by Prof. De Morgan ("Budget of Paradoxes," p. 385) from ἀ (or ἀν), privative, and ἀεροειδής, "like the air," or "having to do with the air;" so that anaëroid, or aneroid, would seem to mean an instrument which has nothing to do with the air, or one which has been named, like the grove in Latin, *lucus a non lucendo*.

The instrument itself consists essentially of a flat cylindrical box formed of thin corrugated metal, from the interior of which the air has been entirely, or nearly,* exhausted; the immediate effect being to bring the top and bottom into contact with each other by atmospheric pressure. The touching surfaces are then separated by means of a strong spring attached to the centre of the upper surface, while the lower is held down, the whole being placed within a larger box properly adapted to receive it. With the varying pressure of the atmosphere the separation of the surfaces is greater or less, or the spring is more or less bent, and the movements thus occasioned are transmitted by proper multiplying-apparatus to an index which traverses a dial like that of a watch. (Fig. 5.)

Fig. 5.

Aneroid Mountain Barometer.

Aneroid barometers often perform very well, and perform well for long periods; but in time, the spring is liable to lose its elasticity, so as to render the indications untrustworthy. These instruments should therefore be occasionally compared with standard mercurial barometers. They are very convenient for transportation, being constructed of various

* Not altogether. In recent constructions, a small portion of air is left within the box, as a means of compensating for variations of temperature; this air gaining as the spring loses in elasticity by elevation of temperature, and *vice versâ*.

dimensions, from eight or ten inches in external diameter down to two, and are often graduated to serve as mountain-barometers for heights as great as 12,000 or 16,000 feet.

Another form of barometer without liquid, and in external appearance resembling the aneroid, is Bourdon's Metallic Barometer, now greatly improved by M. Richard of Paris, and constructed almost or quite exclusively by him. In this, a broad and nearly flat tube of thin metal, bent into the form of a horse-shoe, having been exhausted of air, is secured by the middle part to the box enclosing it, while the ends, left free, are connected by delicate chains

Fig. 6.

or wires with the apparatus controlling the index. (Fig. 6.) The effect of increased atmospheric pressure upon an exhausted tube of this form is to bring the extremities nearer together, and that of diminished pressure to cause them to recede; and these changes are shown by the index on the dial. M. Richard's principal improvement consists in the introduction within the tube of a steel spring having the curved form of the tube, but nowhere touching its walls; giving to it greater rigidity, and much greater uniformity of action, than belonged to the instrument as originally constructed.

Long-continued observations of the barometer have demonstrated that there are certain fluctuations of atmospheric pressure which are periodical and regular, though not large; while such as are noticeable for their magnitude are subject to no obvious law. Of periodical fluctuations there is a semi-diurnal inequality having its maximum at about 10 o'clock morning and afternoon, and its minimum at 4, afternoon and morning. Its magnitude varies with the latitude, being greatest (0.104 in.) at the equator. In lat. 40° it is 0.05 in., and in lat. 70° only 0.003 in. There is also an inequality dependent on the seasons, which in some parts of the earth is large, and in others almost or quite imperceptible. Where it is noticed, the highest reading occurs in January, and the lowest in July, or a little later. At Pekin, in China, the mean pressure for the first of these months is three-fourths of an inch greater than that for the second. A large part of Asia is similarly affected. At Havana the fluctuation is hardly a quarter of an inch, the minimum seems not to be reached before the month of August, and the decline of the monthly means is not regular. At Boston and at London the monthly means throughout the year scarcely differ from each other by the tenth of an inch, and an annual inequality can hardly be said to exist. The position of the moon seems to have a slight influence on atmospheric pressure, but this, even where most observable, is little more than half a hundredth of an inch.

The non-periodic fluctuations of pressure are very much greater than the periodic. If we call the difference between the greatest and least readings of the barometer within any month the *monthly oscillation*, and combine the observations of many years for the same month, we shall obtain the mean monthly oscillation. This is least near the equator, and increases towards the poles. At the equator it hardly exceeds 0.1 inch; in lat. 30° it is 0.4 in.; in lat. 45°, over the Atlantic, it is 1 inch; in lat. 65° it is 1½ in. During the three winter months the mean is about one-third greater. On the continents bordering the Atlantic the means are usually less than over the intervening ocean. The *extreme* fluctuations of the barometer, however, very much exceed these means. In Boston the greatest height observed in thirty-seven years is 31.125 in., and the least, 28.47 in.—difference 2.655 in. The greatest observed range at London is 3 in.; at St. Petersburg, 3.5 in. Within the tropics the range is small. At Christiansborg, near the equator, the greatest range observed in five years was 0.47. (*Loomis's Meteorology.*)

The barometer is often spoken of as a weather-glass; and the scale of the instrument is often inscribed with words indicative of the weather which may be expected when the head of the column stands opposite them. This is, however, apt to convey very erroneous notions; for neither the actual nor the approaching weather can be correctly inferred from a knowledge of only a single one of the conditions which determine meteorological phenomena. The indications of the thermometer, the anemometer, and the hygrometer, and the progressive changes denoted by those instruments, are quite as important to the prediction of the weather as those of the barometer. Moreover, the prognostications derived from these instruments which would be justified in one part of the world, would not be at all so in another where the physical conditions are different. One remark, however, is true generally. Inasmuch as there can be no considerable change in the condition of the atmosphere as to heat or moisture or movement which is not accompanied or immediately preceded or followed by a change of pressure, therefore when the barometer continues steady, whether it be high or low, the actual state of the weather, whatever it may be, is likely to last. It may be added that a rapid movement of the barometer upward or downward, say three-fourths of an inch in twenty-four hours, is of unfavorable augury. Also that a very rapid fall will probably be followed by a violent wind. A slow movement upward gives assurance generally of fair weather. On the Atlantic coast of the U. S., however, according to Loomis, the approach of a violent N. E. storm is generally indicated by a rise of the barometer above its mean height; the wind veers to the N. E., and the atmosphere becomes hazy. Rain or snow follows, and afterwards the barometer begins to fall. When it reaches the lowest point, the wind changes to N. or N. W., and the barometer rises. If a gale sets in from the E. or S. E., and the wind veers by the S., the barometer will fall till the wind becomes S. W. A lull may then occur, followed by a renewal of the gale with the wind from the N. W., and a simultaneous fall of the thermometer and rise of the barometer. When a storm of rain or snow follows, as it usually will, a rapid fall of the barometer, the wind will be N. if the thermometer is low, and S. if it is high. If the barometer falls with a rising thermometer and increased dampness, wind and rain are likely to follow from the S. The result of all rapid changes in the weather, or in the indications of meteorological instruments, is of brief duration, while that of gradual changes is generally lasting. (See Meteorological Instruments.)

While observation enables us, thus, in some manner, to connect the fluctuations of the barometer with the varying conditions or aspects of the weather, it is not easy in all cases to assign satisfactory causes for the fluctuations themselves. The low state of the column which is commonly observed to accompany the formation of heavy clouds and the fall of rain or snow, shows that the popular language, which speaks of the atmosphere at such times as "heavy," is scientifically incorrect. Many hypotheses, among them some which, in the present state of science, would be pronounced absurd on the face of them, have been proposed to account for the phenomena; but the true reason of at least the more conspicuous variations of atmospheric pressure must be looked for in rarefaction by heat, of which the ultimate source is the sun. Different portions of the earth's surface become unequally heated by the solar radiation. The heat thus acquired is imparted by the earth to the atmosphere above it, of which the portions most heated are also most dilated, and, in consequence of their diminished specific gravity, tend to rise. In rising they are further dilated by diminished pressure, and their temperature consequently falls until their contained vapor is condensed to cloud, with evolution of its latent heat. The heat evolved increases the rarefaction, and the upward movement continues. The rarefied column is not changed in weight by the mere fact of its rarefaction; but as its altitude is increased it necessarily overflows at top upon the surrounding air, of which the pressure is thus augmented, while its own is correspondingly diminished. As a necessary consequence, the barometer below it falls; and as rain naturally follows the precipitation of vapor, the rain-area will usually be found to correspond with the area of low barometer. Of periodical oscillations, the diurnal are in like manner traceable to heat. Those of longer period depend on causes less easy to ascertain.

(For more full information as to the barometer and its uses, see "Smithsonian Miscellaneous Collections," vol. I., pp. 693, by Prof. Guyot and J. W. C. Coffin, 1862; also "Manual of the Barometer," by J. W. Belville, London, 1849; also the "Smithsonian Annual Reports" of the

years 1855, 1856, 1859, and 1867. The report of 1856 has a detailed description of the construction of Green's Standard Barometer; that of 1867 contains an important memoir by Marshal VAILLANT on the hornry variations. LOOMIS'S "Meteorology," and REID'S "Law of Storms" may also be consulted with advantage.) F. A. P. BARNARD.

Barometric Light. When an upright barometer is moved gently backward and forward from the vertical to an oblique position, so as to make the mercury oscillate in the tube through a range of a few inches, the Torricellian vacuum becomes lighted up, so as to be visible in the dark. This is called the *barometric light*, and is due to electricity arising from the friction of the mercury against the inner surface of the tube. The phenomenon may be exhibited on a large scale in the vacuum of an air-pump. The chief precaution is, that the mercury and the glass apparatus be quite dry; hence the experiment succeeds best in frosty weather.

Bar'ometz, sometimes called **Tartarian** (or **Scythian**) **Lamb,** the prostrate stem (rhizome) of a fern (*Aspidium Barometz*) which grows in salt plains near the Caspian Sea. It is covered with a shaggy, silky down, and has some resemblance to an animal. It was anciently believed to be half plant, half animal. It was also known as baranetz.

Bar'on, the title of the lowest degree of hereditary nobility in Great Britain and Ireland, is the next below that of viscount. The word was formerly used to include the whole English nobility, because all noblemen were barons. The distinction between the greater and lesser barons seems to have been made at an early period in most of the countries of Europe. The greater barons, who were the king's chief tenants, held their lands directly, or *in capite*, of the Crown; while the lesser held of the greater by the tenure of military service. The greater barons had a perpetual summons to attend the parliament or great councils of the nation. The practice of conferring the rank of baron by letters-patent, and as a mere title of honor apart from the possession of land, originated in 1387. Barons are sometimes created by writ, but this mode is nearly obsolete, and creation by patent is the surest way of ensuring the hereditary character of the peerage. On great occasions a baron wears a coronet adorned with six pearls set at equal distances on the chaplet. He is addressed as "my lord" or "your lordship," and is styled "right honorable." In France and Germany and in many other countries a baron is a nobleman next in rank to a count. Formerly in Scotland a baron was not necessarily a nobleman, but was a holder of land in what was called baronial right. There are at present several classes of barons: (1) barons of England; (2) barons of Great Britain; (3) barons of the United Kingdom (all the members of these classes have seats in the House of Lords); (4) barons of Scotland; and (5) barons of Ireland; the members of the two latter classes having no seat in the House of Lords unless chosen as representative peers. The life peerage, rarely conferred, does not entitle to a seat in the House of Lords. Certain judges of the exchequer courts of England and Ireland are called barons of the exchequer.

Baron (ALEXANDER), M. D. See APPENDIX.

Baron (BERNARD), a distinguished French engraver, born at Paris in 1700, was a pupil of Nicolas Henri Tardieu, and resided for a number of years in England, where he died at London in 1762. He engraved several plates for J. A. Crozat's collection of prints. His style is coarse in mechanical execution, but his merits are acknowledged to be great. His works should not be confounded with those of John Baron (or Baronius) of Toulouse (hence called *Tolosano*), who was born in 1631, and lived at Rome, where he engraved historical scenes and portraits.

Baron, originally **Bayron** (MICHAEL), one of the greatest of French actors, was born at Paris Oct. 8, 1653. His father, a leather-merchant, having fallen in with a very beautiful travelling actress, left his business and entered the same troupe. The actress became the mother of Michael Baron. Going to Paris in after years, Michael, a very handsome young man, attracted the attention of the great Molière, who became his friend and instructor. Baron rose rapidly to the first rank of his profession, and was as eminent in tragedy as in comedy. He was with justice called "the honor and the marvel of the French stage." As a writer of plays he was very prolific. His beauty and talents caused his name to be mixed up with much of the gross scandal of the time. His personal vanity was very great. He used to say, "Every century might produce a Cæsar, but it took ten thousand years to produce one Baron." It is commonly reported that he died upon the stage, but in reality, though stricken with apoplexy on the stage, he lived after that event more than two months. He died at Paris Dec. 3, 1729.

Baron (PIERRE), called **Peter Baro,** a native of Etampes, in France, became a Protestant, and escaped to England in Queen Elizabeth's time. In 1575 he was appointed Lady Margaret professor of divinity at Cambridge, an office which he held till 1596, notwithstanding the strong opposition which his doctrinal teachings encountered. He was an opponent of Calvinism, then strongly maintained at the university and by the archbishop of Canterbury—Dr. John Whitgift. Baron was therefore subject to many vexatious annoyances, and was openly accused of heresy and of endeavoring to carry the university back to Romanism. He held to his course with great persistency, and even had the courage to preach against the famous Lambeth Articles, which had been drawn up to oppose him and his party. He was consequently forbidden to engage in polemics, and was made so uncomfortable that he was obliged to resign his position (1596) and retire to London, where he soon after died, leaving a number of Latin treatises, since published in English.

Baron and Femme, in heraldry, is the term used to designate the bearing by which the arms of husband and wife are carried per pale, or marshalled side by side on the same shield. The husband's arms are always carried on the dexter side.

Bar'onet, a diminutive of baron, is a title of honor which is hereditary. A baronet is the next lower than a baron, compared with whom, however, he is very inferior in rank. Baronets were first created in 1611 by James I., whose object was to raise money. The creation of baronets is limited only by the will of the sovereign, who confers the rank either by patent or by writ. A baronet is entitled to the prefix *Sir* to his name, and has precedence of all knights except bannerets, knights of the Garter, and privy councillors. Baronets are of four classes—those of Ulster, England, Nova Scotia (or Scotland), and the United Kingdom.

Baro'nius (CESAR), a Roman Catholic church historian, born Oct. 30, 1538, was a disciple of Saint Philip of Neri. He became cardinal and librarian of the Vatican. His celebrated "Ecclesiastical Annals" (Rome, 1588–93, 12 vols. fol.; Antwerp, 1589–1603; Mayence, 1601–05, rev. ed.) was a work of twenty-seven years. Baronius was a brilliant dialectician and stylist, but has been charged with many blunders, owing to his ignorance of Greek. Notwithstanding these errors and his strong partisan spirit, the "Annals" of Baronius are conceded to possess very great learning and value. They were written in reply to the Magdeburg Centuriators. He published a number of other works, characterized by the same faults and the same great learning as marked his "Annals." Died June 30, 1607.

Bar'ony, the lordship, honor, or fee of a baron. In England, manors were formerly called baronies, and a barony was a manorial and hereditary right arising out of land known to the law both of England and Scotland. In the Scottish law a right of barony is a right in relation to lands which have been erected or confirmed by a clause in crown charters, making the grant in *liberam baroniam*. It involved civil and criminal jurisdiction, but the clause in crown charters erecting baronies has become obsolete. The divisions of the Irish counties corresponding to the English hundreds, wapentakes, and wards, are called baronies.

Baro'zzo, or **Barozzio** (JACOPO), an illustrious Italian architect, was born at Vignola, near Modena, in 1507, from which fact he is often called **Vignola.** He studied painting at Bologna, but was so fascinated by the study of perspective that he abandoned painting for architecture, in which art he attained a great reputation. He was employed by an association of antiquaries in Rome to take measurements and execute models of the remains of the ancient statuary of Rome. These models were afterwards cast in bronze. In 1541 he went to Paris to superintend the casting of his copies, and while there was engaged in architectural pursuits. In 1550 he became architect to Pope Julius III. He designed the splendid palace of Cardinal Farnese (Caprarola), in which were placed some of his own pictures. He was engaged upon this work from 1555 to 1573. Meanwhile, upon the death of Michael Angelo in 1564, he succeeded the latter as architect of St. Peter's church. He published several valuable works on architecture, among which the best known is "Regole de' cinque ordini d'architettura" (1563), illustrated by engravings. This was long the standard authority in classic architecture. He was one of the designers of the Escorial Palace in Spain. His buildings show a happy combination of dignity and gracefulness. He died at Rome July 7, 1573.

Barquesime'to, a province of Venezuela, is bounded on the N. by Coro, on the E. by Carabobo, on the S. by Barinas and Trujillo, and on the W. by Trujillo and Maracaybo. The province of Yuracuy has lately been detached from this province, but nothing definite being known of

the boundaries, etc. of Yuracuy, we treat of the two as one. Area, 9350 square miles. The southern part of the province is mountainous, while the N. is level. The largest river of the province is the Tocuyo, which, however, does not become navigable until it enters the province of Coro. The soil is poor, but the climate, with the exception of one or two districts, healthy. The chief occupation of the inhabitants is agriculture, and the chief products are tropical fruits, wheat, coffee, cacao, indigo, and sugar. Chief town, Barquesimeto. Pop. 313,881.

Barquesimeto, a city of Venezuela, capital of the above province, and situated on a river of its own name, 175 miles W. S. W. of Caracas. It was almost destroyed by an earthquake in 1812, previously to which it had about 15,000 inhabitants. It has a college, and is situated in a fertile and well-cultivated district. Present pop. about 10,000.

Barr, a town of Germany, in Lower Alsace, 23½ miles by rail S. W. of Strasburg, has numerous vineyards. Pop. in 1871, 5651.

Barr, a township of Daviess co., Ind. Pop. 2758.

Bar'ra, a town of Italy, 3 miles E. of Naples, of which it is a pleasant suburb. It has many fine residences or country villas. Pop. 7656.

Bar'racks, buildings for the habitation of troops. The word is sometimes applied to any collection of buildings densely occupied by human beings.

The experience of the civil war in the U. S. has demonstrated that ventilation, abundance of pure air, is more important to the health of man than complete protection from cold and heat. While soldiers camped in small and crowded tents, kept closed to exclude the cold, suffered from typhoid fevers, the sick and wounded in hospital tents and in the light and open wooden barracks established as general hospitals, recovered more rapidly and certainly than those in what are called better buildings, closer and more substantial.

There are few large masonry barracks in the U. S., such as are found on the continent of Europe in almost every large town. Most of the military posts are beyond the frontier which separates the country of civilization and cultivation from the region occupied, or rather traversed, by the nomadic Indian tribes, and the scarcely less nomadic white miner and hunter. A very few of these posts built on the open prairies, where timber is scarce and costly, have been constructed of stone or brick; more are of sun-dried bricks, called by the Mexicans *adobes*. But the greater part of them are of wood—log houses in the timbered country, light frames covered with boards in the prairies. The open joints of the board wall-coverings and roofs and floors make it impossible to exclude fresh air, and they ensure a circulation of air, notwithstanding the efforts of the occupants of the building to close all ventilating openings.

The principal and more permanent barracks of the U. S. are Madison Barracks, Sackett's Harbor, N. Y.; the Citadel at Charleston; the barracks at Pensacola; Jackson Barracks, New Orleans, La.; Jefferson Barracks, St. Louis, Mo., now used as an arsenal; Baton Rouge Arsenal, and Mount Vernon Arsenal, Mississippi, now used as barracks for the army; Oglethorpe Barracks, Savannah; Benicia Barracks, California; Carlisle Barracks, Pa.; Omaha Barracks, Omaha; Fort Leavenworth, Kan.; Mobile Barracks, Mobile; Newport Barracks, Ky.; Presidio of San Francisco, Cal.; Ringgold Barracks, and Fort Brown, on the Rio Grande, Tex.; and Plattsburg Barracks, Lake Champlain. In the official list of the quartermaster's department there are 231 military posts, at all of which there are barracks, either owned or rented by the U. S. The army occupies about 5000 buildings.

At most of the U. S. navy-yards there are barracks for the marines, generally of masonry. Among them are the marine barracks of Washington, Charlestown, Brooklyn, Pensacola, and Benicia.

Since the Revolution, Paris has been enriched with very fine buildings as barracks. Those of the Prince Eugène, the Napoleon Barracks, and the new barracks on the Ile de la Cité, are noble and beautiful buildings. But it seems impossible to so arrange these great buildings as to secure thorough and satisfactory ventilation, and without fresh air, and disturbed by the movement which must take place night and day among large bodies of men occupying large rooms, these palaces are not believed to have as low rate of mortality as the temporary cheap structures in which the U. S. army lives on the frontier.

There are large barracks in all the great European capitals. Stuttgart, St. Petersburg, Paris, Naples, Rome, are noted for the beauty and extent of their barracks. The Museo Borbonico at Naples was built for a cavalry barrack; in it are now collected the many remains of Roman and Greek art unearthed at Pompeii and Herculaneum.

The Romans, who conquered the known world and held it by military occupation, built strong barracks wherever they established a permanent post. They had no firearms, and a small garrison depended upon the strength of their walls to resist the attacks of barbarians. The remains of such barracks, nearly perfect, have been found of late years at ancient Roman stations in the wilderness of Syria and Palestine. While the Roman legionary was trained and practised at hard work, he did not hesitate to use in all such constructions the forced labor of his captives of whatever rank or station. Our troops are obliged generally to build their own barracks, and, armed with rifles of long range, they depend upon superior knowledge and discipline, and seldom fight the savages from behind their barrack-walls.

There are two uses to which barracks are put: one is protection during a siege and bombardment from the missiles of the enemy; the other, and far more constant use, is protection mainly from the weather.

Many of the sea-coast forts of the U. S. make ample provision in vaulted casemates for the garrison during a siege, but such barracks in the climate of the coasts of the U. S. should never be occupied in time of peace. They are dark, damp, ill-ventilated, and unhealthy, and provision should be made for shelter outside the ramparts for the peace garrison in all cases. In the climate of Spain and Italy, of the West Indies, and of Mexico, it is probable that the custom of the tropics of living in rooms roofed with earth or masonry has not such disadvantages as farther N.

European practice allows from 420 to 1200 cubic feet of space per man in barracks and hospitals; and the latter is better than the former; but in practice the air-space is limited by the appropriations which the government grants for barracks and quarters for troops. Thorough drainage of the buildings and of the sites is essential to health. Temporary cantonments should never remain long in one place. The troops should remove to fresh ground, and the old site should not be reoccupied until time and frost have thoroughly destroyed the effete animal and vegetable matter which collects about any large body of men.

All barracks are liable, on any temporary increase of the garrison, to overcrowding. The "Regulations" of the U. S. army give to every six soldiers from 225 to 256 square feet of floor as the post is N. or S. of the 38th degree of latitude. This area, with a height of roof to average twelve feet, gives to each man 450 to 512 cubic feet of air-space. In a room intended to be occupied by thirty men, at least 60,000 cubic feet of fresh air per hour should be admitted from the outside, and as much more as can be borne without inconvenience. But all ventilating arrangements are liable to be obstructed by those for whose benefit they are intended, unless made on the most extensive and elaborate scale, and placed entirely beyond their control. A man feels the cold sensation from a draught more distinctly than the headache or oppression resulting from too close and impure an atmosphere. He knows that if he stops the ventilating inlet near him he will get rid of the draught. He does not realize that at a future time his health may break down as a consequence of this interference with ventilation. Practically, therefore, the most efficient barrack ventilation, except in the palaces of masonry built in Europe and ventilated by steam-power, is that inseparable from the imperfect construction of the building itself. These defects, beyond the skill and power of the soldier to remedy, save his health by supplying him continually with fresh air against his will.

The War Department has of late years adopted an iron barrack-bunk to be occupied by a single man, but which can be piled three tiers in height, so as to give space for circulation during the day, and has abolished the use of the two-story double wooden bunks in which soldiers formerly slept.

Books of reference: "Reports of the British Barrack Commission," London, 1861; "Circular Nos. 3 and 4 of the Surgeon-General of the United States;" "Reports on Barracks and Hospitals;" "Outline Description of Military Posts and Stations," published in 1871 by the quartermaster's department. M. C. Meigs, *U. S. Army.*

Bar'rackpore, or **Barrackpoor,** a town and military cantonment of British India, on the left (or E.) bank of the Hoogly, about 15 miles above Calcutta. It contains the country residence of the governor-general of India, and many elegant mansions of the European citizens of Calcutta, who are attracted by the salubrity of the place. The adjacent country is covered with beautiful forests and a luxuriant tropical vegetation. Here is a noble park of 250 acres, which exhibits an admirable specimen of landscape-gardening. Barrackpore was called the cradle of the Sepoy mutiny of 1857. Several regiments of native troops were stationed here. They objected to biting off the ends of the cartridges for the Enfield rifle, believing

the paper to be polluted with animal fat. A Sepoy named Mungal Pandy wounded an officer (in Feb., 1857), whose blood was the first that was shed by the mutineers.

Barracu'da, or **Barracou'da,** a kind of fish (*Sphyræna Barracuda*) of the Atlantic Ocean. It is from six to ten feet in length, and very voracious. Its flesh is eatable, except at certain seasons, when, from some unknown cause, it becomes poisonous. It is common about the Bahama Islands.

Barrafran'ca, a town of Sicily, in the province of Caltanisetta, 11 miles S. E. of Caltanisetta. P. in 1861, 8706.

Barras, de (Paul François Jean Nicolas), Count, a French Jacobin and regicide, born in Provence June 30, 1755. He was chosen a deputy to the States-General in 1789, and a member of the National Convention in 1792. He acted with the party called the Mountain, voted for the death of the king, and joined the enemies of Robespierre on the 9th Thermidor, 1794, in which crisis he was commander of the national guard. On the 13th Vendemiaire (Oct. 5, 1795), he was again appointed commander of the troops by the Convention. With the aid of Bonaparte he defeated the royalist insurgents of Paris on that day. He was one of the first five members of the Directory appointed in Nov., 1795, and acted a prominent part in the conflict of the 18th Fructidor, 1797, after which he was perhaps the most powerful of the Directors. He was venal and dissolute, and abused his power. His political career was ended by the ascendency of Bonaparte in 1799. Died Jan. 29, 1829. (See Thiers, "History of the French Revolution;" C. Doris, "Amours et Aventures du Vicomte de Barras," 4 vols., 1816.)

Bar'ratry [from the Old Fr. *barater*, to "deceive"], in law, used in various branches with different significations:

1. *Marine Insurance.*—An act committed by the master or mariners of a ship for some unlawful or fraudulent purpose, contrary to their duty to the owners, whereby an injury is sustained. Under this definition an act of negligence would not be barratry, and such is the rule in England. The French writers use the word in a broader sense, and include in it gross negligence, without reference to the motive. Some of the American cases follow this view. The general rule is, that fraud is an element in an act of barratry, though the word *fraud* is employed in a broad sense to include acts done in opposition to the owner's instructions, and yet intended for his benefit, such as sailing out of port without payment of the duties, disregard of an embargo, or breach of a blockade. Insurance is frequently made specifically to include losses occasioned by acts of barratry, and sometimes with the exception that the master is not the owner of the vessel. Barratrous acts of a serious kind are declared to be crimes by the laws of Congress. Instances are the act of piratically or feloniously seizing or running away with the vessel or cargo, or voluntarily delivering the vessel into the hands of pirates. These are capital offences.

2. *In Criminal Law.*—The act of stirring up suits and quarrels. A person practising such acts is called a "common barrator," or, in the language of Lord Coke, a common mover and maintainer of suits in disturbance of the peace, etc. A person cannot be a barrator in respect of one act only. It must appear that he is a *common* barrator. The subject is usually regulated by statute.

3. In Scotch law, barratry is the crime of a judge who is induced by bribery to render a judgment. T. W. Dwight.

Bar're, in Worcester co., Mass., 21 miles N. W. of Worcester, is on the Ware River and Massachusetts Central R. Rs. It has a national bank, savings bank, an institute for feeble-minded children, several large mills and shops, five churches, important manufactures, and one weekly newspaper. It was named in honor of Colonel Isaac Barré. Principal business, farming and dairying. Pop. 2572. D. Lyman Crandall, Ed. "Gazette."

Barre, a township of Orleans co., N. Y. Pop. 6756. It contains the village of Albion (which see).

Barre, a post-township of Washington co., Vt., 6 miles S. E. of Montpelier. It has a national bank, an academy, is the seat of Goddard Seminary, and has manufactures of agricultural tools, castings, doors, sash, blinds, etc. P. 1882.

Barre, a township of La Crosse co., Wis. Pop. 1392.

Barré (Col. Isaac), born in Dublin, Ireland, in 1726, of French parents, entered the British army, where he served with great distinction, receiving a wound at Wolfe's victory at Quebec (1759), in consequence of which he ultimately became blind. He entered the British Parliament in 1761, where for years he nobly defended the rights of the American colonists. Died in London July 20, 1802.

Bar'ree, a township of Huntingdon co., Pa. P. 1237.

Barréges, or **Baréges,** a celebrated watering-place of France, in the department of Hautes-Pyrénées, 23 miles S. of Tarbes, is 3240 feet above the level of the sea. Here are warm sulphurous springs having a temperature of about 104° to 122° F., which are esteemed efficacious in cases of scrofula, gout, etc.

Bar'rel, a large wooden vessel for holding liquids or solids, is bound with hoops, and formed of staves, which are wider in the middle than at the ends, and have bevelled edges, which render the joints tight. Each end of the barrel is closed by a circular head. The arched arrangement of the staves enables it to resist pressure from without. The term is also applied to the quantity contained by a barrel, which varies for different substances. A barrel of flour in the U. S. is equal to 196 pounds, and a barrel of pork or beef contains 200 pounds. In wine measure, 31½ gallons make a barrel. A barrel of beer in England is equal to 36½ imperial gallons.

Bar'rel Or'gan, a musical machine in which the music is produced by a barrel or cylinder set with pins or staples, which, when driven round by the hand, open the valves for admitting the wind to the pipes. The number of tunes which a single barrel organ can play is small. Barrel organs are portable, and are mostly used by performers in the streets, called organ-grinders. A street organ usually costs from $150 to $240.

Bar'ren, a county in the S. of Kentucky. Area, 500 square miles. It is bounded on the S. W. by the Big Barren River. The surface is undulating, the soil fertile. Tobacco, grain, and wool are extensively raised. Cavernous limestone underlies this county. The Louisville and Nashville R. R. passes through the N. W. part. Capital, Glasgow. Pop. 17,780.

Barren, a township of Independence co., Ark. Pop. 887.

Barren, a township of Jackson co., Ark. Pop. 290.

Barren Creek, a township of Marion co., Ark. P. 320.

Barren Creek, a township of Wicomico co., Md. P. 1572.

Barren Island, a sandy tract of land at the entrance to Jamaica Bay, on the S. shore of Long Island, is a part of Gravesend township, King's co., N. Y. It has fat-rendering establishments for utilizing the offal of New York City.

Bar'rett, a township of Monroe co., Pa. Pop. 930.

Barr'head', a manufacturing town of Scotland, in Renfrewshire, 7 miles S. W. of Glasgow. It has cotton-mills, a machine-shop, print-works, bleaching-works, etc. P. 6069.

Barricade, a military barrier or defensive work, employed to obstruct the passage of an enemy through a road or a street of a city, or to protect troops against the fire of the enemy. Such works are formed of trees, wagons, paving-stones, chains, palisades, etc. They have been often used in popular revolts and street-fights, especially by the insurgents of Paris. In 1588 the Roman Catholic faction raised barricades in Paris against Henry III., who was compelled to save himself by flight. A great number of barricades were erected in Paris by the popular party in the revolution of July, 1830, when Charles X. was dethroned. In June, 1848, the streets of Paris were again obstructed by barricades, and a bloody battle was fought between the government of Cavaignac and the Socialists or Communists, who were defeated. In order to counteract such operations, Napoleon III. widened and macadamized the principal streets of his capital, but barricades were again employed by the Communist insurgents in the spring of 1871.

Bar'rie, the capital of Simcoe co., Ontario (Canada), is at the W. extremity of Lake Simcoe, and on the Northern Railway, 65 miles N. N. W. of Toronto and 30 miles S. E. of Collingwood. It has excellent schools, a large trade, manufactures of woollen goods, and three weekly papers. Steamboats ply on the lake. Pop. in 1871, 3398.

Bar'rier Treat'ies, the name given to several treaties between England and foreign powers; the first between England and the Netherlands, negotiated by Lord Townsend in 1709. The Dutch pledged themselves to maintain the queen of England's title and the Protestant succession, while the English engaged to assist the Dutch in preserving their barrier-towns. The second was concluded between the same powers at Utrecht in 1713. The third was signed at Antwerp in 1715, between England, the Netherlands, and the emperor Charles VII.

Bar'ringer (Daniel Moreau), an American politician, born in North Carolina in 1807, graduated at the State University in 1826, and became a lawyer. He represented that State in Congress for six years (1843–49), and was American minister to Spain from 1849 to 1853. He was a delegate to the national union convention at Philadelphia in 1866. Died Sept. 1, 1873.

Bar'ringer's, a township of Iredell co., N. C. P. 998.

Bar'ring Out, a practice formerly common in English schools, consisted in the scholars taking possession of the

building and fastening the doors against the master. It seems to have been a rule that if the scholars could sustain a siege for three days, they were entitled to dictate terms regarding the holidays, hours of recreation, etc. for the ensuing year. If the master succeeded in forcing an entry, the insurgents were at his mercy. The masters, in most cases, appear to have acquiesced good-humoredly, but some exerted all their strength and ingenuity to storm the garrison. It is a singular fact that the scholars of Witton school, in Cheshire, were in 1558 directed by the statutes drawn up by the founder, Sir John Deane, to observe the practice: "To the end that the schollars have not any evil opinion of the schoolmaster, nor the schoolmaster should not mistake the schollars for requiring of customs and orders, I will that upon Thursdays and Saturdays in the afternoons, and upon holydays, they refresh themselves; and a week before Christmas and Easter, according to the old custom, they bar and keep forth the school the schoolmaster, in such sort as other schollars do in great schools."

Bar'rington, a post-village of Barrington township, Shelburne co., Nova Scotia, on the Atlantic coast, has thriving fisheries, shipbuilding, and coasting trade. Pop. about 800.—BARRINGTON PASSAGE, another village of the same township, has extensive fisheries, and is connected with Cape Sable Island by ferry. Pop. about 500.

Barrington, a township of Cook co., Ill. Pop. 1490.

Barrington, a post-township of Strafford co., N. H. Pop. 1581.

Barrington, a post-village and township of Yates co., N. Y. It has a mineral spring of some reputation. P. 1506.

Barrington, a post-township of Bristol co., R. I. P. 1111.

Barringtonia'ceæ, a natural order of exogenous trees and shrubs, natives of tropical countries, have generally very beautiful flowers and foliage. The stamens are numerous and conspicuous. Some species bear an edible fruit, as the *Careya arborea*, an East Indian tree, and *Gustavia speciosa*, which grows in America. The *Barringtonia speciosa*, or *moordilla*, is a remarkable tree of Ceylon, having dark glossy leaves, and delicate white flowers with crimson tips. Each flower has nearly one hundred stamens.

Bar'rister, in law, a person admitted to plead at the bar, and to take upon him the protection and defence of clients. Such persons are admitted in England by voluntary societies existing for several centuries, called Inns of Court. A barrister differs from an attorney principally in this respect, that an attorney prepares a cause for hearing, and a barrister conducts the trial in court. In England, a barrister can maintain no action for his fees. His services are deemed to be honorary. He may, however, receive a retainer. In the U. S., the distinction corresponding to that in England of "attorney and barrister" is attorney and counsellor-at-law. The common practice is to admit the same person to both degrees in the legal profession. A counsellor may maintain an action for his fees, as well as an attorney. Both are under the control of the courts, and may be removed for misconduct. In order to encourage freedom of speech, counsellors are not answerable for matter spoken in a cause and pertinent to the subject under discussion, even though it may reflect upon the reputation of another and be false; though it would be otherwise if the false charge was not pertinent. In England, some of the barristers and sergeants-at-law are selected to be KING'S or QUEEN'S COUNSEL (which see).

Bar'ron, a county in the N. W. of Wisconsin, drained by the Red Cedar River and several creeks. Area, 1000 square miles. Wheat, oats, and potatoes are the chief crops. Capital, Barron. Pop. 538.

Barron, a post-village, the capital of Barron co., Wis., in a township of its own name, on the Vermilion River, 121 miles N. N. W. of La Crosse. Pop. of township, 538.

Barron (JAMES), an American naval officer, born in Virginia in 1768, served in the navy under his father, who was a "commodore of all the armed vessels of the Commonwealth of Virginia," was commissioned lieutenant in the U. S. navy in 1798, and in 1799 was promoted to be a captain. He was employed on sea-service in the Mediterranean and other waters until 1807, and had acquired a high reputation for seamanship and discipline when the affair of the Chesapeake cast a shadow over his life. On the 22d of June, 1807, the Chesapeake, bearing the pennant of Com. Barron, sailed from Hampton Roads for the Mediterranean. The English war-vessel Leopard preceded the Chesapeake several miles, keeping in sight until about 3 o'clock in the afternoon, when the former bore down upon and hailed the latter, informing Com. Barron she had a despatch for him. A boat being sent alongside, the message proved to be the instructions of Admiral Berkeley of the British navy to search the Chesapeake for deserters. This Com. Barron indignantly refused to permit, and he wrote to Captain Humphreys, commanding, that he knew of no deserters on the Chesapeake, and that his orders would not permit his men to be mustered by any other than their own officers. The lieutenant who had brought this despatch to Com. Barron returned to the Leopard, and shortly after this vessel opened fire on the Chesapeake, which proved to be entirely unprepared for battle. Her decks were covered with various objects, and it was with great difficulty her batteries could be got ready; and when ready everything necessary to serve them was found to be wanting. But one gun was discharged from the Chesapeake before she struck her colors. Three deserters were found on board, and taken to the Leopard, Com. Barron being permitted to retain his ship, with which he at once returned to Norfolk. This outrage caused the greatest excitement throughout the nation. Barron was court-martialed for neglect of duty, found guilty, and suspended from the service for five years. Although restored to his rank and placed in responsible positions ashore, he never again did sea-service. A long correspondence with Com. Decatur on the Chesapeake affair terminated in a duel between them at Bladensburg, Md., in 1820, in which both were severely wounded, Decatur mortally. Barron died at Norfolk, Va., April 21, 1851, being at the time of his death the senior officer in the U. S. navy.

Barron (SAMUEL), a commodore, a brother of the preceding, was born at Hampton, Va., Sept. 25, 1765. He commanded a squadron of ten vessels which waged war against Tripoli in 1805. Died Oct. 29, 1810.

Barron (SAMUEL), a native of Virginia, entered the U. S. navy in 1812, and received the regular promotions, becoming a captain in 1855. In 1861 he entered the navy of the Confederacy, and became an admiral. He was made prisoner at the capture of Forts Clark and Hatteras, Aug. 27, 1861.

Barros, de (João), one of the most eminent of Portuguese historians, born at Viseu in 1496. He was appointed governor of the Portuguese possessions in Guinea in 1522. His greatest work is entitled "Asia, or the History of the Discoveries and Conquests of the Portuguese in the East Indies" (1552–62). He wrote only three decades of this work, which was continued by Diego de Couto to the twelfth decade. This history is admired for elegance of style and other merits. Died Oct. 20, 1570. (See MANOEL SEVERIM DE FARIA, "Vida de João de Barras," 1624; BARBOSA MACHADO, "Bibliotheca Lusitana.")

Barrot (CAMILLE HYACINTHE ODILON), a French statesman and advocate, born at Villefort in Lozère July 19, 1791. He practised law with distinction in Paris, and acted with the popular party in the revolution of 1830. About the end of that year he was elected to the Chamber of Deputies, in which he was a leader of the opposition, and advocated electoral reform. During the revolution of 1848 he supported the proposition to appoint the duchess of Orleans as regent. He was minister of justice in the first cabinet of Louis Napoleon, from Dec., 1848, to Sept., 1849.—His brother, VICTORIN-FERDINAND, born Jan. 10, 1806, practised law with success. He was minister of the interior from Oct., 1849, to Mar., 1850, and became a senator in 1853.

Bar'row, a river of Ireland, rises in Queen's county, on the N. E. slope of the Slieve Bloom Mountain. It flows in a general southward direction, passes by Carlow and New Ross, divides the counties of Kildare, Carlow, and Wexford from the counties of Queen's and Kilkenny, and, after uniting with the Suir, enters the sea through Waterford harbor. It is about 100 miles long, and is next in importance to the Shannon among Irish rivers. It is navigable for ships of 300 tons to New Ross, 25 miles from its mouth.

Barrow [from the Anglo-Saxon *beorg*, a "hill or mound," allied to the Ger. *Berg*, a "hill"], a name of the artificial mounds which are found in many countries, and which were erected in ancient times in honor of eminent persons or for monumental purposes. They are formed of earth or stones, and contain in some cases human bones, with armor and utensils. In Great Britain there are numerous barrows, which are supposed to have been raised before the island was conquered by the Romans. One of the largest barrows in Europe is Silbury Hill, in Wiltshire, which has a vertical height of 170 feet and covers 5 acres. Many artificial mounds occur in the U. S., as at Grave Creek, W. Va., and near Marietta, O.; also in Central America.

Barrow (ISAAC), D. D., F. R. S., an eminent English pulpit orator and mathematician, born in London Oct., 1630. He graduated at Cambridge as M. A. in 1652, and became professor of Greek in that place in 1660. He was appointed Lucasian professor of mathematics in 1663, but he resigned that chair in favor of his pupil, the illustrious Newton, in 1669. In 1672 he was appointed master of Trinity College, Cambridge. He published, besides other

able works, "Lectiones Opticæ" (1669) and "Lectiones Geometricæ" (1670). His reputation as a theologian rests chiefly on his sermons, which were edited by Dr. Tillotson (3 vols., 1685). They are very remarkable specimens of clear and exhaustive argument. "The sermons of Barrow," says Hallam, "display a strength of mind, a comprehensiveness, and fertility which have rarely been equalled." Died May 4, 1677. His personal character was noble. (See ARTHUR HILL, "Life of Barrow," prefixed to his collected works, 1685; WARD, "Lives of the Professors of Gresham College.")

Barrow (Sir JOHN), BART., F. R. S., an English traveller, born in Lancashire June 19, 1764. As secretary to Lord Macartney he went to China in 1792, and to the Cape of Good Hope in 1797. He was secretary to the admiralty for nearly forty years, and rendered many services to geographical science by promoting scientific expeditions. He was the chief founder of the Geographical Society. Among his works are "Travels in Southern Africa" (2 vols., 1801–03), and a "History of Voyages in the Arctic Regions" (1818). Died Nov. 23, 1848. (See his "Autobiographical Memoir," 1847.)

Bar'row-in-Fur'ness, a seaport and important town of England, in Lancashire and on the Irish Sea, 18 miles W. N. W. of Lancaster. It is on the peninsula of Furness, and is the western terminus of a railway which extends to Dalton, and connects Barrow with the whole railway-system of England. It is separated by a narrow channel from Barrow Island, and has a good harbor, formed by the island of Walney, which is 8 miles long. This place, which about 1845 was only a small fishing-village, derives its prosperity from rich mines of iron ore (red hematite) and manufactures of iron and steel, and it has recently increased with great rapidity. In 1867 the Barrow Hematite Steel Company had eleven blast furnaces in operation, and the quantity of ore taken from the mines was estimated for that year at 400,000 tons. This ore yields about 57 per cent. of iron. The steel-works of Barrow are said to be the largest Bessemer steel-works in Britain. Nearly 20,000 tons of slate are annually quarried in the vicinity. Barrow has a town-hall, a public library, and numerous churches. Large sums of money have been expended in converting the channel between the town and Barrow Island into docks, and it is probable that Barrow will become an important commercial city. Pop. in 1871, 17,992.

Barrow Strait, the passage leading from Baffin's Bay into Melville Sound. Its average width is about 30 miles.

Bar'rows (ELIJAH PORTER), S. T. D., born at Mansfield, Conn., Jan. 5, 1805, graduated at Yale in 1826, taught school in Hartford 1826–31, was ordained in 1832, pastor of the first Free Presbyterian church, New York City, 1835–37, professor of sacred literature in Western Reserve College 1837–52, and of Hebrew language and literature at Andover Theological Seminary 1853–66. In 1872 he entered the same professorship in Oberlin Theological Seminary. He has published a "Memoir of Evertin Judson" (1852), "Companion to the Bible" (1869), "Sacred Geography and Antiquities" (1872). He was one of the authors and editors of the "Bible with Notes" (American Tract Society), and has published twenty-five articles in the "Bibliotheca Sacra."

Barr's Store, a post-township of Macoupin co., Ill. Pop. 999.

Barrun'dia (José FRANCISCO), a statesman, born in Honduras in 1779, raised the standard of revolt against the Spanish government, and was chosen in 1829 president of the republic. As a member of the first republican assembly in 1824, he had introduced and carried a decree for the abolition of slavery. In 1854 he was minister to the U. S., and died Aug. 4, 1854, in New York City.

Bar'ry, a county of S. W. Central Michigan. Area, 576 square miles. It is intersected by the Thornapple River. The surface is undulating, and diversified by many small lakes, prairies, and forests of ash, sugar-maple, beech, etc. The soil is productive. Dairy products, wool, wheat, and corn are largely grown. The county is intersected by the Grand River Valley R. R., a branch of the Central R. R. Capital, Hastings. Pop. 22,199.

Barry, a county of Missouri, bordering on Arkansas. Area, 700 square miles. The White River of Arkansas flows through the S. E. part. The surface is hilly; the soil is partly based on limestone, and is mostly fertile. Grain, tobacco, and wool are raised. Lead is found here. Capital, Cassville. Pop. 10,373.

Barry, a city and township of Pike co., Ill., on the Hannibal and Naples R. R., 26 miles S. E. of Quincy, in a fine agricultural region. It has one weekly newspaper and a heavy trade in grain. Pork-packing is an important industry. Pop. of township, 2496. H. C. COBB, ED. "ADAGE."

Barry, a township of Barry co., Mich. Pop. 1297.

Barry, a post-township of Schuylkill co., Pa. P. 950.

Bar'ry (JAMES), an historical painter, born at Cork, Ireland, Oct. 11, 1741, was patronized by Edmund Burke. He passed about five years at Rome, and became a member of the Royal Academy of London, but he was expelled from the same in 1797 on account of his irritable temper. His masterpiece is "The Victors at Olympia." Died Feb. 22, 1806. (See CUNNINGHAM, "Lives of Painters and Sculptors;" "Edinburgh Review" for Aug., 1810.)

Barry (JOHN), COMMODORE, an American naval officer, born in Ireland in 1745, emigrated to America about 1760. He became commander of a U. S. frigate in 1776, and captured the English vessel Atalanta in May, 1781. Died Sept. 13, 1803.

Barry (JOHN S.) was born in Vermont in 1802. He studied law, but became a merchant of Constantine, Mich., where he removed in 1832. He became a prominent Democratic politician, and was governor of Michigan (1842–46 and 1850–52). Died Jan. 15, 1870.

Barry (MARTIN), M. D., F. R. S., an English physiologist, born in Hampshire in Mar., 1802. He graduated as M. D. in Edinburgh in 1833, and was chosen a fellow of the Royal Society in 1840. His most important work is "Researches in Embryology," for which he received the gold medal of the Royal Society of London. Died April 27, 1855.

Barry (Sir CHARLES), a distinguished English architect, born at Westminster in May, 1795. He visited Italy, Greece, and Egypt about 1818. He designed the Manchester Athenæum and the grammar-school of Edward VI. at Birmingham. In 1841 he became a royal academician. His design for the new Houses of Parliament was preferred to those of his competitors, and the work was commenced in 1840. He died in 1860. (See a "Memoir of Sir Charles Barry," by his son, the Rev. ALFRED BARRY, 1867.)

Barry (PATRICK), born near Belfast, Ireland, May, 1816, received a good English education, and devoted some years to teaching in one of the national schools. He arrived in New York May, 1836, and became clerk for Prince & Sons, nurserymen of Flushing. He removed to Rochester, N. Y., in 1840, and entered into the nursery business in partnership with George Ellwanger. The nurseries of Ellwanger & Barry are now the most extensive in the world. From 1844 to 1852 Mr. Barry edited the "Genesee Farmer;" from 1852–54, "The Horticulturist." In 1852 he published "The Fruit Garden," still a standard authority on pomological matters.

Barry (WILLIAM FARQUHAR), a distinguished American officer, colonel of the Second Artillery and brevet brigadier-general U. S. army, born Aug. 18, 1818, in New York City, graduated at West Point in 1838. His first active services were in the war against the Indians in Florida, 1852–53, when he was advanced to a captaincy. In the Mexican war he acted as aide-de-camp to Maj.-Gen. Worth. He served in the difficulties with the Indians in Dakota in 1856, and took part in the Utah expedition, 1858. When the civil war broke out he was appointed chief of artillery of the Army of the Potomac, with the rank of major and brigadier-general of volunteers. His gallant and meritorious conduct in the capture of Atlanta won him the brevet titles of colonel U. S. army and major-general of volunteers, Sept. 1, 1864. Mar. 13, 1865, he was brevetted brigadier-general U. S. A. for gallant services in the campaign terminating in the surrender of the army under Gen. J. E. Johnston, and was made brevet major-general U. S. A. in 1865. Gen. Barry organized the entire artillery of the Army of the Potomac, and served in the field with that army as chief of artillery from Mar., 1862, to Sept., 1862, participating in the siege of Yorktown and the Seven Days' battles ending with Malvern Hill. He subsequently commanded the artillery serving in the defences of Washington 1861–63, and served as chief of artillery in the armies commanded by Gen. Sherman. He has been a member of various boards, and after the war was assigned to the command of the northern (lake) frontier for the preservation of the national neutrality; and in 1867 appointed to command the U. S. Artillery School at Fortress Monroe, which post he now occupies. Gen. Barry is the author of "Engineer and Artillery Operations of the Army of the Potomac, A. D. 1861–62," in conjunction with the writer, and "A System of Tactics for the Field Artillery of the U. S.," in conjunction with Maj.-Gens. W. H. French and H. J. Hunt. J. G. BARNARD, *U. S. Army.*

Barry (WILLIAM TAYLOR), born in Lunenburg, Va., Feb. 5, 1784, graduated at William and Mary College in 1803, became a lawyer, was member of Congress from Kentucky (1810–11), served in the war of 1812, was U. S. Senator (1814–16), was in turn a judge, lieutenant-governor,

State secretary, and chief-justice of Kentucky; postmaster-general under Jackson (1828–35), and died in Liverpool Aug. 30, 1835, while on his way to Spain as U. S. minister.

Barry, du (Marie Jeanne Gomart de Vaubernier), Countess, a mistress of Louis XV. of France, born Aug. 9, 1746, had a great influence in public affairs. She was guillotined during the Reign of Terror, Dec. 3, 1793. (See "Histoire de France pendant le dix-huitième Siècle," by de Lacretelle.)

Bar'rytown, a post-village of Red Hook township, Dutchess co., N. Y., on the Hudson River R. R., 94 miles N. of New York. It has an important trade. Pop. 248.

Bars, a county of Northern Hungary. Area, 1032 square miles. With the exception of a small part in the S., the country is mountainous, and is traversed by the Gran and the Zsitva. The soil of the plain in the southern part is very fertile, and produces chiefly grain. Pop. in 1869, 137,191. Chief town, Kremnitz.

Bar-sur-Aube [Lat. *Bar'rum ad Al'bulam*], an ancient town of France, in the department of Aube, on the river Aube, 33 miles by rail E. S. E. of Troyes. It has a trade in wine, hemp, grain, and wool. The allied sovereigns held a council here Feb., 1814, and here, in the same year, occurred two battles between the allies and the French. Pop. 4809.

Bart, a post-township of Lancaster, co., Pa. Pop. 1432.

Bart, or **Barth** (Jean), a French naval hero, was born at Dunkirk in 1651. He became the captain of a privateer, and fought against the Dutch. Having performed several bold and successful exploits, he was appointed a captain of the royal navy, and obtained command of a squadron in 1697. Died April 27, 1702. (See A. Richer, "Vie de Jean Bart," 1780; Vanderest, "Histoire de Jean Bart," 1841.)

Bart'enstein, a town of Prussia, in the province of Prussia, 35 miles S. W. of Königsberg. It has considerable manufactures. Pop. in 1871, 5880.

Bar'ter, the exchange of one commodity for another, is a method of trading sometimes practised by barbarous people and others who have no money or credit. Ships sailing to uncivilized countries often carry weapons, tools, or ornaments to be used in barter with savages. Farmers in the U. S. also take produce to country stores, and receive goods in exchange without the intervention of money. In law, barter or exchange is a contract for transferring property, the consideration being some other commodity.

Bart'fa, or **Bart'feld,** an old town of North Hungary, in the county of Saros, on the river Tepla, 20 miles N. of Eperies. It has hot baths, which are much frequented, and a considerable commerce in wine, brandy, linen, etc. Pop. in 1869, 5303.

Barth, or **Bardt,** a seaport-town of Prussia, in the province of Pomerania, on the Binnensee, 15 miles W. N. W. of Stralsund. It has shipbuilding docks, and a trade in grain and wool. Pop. in 1871, 5774.

Barth (Heinrich), an enterprising German explorer, born at Hamburg Feb. 16, 1821. He travelled in Northern Africa in 1845, after which he extended his explorations to Palestine, Arabia, and Asia Minor, and published "Wanderings along the Shores of the Mediterranean" (1849). He joined Richardson and Overweg in an expedition to Central Africa, but they died in 1851, and he explored that country alone for about five years. In 1863 he became professor of geography in Berlin. He published "Travels and Discoveries in Central Africa" (5 vols., 1857), which is a very valuable work. Died Nov. 25, 1866. (See "Edinburgh Review" for Jan. to April, 1859.)

Barthélemy (Auguste Marseille), a French satiric poet, born at Marseilles in 1796. He published a number of satires which had great success. Among them are the "Villéliade," directed against the ministry of Villèle (1826), "Napoleon in Egypt" (1828), and "La Némésis" (1831). The last named was the first of a series issued weekly for one year. Died Aug. 23, 1867.

Barthélemy (Jean Jacques), an eminent French antiquary, born near Aubagne, in Provence, July 20, 1716, was an uncle of the preceding. He learned the Greek, Hebrew, Arabic, and Chaldee languages, and became keeper of the royal cabinet of medals in 1753, after which he travelled in Italy and collected many medals. He wrote several treatises on numismatics and ancient inscriptions. His principal and most popular work is "Travels of Anacharsis the Younger in Greece" ("Voyage du jeune Anacharsis en Grèce," 4 vols., 1788), which is a very agreeable production. It has been translated into many languages. He was admitted into the French Academy in 1789. Died April 30, 1795. (See Mancini-Nivernais, "Essai sur la vie de J. J. Barthélemy," 1795; Villenave, "Notice sur les ouvrage de J. J. Barthélemy," 1821.)

Barthélemy Saint-Hilaire (Jules), a French scholar and journalist, born in Paris Aug. 19, 1805. He was an editor of the "National" and other liberal journals. In 1838 he became professor of Greek and Latin philosophy in the College of France in Paris. He translated into French the works of Aristotle (4 vols., 1839–44), and wrote several works, among which is "Du Bouddhisme" (1855). He was elected a member of the National Assembly in 1848. He was secretary to President Thiers in 1872–73.

Barthez, or **Barthès** (Paul Joseph), M. D., LL.D., an eminent French physician and writer, born at Montpellier Dec. 11, 1734. He became professor of medicine at that city in 1759, and removed to Paris in 1780, after which he was consulting physician to the king and a member of the council of state. He wrote, besides other works, "New Elements of the Science of Man" (1778). Died Oct. 15, 1806. (See Lordat, "Mémoires sur la vie de P. J. Barthez," 1818.)

Bar'tholin (Thomas), M. D., one of the most eminent physicians of his time, was born at Copenhagen Oct. 20, 1616. He became in 1648 professor of anatomy at Copenhagen, and wrote, among other works in Latin, one on the lymphatic vessels (the discovery of which he claimed), a treatise on the functions of the liver, and "Anatomia" (1641), which passed through many editions and obtained a high reputation as a text-book. The Bartholin family produced many eminent physicians. Died Dec. 4, 1680.

Bartholomew, a bayou in Arkansas and Louisiana, rises in Jefferson county in the former State, flows nearly southward into Louisiana, and enters the Washita River at Washita City. It is navigable for steamboats for 250 miles.

Bartholomew, a county of the central part of Indiana, contains 400 square miles. It is drained by the Driftwood Fork of White River. The surface is partly hilly; the soil is fertile. Live-stock, grain, and tobacco are largely exported. It is intersected by the Jeffersonville Madison and Indianapolis R. R. Capital, Columbus. Pop. 21,133.

Bartholomew, a post-township of Drew co., Ark. Pop. 560.

Bartholomew, a township of Jefferson co., Ark. P. 459.

Bartholomew [Gr. Βαρθολομαῖος; Lat. *Bartholomæ'us*], Saint, one of the twelve apostles, supposed to be the same as the Nathanael mentioned in John i. 45–49. We have no authentic information respecting his labors or his death. According to tradition, he preached the gospel in India.

Bartholomew (Edward Sheffield), an American sculptor, was born at Colchester, Conn., in 1822. He practised dentistry for a time, and then learned painting, but afterwards became distinguished as a sculptor. From 1845 to 1848 he was in Hartford, and after two years spent in New York he went to Italy, where he died, at Naples, May 2, 1858. Some of his works are greatly admired. Among them are—"The Shepherd Boy," "Youth and Age," a monument to Charles Carroll, "Ganymede and the Eagle," etc.

Bartholomew Fair, a great English market held annually in West Smithfield, London, on the festival of St. Bartholomew (Aug. 24, old style). The charter of this fair was granted by Henry I. in 1133. It was originally connected with the Church, under whose auspices miracle-plays, mysteries, and moralities were represented at the fair. In the first centuries of its existence this was the chief cloth-fair of the kingdom. Leather, pewter, and live cattle were also sold here. Crowds of people were attracted to it by a variety of popular amusements and the exhibitions of acrobats, tumblers, mountebanks, mummers, and merry-andrews. Having ceased to be a place of traffic and become a nuisance, it was abolished in 1855. (See Henry Morley, "Memoirs of Bartholomew Fair," 1859.)

Bartholomew's Hospital, London, was founded in 1102 by Rahere, the king's minstrel, and was at first connected with a priory established by the same person. It was made a sanctuary by Edward II., but hospital and priory were both dissolved by Henry VIII., who founded the hospital anew, giving 500 marks yearly for its maintenance, on condition the city should give the like sum. There is a medical school attached to it, and the hospital relieves 70,000 patients annually.

Bartholomew, St., Massacre of, the massacre of French Protestants which commenced at Paris in the night between the 23d and 24th of Aug., 1572. During the minority of Charles IX. and the regency of his mother Catherine de Médicis, a long civil war raged in France between the Catholics and Huguenots, whose leaders were the prince of Condé and Admiral Coligny. In 1570 the court made to the Huguenots overtures which resulted in a treaty of

peace. Charles invited Coligny and other leaders of that party to court, and received them with warm demonstrations of friendship, which were probably perfidious. The false security of the Huguenots was increased by a marriage between Henry of Navarre and Margaret, who was a sister of Charles IX. Many Huguenots came to Paris to attend the wedding in Aug., 1572. Among the principal instigators of the massacre were Catherine de Médicis and her sons. Admiral Coligny was wounded by a shot from a window of the royal palace on the 22d. The general massacre commenced at two o'clock on Sunday morning, Aug. 24th, and continued for several days. The provinces followed the example of the capital, with some exceptions. In regard to the number of victims there is no certainty. Estimates have varied from 1000 to 10,000 for Paris, and from 2000 to 100,000 for the whole of France. (See Sismondi, "History of France;" H. Martin, "History of France;" De Thou, "Historia sui Temporis;" "The Massacre of St. Bartholomew," by Henry White, 1868.)

Bar'tizan, in Norman castles, a projecting balcony or small stone closet placed on corbels over doorways and on other parts, generally for defence, and designed to command some assailable point with the fire of its crossbow-bolts. It had perforated battlements for the defence of the archers and crossbowmen.

Bart'lett, a post-township of Carroll co., N. H. It has manufactures of lumber, etc. Pop. 629.

Bartlett, a post-village of Shelby co., Tenn. It has one weekly newspaper. Pop. 244.

Bartlett (Elisha), M. D., an American physician, born in Smithfield, R. I., Oct. 6, 1804. He became professor of medicine in the University of Maryland in 1844, and took the same position in the University of New York in 1850. He was popular as a teacher, and wrote, among other medical works, one entitled "Essay on the Philosophy of Medical Science." Died July 19, 1855.

Bartlett (Henry A.), U. S. M. C., born Aug. 19, 1838, in Patuxent, R. I., appointed a second lieutenant in the marine corps Oct. 16, 1861, became a first lieutenant Nov. 26, 1861, and a captain Nov. 29, 1867. From July, 1862, to Aug., 1864, he served on board the iron-clad New Ironsides during her numerous engagements with the forts and batteries of Charleston harbor.

Foxhall A. Parker, U. S. N.

Bartlett (Ichabod), an eminent American lawyer, born at Salisbury, N. H., July 24, 1786, and graduated at Dartmouth in 1808. He was a member of Congress from 1833 to 1839. Died Oct. 19, 1853.

Bartlett (John R.), U. S. N., born Sept. 26, 1843, in the State of New York, became an ensign in 1863, a lieutenant in 1864, and a lieutenant-commander in 1866. He served in the steamer Mississippi at the passage of Forts Jackson and St. Philip and capture of New Orleans, April 24, 1862. While attached to the steam-sloop Susquehanna he took part in both attacks on Fort Fisher, and was one of the assaulting party of Jan. 15, 1865. Commodore Godon, who commanded the Susquehanna, makes honorable mention of Bartlett in his official despatch of Jan. 17, 1865, and Lieutenant-Commander Blake, who led the men of the Susquehanna in the assault on the fort, refers to his conduct on that occasion in the following terms: "Lieutenant Bartlett, belonging to my command, remained at the 'palisades' until nightfall, and I beg to call your attention to his personal gallantry."

Foxhall A. Parker, U. S. N.

Bartlett (John Russell), an American writer, born at Providence, R. I., Oct. 23, 1805, was one of the founders of the American Ethnological Society. He was appointed in 1850 commissioner to determine the boundary between Mexico and the U. S. He published, besides other works, a "Narrative of Explorations and Incidents in Texas and New Mexico" (2 vols., 1854); "Progress of Ethnology" (1847); "Dictionary of Americanisms" (1848); "Bibliotheca Americana" (4 vols., 1865–70), etc.

Bartlett (John Sherren), M. D., an English journalist, born in 1790. He founded in New York in 1822 the "Albion," a journal which he edited with much ability until 1848. He was afterwards connected with other newspapers. Died Aug. 24, 1863.

Bartlett (Joseph), a satiric poet, born in Plymouth, Mass., June 10, 1762, graduated at Harvard in 1782, and after many vicissitudes of fortune became a lawyer. He wrote a poem on physiognomy, and one entitled "The New Vicar of Bray." Died Oct. 20, 1827.

Bartlett (Josiah), M. D., an American patriot, born at Amesbury, Mass., Nov. 21, 1729. He signed the Declaration of Independence, and was a member of the Continental Congress in 1776–78. He became president of New Hampshire in 1790, and governor of that State under the new constitution in 1793. Died May 19, 1795.

Bartlett (Samuel Colcord), D. D., was born in Salisbury, N. H., Nov. 25, 1817, and in 1836 graduated at Dartmouth College, where he was afterwards tutor, and at the Andover Theological Seminary in 1842. In 1843 he was settled over the Congregational church in Monson, Mass., in 1846 became professor of intellectual and moral philosophy in Western Reserve College, in 1852 took charge of the Franklin street church, Manchester, N. H., in 1857 became pastor of the New England church, Chicago, Ill., and in 1858 was made professor of biblical literature in the Chicago (Congregational) Theological Seminary. In 1873 he had leave of absence for a year to travel in the East. He has published "Life and Death Eternal" and "Sketches of Missions of the American Board," besides a goodly number of sermons, orations, addresses, and articles in the leading reviews. He contributed to the American edition of Smith's "Dictionary of the Bible." He has also in contemplation other and more important works.

Bartlett (William), born in Newburyport, Mass., Jan. 31, 1748. He acquired great wealth in mercantile pursuits, which he used liberally in promoting education, temperance, missions, and the cause of religion and morals. He gave $30,000 to found the Andover Theological Seminary, and added to this gift various benefactions, amounting in the aggregate to about $250,000. He also bestowed large sums upon other benevolent enterprises. Died Feb. 8, 1841.

Bartlett (William Francis), an American officer of volunteers, born in Haverhill, Mass., June 6, 1840, graduated at Harvard University in 1861. On the outbreak of the civil war he entered the service as a private soldier, and was appointed captain in the Twentieth Massachusetts July, 1861; at the siege of Yorktown, April, 1862, he lost a leg; was commissioned colonel of the Forty-ninth Massachusetts Infantry, which regiment he led in the assault on Port Hudson, La., May 27, 1863, where he was wounded in the leg and arm. On this occasion he displayed such daring, and was so conspicuous a mark, being mounted, that the Confederate officers gave orders not to shoot at him. Colonel of the Fifty-seventh Massachusetts Veteran Regiment, Aug., 1863, wounded in the battle of the Wilderness, and brigadier-general of volunteers June 22, 1864, for conspicuous gallantry. He led the assaulting column at the explosion of the mine near Petersburg July 30, 1864, and was wounded and taken prisoner. Brevetted major-general U. S. volunteers.

Bartlett (William Henry), an English artist and writer, born in London in 1809. He travelled in many parts of Europe and America, and visited Egypt and Palestine. He published numerous popular works, illustrated with engravings designed by himself. Among his works are "Walks in and about Jerusalem" (1844), and "The Nile-Boat, or Glimpses of the Land of Egypt" (1849). He died at sea in 1854.

Bartlett (William H. C.), LL.D., an American officer and scientist, born in 1804 in Lancaster co., Pa., graduated at West Point in 1826. He served, while lieutenant of engineers, as assistant professor at the Military Academy 1827–29, in the construction of Fort Monroe, Va., and Fort Adams, R. I., 1828–32, as assistant to the chief engineer at Washington, D. C., 1832–34, and as acting professor of natural and experimental philosophy at the Military Academy 1834–36. On resigning his lieutenancy, April 20, 1836, he was appointed full professor of philosophy, continuing as such till retired from active service, Feb. 14, 1871. He is author of a "Treatise on Optics," 1839, of "Synthetical Mechanics," 1850–58, of "Acoustics and Optics," 1852–59, of "Analytical Mechanics," 1853–59, and of "Spherical Astronomy," 1855–58. He is a member of several scientific associations, corporator of the National Academy of Sciences from its formation, and, since 1871, actuary of the Mutual Life Insurance Company of New York City.

George W. Cullum, *U. S. Army.*

Bart'ley (Mordecai) was born in Fayette co., Pa., Dec. 16, 1783. He removed to Ohio in 1809, and settled in Mansfield, Richland co. He served as a captain in the war of 1812, was a member of Congress (1823–31), and governor of Ohio (1844–46). Died Oct. 10, 1870. (See his Life, by A. T. Goodman.)

Bart'low, a township of Henry co., O. Pop. 126.

Bar'tol (Cyrus Augustus), D. D., a Unitarian divine and author, born at Freeport, Me., April 30, 1813. He graduated at Bowdoin College in 1832, at the Cambridge Divinity School in 1835; settled as colleague pastor of West church, Boston, in 1837. His principal writings are "Discourses on the Christian Spirit and Life" (1850), "Discourses on the Christian Body and Form" (1854), "Pictures of Europe" (1855), "Radical Problems" (1872),

and "The Rising Faith" (1873). His contributions to periodical literature are numerous and valuable, being characterized by fine literary taste and deep religious feeling.

Bartoli'ni (LORENZO), an eminent Italian sculptor, born in Tuscany in 1777. He studied and worked in Paris, and was patronized by Napoleon, who in 1808 directed him to found a school of sculpture at Carrara. In 1815 he removed to Florence, where he worked for many years. Among his masterpieces are a colossal bust of Napoleon I., the group of "Hercules and Lycus," and a group called "Charity." His works are characterized by a classic repose and simplicity. He is ranked by the Italians as second only to Canova. Died Jan. 20, 1850.

Bartoloz'zi (FRANCESCO), an Italian engraver, born in 1725, was a scholar of Ferreti and Joseph Wagner. He lived many years in London. He exerted a bad influence by spreading the stippled manner. His works are very numerous. Died in 1819.

Bar'ton, a county in the central part of Kansas. Area, 900 square miles. It is intersected by the Arkansas River and the Atchison Topeka and Santa Fé R. R., and also drained by Walnut Creek. Capital, Great Bend. Pop. in 1870, 2.

Barton, a county of Missouri, bordering on Kansas. Area, 600 square miles. It is drained by the North Fork of Spring River and several creeks. A large part of the county is prairie. Corn, wool, and tobacco are the chief crops. Among its mineral resources are coal and limestone. Capital, Lamar. Pop. 5087.

Barton, a township of Gibson co., Ind. Pop. 1626.

Barton, a post-township of Newaygo co., Mich. P. 383.

Barton, a post-township of Orleans co., Vt., is a thriving country town, with three villages and good railroad facilities. The fertile soil and abundant water-power make agricultural and manufacturing business profitable. The chief article of manufacture is lumber. There are four churches, two graded schools, one academy, one library, and one weekly newspaper. Pop. 1911.

G. H. BLAKE, ED. OF "MONITOR."

Barton, a post-township of Tioga co., N. Y. It contains Waverley and other manufacturing villages. P. 5087.

Barton, a post-tp. of Washington co., Wis. Pop. 1376.

Barton (BENJAMIN SMITH), M. D., born at Lancaster, Pa., Feb. 10, 1766, was educated at Pennsylvania College and in Europe, graduating as M. D. at Göttingen. In 1789 he became professor of natural history and botany in the College of Philadelphia, and in 1813 professor of materia medica. He published various works on natural science, materia medica, and other subjects, of which the best known is his "Elements of Botany" (1804 and 1812). Died Dec. 19, 1815.

Barton (BERNARD), known as the "Quaker poet," born in London Jan. 31, 1784, was a member of the Society of Friends. He became a clerk in a bank at Woodbridge. He published "Poems" (1820), "Napoleon, and other Poems" (1822), "Devotional Verses" (1826), "The Reliquary" (1836), "Household Verses" (1845), and other works. Sir Robert Peel procured for him a pension of £100. His works are pervaded by pious sentiment and tenderness. Died Feb. 19, 1849. (See "Memoirs and Letters of Bernard Barton," edited by his daughter.)

Barton (EDWARD H.). See APPENDIX.

Barton (WILLIAM), a Revolutionary general, born in Providence, R. I., in 1747. As lieutenant-colonel of the Rhode Island militia he captured Gen. Prescott July 10, 1777. He was wounded and disabled in 1778 at Bristol Ferry. Congress gave him a colonel's commission and a sword, and he received a grant of land in Vermont. He was many years imprisoned in Vermont for debt, but was liberated in 1825 by La Fayette, who paid the demand against him. Died at Providence Oct. 22, 1831.

Barton (WILLIAM P. C.), M. D., a botanist, nephew of Dr. B. S. Barton, graduated at Princeton in 1805, and received his degree of M. D. at the University of Pennsylvania in 1808. He published "Floræ Philadelphicæ" (1815–25), "Flora of North America" (3 vols., 1821–23), "Materia Medica," "Medical Botany," "Plan for Marine Hospitals" (1817), and several other works. He was professor of botany in the University of Pennsylvania. Died in 1855.

Barton Beds, a group of strata of clay and sand forming part of the middle eocene formation, included in the BAGSHOT BEDS (which see).

Barton City, a township of Barton co., Mo. P. 270.

Barton's Buttons (called also **Iris Ornaments**). By means of a dividing-engine, Mr. John Barton succeeded in engraving lines on steel and other surfaces not more than from the two-thousandth to the ten-thousandth of an inch apart. These, owing to the action of grooved surfaces on light, shine in the light of candles or lamps with all the colors of the spectrum. From steel dies thus prepared impressions were stamped upon buttons and other articles, forming ornaments rivalling in colors the brilliant flashes of the diamond.

Barton's Creek, a township of Wake co., N. C. P. 1585.

Bar'tow, a county in the N. of Georgia, was formerly called CASS. Area, 550 square miles. It is intersected by the Etowah River. The surface is partly mountainous or hilly; the soil is fertile. Grain, cotton, and wool are the chief crops. Copper, iron, lead, marble, and limestone are found in it. It is traversed by the Western and Atlantic R. R. Capital, Cartersville. Pop. 16,566.

Bartow (FRANCIS STEBBINS), born in Savannah, Ga., Sept. 6, 1816, graduated at Franklin College, Ga., 1835, studied law at the law school, New Haven, Conn., became a prominent member of the Savannah bar, was a member of the Georgia legislature, of the senate, and of the Confederate Congress. During the civil war he entered the army as captain of the Oglethorpe Light Infantry, was appointed colonel of Eighth Georgia Infantry, and brigadier-general C. S. A. Killed at Manassas July 21, 1861.

Bar'tram (JOHN), an American botanist, born in Darby, Chester co., Pa., in 1701. He planted a botanical garden on the Schuylkill near Philadelphia, made extensive excursions in the unsettled parts of North America, and sent specimens to Linnæus, who pronounced him "the greatest natural botanist in the world." He wrote a "Journal of a Tour to East Florida in 1766," and other works. Died Sept. 22, 1777. (See WILLIAM DARLINGTON, "Memorials of John Bartram and Humphrey Marshall," 1849.)

Bartram (WILLIAM), a botanist, a son of the preceding, was born at Kingsessing, Pa., Feb. 9, 1739. He explored the animals, plants, etc. of several Southern States, and published "Travels through North and South Carolina, Georgia, and Florida" (1791). He also prepared a list of American birds. Died July 22, 1823.

Bartsch (JOHANN ADAM BERNHARD), a German engraver and writer, born at Vienna Aug. 17, 1757. His principal work is called "The Painter-Engraver" ("Le Peintre-Graveur," 21 vols., 1821). He also prepared a "Catalogue of all the Prints of Rembrandt," and other similar works. Died Aug. 21, 1821.

Ba'ruch, a Hebrew scribe, was a friend and companion of the prophet Jeremiah, whom he served as amanuensis. Shortly after 586 B. C. he accompanied Jeremiah to Egypt. His subsequent history is unknown. The book of Baruch, which the Catholics admit into the canon of the Holy Scripture, is considered apocryphal by Protestants and Jews. It is not without literary merit. In what language or by what hand it was first written is unknown. Its sixth chapter, the so-called "epistle of Jeremiah," is of later, though very ancient, date. There is a pseudepigraphic "epistle of Baruch" in the Syriac language, probably a monastic forgery, and certainly worthless.

Bar'wood, or **Camwood,** a red dyewood from the western coast of Africa. It is the wood of *Baphia nitida*, a leguminous tree. Its coloring principle is slightly soluble in boiling water, freely soluble in alcohol and alkaline solutions. It is supposed to be identical with santoline.

Barycentric. See APPENDIX.

Bary'ta, or **Bary'tes** [Gr. *βαρύς*, "heavy," alluding to "heavy spar," its sulphate], (symbol BaO), the oxide of barium, is an alkaline earth and a virulent poison. It is an ingredient in sulphate of baryta, or heavy spar, from which it is obtained, but it is not useful for any purpose except chemical analysis. A solution of baric hydrate is used by the chemist as the best test of the presence of carbonic acid. Sulphate of baryta, or heavy spar, is a common crystallized mineral which is mixed with white lead and used as a pigment under the name of *permanent white*. Several mixtures of sulphate of baryta and white lead are manufactured and are known in commerce. *Venice white* contains 1 part sulphate of baryta and 1 part white lead. *Hamburg white* contains 2 parts sulphate of baryta and 1 part white lead. *Dutch white* contains 3 parts sulphate of baryta and 1 part white lead. The native sulphate of baryta was employed by the celebrated potter Wedgwood in the manufacture of jasper ware and for the formation of white figures, etc. on colored jars and vessels. It is also extensively used for adulterating white lead and for giving weight to paper. Baryta abounds in N. C.

Bar'ytone, written also **Baritone** [from the Gr. *βαρύς*, "heavy," and *τόνος*, "tone"], signifies the tone of a man's voice, about halfway between the bass and tenor.

It generally extends in compass from B flat to F, and occupies the same position as the *mezzo soprano* of the female voice. In Greek grammar, words with an unaccented final syllable are called barytones.

Basalt' [Lat. *basal'tes*], a rock of volcanic formation, is considered a variety of trap-rock, and is composed of felspar and augite or hornblende. It has a compact texture, a dark-green, dark-gray, or black color, and a conchoidal fracture. The most remarkable characteristic of basalt is the columnar structure which it often assumes. The columns have a regular prismatic form, which appears to be the result of a tendency or effort towards crystallization, but many theorists deny that it is at all analogous to crystallization. They generally have five or six sides, and are often divided transversely by joints at nearly equal distances. Beautiful specimens of vertical columns of basalt are found at the Giants' Causeway in the north of Ireland, and Fingal's Cave in the Scottish island of Staffa.

Bas'com (Henry Bidleman), D. D., LL.D., a bishop of the Methodist Episcopal Church South, was born at Hancock, Delaware co., N. Y., May 27, 1796. He was licensed to preach in 1813, and in 1823 was chosen chaplain to Congress; was president of Madison College, Pa. (1827–29), professor of morals, Augusta College, Ky., in 1832, and in 1842 president of Transylvania University, Ky. From 1846 to 1850 he was editor of the "Quarterly Review" of his Church. In 1850 he was made a bishop; died Sept. 8, 1850. In one of his earlier years he preached 400 times, and received a salary of twelve dollars and ten cents. Bishop Bascom was an extremely popular speaker. His sermons are considered to have been very brilliant and powerful. His complete writings were published in 1856.

Bascom (John), LL.D., born at Genoa, N. Y., May 1, 1827, and graduated at Williams College in 1849, studied law and theology, the latter at Andover Seminary. In 1855 he became professor of rhetoric in Williams College. He has published "Political Economy" (1861), "Æsthetics" (1862), "Rhetoric" (1865), "Elements of Psychology" (1869), "Science, Philosophy, and Religion" (1871), "The Philosophy of Religion," "The Philosophy of English Literature," and other works. In 1873 he was appointed president of Wisconsin University.

Base [Lat. *ba'sis*, from the Gr. βάσις, a "foundation"], a term having important applications in architecture, chemistry, geometry, heraldry, and music (It. *basso*). Base in general signifies the bottom of anything considered as its support, as the base of a mountain, the base of a pillar.

Base, in architecture, is the lower part of a pillar—*i. e.* the part between the lower end of the shaft and the top of the pedestal. The Doric column had no base. The base is composed of two parts—the *plinth*, which is a flat, square block; and the *moulding*, which is usually circular and rests upon the plinth. In botany, the base of a leaf is the part next to the petiole. The base of a fruit is the part next to the root, or the end to which the stem, peduncle, or pedicel is attached. The stem-end of a pear is called the base, although it is smaller and usually higher in position than the apex.

Base, in chemistry, is a compound body, generally consisting of a metal united with oxygen. For example, potassium (K) combines with oxygen (O), and thus forms the base potash (K_2O); sodium (Na) and oxygen, the base soda (Na_2O); lead (Pb) and oxygen, the base lead monoxide or litharge (PbO). Every oxygen base forms salts with oxygen acids to form oxy-salts. Thus, the base potash (K_2O) combines with sulphuric acid (SO_3) to make the salt sulphate of potash (K_2O,SO_3); potash with nitric acid (NO_5) to form the salt nitrate of potash or nitre (K_2O,NO_5). Occasionally sulphur or some other element replaces the oxygen in a base. Thus, the metal potassium (K) unites with sulphur (S) to form the *sulphur* base sulphide of potassium (K_2S), which can unite with a sulphur acid like sulpharsenious acid or orpiment (As_2S_3) to make the salt sulpharsenite of potash (K_2S,As_2S_3). The metal half of a base need not be a simple element, but may be a compound body which, for the time, plays the part of a simple substance. Thus, the compound ethyl (C_4H_5) can combine with oxygen to form ordinary ether ($C_4H_5)_2O$: and the base thus produced can, in its turn, combine with acids to form salts. In the new chemistry, while the basic properties of certain oxides are necessarily recognized, a different statement is made in regard to their relations to acids. Thus, it is said that, 1. In some cases, basic oxides form salts by direct combination with acids; as when vapor of sulphuric anhydride (SO_3) is passed over red-hot barium oxide (BaO), barium sulphate (BaO,SO_3 or $BaSO_4$) is formed. 2. Mostly, however, metallic salts are formed by the substitution of a metal for hydrogen in the acid. Thus, nitric acid, or hydrogen nitrate (HNO_3) + potassium hydrate (KOH) = potassium nitrate (KNO_3) + water (H_2O). In geometry, the base of a solid is the lowest part, or the side on which it stands, as the base of a cone or plane. Revised by C. F. Chandler.

Base (of operations), a military term denoting, in contradistinction to the *line* of operations, the (usually) contiguous and well-guarded (by our own or allied forces) region upon which an army depends for its supplies, reinforcements, etc., to which it sends back its sick and wounded, and upon which it (generally) would fall back in case of reverse and retreat. Much pedantry is expended upon these phrases in what were recognized as standard military treatises. The *essential* thing is, that an army *have* a base, though it may temporarily abandon one to acquire another; or in rare cases it may so thoroughly control the hostile region in which it operates as to use *it* for most of the purposes of a base.

Revised by J. G. Barnard, *U. S. Army*.

Base, in heraldry, is the lower portion of the shield. There is a dexter base, a middle base, and a sinister base.

Base, in music. See Bass.

Ba'sedow (Johann Bernhard), originally Johann Berend Basedau, a German educational reformer, born at Hamburg Sept. 11, 1723. He aimed to realize Rousseau's ideas of education, for which he founded at Dessau, in 1774, a model school called Philanthropin, and published a school-book entitled "Orbis Pictus" (1774), which was illustrated with 100 copper-plate engravings, and became very popular. His influence at one time was very great. He sought to render science and learning attractive and interesting by pictures and natural objects, instead of filling the memory with abstractions. Died July 25, 1790. (See J. C. Meyer, "Basedow's Leben und Schriften," 2 vols., 1792; H. Rathmann, "Beiträge zur Lebensgeschichte J. B. Basedow's," 1796.)

Basedow's Disease, called also **Graves' Disease** and **Exophthalmic Goitre,** is a disease more common among women than men, and characterized by prominent eyeballs, slightly enlarged thyroid gland, palpitation of the heart, and generally by anæmia. Basedow's disease frequently, though not always, ends in recovery. Its cause is stated by Niemeyer to be probably a paralysis of the vaso-motor nerves. It is best treated by good food, chalybeates, gentle exercise, and hygienic measures.

Basel'la, a genus of tropical plants of the order Chenopodiaceæ. The *Basella alba* and *rubra* have twining stems, and are commonly used as potherbs in the East Indies. In the vicinity of Paris they are raised in hotbeds, transplanted to borders, and used as a substitute for spinach. The *Basella rubra* yields a rich purple dye.

Base'ment, in architecture, the lowest story of a building, is often sunk below the level of the street, and is sometimes entirely subterranean.

Ba'shan [Heb. בָּשָׁן, of disputed significance], a district in Palestine E. of the Jordan, most of it high tableland, extending from Mount Hermon in the N. to Gilead in the S., the Yarmuk (Hieromax), which enters the Jordan just below the Sea of Galilee, being the boundary between Bashan and Gilead. At the time of the Exodus it was occupied by Amorites ("highlanders"), whose king, Og, was slain in battle with the Israelites, his people overpowered, and the whole territory assigned to the half-tribe of Manasseh. After the Captivity, Bashan consisted of four provinces: (1) Golan (modern Jaulan); (2) Argob, or Trachonitis (modern Lejah); (3) Hauran (name unchanged); (4) Batanæa (modern Bethanyeh). Iturea (now Jedur) in the N. W. was not strictly a part of Bashan, though taken by the Israelites. The whole district was, and still is, exceedingly fertile, and was famous for its oaks and its cattle. Remarkable ruins of ancient cities are found there. (See Porter's "Damascus," 1855; Wetzstein's "Reisebericht über Hauran und die Trachonen," 1860; and Porter's "Giant Cities of Bashan," 1865.)

Bashaw' [a corruption of *pâshâ*, which again is a contraction of the Persian *pâdâshâh*, a "king"], a title of honor given in the Turkish dominions to viceroys, provincial governors, generals, etc. The term is also used in English to denote a domineering, proud, or tyrannical man.

Bash'i, a township of Clarke co., Ala. Pop. 640.

Ba'shi-Bazooks', the name of certain irregular troopers in the service of the Turkish sultan. They are mostly Asiatics, and are wild, turbulent men, much addicted to plundering. They fought against the Russians in the Crimean war (1854–55).

Bash'kirs, the name of a nomadic race who inhabit the Russian government of Orenburg. In religion they are Mohammedans.

Ba'sil (*Oc'imum*), a genus of herbs and shrubs of the natural order Labiatæ. They are natives of tropical or

other warm regions, and generally have an aromatic smell and taste. The *Ocimum basilicum* (sweet basil) is an annual plant, a native of the East Indies, and is cultivated in Europe, where it is used to season food. The *Ocimum minimum*, or bush basil, another East Indian plant, is cultivated for the same use. The *Ocimum Campeachianum* is a native of Florida and of tropical America. Basil is also a common name for *Pycnanthemum*, a North American genus with numerous species, all erect, rigid herbs; also of the *Calamintha clinopodium* of Europe and North America, and other labiate herbs.

Ba'sil, or Basil'ius [Gr. Βασίλειος or Βασίλιος], Saint, surnamed the Great, an eminent Greek Father of the Church, was born at Cæsarea, in Cappadocia, about 329 A. D. He was older by about two years than his brother, Gregory of Nyssa, and was an intimate friend of Gregory Nazianzen. From 351 to 355 he was a student at Athens. Then he travelled extensively. Then he spent some seven years in monastic retirement in Pontus. In 370 he succeeded Eusebius as bishop of Cæsarea, and he died Jan. 1, 379, worn out by his ascetic habits. His works (in 3 vols., Garnier's ed., 1721–30) consist of treatises, homilies, and letters. He excelled as a letter-writer. He was the author of monastic rules and of a liturgy which still bears his name, and which is still used in the Russian Church. (See G. Hermant, "Vie de Saint Basile," 1674; J. E. Feisser, "Dissertatio de Vita Basilii Magni," 1828; Klose, "Basilius der Grosse nach seinem Leben," 1835.)

Basil I. [Lat. *Basilius*], surnamed the Macedonian, emperor of the East, was born in Macedonia in 820 A. D. His origin was obscure. He gained the favor of the emperor Michael III., who appointed Basil his own colleague in the empire in 866. After Michael was assassinated in 867, Basil became emperor. He obtained Asia Minor by conquest from the Saracens, whom he also drove out of Italy. He was an able ruler. He died in 886 A. D., and left the throne to his son, Leo VI. (See Le Beau, "Histoire du Bas-Empire;" G. Impaccianti, "Basilio il Macedone," 2 vols., 1809.)

Basil II., emperor of the East, a son of Romanus II., was born in 958 A. D. He began to reign, in conjunction with his brother Constantine, in 975. He was an able commander, and waged war with success against the calif of Bagdad and the Bulgarians. He completed the conquest of Bulgaria in 1018. Died in 1025.

Basile'an Man'uscript [Lat. *Co'dex Basilen'sis*, from *Basile'a*, the Lat. name of Bâle], the name of two very valuable manuscripts of the Greek New Testament, now in the library of Bâle: 1. A nearly complete uncial copy of the Gospels. It is believed to belong to the eighth century, and to have been written at Constantinople. 2. A beautiful cursive manuscript of the whole New Testament except the Apocalypse. It dates from the tenth century.

Basil'ian Man'uscript (*Co'dex Basilia'nus*), an important uncial manuscript of the Apocalypse, now in the Vatican library. It takes its name from the Basilian monastery at Rome, to which it once belonged. It is referred to the eighth century.

Basil'ian Monks, or Monks of St. Basil, a religious monastic order founded by Saint Basil the Great in 363 A. D. He composed a system of monastic discipline which was approved by the pope, and was practised by great numbers of monks both in the churches of the East and the Latin or Western Church. Spain, Italy, Asia Minor, and many other countries contain monasteries of this order at the present time. Those of Italy are chiefly of the Greek rite, and those of Spain, etc. of the Latin rite. In Asia Minor the United Melchite Greeks have many Basilian monks. There are convents of Basilians in Toronto and Sandwich, Canada. The monks of the Russo-Greek Church nearly all follow the rule of Saint Basil, variously modified, even the so-called monks of Saint Anthony following what is substantially the Basilian rule. The Armenian Church has also an order of Basilian monks.

Basil'ica [Gr. βασιλική, the fem. of βασιλικός, "royal," from βασιλεύς, a "king;" *i. e.* a "royal hall"], a name given by the ancient Greeks and Romans to a public hall or court-house in which princes and magistrates administered justice. Among the Romans it attained the greatest importance, and became, besides a court of justice, a market-place and exchange. The first basilica mentioned in Roman history was the Basilica Porcia, built about 182 B. C. Great numbers were subsequently erected in Rome, and each provincial town had its basilica, which was usually adjacent to the forum. The most ancient basilicas were open to the external air, and surrounded by a peristyle of columns, for which an external wall was afterwards substituted. After the reign of Constantine I. some basilicas were converted into Christian churches. The term basilica is still applied to the five great patriarchal churches in Rome and to several smaller ones.

Basilica, a code of laws, the compilation of which was commenced by Basil I., emperor of the East (867–886 A. D.), and completed by his son Leo. It is considered valuable for the interpretation of the Roman *corpus juris*, but a portion of it is lost. The "Basilica" was published by Heimbach (5 vols., 1833–50).

Basilica'ta (the ancient *Luca'nia*), a province of Italy, bounded on the N. by Capitanata, on the N. E. and E. by Bari and Otranto, on the S. E. by the Gulf of Taranto, on the S. by Calabria Citra, and on the W. by Principato Ultra and Citra. Area, 4122 square miles. It is drained by the Brandano and Basiento. The surface is mountainous. It contains a large fertile plain next to the Gulf of Taranto. Wine, grain, tobacco, and hemp are the staple products. Capital, Potenza. Pop. in 1862, 492,959.

Basil'icon Do'ron ("royal gift"), two Greek words composing the title of a work which James I. of England wrote for the instruction of his son Henry (1599). It is interesting chiefly as a literary curiosity.

Basil'icon Oint'ment, sometimes written **Basil'icum** [from the Gr. βασιλικός, "royal," so named on account of its great virtues], the *Cera'tum resi'næ* of the Pharmacopœias, is composed of five parts of resin, eight of lard, and two of yellow wax. It is much used as a stimulating application to ulcers, burns, etc.

Basili'des [Gr. Βασιλείδης], a Gnostic and founder of a sect called Basilidians, lived in Egypt in the reigns of Trajan and Hadrian, about 100–140 A. D. The events of his life are not known. Like Zoroaster, he taught the existence of two independent creative principles or powers—Good, or Light, and Evil, or Darkness.

Basilis'cus [Gr. Βασιλίσκος], emperor of the East, was a brother of Verina, the wife of Leo I. In 468 A. D. he commanded a large armament which Leo sent against Genseric the Vandal, by whom he was totally defeated. He usurped the throne in 474, but was defeated and deposed by Zeno in 476. Died in 477 A. D. (See Gibbon, "Decline and Fall of the Roman Empire.")

Bas'ilisk [Lat. *basilis'cus*; Gr. βασιλίσκος, the diminutive of βασιλεύς, a "king," so called because the protuberance on its head was thought to resemble a crown], a genus of saurian reptiles of the family Iguanidæ, sub-order Pachyglossæ, natives of the tropical parts of America. They are characterized by a thin triangular fold of skin rising from the occiput and inclined backward. They also have an elevated crest along the back and tail, capable of being erected or depressed at pleasure. They are well adapted for swimming and for climbing trees, and are innocuous and inoffensive animals. The tail is much longer than the body. The *Basiliscus mitratus* (or *Americanus*) is from twenty-five to thirty inches long, including the tail. The term basilisk was also applied to a fabulous monster by ancient and mediæval writers, who supposed that it had the form of a snake or lizard, that it infested the deserts of Africa, and that it was hatched by a toad or serpent from an egg laid by a cock. According to popular opinion, its breath poisoned the air and burned up vegetation, and the glance of its eye was fatal to men and other animals. It was sometimes called cockatrice and the king of dragons. The only creature who could face the basilisk and live was believed to be the cock; and travellers were advised to carry loud-crowing cocks with them, for the basilisk was believed to stand in great dread of his near relative, the cock, and the crowing of the cock was considered the only means of driving him away.

Basilisk.

Ba'sin [Fr. *bassin*], in geography, is a great natural depression or concavity on the earth's surface, without reference to the stratification. The basin of a river is the whole tract of land drained by that river and its tributaries. The basin of the Mississippi, for example, is coextensive with all the country between the Rocky Mountains and the Appalachian chain. The area of this is estimated at 1,244,000 square miles. The basin of a lake includes, besides the space occupied by the lake, the land drained by the rivers that flow into it. The highest line between two basins is the *watershed*, or line of separation between the waters.

Basin, in geology, is applied to depressions in the strata in which beds of a later age have been deposited. Thus, the site of the city of London, called the London basin, consisting of tertiary sands and clays, occupies a hollow in the chalk, which is bounded by the North Downs on the S.

and by the chalk-hills of Berks, Wilts, and Bucks on the N. The term is also applied to synclinal depressions of strata, especially in the coal-fields.

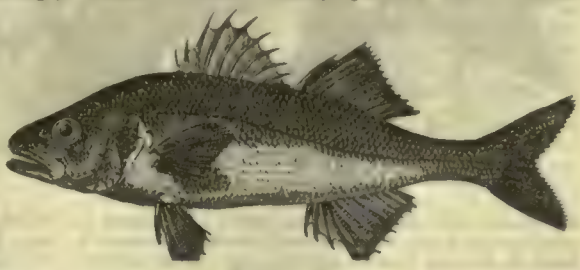
Ba'singstoke, a town of England, in Hampshire, on the South western Railway, 46 miles W. S. W. of London. It has considerable commerce in grain, malt, coal, and timber, facilitated by the Basingstoke Canal. Here is a church built at the time of Henry VIII. Basingstoke has been a market-town ever since the Norman Conquest, and was anciently of more importance than at present. Pop. in 1871, 5574.

Bas'kerville (John), a celebrated English printer and letter-founder, born in Worcestershire in 1706. He made great improvements in typography. From his press came editions highly prized of Virgil (1756), Milton, and the New Testament (1763), besides many other beautifully printed works. Died Jan. 8, 1775.

Bas'ket [Lat. *cor'bis* or *fis'cus*; Welsh, *basgawd*, "a weaving of splinters"], a vessel made of willows, twigs, or splints interwoven. Baskets have been in use from very early ages. The monuments of ancient Egypt abound in representations of baskets. They are frequently mentioned in the Bible. The ancient Britons were remarkably expert in the manufacture of baskets, which were much prized by the Romans for their neatness and elegance. The process of basket-making is very simple, and appears to be well known among the rudest peoples—even among the aborigines of Van Diemen's Land—and many tribes of American Indians display great skill and taste in making and ornamenting them. Willow, oak, and ash are chiefly made use of in the manufacture of baskets. In several parts of England and Scotland great attention is paid to the cultivation of the willow, and the returns yielded are very satisfactory. In the U. S. the rattan, oak, willow, and black ash are employed extensively. The Chinese export great numbers of beautiful baskets made of finely split bamboo.

Basnage de Beauval (Jacques), an eminent French scholar and theologian, born at Rouen in 1653. In 1676 he became a Protestant minister at Rouen, whence he emigrated to Holland in 1685. He was appointed pastor of a church at The Hague in 1709. Among his works are "The Holy Communion, or a Treatise on the Necessity and Means of Communing Worthily" (1688), a "History of the Church" (2 vols., 1699), and a "History of the Jews from Jesus Christ to the Present Time" (5 vols., 1706). Died Dec. 22, 1722. (See Niéron, "Mémoires.")

Basque Provinces [Sp. *Vasconga'das*], a part of Spain, bounded on the N. by the Bay of Biscay, comprises the four provinces, Navarre, Biscay, Guipuzcoa, and Alava. These coincided with the ancient *Cantabria*. Area, 6827 square miles. Pop. in 1867, 778,229. The surface is mountainous and presents much picturesque scenery. The tops of the hills are mostly covered with forests of oak, chestnut, beech, etc. Among the mineral resources are copper, tin, iron, marble, and porphyry. The chief towns are Bilbao, Tolosa, and Vittoria. The Basques are celebrated for their bravery, vivacity, and love of independence. They speak a peculiar language, whose relation to other tongues is still in question. Some have found a relationship, real or fancied, to the Tartar and Ugrian tongues; others find a slight resemblance to the Coptic. It is called *Euscara* by the Basques, who call their country *Euscaleria*. They have never been subdued, and retain a separate constitution, which secures to them political privileges not enjoyed by the other Spanish subjects. The origin of the Basques is doubtful. W. von Humboldt considered them descendants of the ancient Iberi. Others have conjectured that they are descendants of the pre-historic races of Europe. The total number of Basques in France and Spain is estimated at about 785,000. (See Ford's "Handbook of Spain;" Karl Wilhelm von Humboldt, "Researches on the Aborigines of Spain by means of the Basque Language," 1821; and F. Michel, "Le Pays Basque, sa Population, sa Langue, etc.," 1857.)



Bas-Relief [It. *basso-rilievo*, *i. e.* "low relief"], in sculpture, a term applied to figures which do not project or stand out far from the ground or plane on which they are formed. It is distinguished from haut-relief (alto-rilievo), in which the figures stand sometimes almost entirely free from the ground. Assyrian and Egyptian bas-reliefs were colored. Phidias in the Parthenon brought this style to a high degree of art. Relief was much cultivated by the Middle Age sculptors.

Bas-Rhin ("Lower Rhine"), a former department of France, in the northern part of Alsace, which was annexed to Germany in 1871. (See Elsass.)

Bass, or **Base** [from the It. *bas'so*, "low"], in music, is the deepest or lowest part. In respect to harmony the bass is the most important part in music, containing more frequently the fundamental notes of the chords, while on it is formed that important and effective figure in music called "organ-point." The term is also applied to the deepest and gravest quality of the human voice, the usual compass of which is from G or F below the bass staff to D or E above it. The bass voice is mostly confined to adult males.

Bass [from the Anglo-Saxon *bæst*; Danish and Ger. *bast*, the "inner bark" of a tree, especially the linden tree], or **Basswood,** is the American name of a tree (*Tilia Americana*), also called **Linden** or **Lime Tree.** It is common in the U. S., has serrate leaves, which are more or less heart-shaped, and bears a woody globular nut one-celled and one or two-seeded. The wood is light, soft, and not of much value for fuel. It is used in carriage-building. Several species of *Tilia* are found in the U. S., one of which, the *Tilia heterophylla*, or white basswood, is found in the West and South, and sometimes grows to an immense size and height. The flowers of the basswood abound in honey of excellent quality, and are eagerly sought by bees. The European linden (*Tilia Europæa*) is planted as an ornamental tree in many cities of Europe and the U. S. This species yields the bark which is made into Russia matting. (See Linden and Bast.)

Bass, the name of many species of fish of various

European Bass.

genera, but appropriately belonging to the genus *Labrax*, of the perch family, and other closely allied genera. The typical species is a European sea-fish, which is prized as food (*Labrax lupus*). It ascends streams, and has become landlocked in fresh water without injury. The striped bass of the U. S. (*Labrax lineatus*), often called rock-fish, affords a valuable supply of food. It ascends rivers, and is caught in both salt and fresh water. The white bass or perch of the great lakes (*Labrax albidus*), the ruddy bass (*Labrax rufus*) of the coast, the white perch (*Labrax pallidus*), the little black bass (*Labrax nigricans*), the spotted bass of the St. Lawrence (*Grystes notatus*), the *Grystes multilineatus* of Western lakes, the *Grystes chrysops* of the lakes, the *Grystes nigricans* (the black bass of the West), the *Centrarchus hexacanthus*, or grass bass, the *Centrarchus æneus*, or rock bass of New York State and the West, are the best known of the very numerous American fishes of the true bass family, most of which are of great value as food. The stone bass (*Polyprion cernium*) of the Atlantic and the black sea-bass (*Centropristis nigricans*) of our Eastern coast are both highly prized. The so-called Otsego bass (*Coregonus Otsego*) is a fine fish of the salmon family. The "bass" of Charleston, S. C., is the red-fish (*Corvina ocellata*), a valuable sea-fish.

Bass (Edward), D. D., the first Protestant Episcopal bishop of Massachusetts, was born at Dorchester, Mass., Nov. 23, 1726, and graduated at Harvard in 1744. He was ordained in England in 1752 by Bishop Sherlock. He was consecrated bishop of Massachusetts May 7, 1797, and his episcopal authority was afterwards extended over Rhode Island and New Hampshire. Died Sept. 10, 1803.

Bassa'no, a town of Northern Italy, in the province of Venice, on the river Brenta, 19 miles N. E. of Vicenza. It stands on an eminence near the foot of the Alps, in a country which produces excellent wine and fruits. It is well built, has many churches and several fine palaces, also a theatre, a picture-gallery, a botanic garden, and the celebrated old printing-establishment of Remondini. Bonaparte here defeated the Austrian general Wurmser, Sept. 8, 1796. Pop. in 1857, 11,827.

Bassano (or da Ponte, Giacomo), a Venetian painter, born in 1510, was the pupil of Bonifazio Venetiano, and painted at Venice and Bassano. He excelled in the representation of familiar scenes and natural objects. His coloring is good, and his works are marked by a bold naturalistic tendency, and have some of the characteristics of modern genre-painting. Died Feb. 19, 1592.

Bas'saris [Gr. *βασσαρίς*, a "fox"], a genus of North American Bassaridæ, representing the true civets of the Old World. The *Bassaris astuta*, known as civet-cat or cacomixtle, and also very incorrectly called the raccoon, is found in Mexico, Texas, California, etc. These animals are about the size of a common cat, and very playful and easily tamed. When wild they live in trees. They catch rats, mice, and birds. The tail is bushy, and marked with rings like that of the raccoon.

The Ring-tailed Bassaris.

Bassein', a city of British Burmah, on an arm of the Irrawaddy, which joins the Bay of Bengal S. of Cape Negrais. It is 90 miles from the sea, and large ships ascend to the city. Much rice is exported hence. Pop. 20,000.

Basses-Alpes (*i. e.* "Lower Alps"), a department in the S. E. part of France, is bounded on the N. by Hautes-Alpes, on the E. by Italy and Alpes-Maritimes, on the S. by Var, and on the W. by Vaucluse. Area, 2685 square miles. The surface is mostly mountainous, with some fertile valleys. It is drained by the river Durance. Pop. in 1872, 139,332. Capital, Digne.

Basses-Pyrénées (*i. e.* "Lower Pyrenees"), a frontier department of France, is bounded on the N. by Landes, on the E. by Hautes-Pyrénées, on the S. by Spain, on the W. by the Atlantic. Area, 2945 square miles. It is intersected by the river Gave-de-Pau, an affluent of the Adour, which forms its N. W. boundary. The surface is partly mountainous; the soil of the lowlands is fertile. Copper, iron, and marble are found here. The chief towns are Bayonne and Pau. Pop. in 1872, 476,701.

Basse-Terre (*i. e.* "low land"), a seaport, capital of the French island of Guadeloupe, on the S. W. coast; lat. 15° 57′ N., lon. 61° 44′ W. It is the residence of a bishop, and has a botanic garden. It has no harbor. Pop. 9480.

Basse-Terre, a town of the British West Indies, capital of St. Christopher (or St. Kitts), on the W. coast. It has a harbor and an active trade. Pop. about 6500.

Bas'sett (Richard), a statesman of Delaware, was a member of Congress in 1787, and of the convention of the same year which framed the U. S. Constitution. He was U. S. Senator (1789–93), governor of the State (1798–1801), and U. S. district judge (1801–02). He was the father-in-law of Hon. James A. Bayard. Died in Sept., 1815.

Bas'set Horn [It. *cor'no di basset'to*], the richest and softest of all wind instruments, was invented in Passau in 1770, and afterwards improved. It is similar to a clarionet in tone and fingering, and its compass is two and a half octaves.

Bas'sia, a genus of plants of the order Sapotaceæ, comprises several species of trees, natives of tropical or sub-tropical countries. It produces flowers remarkable for their fleshy corolla, and a pulpy fruit enclosing three or four seeds, which contain an abundance of oil or butyraceous fat, which is used as food and for other purposes. The *Bassia latifolia*, an East Indian tree called madhuca or mahowa, is valuable for timber, and bears seeds from which oil is obtained. The Galam butter or Shea butter, an important article of commerce in Central Africa, which is procured from the seeds of *Bassia Parkii*, is more solid and more palatable than the butter of cow's milk. It is asserted that it will keep for a year without salt.

Bassi'ni (Carlo), born in Cuneo, Italy, in 1812, became celebrated as a violinist, musical director, and composer. He was long a successful music-teacher in New York. He published the "Art of Singing" (1857), "Melodic Exercises" (1865), "Method for the Tenor" (1866), "Method for the Barytone" (1868), and other valuable works. Died Nov. 26, 1870.

Bassompierre, de (François), Baron, a French general, born at Harnel, in Lorraine, 1579. He was an accomplished courtier, greatly addicted to intrigues, and gained the favor of Louis XIII., who raised him to the rank of marshal of France in 1622, and sent him on embassies to Spain and England. He fought against the Huguenots at La Rochelle. Having offended Cardinal Richelieu, he was confined in the Bastile about twelve years (1631–42). He died Oct. 12, 1646, leaving interesting "Mémoires" (2 vols., 1665), which were written in the Bastile, and are commended as attractive in style. (See Puymaigre, "Vie de Bassompierre," 1848.)

Bassoon' [Fr. *basson;* It. *fagot'to*], a wind instrument which consists of a perforated tube of wood in several pieces, which are fastened together, so as to bring the holes and keys within the reach of the fingers. At the end is attached a small tapering, crooked brass tube, at the termination of which is placed a reed to produce the tone. It has a compass of three octaves, from double B flat to B flat in alt.

Bas'sora, Bas'sorah, Bas'ra, or **Bus'sorah,** a city of Asiatic Turkey, in the province of Irak-Arabi, on the Euphrates (here called Shat-el-Arab), 70 miles from its mouth. It is surrounded by a brick wall nearly eight miles in circuit, which encloses gardens, rice-fields, and groves of the date-palm. The houses are mean and the place is unhealthy. About half of the inhabitants are Arabs. Bassora has an extensive trade, being an entrepôt for the exchange of the productions of Turkey and Persia for the commodities of India. The river is navigable to this point for ships of 500 tons. Among the exports are horses, dates, raw silk, and precious metals. Bassora was founded by the calif Omär about 636 A. D., and was once a rich and populous city. Pop. about 4000.

Bassora Gum, a whitish or yellowish opaque substance resembling gum-arabic, but differing from it by being mostly insoluble in water.

Basso-Rilievo. See Bas-Relief.

Bass River, a township of Burlington co., N. J. Pop. 807.

Bass's Strait separates Australia from Tasmania, and is about 140 miles wide. It was first explored by George Bass in 1798. The navigation of this strait is obstructed by small islands and coral reefs.

Bast, or **Bass** [Lat. *liber* or *endophlæ'um*], the fibrous inner bark of exogenous plants, consists mostly of sap-vessels or laticiferous vessels. It is most conspicuous in exogenous trees as the substance interposed between the true bark and the wood. It is sometimes valuable for medicinal purposes, and is often used in the fabrication of cloths, ropes, mats, sacks, etc. The Russians apply the name bast especially to the inner bark of the linden tree (*Tilia Europæa*), which is extensively used for making ropes, mats, and shoes. The trees are cut down in spring when the sap abounds. This matting is extensively imported, and used in packing furniture and other articles, covering tender plants in gardens, etc.

Bas'tard [Old Fr.], in law, a person born of parents not married to each other. It includes several distinct cases, as where the mother is unmarried, or she is a married woman, or where she was married at the time of conception, but not married at the time of birth—*e. g.*, being then divorced from the bonds of matrimony or a widow. By the rules of the common law the fact of the marriage of the

parents at the time of birth is the test of legitimacy, even though such marriage may have immediately preceded the birth. By the civil or Roman law, intermarriage after birth has a retroactive effect, and makes the child legitimate. This rule prevails in Scotland. This difference presents frequently an interesting question in private international law. Thus, if a person owning both land and personal property in England should become domiciled in Scotland, and there marry the mother of his bastard child, the marriage would make the child legitimate, so that he could succeed to the personal property in England, but he would not inherit the land there situated. Some of the States in this country follow the common-law rule, while others by statute have adopted the Scotch, so that the same point may arise in our inter-State jurisprudence. In the case where the mother is a married woman, and it is claimed that a child is the offspring of an adulterous connection, it will not be enough that the adulterer may have been the father. It must be proved that the husband could not have been, either by absence from the country or other sufficient reason. The presumptions of law favor legitimacy, and public policy requires that these should only be overcome by the most satisfactory proof. (The details of this branch of the law can be found in the work of Mr. NICHOLAS on the "Law of Adulterine Bastardy.") Public policy also requires that the mother should not be allowed, for the purpose of bastardizing the issue, to be a witness to prove want of access on the part of the husband. In the special case where the mother is at the time of the child's birth a widow, a question may arise as to the effect of the time intervening between the death of the husband and the birth of the child in raising a presumption of illegitimacy. No precise time is fixed by law, and the testimony of experts must be resorted to. Statutes sometimes fix a period after which the presumption of illegitimacy will arise. A similar question may arise after a divorce from the bonds of matrimony for the husband's fault. In the case of a divorce from bed and board, where a child subsequently comes into existence it is presumed to be illegitimate, as it will be supposed that the parties have obeyed the decree of the court and have lived apart. This presumption may be rebutted by satisfactory evidence.

By the common law, a parent is not bound to sustain an illegitimate child. By a series of statutes in England, commencing in the reign of Queen Elizabeth, the duty of support is imposed on the supposed father as well as the mother. This legislation proceeds upon the theory that it is a criminal act to bring such a child into the world and to cast its support upon the public. Accordingly, an inquiry is had before magistrates into the facts of the case, and if parentage is established an order is made for a periodical allowance for the child's support. Should the parent abscond, his or her property may be sequestered. Due provision is made for a review of the order of the magistrates. These statutes are substantially re-enacted in this country. This class of children do not have the same civil rights in all respects as those who are legitimate. They cannot inherit land from either father, mother, or collateral relatives, or transmit land to them. Natural ties are, however, regarded, it being the same crime for bastard relatives to intermarry as for those who are legitimate. Such a child has no name except as it may acquire it by reputation. It is deemed to have its domicil of origin at the place of its birth. These disabilities in this country are to some extent modified by statutes in the respective States. Thus, in New York an illegitimate child may inherit from its mother, in default of legitimate descendants; so the mother may in like circumstances inherit from the child. A bastard child may be made legitimate by a special act of the legislature both in England and in this country. Such an act cannot, however, interfere with vested rights of others. It could not divest property which had been previously transmitted to legitimate relatives.

T. W. DWIGHT.

Basti'a, a fortified seaport of Corsica, on the N. E. coast, 75 miles N. E. of Ajaccio; lat. 42° 42′ N., lon. 9° 27′ E. It is the richest and most populous town in the island, of which it was formerly the capital. It is picturesquely situated on the slope of a hill which rises in the form of an amphitheatre. It has a harbor which admits small vessels, and has a considerable trade in leather, wine, oil, coral, etc. Here are numerous tanneries. Pop. in 1866, 21,535.

Bas'tian (HENRY CHARLTON), M. D., F. R. S., born at Truro, England, April 26, 1837, is distinguished as an advocate of the doctrine of the spontaneous generation of living organisms. He early gained a brilliant fame as a pathologist. He has since his twenty-third year been officially connected with the London University, and in 1871 became professor of pathological anatomy in University College. He has published "Modes of Origin of Lowest Organisms" (1871) and "The Beginnings of Life" (1872).

Bastiat (FRÉDÉRIC), an eminent French political economist and advocate of free trade, was born at Bayonne June 29, 1801. He wrote against the protective system in the "Journal des Économistes." During a visit to England he became acquainted with Cobden, and on his return (1845) he produced translations of the speeches of British free-traders. He was chosen a member of the Constituent and Legislative Assemblies of 1848 and 1849. His chief work is "Harmonies Économiques" (1849). He died at Rome Dec. 24, 1850.

Bastide (JULES), a French republican and journalist, was born in Paris Nov. 22, 1800. He became chief editor of the "National" about 1836, and founded the "Revue Nationale" in 1846. He was minister of foreign affairs under Cavaignac from June to Dec., 1848. He has published important educational and historical works.

Bastile, or **Bastille** [from *bâtir* or *bastir*, to "build"], a French word signifying "fortress," applied especially to the state prison and citadel of Paris, which was built about 1370 by Charles V. Additions were made to it by several successive kings, and it was surrounded by a wide ditch. Among its prominent features were eight large round towers five stories high, having walls twelve feet thick or more. In these towers were many cells for prisoners. The inmates of this prison were generally noblemen, authors, politicians, etc., who had not been legally convicted of crime, but were victims of royal jealousy, political despotism, court intrigue, or ecclesiastical persecution. The only formula used in condemning a man to the Bastile was the *lettre de cachet*. Among the eminent men confined here were Voltaire, Bassompierre, and the Man in the Iron Mask. The prisoners were left in ignorance of the cause and duration of their punishment, and were completely debarred from intercourse with their friends. The first violent symptom of the French Revolution was the destruction of the Bastile, which the populace took by storm July 14, 1789. They killed the governor, De Launay, and released the prisoners, who were only seven in number.

Bastina'do [It. *bastona'ta*, a "blow with a stick," from *basto'ne*, a "staff" or "stick"], a name given by Europeans to a form of punishment which is common in Turkey and several Oriental countries, and was practised by the ancient Egyptians. It consists of blows inflicted with a stick on the soles of the feet.

Bas'tion [from the Fr. *bâtir* (formerly spelled *bastir*), to "build"], a bulwark; a projecting tower erected to defend the wall of a town or fortification. An unbroken wall enveloping a city or other place, for its defence, would be unseen at its foot; hence during ancient times and the Middle Ages towers of various kinds projected at intervals, from which the intermediate portions of the wall could be observed and reached by defensive projectiles (*i. e.* "flanked"). The invention of gunpowder made it necessary to cover enveloping walls (the *enceinte*) by earth in the form of a glacis in front of the ditch, and to enlarge these flanking towers to receive artillery. Thus enlarged, their own walls would have been undefended had not their outline been so contrived that they should *flank* each other. Hence arises the *bastion*, the two faces of which, directed upon the inner extremities of the flanks of the adjoining bastions, are *flanked* (that is, defended) by them; hence a bastion has two faces and two flanks; the fifth side of the figure, called the *gorge* (between the extremities of the *curtain* and towards the interior of the place), is usually open. That portion of the enceinte which fills the interval between two bastions, uniting with the inner extremities of their flanks, is called the *curtain*. The *ensemble* of a curtain and two half bastions is called a *bastioned front*. (See FORTIFICATION, by O. H. ERNST, captain of engineers, U. S. Army.)

Bas'tress, a township of Lycoming co., Pa. Pop. 251.

Bas'trop, a county of the central part of Texas, has an area of 1001 square miles. It is intersected by the Colorado River, which is here navigable for steamboats. The surface is undulating; the soil is generally fertile, and produces cotton and maize. Lignite is abundant. It is intersected by the western division of the Houston and Texas Central R. R. Capital, Bastrop. Pop. 12,290.

Bastrop, a post-village, capital of Morehouse parish, La., on Bayou Bartholomew, 300 miles N. by W. of Baton Rouge. It has two academies, one weekly paper, and is in one of the best cotton regions in the State. Pop. 521.

ED. "MOREHOUSE CONSERVATIVE."

Bastrop, a post-village, capital of Bastrop co., Tex., on the Colorado River, 35 miles E. S. E. of Austin City. It has one weekly newspaper. Pop. 1199.

Bas'yle [from the Gr. βάσις, "base," and ὕλη, "timber," "substance"] is the name given by Graham to a substance,

whether simple or compound, which can unite with oxygen to produce a base. Thus, all the metals are examples of simple basyles, while ammonium, ethyl, methyl, etc. are compound basyles.

Bat [Lat. *vespertilio*], the common name for animals belonging to the order Cheiroptera, mammals possessing a fold of skin which commences at the neck and extends on each side between the fore legs or arms and the posterior limbs, serving as wings which enable the animal to fly. Bats are the only mammals which have the power of flight. The anterior extremities and digits are usually very long, the eyes small, ears large, thumbs short and armed with a hook-like nail, as are each of the toes of the hind feet. The clavicle is generally long. Some species have a spur on the heel. Bats fly for the most part only in the night, living by day in hollow trees, caves, and dark buildings. Even when their eyes have been destroyed, they can fly through narrow and tortuous passages without hitting. This is probably owing to their delicate sense of hearing and touch. Except in tropical climates, they hibernate in cold weather.

Bats are divided into two groups: the so-called frugivorous and the insectivorous bats. The former are found only in the Old World tropical regions. They feed chiefly on fruits, but also eat birds, small mammals, etc. They number forty or more species, and include the rousettes, kalongs, "flying foxes," etc. Some of them can spread their wings five feet from tip to tip. The principal genus is *Pteropus*, and its species are remarkable as having only twenty-four vertebræ, a smaller number than any other known vertebrate possesses. The insectivorous bats are by far the most numerous, some 200 species being described. The most formidable of these are the vampires—tropical American bats of the genus *Phyllostoma*, having a leaf-like membrane on the end of the nose. They are famous for their habit of fastening upon sleeping animals and men for the purpose of sucking their blood. Such witnesses as D'Azara, Tschudi, Waterton, and Darwin confirm this disputed statement. The bats of the U. S. are not very numerous in species, though abundant in individuals. They are of the genera *Vespertilio*, *Molossus*, *Plecotus*, etc. Europe is much more rich in species, the "long-eared bat," *Plecotus communis*, being one of the most common. Bats are extremely useful in destroying insects, and their excrement so accumulates in certain caves, as in Farther India, in Tennessee, Arkansas, etc., as to promise to become an important source of guano, of which the quality is in some cases excellent. Fossil remains of bats first appear in the eocene.

Flying Fox Bat.

Vampire Bat.

Long-eared Bat.

CHAS. W. GREENE.

Bat'aszek, a town of Hungary, in the county of Tolna, 70 miles W. of Szegedin, has large vineyards which produce an excellent wine. Pop. in 1870, 6452.

Batatas Edulis. See SWEET POTATO.

Bata'vi, an ancient German tribe or nation who inhabited the country now called Holland, especially an island called *Batavia* or *Insula Batavorum*, which was enclosed by the Rhine, the Waal (Vahalis), the Meuse (Mosa), and the ocean. They were conquered by Germanicus, and became loyal subjects of the Roman empire. They were exempted from the payment of taxes. The Batavian cavalry served in the Roman armies, and had a high reputation.

Bata'via, a city and seaport of Java, the capital of the Dutch possessions in the East Indies, is on the northern coast of the island and on the Java Sea; lat. 6° 8′ S., lon. 106° 50′ E. Its site is flat and marshy, and intersected by canals. The place was formerly very unhealthy, but has been improved by draining. The temperature continues about uniform throughout the year, the average being 78° F. Batavia, which has a good harbor, is the greatest commercial emporium of the Malay Archipelago. It has a stadthouse, an exchange, numerous churches, several Chinese temples, a bank, a school of arts and sciences, and a botanic garden. A telegraphic cable connects it with Singapore, about 600 miles distant. The chief articles of export are coffee, sugar, pepper, indigo, hides, cloves, nutmegs, mace, tin, rice, and rattans. Among the imports are various articles of European manufacture. Pop. estimated at 180,000. This city was founded by the Dutch in 1619.

Batavia, a post-village and township of Kane co., Ill., on Fox River, 38 miles W. of Chicago, with which it is connected by two railroad lines. It has two large schools, an institute for the insane, valuable quarries, extensive manufactures, a weekly newspaper, and a national bank. Pop. of township, 3018. ED. OF "NEWS."

Batavia, a post-township of Branch co., Mich. P. 1308.

Batavia, the county-seat of Genesee co., N. Y., on the Tonawanda Creek and the New York Central and Erie R. Rs. The Canandaigua and Tonawanda and Attica R. Rs. meet at this point, 36 miles E. of Buffalo and 32 miles W. of Rochester. It contains six churches, several important manufactories, two national banks, one savings bank, three newspaper-offices, union school, ladies' seminary, public library, and the State institution for the blind. Pop. of village, 3890; of Batavia township, 6485.
HENRY TODD, ED. "SPIRIT OF THE TIMES."

Batavia, a post-village, capital of Clermont co., O., on the East Fork of the Little Miami River, 21 miles E. of Cincinnati. It has a manufactory of tin-ware, one of carriages, a national bank, and two weekly papers. Pop. of township, 3334. ED. OF "CLERMONT SUN."

Bata'vian Repub'lic. Holland having been conquered by the French in 1795, the prince of Orange was deposed and a new government was established with the title of the Batavian republic. This was an ally or tributary to the French republic, and as such was involved in a war against the British, who nearly ruined the Dutch navy. In June, 1806, this republic was converted into a kingdom, of which Louis Bonaparte became king.

Bat'chelder (SAMUEL), born in Jaffrey, N. H., June 8, 1784, began the cotton manufacture in New Ipswich, N. H., in 1808. He superintended the erection of cotton-mills in Lowell, Saco, etc., invented a dynamometer for mill-work, and published a "History of the Cotton Manufacture in the U. S."

Bat'cheller (OLIVER A.), U. S. N., born June 1, 1842, in the State of New York, graduated at the Naval Academy in 1861, became an ensign in 1862, a lieutenant in 1864, and a lieutenant-commander in 1866. He was attached to the steamer Mississippi at the attack on Port Hudson, Mar. 15, 1863, when that vessel was destroyed. In 1864 and 1865 he was attached to the Western Gulf blockading squadron, and served on the steamer Monongahela as executive officer in the battle of Mobile Bay, Aug. 5, 1864, and in the subsequent operations leading to the fall of Mobile. He was commended for gallantry by his commanding officer, Commander Strong, in his official report to Rear-Admiral Farragut of Aug. 6, 1864.
FOXHALL A. PARKER, U. S. N.

Bateman (KATE JOSEPHINE), an actress, was born at Baltimore, Md., Oct. 7, 1842, and was the daughter of H. L. Bateman and Mrs. Bateman, both well known in theatrical circles; and her sister Ellen (Mrs. Greppo) was also an actress before her marriage. The sisters were brought up almost from infancy upon the stage. In 1862, Kate Bateman appeared at Boston as "Leah," her greatest character, and won great applause in the U. S. and Great Britain. In 1866 she was married to George Crowe, a former editor of the "London News."

Bates, a county of Missouri, bordering on Kansas. Area, 900 square miles. It is traversed by the Marais des Cygnes (or Osage River). Cattle, grain, and tobacco are extensively raised. The surface is undulating; a large part of the county is prairie. Capital, Butler. Pop. 15,960.

Bates, a township of Sebastian co., Ark. Pop. 623.

Bates, a township of Greenville co., S. C. Pop. 1400.

Bates (EDWARD), LL.D., an American statesman and lawyer, was born at Belmont, Goochland co., Va., Sept. 4, 1793, and emigrated to Missouri in his youth. He became a political friend of Henry Clay, and was elected a member of Congress in 1827. He presided at the national convention of the friends of internal improvement which met at Chicago in 1847, and opposed the repeal of the Missouri Compromise in 1854. In Mar., 1861, he was appointed attorney-general of the U. S. He resigned in 1864. Died Mar. 25, 1869.

Bates (ISAAC C.), born at Granville, Mass., in 1780,

graduated at Yale in 1802, became a lawyer at Northampton, Mass., was a Whig member of Congress (1827–35) and U. S. Senator (1842–45). Died Mar. 16, 1845.

Bates (Joshua), born in Weymouth, Mass., in 1788. He removed to London in 1826, and became a partner in the banking house of Baring Brothers & Co. He was the principal founder of the Boston Free Library, to establish which he gave $50,000, on the condition that it should be "perfectly free to all, with no other restrictions than may be necessary for the preservation of the books." He afterwards contributed books to the value of $50,000. Died Sept. 24, 1864. (See "Memorial of Joshua Bates, from the city of Boston," 1865.)

Bates (Joshua), D. D., born at Cohasset, Mass., Mar. 20, 1776, graduated at Harvard in 1800, was ordained pastor of the Congregational church at Dedham, Mass., in 1803, was president of Middlebury College, Vt. (1818–39), was for a time chaplain of the U. S. Senate, and pastor in Dudley, Mass. (1843–54). He published various discourses, sermons, and other writings. Died Jan. 14, 1854.

Bates (Martin W.), born at Salisbury, Conn., Feb. 24, 1787, studied medicine, but became a lawyer of Delaware, from which State he was U. S. Senator (1857–59). Died at Dover, Del., Jan. 1, 1869.

Bates (Samuel Penniman), LL.D., born at Mendon, Mass., in 1827, graduated at Brown University in 1851, was principal of Meadville Academy, Pa. (1852–57), where he did much to stimulate the cause of education. In 1857 he became superintendent of schools in Crawford co., Pa.; in 1860 deputy State superintendent; in 1865 State historian of Pennsylvania. He has published various works, among which are a "History of Pennsylvania Volunteers" (5 vols.), "History of the Colleges of Pennsylvania," "School Laws of Pennsylvania. He assisted in preparing Armor's "Lives of the Governors of Pennsylvania" (1873).

Bates (William), D. D., one of the most ornate and learned of the English nonconformist writers, was born in Nov., 1625, and died at Hackney, July 14, 1699. He assisted at the Savoy Conference for reviewing the Liturgy. Soon after the restoration of Charles II. he was made one of His Majesty's chaplains, and but for his nonconformity might have become a bishop. His contemporaries called him the "silver-tongued." In 1681 he published (anonymously) "Vitæ Selectorum Aliquot Virorum." His most valuable treatise is "The Harmony of the Divine Attributes in the Contrivance and Accomplishment of Man's Redemption," 1697. His collected works were published in 1700, again in 1723, and again in 1815, by Farmer, in 4 vols. 8vo.

Batesville, a post-village, capital of Independence co., Ark., on White River, 90 miles N. N. E. of Little Rock, and 115 miles W. N. W. of Memphis. It is the seat of Batesville Academy and Soulesbury Institute. The river is navigable for small steamboats to this point, and part of the year for large ones. It has 2 free schools, 2 hotels, 1 woollen factory, 5 flouring-mills, 2 wagon-shops, 1 cabinet warehouse, and 1 weekly paper. Pop. 881.

W. H. Bayne, Pub. "Republican."

Batesville, a post-village of Panola co., Miss. P. 227.

Bath [Ger. *Bad*], the application to the body of water or other liquid, or of spray or vapor, for the purpose of cleansing the surface or of preserving or restoring health. Water, employed in the bath, is an important agent in the treatment and prevention of disease. In ancient Greece, Rome, Germany, and Judea, in Mohammedan lands (by religious precept), as in modern Finland and some other countries, bathing may be regarded as almost universal, though in desert countries the Moslems use sand instead of the water which is there so precious. Some of the American Indians, though not otherwise remarkably clean, practise bathing in water or steam even to excess. Surf-bathing is a nearly universal pastime on many islands of the Pacific. The ancient Romans had extensive public baths—institutions which of late have been revived in Europe and America on a smaller scale, but in a manner not liable to the serious abuses which disgraced the Roman baths.

The "hot" bath and vapor bath are above 99° F., the normal heat of the blood; warm, tepid, and cold baths being of lower temperature. The vapor bath of water or alcohol accelerates the heart's action, softens the skin, and produces profuse sweating, and is useful in various skin diseases, in chronic rheumatism, and in some diseases of the kidneys, etc. The hot bath is also stimulant. Locally applied, it relieves pain and allays inflammation. The hot bath is often employed in the convulsive diseases of children, but its effect may be a profound one; and the tepid or warm bath is much safer, since the skin of a child is extremely sensitive to heat and cold. The hot bath sometimes causes a sense as of choking, and a degree of giddiness or headache. When its action is favorable, profuse sweating results. The warm bath is a sedative, usually inclining one to inactivity or sleep. It is useful in feverish or restless conditions and in eruptive diseases, but is not to be recommended in acute diseases of the chest, which may be aggravated by it. The cold and tepid bath are those most generally to be employed. Cold bathing ought never to be practised while the person is exhausted or perspiring freely; and there are many nervous, thin, and sensitive persons who cannot safely endure the shock and loss of heat which it occasions. The application of cold water by the sponge or "pack" is an excellent measure in many cases of typhoid and other fevers. The "hydropathic pack" (in which the patient is wrapped in a wet sheet and closely covered with blankets), the hip bath, the douche or jet, and the shower bath have each their important uses in therapeutics. Various sulphur and other springs have a direct effect in skin diseases, and useful saline and other principles are no doubt capable of absorption into the system by the skin. Various drugs are used in vapor baths, and act upon the patient after absorption. Sea-bathing has a peculiar tonic effect upon some patients. Besides the above, the "Turkish" and "Russian" baths have been devised, which combine a thorough and direct detergent effect upon the skin with the various advantages of the warm and tepid bath, adding thereto the often invaluable results of manipulation or "kneading" the patient, a process the importance of which in selected cases can hardly be overestimated. "Wine baths," "mud baths," and other devices have been tried in different diseases, often with more or less benefit to the patient.

Revised by Willard Parker.

Bath (anc. *Aquæ Solis*), a city of England, capital of Somersetshire, is beautifully situated in a valley on the river Avon, 20 miles from its mouth and 102 miles by rail W. S. W. of London; lat. 51° 23′ N., lon. 2° 22′ W. The houses are mostly built of white freestone, "Bath oolite," quarried in the vicinity. Bath presents perhaps a finer appearance than any other city of England, which is partly a consequence of the configuration of its site. This is in the form of an amphitheatre, on the declivity of which the finest streets extend in successive terraces. The principal public buildings are the Abbey church, in the latest Gothic style, 210 feet long; St. Michael's church, the guild-hall, an elegant theatre, a masonic temple, and the assembly and concert rooms. The beauty of the situation, the mildness of the climate, and the curative efficacy of its hot saline springs render Bath a very fashionable place of resort. The temperature of the springs, four in number, varies from 97° to 117° F. They rise on the bank of the river, and discharge 184,320 gallons daily. This water is recommended for scrofula, palsy, gout, cutaneous diseases, etc. This city sends two members to Parliament. The Romans erected baths at this place in the first century, and called it *Aquæ Solis*. Numerous Roman antiquities have been found in and near Bath. The Great Western Railway passes through Bath. Pop. in 1871, 52,542.

Bath, a port of entry, capital of Addington co., province of Ontario, Canada, is on the N. shore of the Bay of Quinté, in Ernestown township, 18 miles W. S. W. of Kingston.

Bath, a county in N. E. Kentucky. Area, 290 square miles. It is bounded on the N. E. by the Licking River. The surface is partly hilly; the soil in the N. W. part is based on limestone, and is fertile. Grain, tobacco, and wool are among the chief crops. The county contains coal and medicinal springs. Capital, Owingsville. Pop. 10,145.

Bath, a county of Virginia, bordering on West Virginia. Area, 725 square miles. It is intersected by the Cowpasture River and Back Creek. The surface is diversified by ridges of the Alleghany Mountains with intervening valleys, and abounds in beautiful scenery. Grain, wool, and stock are raised. Limestone and iron ore are found here. The county is traversed by the Chesapeake and Ohio R. R. It contains many medicinal springs, including the "Hot Springs" (110° F.), the "Warm Springs," the "Healing Springs," the "Bath Alum Springs," etc. It also contains the famous "Blowing Cave," and abounds in fine scenery. Capital, Bath Court-house, or Warm Springs. Pop. 3795.

Bath, a post-village and township of Mason co., Ill., near the Illinois River, and on the Peoria Pekin and Jacksonville R. R., 34 miles N. by E. of Jacksonville. Pop. 464; of township, 2124.

Bath, a township of Franklin co., Ind. Pop. 675.

Bath, a city of Maine, and capital of Sagadahoc co., is on the right (W.) bank of the Kennebec River, 12 miles from the ocean, 30 miles S. of Augusta, and 36 miles N. E. of Portland. It is built on uneven ground, is lighted with gas, and contains five national banks and twelve churches.

It is advantageously situated for navigation, and has steamboat communication with Boston and Portland. The Knox and Lincoln R. R., running from Rockland, 45 miles long, connects with the Maine Central at Bath. The principal business of Bath is shipbuilding. In the year ending June, 1863, sixteen ships and barks, two brigs, and one steamer were built here. There are also many extensive manufactories of lumber, two of boots and shoes, one of carriages, and a large manufactory of railroad cars, a large iron-foundry, brass-foundry, cordage-factory, and machine and boiler shops. There are three printing-offices, one daily and one weekly paper, three bookstores, and one bookbindery. Bath has long been noted for the excellence of its schools. Pop. 7371.

E. Upton, Ed. "Daily Times."

Bath, a post-township of Clinton co., Mich. P. 1125.

Bath, a township of Freeborn co., Minn. Pop. 404.

Bath, a post-township of Grafton co., N. H., on the Connecticut River and on the Boston Concord and Montreal R. R., 15 miles S. W. of Littleton. It has an academy, and manufactures of lumber, leather, paper, boots, shoes, starch, etc. Pop. 1168.

Bath, a village of New Utrecht township, Kings co., N. Y., on Gravesend Bay, and on the Brooklyn Bath and Coney Island R. R., 2 miles from Coney Island. It is a summer resort.

Bath, a village of North Greenbush township, Rensselaer co., N. Y., on the Hudson River, opposite the upper portion of Albany. It has a mineral spring. Pop. 1465.

Bath, a post-village and semi-capital of Steuben co., N. Y., is on the Cohocton Creek and on the Erie R. R. (Rochester division), 74 miles S. S. E. of Rochester and 310 miles from New York. It has a jail and court-house, six churches, one national bank, several factories and mills, two newspapers, and an orphan asylum. Pop. of Bath township, 6236.

Bath, a post-township of Beaufort co., N. C. Pop. 1969.

Bath, a township of Allen co., O. Pop. 1255.

Bath, a post-township of Greene co., O. Pop. 2684.

Bath, a post-township of Summit co., O. Pop. 1034.

Bath, a post-borough of Northampton co., Pa., 10 miles W. of Easton, with which it is connected by railroad. Pop. 707.

Bath (or **Berk'ley Springs**), the capital of Morgan co., West Va., is situated 2½ miles S. of the Potomac River and the Baltimore and Ohio R. R., at Sir John's Run, 128 miles W. N. W. of Baltimore. Here are medicinal springs, which are much frequented, and have a temperature of 74° F. They are useful in rheumatic, calculous, nervous, and catarrhal diseases. It has a large tannery and one weekly newspaper. Pop. 407; of Bath township, 925.

C. H. Hodgson, Ed. "Mercury."

Bath Alum Springs, a post-village of Bath co., Va., 5 miles E. of Bath Court-house and 45 miles W. of Staunton. Here are several aluminous and chalybeate springs, which are much frequented by patients who require tonic and moderately astringent medication.

Bath Court-house, or **Warm Springs,** a post-village, capital of Bath co., Va., 50 miles W. of Staunton and 5 miles N. E. of Hot Springs. It has warm saline, chalybeate springs, which have a reputation for the cure of scrofula, rheumatism, and anæmia.

Bath King of Arms (called also **Gloucester King of Arms**), the principal herald of the order of the Bath and of the principality of Wales. Gloucester King of Arms was a title conferred only by Richard III. of England, until 1726, when George I. restored the office, and conferred the higher title of Bath King of Arms. This officer does not belong to the College of Heralds, but takes precedence of both Clarenceux and Norroy. He grants arms in his jurisdiction, subject to Garter and the Earl Marshal.

Bath, Knights of the, a military order in Great Britain, deriving its name from the ceremony of bathing which was performed at the initiation of the knights. The earliest authentic instance of this ceremony was at the coronation of Henry IV. (1399). The last occasion on which this ceremony was used was the coronation of Charles II., in 1660, after which the order fell into oblivion until it was revived by George I. in 1725. It is now the second in rank among the orders of England, the order of the Garter being the highest. The order of the Bath comprises three classes: first class, Knights Grand Cross (K. G. C.), the number of whom is limited to 50 military men and 25 civilians, besides the royal family; second class, Knights Commanders (K. C. B.) = 102 military and 50 civil; these and the first have the title of Sir; third class, Companions (C. B.) = 525 military and 200 civil.

Bath, Marquesses of (1789, Great Britain); Viscounts Weymouth, Barons Thynne (England, 1682), and baronets (England, 1641), a prominent family of Great Britain.—John Alexander Thynne, the fourth marquess, was born Mar. 1, 1831, and succeeded his father in 1837.

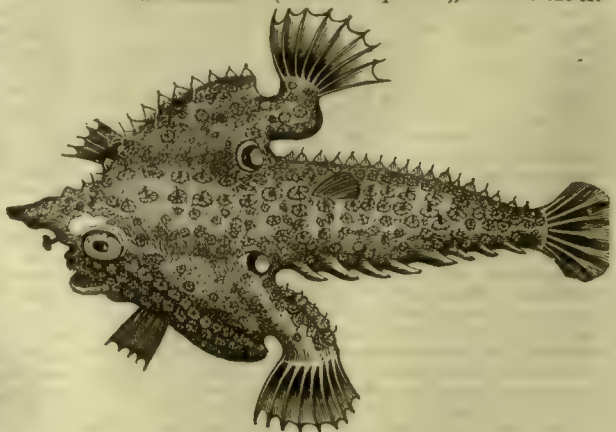
Bath Stone, a building-stone extensively used in England, is procured from quarries in the lower oolite in Somersetshire, near Bath. It is fine-grained, of a rich cream color, is easily wrought, and hardens on exposure to the air, but is not very durable. It contains about 94 per cent. of carbonate of lime and 2½ of carbonate of magnesia.

Bath'urst, a thriving town of New South Wales, capital of Bathurst county, is on the Macquarie River, 98 miles W. N. W. of Sydney. It is connected with Sydney by a fine road leading over the mountains. It is the centre of the mining district of New South Wales. Pop. in 1871, about 5000; of the town and district, 16,826.

Bathurst, a port of entry, capital of Gloucester co., New Brunswick, on the Bay of Chaleurs, 175 miles N. by E. of St. John, has a good harbor, and an extensive trade in lumber, trout, and salmon. Pop. in 1871, 4469.

Bathurst, Earls of, Barons Apsley (1771), Barons Bathurst (1712, in the peerage of Great Britain), a prominent family of Great Britain.—William Lennox Bathurst, the fifth earl, born Feb. 14, 1791, succeeded his brother, the fourth earl, in May, 1866.

Bathyb'ius [from the Gr. *βαθύς*, "deep," and *βίος*, "life"], a name given by some biologists to a formless expanse of matter of an albuminous or protoplasmic character which is believed to cover large areas of the ocean's bed, and to manifest some characteristic evidences of possessing organic and perhaps animal life. Its existence is not universally admitted by savants.



Bathyl'lus [Gr. Βάθυλλος], a popular comedian and performer of comic pantomime, was born at Alexandria in Egypt, and lived about 30 B. C. He was a freedman of Mæcenas, and played in Rome.

Bat'iscan Bridge, a post-village of Champlain co., Quebec, Canada, on the N. shore of the St. Lawrence, 69 miles below Quebec, has two lighthouses and manufactures and exports of flour, lumber, and leather.

Batiste (bȧ'teest') **Cambric,** a fine white linen tissue, remarkable for the firmness and evenness of the threads, manufactured in India and France. The term is sometimes applied to a thin fabric which is partly cotton, or to a thin stuff made of silk and wool or of native Indian fibre.

Batley (Robert), M. D. See Appendix.

Bat Malthæ'a (*Malthæa vespertilio*), a fish of the Atlantic Ocean, found from South America to Newfoundland, chiefly remarkable for the monstrosity of its shape. Other species of the genus are known, but they are not very frequently taken.

Bat Malthæa.

Bat'on [originally, *baston;* a French word signifying "staff," "stick," or "truncheon"] a staff of office, a symbol of authority among many nations. The baton of a marshal of France or British field-marshal is a symbol of the highest military authority. The term is also applied by the French to a bishop's crook and to a flagstaff.

Baton Rouge, a city of Louisiana, capital of the

parish of East Baton Rouge, is on the left (E.) bank of the Mississippi, 129 miles above New Orleans; lat. 30° 28′ N., lon. 91° 11′ W. It stands on a bluff which rises about 25 feet above the highest inundations. The river below the city is bordered by plantations of sugar-cane, groves of tropical fruit trees, and handsome villas and gardens. The seat of government was established here in 1817. The capitol was completed in 1852 at a cost of $246,000. It contains a State-house (which was burned during the war, though its walls are still perfect), a college, four churches, asylums for the deaf and dumb and the blind, and a penitentiary in which are 600 convicts. The legislature met here Jan. 21, 1861, and on the 26th adopted the ordinance of secession. The city was taken by the U. S. forces May 7, 1862. On Aug. 5, 1862, a Confederate force, numbering 5000, under Gen. Breckenridge, attacked the garrison under Gen. Thomas Williams, but was repulsed after a fierce contest of two hours' duration, in which Gen. Williams was killed. The place was shortly after evacuated by the U. S. forces. The arsenal has been broken up. The climate is delightful and healthy, and the soil from which this city draws its support is rich and easy to cultivate. For the growth of grapes, peaches, plums, figs, etc. it has few equals. Baton Rouge has two weekly, one semi-monthly, and one tri-weekly paper. Pop. 6498.

W. C. Annis, Ed. "Gazette-Comet."

Baton Rouge, a village and township of Chester co., S. C., 54 miles N. N. W. of Columbia. Pop. of township, 3098.

Ba'too' (**Baton** or **Batu**) **Khan,** said to have been the grandson of Jengis Khan, became governor of Kapchak in 1223. He conquered Russia, which he held in subjection ten years, and made war on Poland and Hungary. Died in 1255.

Batra'chia (plu.), [from the Gr. βάτραχος, a "frog"], called also **Batrachians** and **Amphibians,** one of the five great classes into which the vertebrate animals are usually divided, though some writers have reduced the class to the rank of an order of reptiles—a class with which they are popularly confounded. The batrachians are cold-blooded and oviparous, and in most living species are without scales, and the blood is partly aërated through the skin. The young, for the most part, breathe by gills like those

Hatching and Progress of the Frog.

of fishes. They generally have limbs, but not always. Their eggs are generally fecundated after extrusion. In most cases the eggs are laid in moist places or in water; the young assume a fish-like form (as the tadpole), and finally, when adult, with few exceptions, lose their gills and commence breathing by lungs like true or scaly reptiles. They further differ from reptiles in various points, such as in having two occipital condyles, while reptiles have but one, and in having very short ribs or none at all, while reptiles have a series of ribs. Batrachians are arranged in four orders: (1) Labyrinthodonts, all extinct, which approached the characters of ganoid fishes in their teeth, while in their scales and in some other points they resembled true reptiles. (2) Cæcilia, which approach the serpents in form, being long and without legs, and having also minute scales; but anatomically and in development they are batrachians. They are popularly classed with snakes. (3) The Anura, or tailless batrachians, including frogs, tree-frogs, and toads, whose young, when they leave the tadpole state, not only lose their gills and become lung-breathers, but also lose the tail, put forth legs, become carnivorous, and for the most part adopt a mode of progression by a series of leaps. It is stated that in waterless regions there are frogs which pass the tadpole state in the egg, and are hatched perfect. (4) The Urodela, or tailed batrachians, comprising, *a*, Salamandridæ (true salamanders which are terrestrial, and tritons or water-newts); *b*, Amphiumidæ, including the "Congo snake," the "hell-bender," etc., breathing by cervical spiracles and undergoing no metamorphosis; *c*, the Sirenidæ, having both lungs and external gill-tufts.

Bat'rachomyoma'chia [from the Gr. βάτραχος, a "frog," μῦς, μυός, a "mouse," and μάχη, a "battle"], the name of a mock-heroic poem, the subject of which was the battles of the frogs and mice. It has been erroneously ascribed to Homer. It was published by Matthiæ (1805) and by Baumeister (1852).

Batshian, or **Batchian,** an island of the group of Moluccas, belonging to the Dutch, lies S. W. of Gilolo. Area, about 900 square miles. The surface is mountainous; the soil is fertile, and produces excellent cloves.

Bat'ta, an allowance to the officers of the British army in India in addition to the ordinary pay. The batta varies according to the part of the country in which the officers are employed, and depends on the circumstance of their being in the field or in cantonments. The officers receive full batta if they are in the field or more than 200 miles from the presidential government cities. They receive half batta when they are in garrison or in cantonment within that distance.

Battaks, called also **Battas,** a race of people living in that part of Sumatra called Batta, which lies between the equator and the parallel of 2° 30′ N. They are addicted to gambling, and are passionately fond of cock-fights. They speak a peculiar language, have an original alphabet or character, and write treatises on pieces of bamboo. They commence at the bottom of the page, and write from right to left. They make books of the inner bark of a species of palm. (See Junghuhn, "Die Battaländer auf Sumatra," 2 vols., 1847.)

Battal'ion [Fr. *bataillon*], a tactical unit of infantry; a body of infantry amounting to nearly 1000 men. In the American cavalry and artillery service eight (in infantry ten) companies constitute a battalion. The full complement of a battalion of British troops is usually ten companies. The British infantry regiments in time of peace have each one battalion, but the regiment of the continental powers is mostly so large as to comprise several battalions. In the U. S. army an infantry regiment has one battalion, while regiments in the other arms of the service have two. A detachment of infantry of more than one company, and less than one regiment, is sometimes called a battalion.

Bat'tel [Fr. *bataille*], an ancient mode of trial by single combat, usually called "wager of battle." It had its origin among the German tribes, and was introduced into England by William the Conqueror at the time of the Norman conquest. It was used, however, in only three cases—in the court of chivalry, in appeals of felony, and in the issue joined in a writ of right to determine the title to real property. In criminal cases the accuser and the accused fought in person; in civil cases, by champions. The lead-

ing reason for requiring a champion in civil cases was that if the parties should engage in combat, and one of them should be killed, the proceeding would terminate by his death, and the object of the contest would be frustrated. This barbarous mode of trial, which was based on the idea that Heaven would give the victory to the injured or innocent party, though for a long time practically disused, continued to be recognized as part of the law of England till the year 1819, when it was abolished by statute. (The details of the method of proceeding in the case of a writ of right will be found in the third book of BLACKSTONE'S "Commentaries," p. 337.)

Battelle, a township of Lewis co., West Va. P. 2002.

Battelle, a township of Monongalia co., West Va. Pop. 1856.

Bat'tering-Ram [Lat. *a'ries*], an engine of war used by the ancient Greeks and Romans to make a breach in the wall of a town or fortress. It consisted of a heavy beam of wood nearly 100 feet long, one end of which was armed with a mass of iron or bronze in the form of a ram's head. It was suspended by a chain or rope from a crane or trivet, and was made to swing backward and forward in a direction nearly horizontal. Sometimes a huge mass of stone, armed with a ram's head and placed on wheels, was driven against the walls with great force. About 100 men were employed in impelling it against the wall. To protect these men a wooden roof (*testudo*) was constructed, and the whole machine was mounted on wheels. The blows of the ram were directed against the same point with gradually increasing momentum, which, if continued long, hardly any wall could resist. These engines continued to be used in the Middle Ages until superseded by cannon.

Bat'tery [Fr. *batterie*], a military term used in various senses. A battery employed in the defence of a fortress is a row of heavy guns mounted on an earthwork or other platform; any one of the lines of a fortress which is armed with siege-guns. If they have a bomb-proof cover they are casemated batteries. A battery used in attacking a fortified place is a number of siege-guns or mortars placed in a line and covered with a parapet. These batteries receive various names, expressing their design, position, etc. In field operations a battery is a number of guns, with the necessary horses, gun-carriages, artillerymen, and officers to manage the guns. The number of guns varies in different nations. The battery of the British, French, and U. S. consists of six guns, of the Austrians and Prussians of eight. In reference to the weight of the ordnance, they are divided into *heavy batteries* and *light batteries*. The term battery is also applied in a narrower sense to the *personnel* or complement of men and officers who serve a set of guns.

Bat'tery, in law, an unlawful touching of the person of another by the aggressor himself, or by any substance put in motion by him. It must be wilfully done, or proceed from want of due care. The law regards a man's person as sacred, and permits no one, without sufficient cause, to interfere with it. This rule prevails, no matter how slight the unlawful force may be. Every battery includes an assault. A battery is sometimes justifiable, and hence permitted by the law; as when it occurs in the exercise of parental authority, or is a means of defence of one's self or the members of one's family, or is committed while acting under process of a court or in aid of the officers of the law. In all these cases the force used must be necessary to accomplish the purpose, and not in excess of what is required. The remedy for a battery is an action for damages. It is also in general a crime, and the wrongdoer is subject to prosecution in the name of the people.

Battery, Floating. See FLOATING BATTERY.

Battery, Galvanic. See ELECTRICITY.

Batthyányi, or **Bathyanyi,** the name of an ancient and celebrated family of Hungarian magnates which has produced several statesmen and generals.

Batthyányi (LOUIS), COUNT, a Hungarian patriot, born at Presburg in 1806. He favored the liberal cause, and was appointed president of the ministry formed in Mar., 1848. Finding his position untenable, he resigned about six months later. After his friends had been defeated in battle by the Austrians, he was tried by a court-martial, and, though his conduct had been moderate, he was shot Oct. 6, 1849. (See HORVATH, "Louis Batthyányi, ein politischer Martyrer," 1850.)

Bat'tle. See GRAND TACTICS.

Battle, a town of England, in Sussex, about 7 miles N. W. of Hastings, is in a valley enclosed on three sides by wooded hills. It is noted for the manufacture of gunpowder. Pop. about 3400. It derived its name from the great battle (usually called the battle of Hastings) which was fought near it on the 14th of Oct., 1066, between William the Conqueror and the Saxon king Harold. The victorious Norman erected here a large abbey, called Battle Abbey, now in ruins.

Battle-Axe, a weapon much used by the early northern nations, Teutonic, Celtic, and Scandinavian, and requiring great strength in its use. The battle-axe had a longer handle and a broader, stronger, and sharper blade than the common axe. It was of various forms, which had different names, such as the bill and the gisarme. The halberd was the latest form of the battle-axe, a form which is even now scarcely obsolete, though used only on occasions of ceremony. Battle-axes were used on foot and on horseback.

Bat'tleboro', a post-village of Edgecomb co., N. C., on the Wilmington and Weldon R. R. It has one weekly newspaper.

Battle Creek, a post-township of Tehama co., Cal. Pop. 199.

Battle Creek, a city of Calhoun co., Mich., at the confluence of the Kalamazoo and Battle Creek rivers, on the Michigan Central R. R., 120 miles W. of Detroit. Its educational facilities are very fine; its manufactures extensive, especially in the line of threshing-machines and farm implements. It has good water-power, four flouring mills, a manufactory of knit goods, three iron-foundries, an edge-tool manufactory, and two furniture-factories, one national bank and one city bank (savings). There are eight churches and two newspapers. Pop. 5838; of township, 1138.

WOOLNOUGH & BORDINE, PUBS. "MICHIGAN TRIBUNE."

Battle Creek, a post-twp. of Madison co., Neb. P. 284.

Bat'tledoor, or **Battledore** [probably from Sp. *batidor*, an instrument of the same shape used in beating clothes in washing], an instrument with a handle and a flat board (or piece of leather stretched tightly on a frame), used to strike a ball or shuttlecock. Battledoor and shuttlecock, played with the above instrument, has been a favorite amusement in Europe since the fourteenth century or earlier.

Bat'tle-Ground, a post-village of Tippecanoe co., Ind., where the celebrated battle of Tippecanoe was fought between Gen. Harrison and the Indians under Tecumseh and his brother, the "prophet," Nov. 7, 1811.

Bat'tlement, a notched or indented parapet sometimes used in fortification, and often employed for the purpose of ornament on the top of a house or castle. The rising parts are called cops or merlons; the spaces or openings between them are crenels, embrasures, or loops. The soldier shelters himself behind a merlon while he shoots through the embrasure.

Battle Mountain, a post-township of Humboldt co., Nev. Pop. 261.

Battle-Pieces, paintings representing battles. Among the remarkable works in this department are Lebrun's "Battles of Alexander the Great" and Rubens's "Battle of the Amazons." Horace Vernet is the most eminent of recent painters of battles.

Bat'tletown, a township of Clarke co., Va. P. 1884.

Battonya, a town of Hungary, in the county of Csanad, 16 miles N. E. of Arad. Pop. in 1869, 8642.

Bat'tue [from the French *battre*, to "beat"], a mode of hunting wild animals or killing game on a large scale. A number of men, arrayed at equal distances, by beating the bushes drive the animals toward a stationary party of hunters, who are waiting to shoot them. Sometimes the array of beaters is circular, and they drive the game from different parts of a large tract of forest to a common centre. Battues in Great Britain are chiefly practised in extensive preserves of pheasants, rabbits, and hares during the autumn and winter, when country gentlemen invite their friends to their mansions for this purpose.

Baudelocque (JEAN LOUIS), a skilful French surgeon, born in Picardy in 1746. He was selected by Napoleon to attend the empress Marie Louise as first accoucheur. He wrote an able work on the "Art des Accouchements" (2 vols., 1781). Died May 1, 1810.

Baudissin (WOLF HEINRICH FRIEDRICH KARL), COUNT, a German author, born Jan. 30, 1789. He translated, together with Tieck, a number of Shakspeare's works. Under the title of "Ben Jonson und seine Schule" (2 vols., 1836) he published translations of the works of other English authors. He also has made translations of Molière's comedies (1865–67).

Bau'er (BRUNO), a German rationalistic theologian and biblical critic, was born in Saxe-Altenburg Sept. 6, 1809. He published numerous works, among which are "Das entdeckte Christenthum" (1843), "Geschichte Deutchlands unter der Französischen Revolution und der Herrschaft

Napoleon's" (2 vols., 1846), and the "Apostelgeschichte" (1850). In these writings he showed himself as a reckless critic of the extreme school of rationalism, who regarded the gospel as fabulous or untrue. In later years he wrote in the interest of the extreme conservative party of Prussia.

Bauer (Georg Lorenz), a German theologian and linguist, born Aug. 14, 1755. He became professor of Oriental languages at Altdorf in 1789, and in Heidelberg in 1805. Among his works are "Hermeneutica Sacra Veteris Testamenti" (1797) and "Biblische Theologie des neuen Testaments" (4 vols., 1800–02). He was a rationalist, and maintained that the Bible should be interpreted by grammatical and historical principles, as the ancient classics are. Died Jan. 12, 1806.

Bauer (Wilhelm), a German inventor, born at Dillingen Dec. 23, 1822. He constructed a diving-boat for submarine operations, with which several successful experiments have been made. He has also made improvements in torpedoes for the destruction of ships and in the firing of guns under water. Bauer served with distinction in the Sleswick-Holstein war of 1850, and has since been in the service of Russia.

Bau'erle (Adolf), a German comic author, born April 9, 1786, gained considerable popularity from his grotesque representations of Viennese life. He wrote "Die falsche Primadonna," "Die moderne Wirthschaft," "Der Tausendsasa," and other comedies. He also published "The Comic Theatre," and in his later life numerous novels. Died Sept. 19, 1869.

Bau'ernfeld', von (Edward), a distinguished German dramatist, born at Vienna Jan. 3, 1802, has published numerous popular comedies, among which may be named "Die Bekentnisse" (1834), "Bürgerlich und Romantisch" (1825), and "Grossjährig" ("Of Age"), (1846).

Bau'gher (Henry L.), D. D., a Lutheran divine, born at Abbotstown, Pa., about 1803, graduated at Dickinson College in 1825, studied theology at Gettysburg and Princeton, became pastor of a church at Boonsboro', Md., in 1829, was a teacher at Gettysburg, Pa. (1830–32), professor of Greek and belles-lettres (1832–50) at Pennsylvania College, Gettysburg, and was afterwards its president (1850–68). Died April 14, 1868.

Baugh'man, a post-township of Wayne co., O. Pop. 2067.

Bau'go, a township of Elkhart co., Ind. Pop. 749.

Bauhin (Gaspard), an eminent botanist and anatomist, born at Bâle in 1550. He became professor of anatomy and botany in his native city in 1588. He wrote valuable medical and botanical works, among which was "Prodromus Theatri Botanici" (1620). Died in 1624.

Bauhin (Jean), a Swiss botanist and physician, born at Bâle in 1541, the brother of the preceding. He became physician to the duke of Würtemberg at Montbéliard in 1570. He wrote in Latin a "New Universal History of Plants" (3 vols., 1650–51). Died in 1613.

Baumé (Antoine), an eminent French chemist, born at Senlis Feb. 26, 1728. He improved the manufacture of porcelain, made several inventions, and simplified several processes in the useful arts. Baumé's hydrometer is in general use among chemists. Among his works is a "Manual of Chemistry" (1763). Died Oct. 15, 1804. (See Cadet de Gassicourt, "Éloge de Baumé," 1806.)

Baum'garten (Alexander Gottlieb), a German philosopher, born in Berlin July 17, 1714, was a disciple of Wolf. He became professor of philosophy at Frankfort-on-the-Oder in 1740. He did much for the science of æsthetics. He published, besides other works, "Metaphysica" (1739) and "Æsthetica" (2 vols., 1750, unfinished). Died May 26, 1762. (See Meyer, "Leben A. G. Baumgarten's," 1763.)

Baumgarten (Michael), a German theologian, born Mar. 25, 1812, became professor of theology in Rostock in 1850. He has published many books and periodicals in opposition to the State Church of Mecklenburg, for which he has been imprisoned and fined. He has been a prominent member of the Protestantenverein since its establishment, and an earnest advocate of disestablishment. He has published "Schleiermacher as Theologian," an "Apostolic History," and many polemical writings and popular appeals in behalf of a people's Church.

Baumgarten-Crusius (Ludwig Friedrich Otto), a learned German theologian, born at Merseburg July 31, 1788, studied theology at Leipsic. He became professor of theology at Jena in 1817. Among his works is the "Handbuch der Christl. Sittenlehre" (1827), which is highly commended. Died May 31, 1843.

Baum'gartner, von (Andreas), a German savant and minister of state, born at Friedberg, in Bohemia, Nov. 23, 1793. He became professor of physics at Vienna in 1823, and Austrian minister of trade and public works in 1841. About this date he was chosen president of the Academy of Sciences in Vienna. He published a work called "Naturlehre" (1823). Died July 29, 1865.

Baum'gartner (Gallus Jacob), a Swiss politician of the liberal party, born Oct. 18, 1797. He took part in the revision of the constitution of St. Gall, and promoted the separation of Bâle country from Bâle city. He founded in Oct., 1842, "Neue Schweizer Zeitung." He published, among other works, "Die Schweizin ihren Kämpfen und Umgestaltengen, 1830–50" (4 vols., 1853). Died in July, 1869.

Baum'stark (Eduard), a German economist, born Mar. 28, 1807, became in 1848 professor of cameralistics at Greifswald. He has taken a prominent part in German politics as a liberal politician and writer. He has written "Concerning Means of Improving the Condition of the Working Classes" (1860), "Cameralistic Encyclopædia" (1835), and "Introduction to the Scientific Study of Agriculture."

Baur (Ferdinand Christian), an influential German Protestant theologian and critic, the founder of the Tübingen school of theology, was born at Schmiden June 21, 1792. He obtained a chair of theology in Tübingen in 1826. Among his numerous works, which display a rare combination of speculative thought with solid erudition, are "Die christliche Gnosis" (1835) and "Die christliche Lehre von der Dreieinigkeit und der Menschwerdung Gottes" (1843). Died Dec. 2, 1860.

Bautain (Louis Eugène Marie), a French philosopher and theologian, born in Paris Feb. 17, 1796. He published several works, among which are "The Philosophy of Christianity" (1835) and "Moral Philosophy" (1842). He was a popular preacher at Paris, and became director of the College of Juilly in 1849. He died Oct. 18, 1867.

Baut'zen, or **Bu'dissin,** a town of Saxony, on the Spree, and on the railway from Dresden to Görlitz, 35 miles E. N. E. of Dresden. It has a royal palace, a cathedral, two public libraries; also manufactures of woollens, linens, leather, hosiery, paper, etc. Pop. in 1871, 13,165. Here occurred a great battle (May 20 and 21, 1813) between Napoleon and the allies, who finally retreated. The loss of the allies is estimated at 13,000, and that of Napoleon at 20,000 men.

Bavanistye, a town of the Austro-Hungarian monarchy, on the Military Frontier. Pop. in 1870, 6120.

Bava'ria [Lat. *Bava'ria* or *Baioa'ria*, *i. e.* the "country of the *Boi'i* or *Boia'rii*;" Ger. *Bay'ern* or *Bai'ern*], a kingdom forming part of the German empire. It is, next to Prussia, the largest German state. It consists of two isolated portions: the eastern and larger portion is bounded N. by Prussia, Saxe-Meiningen, Saxe-Coburg-Gotha, Reuss, and Saxony; E. and S. by Austria; W. by Würtemberg, Baden, and Hesse-Darmstadt; the western and smaller portion, known as Rhenish Bavaria or the Palatinate, is bounded by Prussia, Alsace, Hesse-Darmstadt, and Baden. Area, 29,373 square miles. The larger portion of the country is mountainous, the principal mountains being the Algäu and Bavarian Alps in the S., the former of which reach to an elevation of 9000 feet: the Bohemian and Bavarian Mountain forests on the eastern frontier: the Fichtel Mountains in the N. E.: the Franconia, Jura, and the Hardt. The main rivers are the Danube, which receives in Bavaria thirty-nine affluents, and the Main in the N. The Rhine forms part of the frontier of the Palatinate. The Danube and the Main are connected by the Ludwigs Canal. The number of lakes, most of which are alpine lakes, amounts to about fifty. The climate is, on the whole, temperate and healthy, but rough and severe in the mountains. The soil is fertile and rich in products, particularly in corn and cattle. There are celebrated mineral springs in Lower Franconia and Upper Bavaria (Kissingen and Brückenau). The total population, according to the census of Dec., 1871, was 4,861,462, of whom nearly three-fourths are Roman Catholics, and a little more than one-fourth Protestants. The Jews number 50,000. It is divided into eight provinces, which, according to the census of 1871, had the following population: Upper Bavaria, 841,579; Lower Bavaria, 602,005; Palatinate, 615,104; Upper Palatinate, 497,960; Upper Franconia, 510,963; Middle Franconia, 583,417; Lower Franconia, 586,122; Suabia, 582,888. As regards the descent of the inhabitants, about 1,750,000 are Bavarians (Old Bavarians or Bavarians proper), 2,250,000 Franconians, and 633,000 Suabians. Bavaria has 3 universities —at Munich, Würzburg, and Erlangen—9 lyceums, 28 gymnasia (colleges), 10 normal schools, polytechnical institutions at Munich and Nuremberg, and 7113 public schools

(4810 Catholic, 2150 Protestant, and 153 Israelite); also a number of Latin, technical, and special schools. All the kings of Bavaria have been liberal patrons of science and art. There is an academy of science and an academy of plastic arts in Munich, which is also celebrated for its rich collections of works of art. The principal occupations of the inhabitants are agriculture and the breeding of cattle; the latter chiefly in the mountainous districts, the former in the plains. Among the chief products are cereals, fodder, potatoes, hops, tobacco, wine (in the Palatinate and in the region of the Main). No less than 10,567 square miles are covered with wood, one-half of which belongs either to the state or to the communities. The culture of the forests is well regulated and profitable. The most active industry is found in the provinces of Middle Franconia, Suabia, and the Palatinate. Prominent among the industrial cities are Augsburg, Kempten, Nuremberg, Fürth, Schwabach, Baireuth, Würzburg, Bamberg, Erlangen, and Hof. The most celebrated branch of Bavarian industry is the brewing of beer. For 1870 the number of breweries was upwards of 5400, which produced annually over 131,000,000 gallons, beer measure. Beer is an important article of export. Bavaria has also flourishing manufactures of linen, woollen, iron, and wooden ware, fifty-one glass-works, manufactories of paper, chinaware, and guns, and celebrated melting-houses at Oberzell. The manufactories of tobacco produce annually about 1200 hundredweight of tobacco and upwards of 30,000,000 cigars. The most important commercial cities are Nuremberg and Augsburg (bills of exchange), Hof, Bamberg, Schweinfurt, Würzburg, Speier, Munich, Ratisbon, Passau (navigation of the Danube). Bavaria had, in 1871, 1508 miles of railroad and 1945 miles of telegraph. The navigation of the Danube engaged fifteen steamers and 2000 sailing vessels; that of the Rhine, twelve steamers and 236 sailing vessels; that of the Inn, 2000 vessels. The chief articles of export are, besides beer, corn, wood, cattle, wine, hops; total value of exports, about 50,000,000 florins.

Bavaria is a constitutional monarchy, the fundamental law of the state bearing date of May 26, 1818, and the electoral law now in force having been adopted on June 4, 1848. The crown is hereditary in the male line only, according to the right of primogeniture. The king exercises the administrative power; the legislative he shares with a legislature consisting of two chambers. The upper chamber, or chamber of the Reichsräthe (counsellors of the empire), had, in 1871, 72 members, of whom 51 were entitled to a seat as being chiefs of noble families, and 8 by their office, while 13 were life-members appointed by the Crown. The lower chamber, or chamber of representatives, had, in 1871, 154 members, who are elected for a term of six years. The chambers must be convoked at least once every third year. There are eight courts of appeal, and one supreme court of appeal in Munich. The receipts and expenditures of the state amounted in 1869 to $34,000,000; the public debt to $170,000,000; the civil list and appanages to $1,300,000. The Bavarian army, according to the treaty of Nov. 23, 1870, forms two army corps of the imperial army of Germany under the independent military administration of the king of Bavaria, though under the chief command of the emperor. The capital is Munich; the most important towns next to it are Nuremberg, Augsburg, Wurzburg, Ratisbon, and Bamberg.
